

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

A DICTIONARY OF

## UNIVERSAL KNOWLEDGE FOR THE PEOPLE

### BELGIUM.

**BELGIUM**, one of the smaller European states, consists of the southern portion of the former kingdom of the Netherlands (as created by the Congress of Vienna). In the time of the Romans, it formed a part of *Gallia Belgica*.

*Geography and Statistics*.—Belgium lies between lat. 49° 27' and 51° 30' N., and between long. 2° 33' and 6° 5' E. It is bounded on the N. by Holland; on the E. by Dutch Limbourg, Luxembourg, and Rhenish Prussia; on the S. and S. W. by France; and on the N. W. by the North Sea. Its greatest length, from north-west to south-east, is 173 English miles; and its greatest breadth, from north to south, 112 English miles. The whole area is 11,313 square miles. The following table gives a list of the provinces in Belgium, with the area, population, and chief town of each:

Provinces.	Area in Square Miles.	Population, Dec. 31, 1870.	Chief Cities.
Antwerp,	1,094	492,482	Antwerp.
West Flanders,	1,213	668,976	Bruges.
East Flanders,	1,154	837,726	Ghent.
Hainault,	1,430	896,285	Mons.
Liege,	1,111	592,177	Liege.
Brabant,	1,260	879,814	Brussels.
Limbourg,	929	200,336	Hasselt.
Luxembourg,	1,695	205,784	Arlon.
Namur,	1,397	318,525	Namur.
Total,	11,313	5,087,105	

B. is the most densely peopled country in Europe, the population being about 404 to the square mile; and in the particular provinces of East Flanders, Brabant, Hainault, and West Flanders, respectively, not less than 675, 594, 537, and 502 to the square mile. The rural population is to that of the towns as 3 to 1.

*Physical Aspect*.—B. is, on the whole, a level, and even low-lying country; diversified, however, by hilly districts. In the south-east, a western branch of the Ardennes highlands makes its appearance, separating the basin of the Maas from that of the

Moselle, but attains only the moderate elevation of 2000 feet. In Flanders the land becomes so low, that in parts where the natural protection afforded by the dunes is deficient, dikes, &c., have been raised to check the encroachments of the sea. In the north-east part of Antwerp, a naturally unfertile district named the Campine, and composed of marshes and barren heaths, extends in a line parallel with the coast. The once impassable morasses of the *Morini* and the *Menapii*, which stayed the progress of Caesar's legions, are now drained, and converted into fertile fields, surrounded by dense plantations, which make the land at a distance look like a vast green forest—though, when more closely regarded, we see only numerous dwellings interspersed among fields, canals, and meadows.

*Hydrography, Climate, Agriculture, &c.*—The abundant water-system of B. is chiefly supplied by the rivers Scheldt and Maas, both of which rise in France, and have their embouchures in Holland. At Antwerp, the Scheldt, which, like the Maas, is navigable all through Belgium, is 32 feet deep, and about 480 yards wide. Its tributaries are the Lys, Dender, and Rupel. The Maas, or Meuse, receives in its course the waters of the Sambre, the Ourthe, and the Roer. These natural hydrographical advantages are increased by a system of canals which unite Brussels and Louvain with the Rupel, Brussels with Charleroi, Mons with Condé, Ostend with Bruges and Ghent, and this last place with Terneuse. According to the resolution passed by the government in 1842, the long postponed project of cutting canals through the Campine district was at length commenced, and has been very advantageous to the spread of agriculture. A large portion of the Campine seems destined to perpetual barrenness—a dreary, silent, irreclaimable waste; but wherever it has been possible to rescue a patch from the stubborn heath or the relentless sand, there agricultural colonies have been planted, and cornfields shine, and pastures brighten in the heart of the immemorial wilderness. The climate of B. in the plains near the sea, is

cool, humid, and somewhat unhealthy; but in the higher south-east districts, hot summers alternate with very cold winters. April and November are always rainy months. These varieties of climate are favourable to a greater variety of produce than the neighbouring country of Holland can supply. The Ardennes districts yield a large supply of wood; while the level provinces raise all kinds of grain—wheat, rye, barley, oats, &c., leguminous plants, hemp, flax, colza, tobacco, hops, dye-plants, and chicory. Belgium contains upwards of 7,000,000 acres, of which one-half is arable, rather more than one-fifth in meadow and pasture, the same in woods and forests, and not above 500,000 acres lying waste. Some hundreds of acres are devoted to vineyards, but the wine produced is of an inferior quality. The forests of Ardennes abound in game and other wild animals. Good pasturage is found on the slopes and in the valleys of the hilly districts, and in the rich meadows of the low provinces. Gardening occupies not less than 130,000 acres; indeed, it has been said that the agriculture of B. is just gardening on a large scale, so carefully and laboriously is every inch of soil cultivated. The spade is still the principal instrument used. In the Campine, the care of bees is very productive, and the cultivation of the silkworm is encouraged. There are valuable fisheries on the coast, which employ about 200 boats. B. is famous for its horses, and in one year contained as many as 294,537 of these animals, 1,203,891 horned cattle, and 662,508 sheep.

**Geology.**—The geological formations of B. are closely associated with those of France and Britain. The greater portion of the country is covered with *Tertiary deposits*. A line drawn across the course of the Scheldt, by Mechlin, along the Demer and Maas, will have on its northern and north-western aspect a tract of tertiary deposits, bounded northwards by the sea. In these tertiary strata the different geological periods are fully represented; but only the second, containing the Pleiocene deposits, is rich in fossils. The *Secondary deposits* occupy an extensive tract in the centre of Belgium, between the Scheldt and the Demer. The most important district, economically, is the south-western, consisting of *Paleozoic rocks*—Silurian, Devonian, and Carboniferous. These beds have a very complicated structure, from the numerous and extensive flexures and folds they have undergone, and these are often accompanied with great upward shifts, by which beds of many different ages are brought to the same level.

**Mineral Products.**—B. is rich in minerals, which, next to its abundant agriculture, constitute the chief source of its national prosperity. The four provinces in which they are found are Hainault, Namur, Liege, and Luxembourg. They include lead, copper, zinc, calamine, alum, peat, marble, limestone, slate, iron, and coal. Lead is wrought, but only to a small extent, in Liege; copper in Hainault and Liege; manganese in Liege and Namur; black marble at Dinant; slates at Herbemont; and calamine principally at Liege. But these products are insignificant compared to the superabundance of coal—from anthracite to the richest gas coal—and iron, in which B. ranks next to England. In 1871, the ‘put out’ of coals in B. was 13,733,176 tons, the total value of which was £6,152,120. Nearly three-fourths of the exports of coal during the four years 1868–1871, went to the Netherlands. The number of people employed at the end of that year in the coal-mines of Hainault, Namur, and Liege was 94,186; the average daily pay of the workmen, 2½ francs; and the cost of production, 9½ francs per ton of coal. The iron-ore weighs annually about two million tons, and the prepared iron nearly half that quantity.

The modern industrial character of the Belgians

may be traced back to a very early period, even to the time of the Romans, who noticed the love of traffic prevailing in the Celtic districts of *Gallia Belgica*. This characteristic has remained steadfast to the present time. It is impossible not to recognise in the cloth-weaving *Atrébatæ* the ancestors of the industrious race who gradually extended themselves towards the east and north of Belgium. During the early commerce of Europe, when trade was secure only within walled towns, Flanders was the principal seat of productive industry; and its recent separation from Holland has also been indirectly favourable to the development of its internal resources. A state which, like B., begins its career under a burden of debt, which is shut in between nations who possess important ports and colonies, and which is peopled by races not yet sufficiently blended to constitute a perfect nationality, must, before all other things, develop its internal, material resources. This has been well understood in Belgium. Since the commencement of its independent career, it has devoted its attention almost exclusively to those branches of industry and commerce by which its future greatness must be supported.

**Manufacture.**—The chief manufactures are linen, woollen, cotton, silk, lace, leather, and metals. The great seats of the linen manufacture—recently revived after a long depression—are Courtray and Bruges, in West Flanders; Ghent, in East Flanders; Brussels, in Brabant; Mechlin, or Malines, in Antwerp; and Tournay, in Hainault. The number of linen pieces annually produced is about 900,000. The lawn and damask fabrics of Bruges are celebrated, as well as the lace made in and near Brussels, Malines, Louvain, and Bruges, which sometimes commands a price of £40 per yard. But the Belgian hand-spun yarn, though superior in quality, cannot maintain its ground against machinery. Verviers, Liege, Dolhain, Ypres, Doperinghe, Limbourg, Bruges, Mons, Thuin, and Hodimont are centres of the woollen manufacture. Ypres alone employs 50,000 workmen in this branch of industry. Brussels and Tournay have large carpet manufactures, and Hainault supplies a considerable amount of hosiery. The principal manufactures of cotton are at Ghent and Lokeren, in East Flanders; Bruges and Courtray, in West Flanders; Malines, Louvain, and Anderlecht, in Brabant; Tournay and Mons, in Hainault; and also at Antwerp. The separation of B. from Holland had at first a prejudicial effect on this as on other trades; but the opening of the navigation of the Scheldt, the intersection of the country by railways and canals, and, in consequence, the rapid and extensive communication with other countries, have revived the activity of the cotton trade, which now gives employment to between one and two hundred thousand workmen. Maestricht, which belongs to Holland, is one of the chief seats of manufactures of leather; but this trade is also carried on at Limbourg, Liege, Stadelot, Namur, Dinant, and especially at Bruges and Ghent. The manufacture of gloves has made great progress in recent years. Metallurgy also has rapidly increased in productivity since 1816, when Cockerill introduced into B. the English method of smelting iron with coke. The principal seats of the metal manufacture are Liege, Namur, Charleroi, Mons, and their neighbourhoods. There are large ordnance foundries at Liege and Malines, and celebrated makers of firearms and machinery in Liege; nail-making at Charleroi; tinware, &c., at Liege and in Hainault; wire and brass factories at Namur; zinc manufactures at Liege; lead and shot factories at Ghent; the gold and silver goods of Brussels and Ghent may also be noticed as important branches of Belgian industry. Flax is

one of the most extensive and valuable products of B., no fewer than 400,000 persons being employed in its culture and preparation. Besides these, we may mention the straw-bonnet manufacture in the neighbourhood of Liege; the paper fabrics of the provinces Liege, Namur, and Brabant; the glass-works of Hainault, Namur, Val-St-Lambert, and Brabant; the porcelain, &c., of Tournay, Brussels, Mons, and Ghent; and sugar-refineries at Antwerp, Bruges, Ostend, Ghent, &c. Steam-engines have been quite familiar objects in the several manufactoryes of B. for many years.

The natural wealth and industrial resources of B. have always been more or less modified by the political relations of the country. In the middle of the 13th c. B., with Bruges as its chief seat of manufactures, had surpassed all its neighbours in industry, and had established a flourishing commerce with the Italians. After the discovery of America, Antwerp took the place of Bruges, and was regarded as a northern Venice. But the unhappy period of Spanish oppression and the war in the Netherlands deeply depressed Belgian commerce, which suffered still more at the peace of Westphalia, when Holland monopolised the navigation of the Scheldt. The river was again opened at the close of the 18th c., when the French had invaded the Netherlands, and Napoleon caused the harbour of Antwerp to be restored and enlarged. At the cost of Amsterdam, Belgian commerce received a new impulse by the union of B. with Holland, as settled by the Congress of Vienna; but scarcely were hopes revived, when the revolution of 1830 changed the prospects of the country. The treaty signed in London, April 19, 1839, gave to Holland the right to levy a toll of two-and-sixpence per ton on all vessels navigating the Scheldt. The privilege of navigation on the inland waters between the Scheldt and the Rhine was purchased by B. for an annual payment of £50,000. In June 1839, this privilege was virtually taken away by the government of Holland, and, in 1843, with additional expense to B., the new treaty of navigation was ratified by both parties. During this crisis preceding the development of a free commerce, B. had not neglected her internal resources. The Société de Commerce de Bruxelles, the Banque de Belgique, and other associations for the extension of trade, had been formed; and May 1, 1834, the government adopted the scheme for a railway-system the most complete of any on the continent. The centre of the Belgian net-work of railways is Malines, whence lines are carried out in all directions. The north line goes to Antwerp and its harbour; the west, by Ghent and Bruges, to Ostend; the south-west, by Brussels and Mons, to Quiévrain and the borders of France, not far from Valenciennes; and the east, by Louvain, Tirlemont, Liege, Verviers, and extending to the confines of Prussia. There were in 1873 open for conveyance in B. 1191 miles of railway lines; of these 467 miles were in the hands of the state, and the rest were worked by companies. The cost of the permanent way and buildings of these lines has been about £18,280 a mile. The net revenue at present is stated to be £1508 a mile. The working of the post-office in B. was, in 1871, as follows: Private letters, 46,136,520; official letters, 7,835,693; packets, 18,371,216; newspapers, 47,120,191. On January 1, 1872, there were in that country 430 post-offices, 452 telegraph stations, and the total length of telegraph lines was 7031 miles, the length of wires 23,994 miles. B., along with France, Italy, and Switzerland, entered on a monetary league in 1865, in which the four states agreed to adopt the French decimal system of coins, weights, and measures. During the three years 1869—1871, the general com-

merce of B. averaged £100,000,000 in value, rather more than half of which sum was due to imports. The commercial intercourse of B. with Great Britain, in 1872, was represented in value by £13,211,004 for exports; and for imports of British home produce, £6,499,062. Among the principal articles of export are coal, flax, linen, woollen, and cotton goods, glass, firearms, and nails. More than a third of the whole quantity is consigned to France, and half of the remainder to the Zollverein, England, and Holland. The unit of the Belgian monetary system is the franc, equal in value to the French franc.

It cannot be said that intellectual improvement has kept pace with the material prosperity of B., though in this respect also there has been a perceptible advance. The great hindrance to a thorough development of the national intellect have been the lack of political independence, which has drawn off the most precious energies of the country to foreign centres of activity; and the variety and confused mixture of dialects, whereby the true Flemish individuality has been driven into the background. An independent national literature, acting as the bond of a pure national unanimity, was not possible, under such unfavourable conditions, to which may be added the facilities afforded for supplying the people with cheap reprints of foreign works. The Flemish element—the most important—seems indeed to have become conscious of its capabilities in respect to literature; but a genuine expression of the entire Belgian mind will first become possible when the Walloon element also begins to develop a freer form of speech along with its own peculiar modes of thought. The Royal Academy of Arts and Sciences at Brussels is at the head of several other unions for scientific purposes. Among the most celebrated names in Belgian literature and science, may be mentioned—Quetelet in mathematics, Altmeyer the historian, Fetis the musical critic, Conscience the Flemish poet and novelist, Willems the philologist, and Baron and Moke in literary history and criticism. Painting and architecture formerly flourished in the wealthy old towns of Flanders; but after the brilliant epoch of Rubens and his pupils, a long period of dulness followed. In modern times, a revival of art has taken place, as may be proved by the names of the painters, Wappers, De Keyser, Gallait, De Bieffe, Verboekhoven, &c.; the sculptors, W. Geefs, Simonis, Jehotte, Fraikin, &c.; the engravers, Calamatta, Brown, and Meunier; and the medallists, Wiener and Hara.

The Belgian school-system suffered for more than ten years under the freedom of teaching allowed by the constitution, which was chiefly made use of by the wealthy Catholic clergy. The consequence was that education assumed a divided and sectarian character. Since the state, however, has exercised a general superintendance over the universities, gymnasias, and elementary schools, a higher style of education has prevailed. The two universities of Ghent and Liege, united with a school of architecture and mining; ten national schools (*Athénées*), in which a classical is combined with a commercial education; fifty schools preparatory to these (*Écoles moyennes*); two seminaries for teachers at Lierre and Nivelle, besides the superintendance now exercised by the state over the institutions formerly maintained by communes and provincial corporations, and, above all, over the primary schools—all this forms a sufficient counterpoise to the numerous schools supported by private individuals and religious bodies. Among the latter may be noticed the Catholic High School of Louvain, founded in 1836, and conducted under strict ecclesiastical discipline; the free university of Brussels; and the gymnasias of the Jesuits at Namur, Brugge, and Liege. Journalism in B.

has been greatly extended by the abolition of the stamp-duty (1848), and 180 daily newspapers are now published, including 56 Flemish papers; but only a few have obtained a proper degree of respectability and influence.

*Population and Religion.*—The population of B. is of mixed German and Celtic origin. The Flemings (a branch of the Teutonic family) and Walloons (a branch of the Celtic family), distinguished by their peculiar dialects, are still conspicuous among the pure Germans, Dutch, and French. The French language has gained the ascendancy in educated society, and in the offices of government; but the Flemish dialect prevails numerically in the proportion of 4 to 3. The *Catholic religion* is the prevailing form. There are only about 10,000 or 12,000 Protestants, and 1400 Jews. The supreme Catholic dignitaries of B. are the Archbiishop of Mechlin, and the five diocesan bishops of Bruges, Ghent, Tournay, Namur, and Liege.

The government of Belgium is a limited constitutional monarchy, and was established in its present form by the revolution of 1830. The legislative body consists of two chambers—that of the senate, and that of the representatives. A responsible ministry, with the king as president, is at the head of all public affairs, and its measures are carried into effect by the governors of the several provinces. The ministry includes departments for home affairs, foreign affairs, finance, justice, public works, and war. The administration of justice retains the forms of French jurisprudence. In the thirty years 1841—1870 the total expenditure of the state amounted to £150,784,059. The national debt amounted in 1873 to 924,549,013 francs, or £36,981,960.

The standing army of B. is formed by conscription, to which every healthy man who has passed his nineteenth year is liable. Substitution is allowed. The legal period of service is eight years, but about five years are allowed on furlough. According to a law passed in 1868, the strength of the army is to be 100,000 men on the war footing, and 80,000 in times of peace. The importance of B. in a military point of view affords a reason for the maintenance of fortifications at Antwerp, Ostend, Nieuport, Ypres, Tournay, Mons, and other places.

*History of Belgium to 1830.*—In the time of the Romans, the name *Gallia Belgica* was given to the Southern Netherlands lying on the confines of Gaul and Germany. It was peopled by Celtic and German tribes. The latter were predominant in Batavia and Friesland, and, under the rule of the Franks in the 5th and 6th c., gained the ascendancy also in the southern districts. Until the close of the 11th c., the feudal system, which arose at the fall of the Carlovingian dynasty, prevailed in the Netherlands, where the several southern provinces were made duchies and counties. The county of Flanders, superior to all the others in industry and commerce, maintained, during a long struggle, its independence against France; and, in 1385, when the male line of the Counts of Flanders expired, was annexed to the powerful House of Burgundy, which, in the beginning of the 15th c., also gained possession of all the other provinces of the Netherlands. The rulers of Burgundy aimed at founding a powerful united state between France and Germany, and therefore endeavoured to repress the free republican spirit which manifested itself in the rapidly rising towns. The work of establishing unlimited sovereignty was interrupted by the fall of Charles the Bold, and the partial division of his territories; but was continued by the Emperor Charles V., the grandson of the Emperor Maximilian, and Maria,

the heiress of Burgundy—through the latter of whom the Netherlands passed into the possession of the House of Hapsburg. After the abdication of Charles, these provinces passed into the hands of Philip II., and by the law of primogeniture, should have remained united with Spain. But scarcely had the peace of Château-Cambresis (1559) put an end to the encroachments of France, when the religious disputes of the Reformation, and the despotic measures of Philip, excited in the provinces a long and bloody war for civil and religious freedom, which ended in the independence of the Northern or Teutonic Netherlands, while in the southern or more Celtic provinces (now included under B.), both the sovereignty of Spain and the rule of the Roman Catholic Church continued. In 1598, B. was ceded by Philip II. to his daughter Isabella, wife of the Archduke Albert, when it became a distinct and independent kingdom. Several measures for the better regulation of internal affairs, especially in the administration of justice, and for the revival of industry, which had been injured by the unenlightened policy of Philip, were projected. Unfortunately, Albert died childless in 1621, and B. fell back into the hands of Spain, and became involved in the wars attending the decline of the Spanish monarchy. Peace was concluded chiefly at the cost of Belgium. By the treaty of the Pyrenees (1659), the counties of Artois, Thionville, and other districts, were given to France. Subsequent conquests by the same powerful neighbour secured to it, at the peace of Aix-la-Chapelle (1668), the possession of Lille, Charleroi, Oudenarde, Courtrai, and other places. These were partly restored to B. at the peace of Nimeguen; but as a compensation, Valenciennes, Nieuport, Cambrai, St Omer, Charlemont, and other places, were given up, and only partially regained by B. at the peace of Ryswick in 1697. After the conclusion of this treaty, at the close of the reign of Charles II. of Spain, some endeavours were made to create prosperity in B. by a new system of taxation and customs, and by the construction of canals, to counteract the injury done to its commerce by the closing of the navigation of the Scheldt; but these projected improvements were interrupted by the Spanish War of Succession, which was not concluded until the peace of Utrecht, in 1713. By this treaty, B. was given to Austria, Holland retaining the privilege of garrisoning the most important fortresses on the French frontier, and also of exercising a monopoly of the navigation of the Scheldt. The 'Belgian Commercial Company' at Ostend, founded by Charles VI. in 1722, fell in 1731—another sacrifice to the cupidity of Holland. During the Austrian War of Succession (1744), almost the whole country fell into the hands of the French; but was peacefully restored to Austria by the treaty of Aix-la-Chapelle (1748).

B. remained undisturbed by the Seven Years' War, and during the long peace following the treaty of Aix-la-Chapelle, prosperity was restored. Especially during the mild reign of Maria Theresa of Austria, measures of public improvement were promoted by Prince Charles of Lorraine, governor of the Belgian provinces. The reign of Joseph II., son and successor of Maria Theresa, began in disputes with Holland. The latter country consented to the abolition of the *Barrière-contract*, in consequence of which, several important fortresses were demolished, though the emperor failed in his endeavour to make free the navigation of the Scheldt. But the errors of his internal administration were the serious feature of his policy. By his innovations, he offended the religious sympathies of the people, and violated the legal privileges of the states, of which he had made the strict preservation

## BELGIUM.

a condition of obedience. In a short time, discontent openly manifested itself. The Austrian authorities were attacked; Brabant refused to pay taxes; while the more violent fled into Holland, and organised an armed expedition. Returning, they were joined by numbers of the inhabitants, defeated the foreign troops, captured Brussels, and in the beginning of 1790, declared their independence. In the course of the year, however, the Austrians succeeded in regaining possession of the country. The privileges of the states as they existed at the close of the reign of Maria Theresa were restored, and at the same time stringent measures were adopted to prevent any renewal of disturbances. But this state of peace was soon interrupted by the outbreak of the war of the French Revolution. B. was conquered by Pichegru in the campaign of 1794, and subsequently united to France by the treaties of Campo-Formio and Luneville. It now shared in the fortunes of France during the Consulate and the Empire; received the *Code Napoleon*; and in all political relations, was organized as a part of France. After the fall of Napoleon, it was united with Holland, and its boundaries defined by the Congress of Vienna (May 31, 1815).

At the introduction of the new constitution, the want of national unity in language, faith, and manners was strikingly manifested by the two great parties—the Dutch Protestant population, with their commercial habits, on the one side, and the Catholic population, of agricultural and manufacturing B., on the other. These natural and unavoidable obstacles to the political harmony of the new kingdom, were further increased by the unfair treatment which B. experienced. All the more important provisions of the constitution had a regard chiefly to the interests of Holland. Repeated attempts were made to supersede the Belgian language by the Dutch in all affairs of administration and jurisprudence, though the former were the more numerous people; the privileges of the Belgian clergy were abridged; the poorer classes were severely taxed; while the government was almost exclusively composed of Dutchmen. In 1830, among seven ministers, there was only one Belgian; among 117 functionaries of the ministry of the interior, only 11 Belgians; among 102 subordinates of the ministry at war, only 3 Belgians; and among 1573 officers of infantry, only 274 Belgians. B. was politically divided into two classes—the Liberal and the Catholic. Both of these strongly resented and opposed the encroachments of Holland: the Liberals, from a desire to preserve the national secular institutions; the Catholics, from a desire to preserve the national Church. The government became alarmed at their increasing hostility; and ultimately, when their patriotic fusion rendered its position critical, it made several concessions; the supremacy of the Dutch language, and the taxes on the necessaries of life, were abolished. Efforts were also made to conciliate the Catholic priesthood. But these concessions came too late, and were, in consequence, only construed as signs of weakness. In 1828 and 1829, it was attempted to coerce and intimidate the opposition, by prosecuting the liberal or democratic leaders. This only fanned the fire of discontent, which was already burning fiercely in the hearts of the Belgians, and panting for an opportunity to break out into visible insurrection.

*From 1830 to 1858.*—The French revolution of 1830 afforded the desired occasion. On the king's birthday (August 24, 1830), several riots occurred in various towns of Belgium. At this period, however, the idea of separation from Holland does not seem to have presented itself consciously to the Belgian mind; the deputies who

were sent to the Hague to state the causes of the general dissatisfaction, merely insisted on its possessing a separate administration, with the redress of particular grievances. But the dilatory and obstructive conduct of the Dutch deputies in the states-general assembled at the Hague on the 13th September, exasperated the Belgian nation beyond measure. A new and more resolute insurrection instantly took place. In seven days, the people had deposed the old authorities, and appointed a provisional government. Prince Frederick, the son of the sovereign, who commanded his father's troops, was compelled to retreat from Brussels to Antwerp, having suffered considerable loss. On the 4th of October, B. was declared independent by the provisional government, composed of Messieurs Rogier, D'Hoogvorst (commandant of the civil guard), Joly, an officer of engineers, and the secretaries Vanderlinde and De Coppin; Count Felix de Mérode, Gendebien, Van de Meyer, Nicolai, and De Potter, the democratic leader. They also announced that a sketch of the new constitution was in course of preparation, and that a national congress of 200 deputies would shortly be called together. Freedom of education, of the press, of religious worship, &c., were proclaimed. Here and there, the new liberty shewed a tendency to become anarchic; but its excesses were speedily suppressed; and at the national congress of the 10th November, out of 187 votes, only 13 were in favour of a democratic government. Meanwhile, the London Congress had assembled, and after mature deliberation, recognised the severance of the two kingdoms as a *fait accompli* (December 10). The Belgian Congress, on its assembly appointed Baron Surlet de Chokier provisional regent, but on the 9th July elected Prince Leopold of Saxe-Coburg king, who entered Brussels on the 21st of the same month, and subscribed the laws of the constitution. This prince proved himself one of the wisest monarchs of modern times. He died in 1865, and was succeeded by his son, Leopold II., the present (1874) king of B. Holland refused to acknowledge the validity of the decision of the London Congress, and declared war against B., which was speedily terminated by France and England—Holland securing that B. should annually pay 8,400,000 guilders as interest for its share in the national debt of Holland. The latter country, however, was still dissatisfied, and ventured to employ force. England and France were compelled to interfere. The blockade of the coast of Holland brought the Dutch to terms, and the dispute was closed by a treaty signed in London, May 21, 1833.

The monarchy of B. is hereditary, according to the law of primogeniture, but with a perpetual exclusion of females and their descendants. The legislative power is vested in the king and two chambers; and the king has the power to dissolve either the Senate or the House of Representatives, or both. The number of deputies in 1869 was 116, sent by 41 electoral districts. Electors must be Belgians by birth or naturalisation, must have attained 25 years of age, and pay taxes, each to the amount of £1, 13s. 4d. Members of the Chamber of Representatives require no property qualification. The Senate consists of half the number of representatives, and is elected by the same constituency, but for 8 years instead of 4. A senator must be 40 years of age, and must pay at least 1000 florins of direct taxes. The budget is annually voted by the chambers, and the contingent of the army is also subject to their annual vote.

In 1842, a law was carried in both chambers, by which it was enacted that the paroisseurs should be bound to provide elementary schools, according to the wants of the population, in all places where the want of education was not fully supplied by

voluntary means. The main regulations for the universities were effected by the ministry of De Theux, 1835; but the organisation of intermediate instruction (that is, between the *Ecoles Primaires* and the universities) was postponed, as involving some delicate party interests, until 1850; and even then was not concluded in a way satisfactory to the Catholic clergy.

In 1838, it seemed as if Holland and B. were likely to engage in war once more. According to the 'twenty-four articles' of the 'Definitive Treaty,' B. was under obligation to give up Limbourg and a part of Luxembourg during the above-mentioned year. This it now refused to do, and put its army on a war-footing; but its obstinacy finally gave way to the unanimous decision of the five great powers.

After 1840, the opposition of the Catholic to the Liberal party became more and more decided. The elections of June 8, 1841, were attended with great excitement, and it was a significant fact, that the liberal candidates re-elected were everywhere returned by large majorities, while in the principal towns where Catholics were returned, only small majorities appeared. Meantime, however, commerce progressed under a wise and liberal policy.

In July 1845, the liberal Van de Weyer, at the head of a new administration, endeavoured to confirm the so-called 'union' of Catholics and Liberals. But he had scarcely asserted the prerogative of the civil power in matters pertaining to the question of education in the 'intermediate schools,' when he was forsaken by his colleagues, who acted under the influence of the Catholic priesthood. In March 1846, a purely Catholic ministry was formed under the presidency of De Theux. This was an anachronism, for the elections of 1845 had secured a victory for the Liberals.

The elections of 1847 at last brought to a close the system of government in subservience to the church. A new liberal ministry was formed by Rogier and others, whose programme of policy promised the maintenance of the independent civil authority in all its subordinate functionaries; a budget favourable to the public with regard to duties on provisions; and measures to promote the interests of agriculture. The institution of numerous agricultural and commercial schools, normal *ateliers*, popular libraries, and other means used for raising the working-classes, were followed by most beneficial results. The revolutionary tempest of 1848, however, menaced the tranquillity of the country; but the king, at the outbreak of the catastrophe in France, promptly declared himself ready to retain or to surrender the crown of B. according to the decision of the people. This frank and ready declaration had a successful result in strengthening the party of order, while it disarmed even those most disaffected to the crown.

In July 1848, the result of the elections was found to be a great strengthening of the liberal-constitutional party. In November 1849, a new commercial treaty for ten years was concluded with France, and the duration of the treaty with the German Zollverein was lengthened. In 1850, the educational question was supposed to be settled on soundly liberal principles; but since then there has been a keen struggle between the Progressists and the Ultramontane. At present (1874) the question of liberal advance in education and religion in B. is, as it is in Prussia, France, and Italy, a question of very considerable interest.

Nothomb's *Travaux Publics en Belgique* (Bruss. 1839); *Statistique de la B.*, by the same author (1849); Juste, *Histoire de B.* (3d ed., Bruss. 1850); Popliment, *La B. depuis l'an 1830* (Bruss. 1850).

BELGOROD (Russian, *Belgorod*, 'White Town'), a town of 15,200 inhabitants, in the Russian government of Kursk. It is situated on the Donetz, in lat. 50° 40' N., long. 36° 35' E. B., which derives its name from a chalk-hill in the vicinity, is divided into two—the old and the new towns. It is built chiefly of wood, is an archbishop's see, has numerous churches, two monasteries, manufactories of leather, soap, &c., and carries on a considerable trade in wax, bristles, and hemp. Three important fairs are held here during the year.

BELGRADE, the ancient *Singidunum*, styled by the Turks *Darol-Jihad*, the 'House of the Holy War,' and in German, *Weissenburg*, is an important fortified and commercial town, capital of Servia. It is situated at the confluence of the rivers Save and Danube. The name B. is derived from the Slavonic *bielo*, 'white,' and *grad* or *grod*, a 'fort' or 'town.' B. contains (1872) 26,674 inhabitants, and is divided into four parts—the fortress, a very strong place, which, situated on the tongue of land between the rivers, commands the Danube; the Water Town, also well protected by walls and ditches, on the north; the Raitzen Town on the west; and the Palanka on the south and east of the citadel. B. contains fourteen mosques, of which the principal one is in the citadel. Here the pasha, 'of three horse-tails,' has his residence. Vessels navigating the Danube anchor between the three islands above Belgrade. B. has manufactories of arms, cutlery, saddlery, silk goods, carpets, &c., and is the seat of the chief Servian authorities. It is the entrepot of the trade between Turkey and Austria. The position of B. has made it the chief point of communication between Constantinople and Vienna, and the key to Hungary on the south-east. It has consequently been the scene of many hard contests. The Greeks held it until 1073, when it was captured by the Hungarian king, Salomon. After this, it passed through the hands of Greeks, Bulgarians, Bosniacs, and Servians, and these last proprietors sold it, in the beginning of the 15th c., to the Emperor Sigismund. In 1442, it was unsuccessfully besieged by the Turks, with a large and vain outlay of time and money; and when stormed (July 14, 1456), was retaken from the Turks by the heroism of Hunyades and Capistrano. In 1522, it was carried by the Sultan Soliman II. In 1688, it was stormed and taken by Maximilian, Elector of Bavaria; but in 1690 was recaptured by the Turks, when the Christian garrison had been reduced to 500 men. In 1693, B. was vainly besieged by the Duke of Croy; and in 1717, the citadel surrendered to Prince Eugene, after he had defeated an army of 200,000 Turks, with a loss to them of 20,000 men. But in 1739, B. again changed owners, the Turks obtaining it without a shot. In conformity with the treaty then signed, the fortifications were demolished. In 1789, it was again taken by the Austrians under General Landon; but by the treaty of peace, 1791, was restored to the Turks, and—excepting a temporary possession of 7 years, from 1806 to 1813, by the insurgent Servians—has, since that time, remained in subjection to Turkey. By the peace of Adrianople (1829), the Porte was allowed to maintain in B. a garrison of 3000 men. During the Crimean war, the defences were strengthened, and the garrison largely increased.

BELIAL, or, more accurately, *Beli'al*, a Hebrew word, signifying idle, wicked, or unprofitable. The scripture phrase, therefore, 'Sons of B.', was originally, in all probability, a mere Hebrew figurative expression denoting worthless or dissolute persons. At a later period, the idea of evil which the word embodies, seems to have been elaborated into a

personality, and B. is supposed by some to correspond to the Pluto of the Greeks.

**BELIEF.** This is a word sufficiently intelligible in common speech; but, nevertheless, various subtle problems and protracted controversies have been connected with it. A brief account of the chief of these may be here given.

1. It has been a matter of no small difficulty with mental philosophers, to give an exact rendering of the state of mind so denominated, or to specify the exact import, test, or criterion of the act of believing. It is easy enough to comprehend what is meant by an idea or a notion, as when we speak of having the idea of a rose, its shape, colour, odour, &c.; but when we make the further step of affirming our belief in the sweeteness of the rose, it is not so easy to describe the exact change that has come over the mind in so doing. In all belief, there must be something intellectual, something thought of, or conceived by the mind; and hence there has been a disposition to recognise the believing function as one of the properties of our intelligence. We believe that the sun will rise and the tides flow to-morrow: here are undoubtedly implied intellectual conceptions of the sun, his rising, and of to-morrow; of the sea, its movements, and so on. But the question comes, what is the difference between conceptions believed in as these are, and conceptions quite as clear and intelligible that are not believed? as the notion that the fluctuation of the sea on the shores of Britain is the same as on the shores of Italy. It is not to the purpose to say, that in the one case we have knowledge and evidence, and not in the other; for what is wanted is to define the change that comes over us, when what is a mere notion or supposition passes into a conviction; when a day-dream or hypothesis comes to take rank as truth.

To answer this inquiry, we must bring in a reference to *action*; for although belief connects itself with our intelligence, as now mentioned, it has action for its root and ultimate criterion. Coming up to the edge of a frozen lake, and looking at the thickness of the ice, we believe that it will bear to be trodden on, and accordingly walk across it. The meaning or purport of the believing state here is, that we do not hesitate to trust our safety to the fact believed. The measure of our confidence is the measure of our readiness to act upon our conviction. If the frozen lake lie between us and our destination, we feel elated by the certainty of arriving there, which we should not under a weak or imperfect trust in the goodness of the ice. Belief, therefore, although embodied in ideas, or intellectual conceptions, is in reality a moral power, operating on our conduct, and affecting our happiness or misery. Belief in coming good cheers us almost as much as if it were already come; a like strength of conviction of approaching evil is to the same degree depressing; 'the devils believe, and tremble.' These two tests—readiness to act according to what we believe, and influence on the mental tone—effectually separate the state in question from mere notions, fancies, or suppositions, unaccompanied with credence. We have firm confidence in the food we eat being able to nourish us; we exert ourselves to procure that food, and when we feel hungry, and see it before us, we have the mental elation arising from a near and certain prospect of relief and gratification. If there be anything that we work languidly to procure, and feel little elated by being near or possessing, our conviction is proved to be feeble as to the utility of that thing, or as to the pleasure we shall derive from it. So, in employing means to compass ends, as when we sow that we may reap, work that we may obtain abundance, study that we may be informed—we have a

certain confidence in the connection between the means and the ends; in other words, we are energetically urged to use those means, and having done so, we have the feeling as if the end were already attained.

Even in cases the furthest removed in appearance from any action of ours, there is no other criterion. We believe a great many truths respecting the world, in the shape of general propositions, scientific statements, affirmations on testimony, &c., which are so much beyond our own little sphere, that we can rarely have any occasion to involve them in our own procedure, or to feel any hopeful elation on their account. We likewise give credit to innumerable events of past history, although the greater number of them have never any consequences as regards ourselves. Yet, notwithstanding such remoteness of interest, the tests now mentioned must apply; otherwise, there is no real conviction in any one instance.

There is a distinction, first characterised by Aristotle, between potentiality and actuality (*posse* and *esse*), which truly represents two different states of mind of real occurrence. Besides the actual doing of a thing, we know what it is to be in a state of *preparedness* to act, before the emergency has arisen, or while it is still at a distance and uncertain. The thirsty traveller, not knowing of a spring where he may drink, is debarred from the act that his condition prompts him to, but he is in an attitude of mind that we call being ready for action the moment the opportunity arrives. We all carry about us a number of unexecuted resolutions, some of them perhaps remaining so to the last, for want of the occasion. They are not, on that account, to be set aside as having no part in our nature; they are genuine phases of our activity. So it is with many things believed in by us, without any actual prospect of grounding actions, or staking our welfare, upon such things. When we say we believe that the circumference of the globe is 25,000 miles, if not repeating an empty sound, or indulging an idle conception, we give it out that if any occasion arise for acting on this fact, we are ready to do so. If we were about to circumnavigate the earth, we should commit ourselves to this reckoning. Should there be any hesitation on the point when the time for action came, the professed belief would be shewn to be hollow, no matter how often we heard the statement, or repeated it, with acquiescence. The genuineness of conviction is notoriously open to question, until an opportunity of proceeding upon it occurs. Very often we deceive ourselves and others on the point—whether we are in full potentiality or preparedness in some matter of truth or falsehood. There is a very large amount of blind acquiescence in, or tacit acceptance of, propositions which never become the subject of any real or practical stake. These beliefs falsely so called confuse the line of demarcation between mere intellectual notions and states of credence or conviction. Of this nature is the acceptance given by the mass of mankind to the statements they are accustomed to hear from the better informed class respecting the facts of science and the transactions of history. They do not dispute those statements; and yet they might be little disposed to commit their serious interests to such facts. So with regard to the religious creed handed down from parent to child. Some are found believing, in the full import of the term; others, opposing no negative in any way, yet never perform any actions, or entertain either hopes or fears, as a consequence of their supposed acceptance of the religion of their fathers; their belief, accordingly, must be set down as a nonentity.

2. There is considerable interest attached to the

inquiry into the sources or operating causes of this efficacious attribute of our active nature. What are the influences that determine us to adopt some notions as grounds of action and elements of hope or depression, in preference to others? The common answer to this question is the possession of evidence, of which two kinds are reckoned by some schools—namely, experience and intuition; while others recognise experience alone, and reject the intuitive as a sufficient foundation of belief.

As regards the actual sources of men's convictions, it is undeniable that many things are credited without any reference to experience. The existence of superstitions is an example. So the partialities arising out of our likings to particular persons, and the undue depreciation of the merits of those whom we dislike, present instances equally removed from the criterion of experience. It is evident, therefore, that men do not abide by that criterion, even granting that they ought to do so. Accordingly, it is one of the tasks of the mental philosopher to specify the portions of our constitution that give birth to false, mistaken, or unfounded beliefs; and in so doing he indicates, first, certain intuitive impulses connected with our active nature; and secondly, our various feelings, or emotions. Whether the intuitive be a source of authentic beliefs, may be a matter of doubt; there is no doubt as to its being a genuine source of real convictions. We have a decided tendency from the first to believe that the present state of things will continue, and that the absent resembles the present. He that has always seen water liquid, cannot at first be convinced that it is ever or anywhere solid. We have always a great difficulty in surmounting the primitive impulse to consider other men's minds as exactly like our own. It is the tendency of the uncultured human being to over-generalise; and experience comes as a corrective, often very painful to submit to. Then, again, as regards the emotions, it is found that every one of these, if at all strong, is liable to blind us to the realities of the world. Fear is a notable example. Under a fright, a man will believe in the approach of the direst calamities. Superstition is, for the most part, the offspring of men's fears. The effect of a strong emotion is to exclude from the mind every fact or consideration except those in keeping with itself. Intense vanity so lords it over the current of the thoughts and the course of the observations, as to present to one's mind only the very best side of the character. A fit of self-abasement and remorse will work the contrary effect.

It is plain enough, therefore, that we are very often in the wrong, by trusting to our intuitive tendencies, and as often so under our emotions; while we are as ready to act, and to derive comfort or the opposite, under false beliefs, as under the very soundest that we can ever arrive at. The practice of life points to *experience* as the check to wrong believing. If we find on trial that another man's feelings differ very much from ours in the same circumstances, we stand corrected, and are perhaps wiser in future. So, in science, experiment is the ultimate canon of truth. There prevails, notwithstanding, in one school of philosophy, comprising the majority of metaphysical philosophers both in this country and in Germany and France, the opinion that experience is not the only source even of *sound* or true beliefs. There are those who contend for an *a priori* origin of scientific first principles; such, for example, as the axioms of mathematics. 'Things that are equal to the same thing are equal to one another,' is one of the class about which this dispute reigns. There is also a doctrine current that the law of causation has an authority derived from intuition. Another class of beliefs relates to matters altogether

beyond experience; such is the metaphysical doctrine of the infinite. These various convictions—*a priori*, as they are called, being grounded solely in the internal impulses of the human mind—are all open to one common remark. It must be conceded that some intuitive beliefs are unsound, seeing that we are obliged to reject a greater or less number because of their being flatly contradicted by our experience. But if any have to be rejected in this way, why may not all be; and what criterion, apart from experience, can be set up for discriminating those that we are to retain? Man undoubtedly has boundless longings; and the doctrine of the infinite corresponds in a manner to these. But in actual life we find very few of our desires fully gratified, not even those most honourable to the human mind, such as curiosity, the passion for self-improvement, and the desire of doing good. How, then, are we to ascertain which of the longings carries with it its own necessary fulfilment? Moreover, the intuitive tendencies are exceedingly various in men; and all cannot be equally true.

Testimony, which is properly reckoned one of the sources of belief, is, in its operation, partly founded on an intuitive tendency, and partly on experience. We at first believe whatever we are told; the primitive phase of our nature is credulity; the experience that we soon attain to of untrue statements puts us on our guard, and we learn to receive testimony under some circumstances, and from some persons, and not in all cases indiscriminately.

*3. Responsibility for Belief.*—A lengthened controversy arose some time ago, on the saying of Lord Brougham, that 'man is no longer accountable to man for his belief, over which he has himself no control.' Reduced to precise terms, the meaning of this assertion is: a man's belief being involuntary, he is not punishable for it. The question therefore arises, *how far* is belief a voluntary function? for it is known that the will does to some extent influence it.

What a man shall see when he opens his eyes is not in his own power; but the opening of the eyes is a voluntary act. So, after listening to a train of arguments on a certain dispute, we might be irresistibly inclined to one side; but, supposing us to live in a country where the adhesion to that side is criminal, and punished severely, we should very likely be deterred from hearing or reading anything in its favour. To this extent, the adoption of a belief is voluntary. The application of strong motives of the nature of reward or punishment is sufficient to cause one creed to prevail rather than another, as we see in those countries and in those ages where there has been no toleration of dissent from the established religion. The mass of the people have been in this way so fenced in from knowing any other opinions, that they have become conscientiously attached to the creed of their education.

When the question is asked, therefore, whether punishment can control men's beliefs, and not their professions merely, all history answers in the affirmative, as regards religious and political creeds, on which the majority of mankind, being insufficient judges of themselves, are led by tradition and by education. But in matters of daily practice, where the simplest can judge as well as the wisest, the case is altered. No severity of threat could bring a man into the state of believing that his night's rest was hurtful to him; he might be overawed into saying that it was so, but he would never act out his forced affirmation, and therefore he would shew that he did not believe it.

If the sentence of Lord Brougham is held to imply that all beliefs are beyond the power of external

motives, and therefore that rewards and punishments can go no further than making outward conformity, we must pronounce it erroneous. For granting that motives cannot have a direct efficacy on the state of a man's convictions—which cannot be conceded in all cases—yet the indirect influence is so great as to produce the unanimity of whole nations for centuries in some one creed. But if it is only meant, that such indirect means *ought not* to be applied to sway men's convictions, this is merely a way of affirming the right of free thought and inquiry to all mankind, and the iniquity of employing force on such a matter.—On the subject of Belief generally, see Bain on the Emotions and the Will.

**BELISARIUS** (in Slavonic, *Beli-zar*, 'White Prince'). This heroic and loyal soldier, to whom the Emperor Justinian was principally indebted for the glory of his reign, was born at Germania, in Illyria, about 505 A.D. He first assumed a conspicuous position when he was appointed to the command of the eastern army of the empire, stationed on the confines of Persia, where, in 530 A.D., he gained a victory over a Persian army nearly twice as large as his own. The historian Procopius was at this time secretary to Belisarius. In the following year, when the Persians had penetrated into Syria, intending to attack Antioch, B. being compelled by the impatience of his troops to offer battle at Callinicum, a town at the junction of the rivers Bilecha and Euphrates, was defeated, and in consequence recalled. This petulant injustice, however, did not weaken that principle of duty which ever controlled and inspired the great soldier. He still remained the firm supporter of his sovereign. In Constantinople, the strife of the two parties, styled respectively 'the green' and 'the blue,' had endangered the authority and even the life of Justinian; already a new emperor, Hypatius, had been elected, when B., at the head of the life-guards, attacked and slew, in the race-course, 30,000 of the green or anti-loyalist party, and thus restored tranquillity. Previous to this, he had married a wealthy but profligate lady, Antonina, whom he loved with the same blind uxorioussness that Marcus Aurelius exhibited towards Faustina. The only points in his history which are not edifying, are those in which he yielded to her noxious solicitations. The military career of B. may be divided into two great epochs: the war against the Vandals in Africa, and the war against the Goths in Italy, which again subdivides itself into two campaigns, with an interval of four years between them. The first of these epochs was commenced by Justinian sending B., in 533 A.D., with an army of 15,000 men into Africa, in order to recover the provinces there held by the Vandal king, Gelimer. After achieving two victories, B. made the king a prisoner, seized his treasures, and after conquering Sardinia, Corsica, and the Balearic Isles, he brought him to Constantinople, where he appeared in a triumphal procession of the conqueror—the first that a subject had enjoyed since the days of Tiberius. The African Vandals never recovered from this overthrow. Medals were struck in B.'s honour; and on the 1st January 535, he was invested with the dignity of 'consul,' and granted a second triumph, according to the old republican style. The second war was occasioned by the divisions existing in the royal family of the Ostrogoths, which induced Justinian to attempt to wrest Italy from the hands of the barbarians. In 535, B. conquered Sicily; and in the autumn of 536, he crossed over to Lower Italy, where all the cities submitted to him except Naples, which he carried by storm. On the 10th of December, he entered Rome, having made an amicable arrangement with

the inhabitants. As he found his forces not strong enough to contend with the Goths in open field, he allowed himself to be enclosed and besieged in Rome: after the defence had lasted a year, the Goths raised the siege. In 538, Narses had been sent with a reinforcement for the army in Italy; but some misunderstanding occurring between the two generals, they were prevented from relieving Milan, which in 539 was carried and devastated by Braias, nephew of the Gothic king, Vitiges. Consequently, Narses was recalled from Italy; and B., now placed at the head of both armies, refused to assent to a treaty proposed to King Vitiges by Justinian's ambassadors. Vitiges had persuaded the Persian king, Choaroes, to invade the eastern Roman territory. B. now drove the Goths back to Ravenna, which he captured in 540, along with Vitiges himself. But before he could complete his conquest of the Goths, he was recalled by Justinian to Constantinople, where he soon appeared, bringing with him the king Vitiges, several Gothic chieftains, and the royal treasures. In 541—542, he was engaged in a campaign against the Persians, who had captured Antioch; but was again recalled, on account of slanderous representations made to the emperor, and the enterprise necessarily proved indecisive. His second great struggle with the Ostrogoths now begins. In 544, the barbarians, under Totila, again invaded and reconquered Italy. B. was sent against them, but with an insufficient army. He, however, maintained his ground for five years, harassing the enemy by his skilful movements, and even succeeded so far as to regain possession of Rome. But, in spite of his repeated entreaties, no reinforcements were sent to him; and in September 548, he gave up the command, his rival, Narses, being appointed in his place. After ten years of retirement, B. once more came forward at the head of an army hastily collected, and overthrew the Bulgarians, who had threatened Constantinople. Here this faithful servant, who at Ravenna had, in a spirit of noble loyalty unknown to the warriors in those selfish and ambitious times, refused the crown of Italy offered to him by the Goths, was at length accused of a conspiracy against Justinian, and imprisoned, December 563; but according to Malala and Theophanes, Justinian became convinced of B.'s innocence, and restored him, after six months, to all his honours. He died March 564.

The biography of B. has been treated with great licence by writers of fiction, especially by Marmontel, who has represented the hero as cruelly deprived of sight, and reduced to beg for his bread in the streets of Constantinople. Tzetzes, a writer of the 12th c., states that, during his half-year's imprisonment, B. suspended a bag from the window of his cell, and exclaimed to those who passed by: 'Give an obolus to B., who rose by merit, and was cast down by envy!' but no writer contemporary with B. mentions this circumstance. Lord Mahon, in his *Life of Belisarius* (Lond. 1829), endeavours, but without success, to confirm the tradition, or rather the fiction, of B. being deprived of sight and reduced to mendicancy. This fiction supplies the subject of a fine picture by the French painter Gérard.

In figure, B. was tall and majestic; in disposition, humane and generous; pure in his morals, temperate in his habits, a valiant soldier, a skilful general, and above all, possessed by a sublime spirit of loyalty to his sovereign.

**BELIZE.** See BALIZE.

**BELL.** Bells are usually formed of a composition of copper and tin, called bell-metals. When the proper proportions of the two metals are fused together,

the compound is poured into a mould. Authorities differ as to the best proportions of the copper and tin. Some give 80 parts of copper to 20 of tin, or 4 to 1; others state the proportions as being 3 to 1. In the reign of Henry III. of England, it would seem to have been 2 to 1; and the small bronze bells discovered by Mr Layard in the palace of Nimroud, are found to contain 10 of copper to 1 of tin. Hand-bells are often made of brass, antimony alloyed with tin, German silver,

Queen Mary's silver-gilt Hand-bell.

real silver, and gold. The notion that in old times silver was mixed with bell-metal to sweeten the tone, is a mistake. Silver, in any quantity, would injure the tone. The quality of a bell depends not only on the composition of the metal it is made of, but very much also on its shape, and on the proportions between its height, width, and thickness; for which the bell-founder has rules derived from experience, and confirmed by science. The pitch of a bell is higher the smaller it is. For a peal of four bells to give the pure chord of ground tone (key-note), third, fifth, and octave, the diameters require to be as 30, 24, 20, 15, and the weights as 80, 41, 24, 10. A less quantity of metal than is due to the calibre of the bell though giving the same note, produces a meagre harsh sound; and the real or fancied superiority in dignity of tone of some old bells, is ascribed to a greater weight of metal having been allowed for the same note than modern economy would dictate. Bells have been cast of steel, some of which have had a tone nearly equal in fineness to that of the best bell-metal, but deficient in length, having less vibration. Some have also been cast of glass, with a considerable thickness of the material; and these give an extremely fine sound, but are too brittle to stand the continued use of a clapper.

From a remote antiquity, cymbals and hand-bells were used in religious ceremonies. In Egypt, it is certain that the feast of Osiris was announced by ringing bells; Aaron, and other Jewish high-priests, wore golden bells attached to their vestments; and in Athens the priests of Cybele used bells in their rites. The Greeks employed them (*koda*) in camps and garrison; and the Romans announced the hour of bathing and of business by the *tintinnabulum*. The introduction of bells into Christian churches is usually ascribed to Paulinus, Bishop of Nola in Campania (400 A.D.); but there is no evidence of their existence for a century later. That they were first made in Campania, is inferred from the name given to them—*campana*; hence *campanile*, the bell-tower. Their use in churches and monasteries soon spread through Christendom. They were introduced into France about 550; and

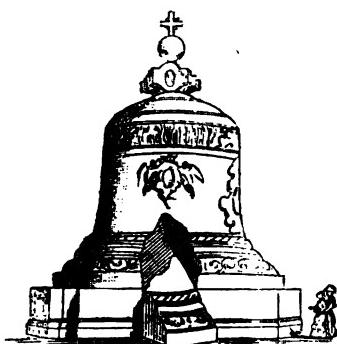

Benedict, Abbot of Wearmouth, brought one from Italy for his church about 680. Pope Sabinian (600) ordained that every hour should be announced by sound of bell, that the people might be warned of the approach of the *hora canonicæ*, or hours of devotion. Bells came into use in the East in the 9th c., and in Switzerland and Germany in the 11th. Most of the bells first used in Western Christendom seem to have been hand-bells. Several examples, some of them, it is believed, as old as the 6th c., are still preserved in Ireland, Scotland, and Wales. They are made of thin plates of hammered iron, bent into a four-sided form, fastened with rivets, and brazed or bronzed. Perhaps the most remarkable is that which is said to have belonged to St Patrick, called the *Olog-an-eadhachta Phatraic*, or 'The bell of Patrick's Will.' It is 6 inches high, 5 inches broad, and 4 inches deep, and is kept in a case or shrine of brass, enriched with gems and with gold and silver filigree, and made (as an inscription in Irish shews) between the years 1091 and 1105. The bell itself is believed to be mentioned in the *Annals of Ulster* as early as the year 552. Engravings as well of the bell as of its shrine, with a history of both, by the Rev. Dr Reeves of Lusk, were published at Belfast (where the relic is preserved) in 1850. Some of the Scotch bells, of the same primitive type, are figured and described in the *Illustrated Catalogue of the Archaeological Museum at Edinburgh* in 1856 (Edin. 1859). The four-sided bell of St Gall, an Irish missionary, who died about 646, is still shewn

St Ninian's Bell, as figured in the above work.

in the monastery of the city which bears his name in Switzerland. Church-bells were suspended either in the steeples or church-towers, or in special bell-towers. They were long of comparatively small size: the bell which a king presented to the church of Orleans in the 11th c., and which was remarkable in its age, weighed only 2600 pounds. In the 13th c., much larger bells began to be cast, but it was not until the 15th c. that they reached really considerable dimensions. The bell 'Jacqueline' of Paris, cast in 1400, weighed 15,000 pounds; another Paris bell, cast in 1472, weighed 25,000; the famous bell of Rouen, cast in 1501, weighed 36,364 pounds. The largest bell in the world is the Great Bell or Monarch of Moscow, above 21 feet in height and diameter, and weighing 193 tons. It was cast in 1734, but fell down during a fire in 1737, was injured, and remained sunk in the earth till 1837, when it was raised, and now forms the dome of a chapel made by excavating the space below it. Another Moscow bell, cast in 1819, weighs 80 tons. The Great Bell at Pekin, 14 feet high, with a diameter of 13 feet, weighs 53½ tons; those of Olmütz, Rouen, and Vienna, nearly 18 tons; that first cast for the New Palace at Westminster (but cracked),

14 tons; that of the Roman Catholic cathedral at Montreal (cast 1847), 13½ tons; 'Great Peter,'

Great Bell at Moscow.

placed in York Minster 1845, 104 tons; 'Great Tom' at Lincoln, 5½ tons; Great Bell of St Paul's, 5½ tons.—See an interesting article on Bells in the *Quarterly Review* for September 1854.

From old usage, bells are intimately connected with the services of the Christian church—so much so, that apparently from a spirit of opposition, the Mohammedans reject the use of bells, and substitute for them the cry of the Imam from the top of the mosques. Associated in various ways with the ancient ritual of the church, bells acquired a kind of sacred character. They were founded with religious ceremonies (see Schiller's *ode*), and consecrated by a complete baptismal service; received names, had sponsors, were sprinkled with water, anointed, and finally covered with the white garment or chrisom, like infants. This usage is as old as the time of Alcæn, and is still practised in Roman Catholic countries. Bells had mostly pious inscriptions, often indicative of the wide-spread belief in the mysterious virtue of their sound. They were believed to disperse storms and pestilence, drive away enemies, extinguish fire, &c. A common inscription in the middle ages was:

Funera plango, fulgura frango, Sabbatho pango,  
Excito lento, dissipo ventos, pacio cruentos.

Among the superstitious usages recorded to have taken place in old St Paul's Church in London, was the 'ringinge the hallowed belle in great tempestes or lightninges' (Brand's *Popular Anti-Quæries*, vol. ii.). From this superstition possibly sprang the later notion, that when the great bell of St Paul's tolled (which it does only on the death of a member of the royal family, or a distinguished personage in the city) it turned all the beer sour in the neighbourhood—a fancy facetiously referred to by Washington Irving in the *Sketch-Book*. It would seem that the strange notion that bells are efficacious in dispelling storms, is by no means extinct. In 1852, the Bishop of Malta ordered the church-bells to be rung for an hour to allay a gale.

Church-bells were at one time tolled for those passing out of the world. It was a prevailing superstition that bells had the power to terrify evil spirits, no less than to dispel storms; and the custom of ringing what was called the *passing-bell*, 'grew [we quote the writer in the *Quarterly Review* above referred to] out of the belief that devils troubled the expiring patient, and lay in wait to afflict the soul the moment when it escaped from

the body.' . . . The tolling of the passing-bell was retained at the Reformation; and the people were instructed that its use was to admonish the living, and excite them to pray for the dying.' But 'by the beginning of the 18th c., the passing-bell, in the proper sense of the term, had almost ceased to be heard. The tolling, indeed, continued in the old fashion; but it took place after the death, instead of before.' The practice of slowly and solemnly tolling church-bells at deaths, or while funerals are being conducted, is still a usage in various parts of the country, more particularly as a mark of respect for the deceased. There is another use of the bell in religion, called the *pardon* or *ave bell*, abolished among Protestants. The pardon-bell was tolled before and after divine service, for some time prior to the Reformation, to call the worshippers to a preparatory prayer to the Virgin Mary before engaging in the solemnity, and an invocation for pardon at its close. Bishop Burnet has recorded the order of a Bishop of Sarum, in 1538, concerning the discontinuance of the custom. It runs thus: 'That the bell called the pardon or ave bell, which of longe tyme hath been used to be tolled three tymes after and before divine service, be not hereafter in any part of my diocesse any more tollyd.'

The ringing of the *curfew-bell*, supposed to have been introduced into England by William the Conqueror, was a custom of a civil or political nature, and only strictly observed till the end of the reign of William Rufus. Its object was to warn the public to extinguish their fires and lights at eight o'clock in the evening. The eight o'clock ringing is still continued in many parts of England and Scotland.

As the liberty of public worship in places of meeting by themselves was yielded to dissenters, by the various governments of Europe, only with reluctance, the use of bells in chapels as a summons to divine service is not allowed except in the more enlightened countries. Speaking on this subject as referring to England, Lord Chief-justice Jervis, in giving judgment on a case tried at the Croydon assizes in 1851, says: 'With regard to the right of using bells in places of worship at all, by the common law, churches of every denomination have a full right to use bells, and it is a vulgar error to suppose that there is any distinction at the present time in this respect.' Throughout England and Scotland, however, comparatively few dissenting places of worship possess bells—still fewer have steeples. In towns and villages, the places of worship connected with the established church are commonly distinguished by some kind of belfry or bell-cote with bells. The ringing of these for divine service on Sundays, and on other occasions, forms the theme of many poetical allusions. The lines of Cowper will occur to recollection:

How soft the music of those village bells,  
Falling at interval, upon the ear,  
In cadence sweet! now dying all away,  
Now pealing loud again, and louder still,  
Clear and sonorous as the gale comes on.

On all that belongs to the playing of bells in belfries, the inventive genius of the Netherlands long since arrived at proficiency. In some of the church-towers of that country, the striking, chiming, and playing of bells is incessant; the tinkling called *chimes* usually accompanies the striking of the hours, half-hours, and quarters; while the playing of tunes comes in as a special diversion. In some instances, these tune-playing bells are sounded by means of a cylinder, on the principle of a barrel-organ; but in others, they are played with keys by a musician. The French apply the term *carillons* to the tunes played

## BELL—BELL, BOOK, AND CANDLE

on bells; but in England, it is more usual to give the term carillons to the suites of bells which yield this kind of music. In this last sense, the tower of *Les Halles*, a large building at Bruges, is allowed to contain the finest carillons in Europe. There is a set of music-bells of this kind in the steeple of St Giles' Church, Edinburgh. On these, tunes are played for an hour daily at certain seasons by a musician, who has a small salary from the civic corporation.

Many of the church-towers in London are provided with peals of bells, the ringing of which is a well-known practice. Eight bells, which form an octave or diatonic scale, make the most perfect peal. The variety of changes or permutations of order that can be rung on a peal, increases enormously with the number of bells: 3 bells allow 6 changes; 4 bells, 24; 12 bells give as many as 479,001,600 changes. The ringing of peals differs entirely from tolling—a distinction not sufficiently recognized in those places where an ordinary ringing of bells is made to suffice alike for solemn and festive occasions. The merry peal almost amounts to an English national institution. It consists in ringing the peal in moderately quick time, and in a certain order, without interruption, for the space of an hour. Merry peals are rung at marriages (if ordered), and at other festive events, the ringers being properly paid, according to use and wont. The English appear to be fond of these peals, and the associations which they call up. They actually make bequests to endow periodical peals in their parish church-towers; leaving, for example, so much money to ring a merry peal for an hour on a certain evening of the week, or to commemorate victories, or some other subjects of national rejoicing, in all time coming. One of the most celebrated peals of bells in London is that of St Mary-le-Bow, Cheapside, which form the basis of a proverbial expression meant to mark emphatically a London nativity—‘Born within the sound of Bow-bells.’ Brand speaks of a substantial endowment by a citizen for the ringing of Bow-bells early every morning to wake up the London apprentices. The ringing of bells in token of merriment is an old usage in England, as we learn from Shakespeare:

Get thee gone, and dig my grave thyself,  
And bid the merry bells ring to thy ear,  
That thou art crowned, not that I am dead.

Sometimes, in compliment to a newly opened church, efforts are made to furnish its belfry with the proper number of bells, and to endow it at once for a weekly merry peal. It is common for some of the humbler class of parishioners to form a company of bell-ringers, acting under the authority of the church-wardens. Some endowments for peals embrace a supper, as well as a money-payment to the ringers; and of course, in such circumstances, there is little risk of the merry peal falling into desuetude. The consequence is, that what with marriages, and other festive celebrations, and as a result of endowments, merry peals are almost constantly going on somewhere in the metropolis—a fine proof, it may be said, of the naturally cheerful and generous temperament of the English, and of their respect for old customs. In Lancashire, the art of playing on bells is cultivated with much enthusiasm and success. The bells are small, and arranged on a movable stand; they are struck by a small instrument which is held in each hand of the performer, and produce a sweet tinkling kind of music.

The custom of hanging bells on the necks of horses, cows, and other animals, was in use by the Romans, and still survives. The bells give notice of approach in the dark, and hung on cows, goats,

or sheep, these animals can be easily found in the woods, or on the mountains. The charming poetical allusion of Gray—

And drowsy tinklings lull the distant folds—

will be called to remembrance. In some parts of England, as many as eight small bells, forming an octave, are attached to the harness of wagon-horses. The attaching of bells in a fanciful manner to riding and sleigh-horses is common in some parts of Europe and America.

The term bell is infused in much of our conversational phraseology. ‘To bear the bell,’ is a phrase which we previously attempted to explain. At one period, a silver bell was the prize in horse-races in England, and the winning horse was said to bear away the bell. A less probable explanation is, that the phrase originated in the custom of one of the most forward sheep in a flock carrying a bell. Hence, at least, ‘bell-wether of the flock,’ a phrase applied disparagingly to the leader of a party. The old fable, in which a sagacious mouse proposes that a bell shall be hung on the neck of the cat, so that all the mice may be duly warned of her approach, has given rise to the well-known phrase of ‘belling the cat.’ Any one who openly and courageously does something to lower the offensive pretensions of a powerful and dangerous person, is said ‘to bell the cat.’

The *hanging of bells* in dwelling-houses, and ringing them by means of wires from the different apartments, is quite a modern invention; for it was not known in England in the reign of Queen Anne. Lately, there has been a great improvement in domestic bell-hanging. Instead of traversing the apartments, and turning and winding by means of cranks, the wires are carried directly upward in tubes in the walls to the garret: thence from a row of cranks, they descend together to their respective bells, which are hung in one of the lower passages. More recently, there has been introduced a system of electric bells, which is likely to supersede all others. The arrangement consists of an electro-magnet, with its armature fastened at one end by a spring, and terminating at the other in a hammer, by which the bell is struck. The battery may be placed in any part of the building, and as there is no motion in the wires, no cranks or other apparatus are required. Contact is made by pressing a stud, and messages may be sent to any part of the house, by the Morse alphabet, or other code of signals.

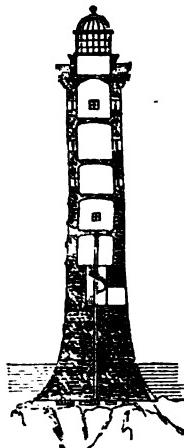

**BELL, BOOK, AND CANDLE.** The excommunication by B., B., and C. is a solemnity belonging to the Church of Rome. The officiating minister pronounces the formula of excommunication, consisting of maledictions on the head of the person anathematized, and closes the pronouncing of the sentence by shutting the book from which it is read, taking a lighted candle and casting it to the ground, and tolling the bell as for the dead. This mode of excommunication appears to have existed in the western churches as early as the 8th c. Its symbolism may be explained by quoting two or three sentences from the conclusion of the form of excommunication used in the Scottish Church before the Reformation: ‘Cursed be they from the crown of the head to the sole of the foot. Out be they taken of the book of life. And as this candle is cast from the sight of men, so be their souls cast from the sight of God into the deepest pit of hell. Amen.’ The rubric adds: ‘And then the candle being dashed on the ground and quenched, let the bell be rung.’ So, also, the sentence of excommunication against the murderers of the Archbishop of Dublin in 1534: ‘And to the terror and fear of the said damnable persons, in sign and figure that they be accursed of

God, and their bodies committed into the hands of Satan, we have rung these bells, erected this cross with the figure of Christ; and as ye see this candle's light taken from the cross and the light quenched, so be the said cursed murderers excluded from the light of heaven, the fellowship of angels, and all Christian people, and sent to the low darkness of fiends and damned creatures, among whom ever-lasting pains do endure.'

**BELL OF A CAPITAL** is the capital of a pillar denuded of the foliage, in which case it resembles the form of a bell reversed.

**BELL ROCK**, or INCH CAPE, a reef of old red sandstone rocks in the German Ocean, 12 miles south-east of Arbroath, and nearly opposite the mouth of the Tay. The reef is 2000 feet long; at spring-tides, part of it is uncovered to the height of four feet; and for 100 yards around, the sea is only three fathoms deep. It was formerly a fruitful cause of shipwreck, and, according to tradition, the abbot of Aberbrothwick (Arbroath) placed a bell on it, 'fixed upon a tree or timber, which rang continually, being moved by the sea, giving notice to the sailors of the danger.' This tradition has been embodied by Southey in his well-known ballad of *The Inchcape Rock*. A light-house, designed by Robert Stevenson, engineer to the Commissioners of Northern Light-houses, was commenced in 1807, and completed on the reef in 1811, and a revolving red and white light exhibited. The structure is 115 feet high, is 42 feet in diameter at base, and 15 at top, is solid for the first 30 feet upwards, 15 feet of which is under water at high tide, and cost upwards of £60,000.

**BELL, ANDREW, D.D.**, author of the 'Madras System of Education,' was born at St Andrews in 1753, and educated at the university of that place. Subsequently, he took orders in the Church of England; and after residing for some time in British America, was appointed one of the chaplains at Fort St George, Madras. While here, he was intrusted by the directors of the East India Company with the management of an institution for the education of the orphan children of the European military. The arduous character of his new duties compelled him to reflect seriously on the best means of fulfilling them. As he found it impossible to obtain the services of properly qualified ushers, he at length resorted to the expedient of conducting the school by the aid of the scholars themselves. Hence originated the far-famed system of 'Mutual Instruction' (q. v.). After superintending the institution for seven years, the state of his health forced him to return to Europe. On his departure, he received a most flattering testimonial from the directors of the school. In 1797, after his arrival in England, B. published a pamphlet entitled *An Experiment in Education, made at the Male Asylum of Madras; suggesting a System by which a School or Family may teach itself under the Superintendence of the Master or Parent*. This pamphlet attracted little attention, until Joseph Lancaster, a dissenter, commenced to work upon the system, and succeeded in obtaining for it a large measure of public recognition. In 1803, Lancaster also

Section of Bell Rock Light-house.

published a tractate on education, recommending the monitorial system, as it was now called, and admitting B. to be the original inventor of it, an admission which he afterwards discreditably retracted. Lancasterian schools now began to spread over the country. The church grew alarmed at the successful results of the efforts made by dissenters to educate the poor, and resolved to be philanthropical ere it was too late. B. was put up against Lancaster. Money was collected, and an immense amount of emulation was excited in the bosoms of churchmen. Fortunately, however, this rivalry produced only beneficial effects, and the motives which induced it may therefore be forgotten. Later in life, B. was made a prebendary of Westminster, and Master of Sherborn Hospital, Durham. He was also a member of various learned societies. He died at Cheltenham, January 28, 1832. He left (besides a valuable estate) £120,000 of three per-cent stocks for the purpose of founding various educational institutions in Edinburgh, Glasgow, Leith, Aberdeen, Inverness, Cupar, and St Andrews.

**BELL, SIR CHARLES**, an eminent surgeon, whose discoveries in the nervous system have given him a European fame, was born at Edinburgh in 1778, and while a mere youth, assisted his brother John (afterwards noticed) in his anatomical lectures and demonstrations. In 1797, he was admitted a member of the Edinburgh College of Surgeons, and soon after appointed one of the surgeons of the Royal Infirmary. In 1806, he proceeded to London, and for some years lectured with great success on anatomy and surgery at the academy in Great Windmill Street. Admitted, in 1812, a member of the Royal College of Surgeons, London, he was elected one of the surgeons of the Middlesex Hospital, in which institution he delivered clinical lectures, and raised it to the highest repute. To obtain a knowledge of gunshot wounds, he twice relinquished his London engagements—the first time after the battle of Corunna in 1809, when he visited the wounded landed on the southern coasts of England; the other, after the battle of Waterloo, when he repaired to Brussels, and was put in charge of a hospital with 300 men. In 1824, he was appointed senior Professor of Anatomy and Surgery to the Royal College of Surgeons, London, and subsequently a member of the council. On the establishment of the London University, now University College, in 1826, B. was placed at the head of their new medical school. He delivered the general opening lecture in his own section, and followed it by a regular course of characteristic lectures on physiology; but soon resigned, and confined himself to his extensive practice, which was chiefly in nervous affections. In 1831, he was one of the five eminent men in science knighted on the accession of William IV., the others being Sir John Herschel, Sir David Brewster, Sir John Leslie, and Sir James Ivory. In 1836, he was elected Professor of Surgery in the university of Edinburgh. He was a fellow of the Royal Societies of London and Edinburgh, and a member of some other learned bodies. Author of various works on surgery and the nervous system, and editor, jointly with Lord Brougham, of Paley's *Evidences of Natural Religion*, B. was one of the eight distinguished men selected to write the celebrated Bridgewater Treatises, his contribution being on *The Hand, its Mechanism and Vital Endowments, as evincing Design* (1834). He died suddenly, April 30, 1842. Among his principal works are: *The Anatomy of the Brain Explained, in a Series of Engravings*, 12 plates (Lond. 1802, 4to); *A Series of Engravings, explaining the Course of the Nerves* (Lond. 1804, 4to); *Essays on the Anatomy*

of *Expression in Painting*, plates (Lond. 1806, 4to); posthumous edition, much enlarged, entitled *The Anatomy and Philosophy of Expression as connected with the Fine Arts* (Lond. 1844, 8vo); *A System of Operative Surgery*, 2 vols. (Lond. 1807—1809; 2d ed. 1814); *Dissertation on Gunshot Wounds* (Lond. 1814, 2 vols. 8vo); *Anatomy and Physiology of the Human Body*, 3 vols. (1816); various papers on the nervous system, which originally appeared in the *Philosophical Transactions*; *Exposition of the Natural System of the Nerves of the Human Body* (1824); *Institutes of Surgery* (Edin. 2 vols. 1838, 12mo); *Animal Mechanics*, contributed to the *Library for the Diffusion of Useful Knowledge* (1828); *Nervous System of the Human Body*, 1830, 4to complete edition (Edin. 1836, 8vo).

BELL, GEORGE JOSEPH, an eminent lawyer, brother of the above, was born at Edinburgh 26th March 1770, and passed advocate in 1791. Acknowledged one of the greatest masters of commercial jurisprudence of his time, and in particular of that department of it which relates to the laws of bankruptcy, he was, in 1822, appointed Professor of Scots Law in Edinburgh University; and in 1823, a member of the commission for inquiring into Scottish judicial proceedings. Subsequently, he was member of a commission to examine into and simplify the mode of procedure in the Court of Session. On the report, drawn up by B., was founded the Scottish Judicature Act, prepared by him, which effected many important changes in the forms of process in the superior courts of Scotland; the jury court being abolished as a separate judicature, and conjoined with the Court of Session. Appointed in 1831 one of the clerks of the Court of Session, he was, in 1833, chairman of the Royal Commission to examine into the state of the law in general. He also prepared a bill for the establishment of a Court of Bankruptcy in Scotland. His principal works are—*Commentaries on the Laws of Scotland, and on the Principles of Mercantile Jurisprudence* (Edin. 1810, 4to; 5th ed. 1826, 2 vols. 4to); *Principles of the Law of Scotland* (Edin. 1829, 8vo; 4th ed. 1839, 8vo); and *Commentaries on the Recent Statutes Relative to Diligence or Execution against the Movable Estate, Imprisonment, Cessio Bonorum, and Sequestration in Mercantile Bankruptcy* (Edin. 1840, 4to). Died 23d September 1843.

BELL, HENRY, the successful introducer of steam-navigation into Europe, fifth son of Patrick Bell, a mechanic, was born at Torphichen, Linlithgowshire, Scotland, April 7, 1767. After working three years as a stone-mason, he was, in 1783, apprenticed to his uncle, a mill-wright. He was instructed in ship-modelling at Borrowstounness, and completed his knowledge of mechanics with an engineer at Bell's Hill. Repairing to London, he was employed by the celebrated Mr Rennie. About 1790 he returned to Glasgow, and in 1808 removed to Helensburgh, where he kept the principal inn, and devoted himself to mechanical experiments. How far B. was anticipated by Fulton and others, in his application of steam to navigation, will be considered under the head of STEAM NAVIGATION. In January 1812, a small vessel, 40 feet in length, called the *Comet*, built under his directions, and with an engine constructed by himself, was launched on the Clyde with success—the first on European waters. Five years previously, on October 3, 1807, Mr Fulton, a Scottish engineer in America, had placed the first steam-boat on the Hudson. B. died at Helensburgh, November 14, 1830. A monument was erected to his memory at Dunglass Point on the Clyde.

BELL, JOHN, of Antermony, a celebrated Asiatic traveller, born in the west of Scotland in 1691, studied for the medical profession. In 1714, he went to St Petersburg, and soon after was appointed physician to an embassy from Russia to Persia. In 1719, he was sent upon another to China, through Siberia. In 1737, he was sent on an embassy to Constantinople, and afterwards settled for some years in the Turkish capital as a merchant. In 1747, he returned to Scotland, and died at Antermony, July 1, 1780. His *Travels from St Petersburg to various Parts in Asia*, in 2 vols. 4to, were published by subscription at Glasgow in 1763. From its simplicity of style, the work has been described as 'the best model, perhaps, for travel-writing in the English language.'

BELL, JOHN, an eminent surgeon, second son of the Rev. William Bell, an Episcopal minister in Edinburgh, was born in that city, May 12, 1763. He studied under the celebrated Black, Cullen, and Monro *secundus*; and while attending the anatomy classes of Dr Monro, first conceived the idea of teaching the application of the science of anatomy to practical surgery. He commenced, in 1786, lecturing at Edinburgh on surgery and anatomy, and in 1793 published the first volume of his *Anatomy of the Human Body*; in 1797, appeared the second volume; and in 1802, the third. A volume of anatomical drawings by himself, illustrative of the structure of the bones, muscles, and joints, was published in 1794; and another volume, illustrative of the arteries, with drawings by his brother, afterwards Sir Charles Bell, appeared in 1801. In 1798, B. passed some weeks at Yarmouth among the seamen of Lord Duncan's fleet wounded at Camperdown; and in 1800 he published a *Memorial concerning the Present State of Military Surgery*. His *System of the Anatomy of the Human Body*, and his *Discourses on the Nature and Cure of Wounds* (Edin. 1793—1795), were translated into German. A good classical scholar, he was distinguished alike for his great conversational powers and general information. Early in 1816, he was thrown from his horse, and, his health declining, he went to Paris, and thence proceeded to Italy. He died at Rome, of dropsy, April 15, 1820. Besides the works mentioned, he was the author of *The Principles of Surgery*, 3 vols. 4to, 1801—1807; new edition, edited by his brother, Sir Charles Bell, 1826. A posthumous work, entitled *Observations on Italy*, edited by Bishop Sandford of Edinburgh, was published by his widow.

BELL, JOHN, an eminent sculptor, remarkable for rejecting the classical antique model, and following nature only in his works, born in Norfolk in 1811, first exhibited at the Royal Academy, London, in 1832, a religious group. His works are numerous, and of high and original merit. B.'s statues of Lord Falkland, exhibited in model at Westminster Hall, 1847, and Sir Robert Walpole, 1854, were commissioned for the new Houses of Parliament. One of his latest designs is a monument to the Guards who fell in the Crimea, executed in 1858. In decorative art, he has also distinguished himself. He was one of the sculptors of the Prince Consort Memorial in Hyde Park, London, which was unveiled in 1873. B. is the author of a *Free Hand Drawing-book for the Use of Artisans*.

BELL, ROBERT, an industrious and versatile literary writer, the son of a magistrate, was born at Cork, 10th January 1800, and when very young, obtained an appointment in a government department in Dublin. He was for a time editor of the government journal, *The Patriot*. In 1828, he removed to London, and was appointed editor

## BELL—BELLADONNA.

of *The Atlas* newspaper. In 1839, in conjunction with Sir Edward Bulwer Lytton and Dr Lardner, he started *The Monthly Chronicle*, a literary periodical, published by Longman & Co.; and latterly was editor of it. In 1841, he retired from *The Atlas*. For Lardner's Cyclopaedia, B. wrote *The History of Russia*, 3 vols., and *The Lives of the English Poets*, 2 vols. The last volume of Southey's *Naval History*, left unfinished by the author, was also written by him, as was the concluding volume of Mackintosh's *History of England*. At the London theatres, three five-act comedies have been produced by him. He was author, also, of *The Ladder of Gold*, a novel, 3 vols., 1850; *Heart and Altar*, a collection of tales, 3 vols.; *Life of Canning*; *Outlines of China*; *Memorials of the Civil War*, consisting of the Fairfax correspondence, 2 vols.; *Way-side Pictures through France, Belgium, and Holland*. In 1854, he commenced an annotated edition of the English poets; and received from the king of the Belgians a gold medal, as a token of his majesty's sense of his services to literature. He died in 1867.

**BELL, THOMAS**, a distinguished naturalist, the son of a medical practitioner, was born at Poole, Dorsetshire, in 1792. In 1814, he went to London, and studied at Guy's Hospital, and in 1815, passed the College of Surgeons. In 1817, he commenced a course of annual lectures on dental surgery at Guy's Hospital, where he also for some time delivered lectures on comparative anatomy. He was one of the founders of, and a principal contributor to, *The Zoological Journal*, of which five volumes were published; also one of the members of the Zoological Club of the Linnean Society, afterwards incorporated with the Zoological Society. Elected in 1828 a Fellow of the Royal Society, in 1840 he was appointed its secretary. In 1836, he became Professor of Zoology in King's College, London. On the establishment of the Ray Society, in 1844, for the publication of rare and costly works on natural history, he was elected its first president. In 1853, he resigned the secretaryship of the Royal Society, on being elected president of the Linnean Society. He is author of a *History of British Reptiles*, in Van Voorst's series of British natural history, 1829; a *History of British Quadrupeds*, same series, 1836; and a *History of the British Stalk-eyed Crustaceans*, same series, 1853. In 1833, he commenced a *Monograph of the Testudinata*. The article 'Reptiles,' in Darwin's *Zoology of the Voyage of the Beagle*, was written by Bell. His last work of interest was a new edition of Gilbert White's *Natural History and Antiquities of Selborne*, on which he began to busy himself in 1872. B. is appropriately the proprietor of the manor of Selborne.

**BELLA**, a thriving town of Italy, in the province of Basilicata, with a population of between 5000 and 6000.

**BELLA, STEFANO DELLA**, a famous Italian engraver, was born at Florence, 18th May 1610. He was intended for a goldsmith, but he soon left that calling, and devoted himself to engraving. He executed upwards of 1400 different works, of almost all subjects—battles, sea-pieces, landscapes, animals, &c. All are characterised by freedom and delicacy, and give evidence of high imagination on the part of the author, and also of much patient and careful manipulation. One of his most admired works is a view of the Pont-Neuf, Paris. He died 12th July 1664.

**BELLADONNA, DWALE, or DEADLY NIGHTSHADE** (*Atropa Belladonna*), a plant of the natural order Solanaceæ (q.v.); an herbaceous perennial, growing up every year as a bush, from two to six feet high, with ovate entire leaves, and

bell-shaped flowers of a lurid purple colour, which are fully larger than those of the common harebell, stalked and solitary in the axils of the leaves. It produces berries, of the size of a middle-sized cherry,

Belladonna.

a, part of a branch with leaves and flowers; b, fruit, with persistent calyx.

and which, when ripe, are of a shining black colour, and of a sweetish and not nauseous taste, although the whole plant has a disagreeable heavy smell. It is a native of the southern and middle parts of Europe, and is not uncommon in England, in the neighbourhood of towns and of ruins. All parts of the plant are narcotic and poisonous, and fatal consequences not unfrequently follow from the eating of its berries, which have an inviting appearance. Its roots have sometimes been mistaken for parsnips. Dryness of the mouth and throat, dilatation of the eyes, obscurity of vision, paralytic tremblings, loss of sensation, delirium, and stupor, are among the effects of poisoning by belladonna. When death takes place from this cause, corruption ensues with extraordinary rapidity. B. is, however, of great value in medicine, soothing irritation and pain, particularly in nervous maladies, and is administered both internally and externally, in the form of extract, tincture, ointment, and plaster, which are generally prepared from the dried leaves, sometimes from the root. It is particularly useful, from its power of dilating the pupil of the eye, and is constantly employed by oculists both for examinations and operations. It is also applied to the eye to diminish the sensibility of the retina to light. It has recently been recommended as a preventive of scarlet fever, apparently on the ground of its tendency, when administered in frequent small doses, to produce an eruption and an affection of the throat, somewhat similar to those characteristic of that disease; but the evidence of its utility for this purpose is not sufficient to warrant confidence.—The name B., i.e., Fair Lady, is supposed to have originated in the employment of the juice for staining the skin. The name Dwale is apparently from the same root with the French *deuil*, grief—an allusion to the same qualities which have obtained for the plant the appellation of Deadly Nightshade. *Atropa* is from *Atropos*, one of the Fates.—The other species of *Atropa* are South American.

B. owes its active properties on the animal system to the presence of the alkaloid *Atropine*, accompanied by another alkaloid, *Belladonnine*. The alkaloid atropine is present in all parts of the plant, and in all the preparations. It is generally procured from the root of B., and then forms

needle-shaped crystals, which are sparingly soluble in water, but readily dissolve in alcohol and ether. Atropine is a very active poison, and its effects on the animal system resemble in an intensified degree the manner in which B. acts. It has recently been introduced into medicine, along with its nitrate, its sulphate, and its hydrochlorate.

**BELLADONNA LILY** (*Amaryllis Belladonna*), a very beautiful species of Amaryllis (q. v.), with rose-coloured drooping flowers clustered at the summit of the leafless flowering stem. It is a native of the Cape of Good Hope and of the West Indies, has become naturalized in Madeira, and is a not unfrequent ornament of gardens in England. The flowering stem is about 18 inches high.

**BELLAMY**, JACOBUS, a distinguished Dutch poet, was born at Vliessingen (Flushing), November 12, 1757, and died March 11, 1786. His parents were very poor, and he was indebted for his education to the patronage of a clergyman, and other persons, who had seen and admired the patriotic effusions of his boyish muse, and who subscribed to send him to the university of Utrecht. Here the talents already remarked in B. were devoted chiefly to poetry, though his benefactors had hoped that he would devote himself to theology. His first sentimental and anacreontic poems, published at Amsterdam in 1782, were followed by a series of earnest patriotic poems (*Vaderlandsche Gezangen*), and in the same year, a third volume full of merit (1785). A collected edition of his works appeared at Haarlem (1826), but it does not contain his most popular poem, *Roosje*. B. was possessed of a glowing spirit and fancy, as well as a fine taste and ease in composition. He deservedly ranks as one of the chief restorers of national literature in Holland.

**BELLARMINE**, ROBERT, one of the most celebrated Catholic theologians, was born at Monte Pulciano in Tuscany, October 4, 1542. He entered the order of Jesuits in 1560, and was distinguished among his *confrères* by the zeal with which he studied theology, the church-councils, the Fathers, Hebrew, history, and the canon law. In 1563, he gave lessons in polite literature and astronomy at Florence; and in rhetoric, at Mondovi, 1564—1567. In his twenty-seventh year, when he went to Louvain as professor of theology, he began that long controversy with 'heretics' which formed the main business of his life. In 1599, when he was made a cardinal against his own inclination, he used his influence over Pope Clement VIII. to prevent the introduction of the Platonic philosophy into the university of Rome, on the ground of its being 'pernicious'; but though himself a Jesuit, he honourably opposed the Dominicans with regard to the Pelagian writings of Molina. He seems, however, to have participated to some extent in that writer's suicidal ethics, for in his *Disputationes* he argues that, as the pope is the supreme authority in doctrine and morals, if he should call virtue vice, and vice virtue we are bound to believe him, and to act accordingly. In 1602, he was appointed Archbishop of Capua. After the death of Clement VIII., he contrived to escape promotion to the papal chair, but was induced by Pius V. (1605) to hold an important place in the Vatican, where he remained until the time of his death, which took place in the Novitiate-house of the Jesuits, September 17, 1621. In his work, *De Potestate Pontificis in Temporalibus* (On the Pope's Power in Secular Matters), he introduced the doctrine that the pope must be held as supreme over all kings. On this account, the book was condemned as treasonable in Paris, Venice, and Mentz. His chief work contains the disputationes held in the Jesuits' College at Rome, 1576—1581, *Disputationes*

*de Controversiis Fidei adversus hujus Temporis Hereticos* (3 vols., Rome, 1581; 4 vols., Prague, 1721; 4 vols., Mayence, 1842). These disputationes are regarded by Catholics as the best arguments for their tenets. There can be no question of their merits with regard to erudition and adroitness in controversy; but as Gerhard, in his *Bellarminus Orthodoxia Testis* (Jena, 1631—1633), and Dalleus have shewn, many of the conclusions are far from being sound or logical. Industry, clearness, and acuteness are the chief merits of B.'s great work; but it is seriously lessened in value by subtlety, forced conclusions, and a very defective exegesis—faults which have long been evident to enlightened Catholic writers themselves. Among his other writings, the most able is the *Christianæ Doctrinæ Applicatio*, originally written in Italian, and now translated into all the European languages. Pope Urban VIII., at the instigation of the Jesuits, declared B. to be a 'faithful servant of God'; but his canonisation as a saint has hitherto been opposed. Complete editions of his works have been published at Venice, 5 vols., 1721; and Cologne, 7 vols., 1619. His life was written in Italian by the Jesuit Fuligatti (Rome, 1624); and translated into Latin by Petrus Sancta (Liege, 1628).

**BELLARY**, a district of British India in the presidency of Madras, bounded on the N. by the Nizam's territories, on the E. by Cuddapah, on the S. by Mysore, and on the W. by Dharwar. With an area of 11,496 square miles, it extends in N. lat. between 13° 40' and 15° 58'; and in E. long. between 75° 44' and 78° 19'. Pop. (1872) 1,653,154. The peculiarities of the district are connected with its situation. Elevated on the east slope of the West Ghats, B. enjoys so healthy a climate that it has been officially recommended as the site of a sanatorium for the neighbouring provinces. Screened by the Ghauts from the south-west monsoon, and protected against the north-east one by its distance from the Bay of Bengal, B. receives, on an average, less rain than any other portion of Southern India—the annual fall ranging between about 12 inches and about 26 inches. Hence all its subordinate streams become, in the dry season, mere expanses of sand, which, excepting when bound together by the growth of the nuth-grass, is apt to encroach from year to year, like a glacier, over the bordering grounds. B., in fact, may in a great measure be said to be habitable through artificial means. Irrigation, though rude, is yet ingenious; dug wells amount to 22,000; of tanks there are 1400; and weirs or dams of huge stones, to the number of 331, cross the various water-courses, so as to form, after the rains, so many reservoirs.

**BELLA'RY**, the chief town of the above district, is situated about 380 miles south-east of Bombay, and 270 north-west of Madras. Lat. 15° 8' N., and long. 76° 59' E. As one of the principal military stations in the presidency of Madras, it is connected by good roads with Belgaum, Bangalore, Hyderabad, and Madras itself. The fort stands on a rock two miles round, and 450 feet high; and is supplied with water from tanks excavated in the solid granite. Besides the fort and adjacent cantonments, B. contains a native town, which numbers about 35,000 inhabitants.

**BELL-BIRD** (*Casmirynchus carunculata*), a bird found in some of the warm parts of South America, remarkable for the metallic resonance of its cry, which resembles the tolling of a bell, with pauses varying from a minute to several minutes. This bird belongs to a genus nearly allied to the Cottinges (q. v.) and Wax-wings (q. v.), but characterised by a very broad and much depressed bill, soft and flexible

at the base, and hard towards the extremity. It is about the size of a jay; the male is of snow-white plumage, and from his forehead rises a strange tubular appendage, which, when empty, is pendulous, but which can be filled with air by a communication from the palate, and then rises erect to the height of nearly three inches. He generally takes his place on the top of a lofty tree, and his tolling can be heard to the distance of three miles. It resounds through the forest, not only at morning and evening, but also at mid-day, when the heat of the blazing sun has imposed silence on almost every other creature.

**BELLE-ALLIANCE**, the name of a farm in the province of Brabant, Belgium, 13 miles south of Brussels. It has become famous as the position occupied by the centre of the French army in the battle of Waterloo, June 18, 1815. The Prussians gave the name B. to this decisive battle; the French named it from Mont-Saint-Jean, the key of the British position, about two miles to the north; but the English name, Waterloo (q. v.), taken from the village where Wellington had his head-quarters, is now commonly used.

**BELLE DE NUIT** (Fr., Beauty of the Night), a name given to certain tropical species of *Convolvulaceæ*, with extremely beautiful and fragrant flowers, which open only during the night. The species to which perhaps the name more particularly belongs, is *Calonyction Bona Nox*, a native of the forests of the West Indies and of tropical America, with twining stem, spiny branches, heart-shaped leaves, and exquisitely beautiful white flowers of five or six inches in diameter, which are produced in large many-flowered corymbs.

**BELLEGARDE**, a hill-fortress of France, in the department of Pyrénées Orientales. It is situated on the Spanish confines on the road from Perpignan to Figueras, and in the pass between Col de Portus on the east, and Col de Panizas on the west. Here the French, under Philip III., were defeated by Peter III. of Arragon in 1285. In the 14th c., B. consisted only of a fortified tower. It was captured by the Spaniards in 1674, and again by the French under Marshal Schomberg in 1675. After the peace of Nimeguen, 1678—1679, a regular fortress, with five bastions, was erected here by order of Louis XIV. In 1793, it was blockaded and taken by the Spaniards under Ricardos, but was retaken by the French in the following year.

**BELLE ISLE**, an island in the Atlantic, about midway between the north-west of Newfoundland and the south-east of Labrador, in lat. 52° N., and long. 56° W. Although on the parallel of Essex in England, it yields little but potatoes and ordinary vegetables. It is chiefly known as giving name to the adjacent strait on the south-west, which, separating Labrador from Newfoundland, forms the most northerly of the three channels between the Gulf of St Lawrence and the open ocean.

**BELLEISLE-EN-MER**, an island belonging to France in the department Morbihan, in the Atlantic, 8 miles south of Quiberon Point. Its length is 11 miles, and its greatest breadth 7. Pop. (1872) 10,804, chiefly engaged in pilchard-fishing. Salt is made on the island. B. is a place of considerable antiquity. The chief town is *Palais* (pop. 2,260), a seaport and fortified place. In the 9th c., B. came into the possession of the Count of Cornouailles, who bestowed it on the abbey of Redon, afterwards on the abbey of Quimperlé. In the 16th c., the monks of Quimperlé ceded the island to Charles IX., who gave it as a marquise to the Marshal de Retz, who fortified it. His successor sold the island in 1658 to Fouquet, intendant of finance, who further improved and

strengthened it. His grandson, the celebrated Maréchal Belleiale, ceded the island to Louis XV. in exchange for the comté Gisora, 1718. In 1761, it was captured by the English fleet under Keppel, and restored in 1763.

**BELLENDEN (BALLANTYNE)**, JOHN, Archdeacon of Moray, a Scottish writer in the reigns of James V. and Queen Mary, was born towards the close of the 15th century, somewhere in the east of Scotland, for in the Records of the university of St Andrews he is entered thus: '1508, Jo. Ballentyn nac. Laudonia.' He completed his education at the university of Paris, where he took the degree of D.D. B. is best remembered by his translation of Boece's *Scotorum Historie* (done in 1533), and of the first five books of Livy (also done in 1533), interesting as specimens of the Scottish prose of that period, and remarkable for the ease and vigour of their style. To both of these works are prefixed poetical prohesmes or prologues. B.'s *Croniklis of Scotland* professes to be a translation of Boece, but it is a very free one, and contains numerous passages not to be found in the original, so that it is in some respects to be considered almost an original work. The author enjoyed great favour for a long time at the court of James, at whose request he executed the translations. As the reward of his performances, he received grants of considerable value from the treasury, and afterwards was made Archdeacon of Moray and Canon of Ross. Becoming involved, however, in ecclesiastical controversy, he left his country, and, according to Bale and Dempster, went to Rome, where he died about 1550. The translation or 'traduction' of Livy was first published in 1822 by Mr Thomas Maitland (afterwards Lord Dundrennan), uniform with his edition of the *Croniklis* in the previous year (Edin., 2 vols. 4to).

**BELLENDEN, WILLIAM**, a Scottish author in the time of Queen Mary and James VI. His personal history is meagre and obscure; all that we know being the testimony of Dempster (*Hist. Eccl.*), that he was a professor in the university, and an advocate in the parliament of Paris, and that he was employed in that city in a diplomatic capacity by Queen Mary, and also by her son, who conferred on him the appointment of Master of Requests. His first work, entitled *Ciceronis Princeps*, &c., was published at Paris in 1608; his next, *Ciceronis Consul, Senator, Populusque Romanus*, in 1612. Both these works are compilations from the writings of Cicero. His next work, *De Statu Prisci Orbis*, appeared in 1615, and consists of a condensed sketch of the history and progress of religion, government, and philosophy in ancient times. These three works he republished in a collected form the year after, under the title *De Statu, Libri tres*. His crowning labour, *De Tribus Luminibus Romanorum*, was published after his death. The 'three luminaries' were Cicero, Seneca, and Pliny, out of whose works he intended to compile, on the same plan as his previous works, a comprehensive digest of the civil and religious history, and the moral and physical science of the Romans. The first of these only was completed, and forms a remarkable monument of B.'s industry and ability. 'B.', says Mr Hallam, 'seems to have taken a more comprehensive view of history, and to have reflected more philosophically on it than perhaps any one had done before.' B.'s works furnished the materials for Dr Middleton's *Life of Cicero*, though that learned divine abstains from any allusion to the forgotten Scot from whom he plundered wholesale. Warton first denounced the theft, which was afterwards made clear by Dr Parr in his edition of the *De Statu, Libri tres*, published in 1787.

**BELLEROPHON**, a genus of univalve shells, known only as a fossil. Montfort, who established the genus, placed it among the chambered Cephalopoda. It was subsequently associated with the living Argonaut, but is now generally considered as a genus of De Blainville's Nucleobranchiata (q. v.), having as

Bellerophon tangentialis.

its nearest ally the genus *Atlanta*; from which, however, it differs in having a strong shell. The shell of the B. is symmetrically convolute, with few and occasionally sculptured whorls, globular or discoidal, and having a dorsal keel, which terminates in a deep notch in the sinuous aperture. It is a palaeozoic organism, extending from the lower silurian to the carboniferous series. Seventy species have been described.

**BELLEROPHON** (originally called *HIPPONOUS*) was the son of the Corinthian king Glaucus, and Eurymede, daughter of Sisyphus. Other accounts make Neptune his father. Having accidentally killed his brother, B. fled to his relative Proetus, king of Argos, by whom he was hospitably received and protected; but Anteia, the spouse of Proetus, having become enamoured of him, and he, like Joseph, having declined her overtures, she revenged herself after the manner of Potiphar's wife. This induced Proetus to send his guest away to Iobates, king of Lycia, to whom B. carried a sealed message. After being entertained nine days at the court of Lycia, B. delivered the letter, which contained a request that Iobates would cause the youth to be slain. This, however, Iobates was reluctant to do in a direct way, as B. was his guest. He consequently imposed upon B. the seemingly impossible task of slaying the formidable Chimera (q. v.). B., mounted on the winged steed Pegasus (given to him by Pallas), ascended into the air, and succeeded in slaying the monster with his arrows. Afterwards, he was sent by King Iobates against the Amazons, whom he defeated. On his way home he destroyed an ambuscade of Lycians, which Iobates had set for his destruction. That monarch now thought it useless to attempt his death, and as a sort of recompense, gave the hero in marriage his daughter Philonoë, by whom he had three children—Iasander, Hippolochus, and Laodameia; such at least is the story as told by Apollodorus, who here concludes. Homer relates that he at last drew on himself the hatred of the gods, and wandered about in a desolate condition through the Aelian field. Pindar relates that B. on Pegasus endeavoured to mount to Olympus, when the steed, maddened by Jove through the agency of a gadfly, threw his rider, who was stricken with blindness. B.'s adventures were a favourite subject of the ancient artists. Sculptures have recently been discovered in Lycia which represent him vanquishing the Chimera.

**BELLES-LETTRÉS**, a term adopted from the French into the English and various other languages. It is generally used in a vague way to designate the more refined departments of literature, but has in fact no precise limits. In English usage it is synonymous with another vague expression, *polite literature*, including history, poetry, and the drama, fiction, essay, and criticism.

**BELLEVILLE**, a town of France, in the

department of the Seine, forming a suburb of Paris, and enclosed by the new fortifications. It has manufactures of cashmeres, varnished leather, articles of polished steel, chemical stuffs, &c. There are springs at B. which have supplied Paris with water from a very early date, and it has tea-gardens and other places of amusement much resorted to by the Parisians. Pop. over 70,000.

**BELLEY**, a town of France in the department of Ain, is a place of great antiquity, and was at one time strongly fortified. The finest lithographing stones in France are procured here. Pop. (1872) 3534.

**BELL-FLOWER.** See *CAMPANULA*.

**BELLINI**, the name of a Venetian family which produced several remarkable painters. The earliest was JACOPO B., who died in 1470. He was a pupil of the celebrated Gentile da Fabriano, and one of the first who painted in oil. His eldest son, GENTILE B., born 1421, died 1501, was distinguished as a portrait-painter, and also as a *medaillleur*. Along with his brother, he was commissioned to decorate the council-chamber of the Venetian senate. Mohammed II., having by accident seen some of his works, invited Gentile to Constantinople, employed him to execute various historical works, and dismissed him laden with presents. The *Preaching of St Mark* is his most famous achievement. His more celebrated brother, GIOVANNI B., born 1422, died 1512, was the founder of the older Venetian school of painting, and contributed greatly to its progress. His works are marked by naivete, warmth, and intensity of colouring. His best works are altar-pieces. His picture of the *Infant Jesus* slumbering in the lap of the Madonna, and attended by angels, is full of beauty and lively expression. His *Holy Virgin*, *Baptism of the Lord*, and *Christ and the Woman of Samaria*, are also much admired. Among his numerous pupils the most distinguished were Giorgione and Titian.

**BELLINI**, VINCENZO, one of the most popular modern opera composers, was born at Catania, in Sicily, November 1, 1802, and died at Puteaux, near Paris, September 24, 1835. He received his early education at the Conservatory of Naples, and was subsequently instructed in composition by Tritto and Zingarelli. After making some attempts, without much success, in instrumental and sacred music, he brought forward, in 1825, the opera *Andelson e Salvina*, which was played in the small theatre of the Royal College of Music (Naples). Another opera, *Bianco e Gernando*, was given in the theatre St Carlo (1826) with such success that, in 1827, Bellini was commissioned to write a piece for *La Scala* at Milan. This opera, *Il Pirata*, was the first which carried the composer's name beyond Italy. It was followed with equal success by *La Straniera*, 1829, and by *I Capuletti ed i Montecchi*, written for the theatre of Venice, 1830, which was the culmination of the fame of B., though it by no means exhausted his productive powers. *La Sonnambula* and *Norma* appeared in 1831, and *Beatrice di Tenda* in 1833. In the same year the composer went to Paris, where he became acquainted with other forms of music beside the Italian. He was received with great applause in London, and after his return to Paris, wrote his opera *I Puritani*, which shews the influence of the French school of music, but without servile imitation. At an early age the career of B. was interrupted by death, before the composer had fully developed his powers. He was the most genial and original of all the followers of Rossini, and though inferior to his master in exuberance of fancy, is superior in carefulness and finish, especially in the due subordination of instrumental decorations to

vocal melody. In private he was highly esteemed for the purity and affectionateness of his character.

**BELLINZONA**, or **BELLENZ**, a town of Switzerland, in the canton of Tessin or Ticino, on the left bank of the river of that name, and the seat of the provincial government, alternately with Lugano and Locarno. It is guarded by three old castles, and completely commands the passage of the valley in which it is situated. In former times, it was considered a place of great military importance, and was the scene of frequent conflicts between the Italians and Swiss; the latter of whom finally made themselves masters of it about the beginning of the 16th c. As an entrepôt for the merchandise of Germany and Italy, it is now a place of considerable commercial importance, though the population is but small—(1870) 2501.

**BELLIS.** See DAISY.

**BELLO'NA**, the goddess of war among the Romans, was described by the poets as the companion, sister, wife, or daughter of Mars; she was also represented as armed with a bloody scourge, and as inspiring her votaries with a resistless enthusiasm in battle. In the war with the Samnites, the Consul Appius Claudius vowed a temple to B., which was erected afterwards on the field of Mars. In this temple the senate gave audience to embassies from foreign powers, and also to consuls who had claims to a triumph which would have been nullified by entrance into the city. The priests of the goddess were styled *Belonarii*, and practised sanguinary rites; such as cutting their own arms or feet, and offering (or even drinking) the blood in sacrifice. This was especially done on the *dies sanguinis* (day of blood), March 24.

**BELLLOT**, JOSEPH RENÉ, a lieutenant in the French navy, who perished in the arctic regions, in search of Sir John Franklin, was born in Paris, 18th March 1826, and educated at Rochefort, in the Naval School. In the French expedition against Tamanataiv, in 1845, he gave proof of so much courage and presence of mind, that the Cross of the Legion of Honour was conferred on him before he had attained his twentieth year. In May 1851, he joined the expedition then preparing in England for the polar regions, in search of Sir John Franklin, and sailed in the *Prince Albert*, Kennedy commander, sent out by Lady Franklin. Distinguished by his noble daring and spirit of enterprise, he took part in several explorations. In one of these he made an important geographical discovery, to which his name was given—*Bellot Strait* (q. v.). On his return, he was promoted to the rank of navy lieutenant. In the expedition fitted out by the British Admiralty, under Captain Inglefield, he sailed as a volunteer, in H.M.S. *Phenix*; but never returned, having been carried by a violent gust of wind, 21st March 1852, into a deep crack in the ice on which he was travelling. A considerable sum was subscribed in England for a monument to his memory. His *Journal of a Voyage to the Polar Seas made in Search of Sir John Franklin in 1851—1852*, edited, with a notice of his life, by M. Julien Lemer, 2 vols., was published at Paris in 1854. English translation, London, 1855.

**BELLLOT STRAIT**, the passage which separates North Somerset from Boothia Felix, and connects Prince Regent's Inlet with Peel Strait or Sound, or, in McClintock's new nomenclature, Franklin Channel. Its east entrance was discovered by Kennedy during his search for Franklin, and he, assuming the continuity of the opening, classified it accordingly, naming it after his lamented companion Bellot. After four unsuccessful attempts, it was explored for the first and perhaps last

time by McClintock on his crowning voyage. It is about 20 miles long, and, at its narrowest part, about 1 mile wide, running pretty nearly on the parallel of 72°, between granite shores which, everywhere high, rise here and there to 1500 or 1600 feet. Through this funnel both the winds and the waters have full play; the latter, permanent currents and flood-tides alike, coming from the west. To the most northerly point on the south shore, McClintock has given the name of Murchison Promontory, which, at least unless other straits like B. S. be found towards the isthmus of Boothia, must be also the most northerly point of the new continent. See BARROW, POINT.

**BELLOY**, PIERRE LAURENT BUIRETTE, one of the first French dramatists who ventured to introduce on the stage native, instead of Greek, Roman, or other outlandish heroes. He was born at St Flour, in Auvergne, 17th November 1727, and died 5th March 1775. His father having died while B. was young, his uncle took him under his protection, and educated him for the law; but the seductions of the drama proved irresistible, and the opposition which he encountered in the cultivation of his theatrical talent ultimately determined him to leave his adopted home. Under the name of Dormont de B., he performed on various northern boards, and was much esteemed for his private worth. For some years he resided at St Petersburg, where the Empress Elizabeth interested herself in him. In 1758, he returned to France, to superintend the 'bringing out' of his tragedy *Tware*, trusting that its success would reconcile his family to him. In this, however, he was disappointed, for the piece proved a failure, being only a feeble imitation of *Metastasio*, and he returned to St Petersburg. After the death of his uncle, he again visited France, and obtained a decided success by his tragedy of *Zémire*. In 1765 appeared *Le Siège de Calais*, which was immensely popular, and is even yet held in estimation; and in 1771, *Gaston and Bayard*, which secured for him an entrance to the French Academy. But of all his productions, the one which has longest retained a place in the *répertoire* of the stage, though it was far from popular at first, is *Pierre le Cruel*. B.'s dramas are not by any means wanting in theatrical effectiveness, but are marred by great incorrectness. They have been collected and edited by Gaillard (6 vols., Par. 1779).

**BELLS**, on shipboard, is a term having a peculiar meaning, not exactly equivalent to, but serving as a substitute for 'time' or 'o'clock' in ordinary land-life. The day, or rather the night, is divided into watches or periods, usually of four hours' duration each; and each half-hour is marked by striking on a bell. The number of strokes depends, not on the hour, according to ordinary reckoning, but on the number of half-hours which have elapsed in that particular watch. Thus, 'three bells' is a phrase denoting that three half-hours have elapsed, but it does not in itself shew to which particular watch it refers. Captain Basil Hall, in his *Fragnents of Voyages and Travels*, while treating of Sunday usages on board ships of the Royal Navy, mentions one or two phrases illustrative of this mode of time-reckoning. While the sailors are at breakfast on Sunday morning, 'the word is passed to "clean for muster," and the dress is specified according to the season of the year and climate. Thus, at different seasons is heard: "Do you hear there, fore and aft! clean for muster at five bells! duck-frocks and white trousers!"—or, "Do you hear there, clean shirt and a shave for muster at five bells!"' A ship's bell is usually hung to the beam of the forecastle, but occasionally

to a beam near the mizzen-mast. Sometimes, in foggy weather, as a warning to other ships, the bell is struck to denote that the ship is on a starboard-tack; leaving the larboard-tack to be denoted by the beat of a drum. See WATCH ON SHIPBOARD.

**BELLU'NO** (the ancient *Bellunum*), a city of Venetia, Northern Italy, on the right bank of the Piave, and 51 miles north of the city of Venice. It is walled, is the seat of a bishop, has a handsome cathedral, hospital, public library, fine aqueduct, &c. It has a trade in timber, and manufactures of silks, hats, leather, and earthenware. Pop. 10,000.

**BELOMANCY** (Gr. *bēlos*, an arrow; *manteia*, prophecy), a mode of divination by arrows, practised among the Arabs and other nations of the east. A number of arrows being shot off with sentences written on labels attached to them, an indication of futurity is sought from the inscription on the first arrow found. This is only one of many ways of divining by arrows. See AXINOMANCY. DIVINING-ROD.

**BELON, PIERRE**, a celebrated French naturalist, was born in 1517 at Souleuvre, in the department of Sarthe. He studied medicine at Paris, and subsequently travelled through Germany. In 1546 he left France, and visited Greece, Asia-Minor, Egypt, and Arabia. He returned in 1549, and in 1553 published the results of his travels, in a work entitled *Observations on several Singular and Memorable Things discovered in Greece, Asia, Judaea, Egypt, Arabia, and other Foreign Countries*. Charles IX. gave him apartments in the Château of Madrid, a sumptuous edifice which Francis I. had constructed in the Bois de Boulogne. Here he resided till his tragic death in April 1564. He was murdered by robbers when gathering herbs at a late hour of the evening in the Bois de Boulogne.

Besides the valuable work already mentioned, B. published in 1551, *A Natural History of Strange Sea-fish, with a correct Representation and Account of the Dolphin, and several others of that Species*, which contains, among other things, an exact description of the dolphin, and the earliest picture of a hippopotamus in any European book; in 1555, *A Natural History of Birds*, which is often quoted by Buffon, and acknowledged to be the most important treatise on ornithology of the 16th c.; in 1558, an elaborate and interesting work on Arboriculture, in which he gave a list of the exotic trees which it would be useful to introduce into France. Besides these, B. wrote several other treatises of trees, herbs, birds, and fishes.

**BEFONE.** See GARFISH.

**BELOOCHISTA'N**, a country of southern Asia, bounded on the N. by Afghanistan, on the E. by Moultan and Sinde, on the S. by the Arabian Sea, and on the W. by a maritime dependency of Muscat in Arabia, and by the Persian province of Kerman. B. corresponds in general with the ancient Gedrosia, excepting that the latter name appears to have extended to the Indus, while the former nowhere reaches that river. B. stretches in N. lat. between 24° 50' and 30° 20', and in E. long. between 57° 40' and 69° 18', respective estimates giving from 110,000 to 200,000 sq. miles, and from one to two million inhabitants. Though it was anciently a part of Persia, yet its modern relations connect it rather with India, more particularly since Sinde and Moultan have fallen under the dominion of the English. In the bygone ages of the overland invasions of Hindustan, the Gedrosian or Beloochee Desert formed, as it were, a barrier for the Lower Indus, constraining every assailant, from Alexander downwards, to prefer the less barren,

though perhaps more rugged route through Afghanistan into the Punjab—a preference strengthened by Alexander's direful experience in returning from the Indus along the coast. The surface is generally mountainous, more especially towards the north, the peak of Takku being said to be 11,000 feet high. Even the bottoms of some of the valleys have an elevation of 5700 feet; and the capital, Kelat, situated on the side of one of them, is 6000 feet above the level of the sea. The rivers are inconsiderable, unless after heavy rains: even the largest of them, the Dusti, after a course of about 1000 miles, has been found to be only 20 inches deep, and 20 yards wide at its mouth. The pastures, as may be supposed, are poor, so that there are few cattle: sheep and goats, however, are numerous. The dromedary is the ordinary beast of burden; and it is only in the north-west, towards Kerman, that horses are bred. Wherever there is a sufficiency of water, the soil is productive—the lowlands yielding rice, sugar, cotton, indigo, and tobacco; and the higher grounds, wheat, barley, madder, pulse, and European fruits. In the sandy waste of Mekran, where Alexander's army suffered its severest hardships and privations, the only valuable product is the date. The minerals are copper, lead, antimony, iron, sulphur, alum, and sal-ammoniac; and the manufactures are skins, woollens, carpets, and tent-covers of goat's and camel's hair, and rude firearms. B. has but one seaport, Sonmeanee, near the frontier of Sind. The trade is insignificant, being, such as it is, chiefly monopolised by Hindus. The inhabitants, however, are, as a body, Mohammedans, of the Sunnite sect, and consequently opposed to their neighbours of Persia, who are Shiites. Most of the east provinces, which alone come into contact with British India, are under the authority of the Khan of Kelat, who, with a revenue of about £30,000, maintains an army of 3000 men. This petty sovereign having acted treacherously towards the British during the Afghan campaign of 1839, his royal city was taken by storm in the same year. In 1840, it was abandoned; but, in 1841, it was again captured, for temporary occupation, by the British.

**BELSHAM, THOMAS**, one of the ablest exponents of the Unitarian system of theology, was born at Bedford in 1750. He was educated in the principles of Calvinism, and for some years officiated as pastor of the dissenting congregation and head of the theological academy at Daventry. These offices he resigned in 1789, on embracing Unitarian views, and shortly after received the charge of a new theological academy at Hackney, which in a few years collapsed for want of funds. Before its extinction, he succeeded Dr Priestley in his pastoral charge, and in 1805 removed to London as the successor of Dr Dianey, where he continued till his death in 1829. Most of his works are controversial: his doctrine regarding the person of Christ represents the purely 'humanitarian' view, as distinguished from the more nearly Arian sentiments of men like Channing. He published also a work on mental and moral philosophy, following Hartley, and a memoir of his predecessor, Theophilus Lindsey. His brother, William (b. 1752; d. 1827), was an active and voluminous writer of history and political tracts on the side of the Whigs.

**BELSHAZ'ZAR, or BELSA'ZAR**, was the last king of the Chaldean dynasty in Babylon. The name occurs only in the Old Testament, where it indicates either the person who is called by Herodotus Labynetos, or his son. For an account of the circumstances attending his overthrow, see the Book of Daniel, Herodotus, &c.

**BELT** (signifying Girdle), the name given to two straits, the **GREAT** and the **LITTLE B.**, which, with the Sound, connect the Baltic with the Cattegat. The **GREAT B.**, about 70 miles in length, and varying in breadth from 4 to more than 20 miles, divides the Danish islands, Seeland and Laaland, from Funen and Langeland. The **LITTLE B.** divides the island of Funen from Jutland. It is equal in length to the Great B., but much narrower. Its greatest breadth is about 10 miles, but it gradually narrows towards the north, until at the fort of Fredericia it is less than a mile wide; thus the passage from the Cattegat into the Baltic is here easily commanded. Both the Belts are dangerous to navigation, on account of numerous sandbanks and strong currents; and therefore, for large vessels, the passage by the Sound (q. v.) is preferred.

**BELTEIN, BELTANE, BEILTINE, or BEALTAINE**, the name of a heathen festival once common to all the Celtic nations, and traces of which have survived to the present day. The name is derived from *tia* or *teine*, fire, and *Béal* or *Beil*, the Celtic god of light or Sun-god, a deity mentioned by Ausonius (399—392 A.D.) and Tertullian (who flourished during the first half of the 3d c.), as well as on several ancient inscriptions, as Belenus or Belinus. B. thus means 'Béal's fire,' and belongs to that sun and fire worship which has always been one of the most prominent forms of polytheism. The great festival of this worship among the Celtic nations was held in the beginning of May, but there seems to have been a somewhat similar observance in the beginning of November (the beginning, and the end of summer). On such occasions, all the fires in the district were extinguished (while the system was in full force, even death was the penalty of neglect); the *needfire* (q. v.) was then kindled with great solemnity, and sacrifices were offered—latterly, perhaps, of animals, but originally, there can be little doubt, of human beings. From this sacrificial fire the domestic hearths were rekindled.

The earliest mention of B. is found by Cormac, Archbishop of Cashel in the beginning of the 10th c. A relic of this festival, as practised in some parts of the Highlands of Scotland about the beginning of the 19th c., is thus described: 'The young folks of a hamlet meet in the moors on the 1st of May. They cut a table in the green sod, of a round figure, by cutting a trench in the ground of such circumference as to hold the whole company. They then kindle a fire, and dress a repast of eggs and milk in the consistence of a custard. They knead a cake of oatmeal, which is toasted at the embers against a stone. After the custard is eaten up, they divide the cake in so many portions, as similar as possible to one another in size and shape, as there are persons in the company. They daub one of these portions with charcoal until it is perfectly black. They then put all the bits of the cake into a bonnet, and every one, blindfold, draws out a portion. The bonnet-holder is entitled to the last bit. Whoever draws the black bit is the devoted person, who is to be sacrificed to Baal, whose favour they mean to implore in rendering the year productive. The devoted person is compelled to leap three times over the flames.' The leaping three times through the fire is clearly a symbolical sacrifice, and there was doubtless a time when the victim was bound on the pile, and burned. See *SACRIFICE*.

It has been usual to identify the worship of the Celtic *Beal* with that of the *Baal* (q. v.) or *Bel* of the Phoenicians and other Semitic nations. It is unnecessary, however, to go beyond the family of nations to which the Celts belong (see *ARYANS*), in order to find analogies either for the name or the

thing. J. Grimm (*Deutsche Mythologie*, i. 208, 581) identifies the Celtic *Beal* not only with the Slavonic *Bielbog* or *Bjelbog* (in which name the syllable *bel* or *bjel* means white, and *bog*, god), but also with the Scandinavian and Teutonic *Balder* (q. v.) or *Paltar*, whose name appears under the form of *Baldag* (the white or bright day), and who appears to have been also extensively worshipped under the name of *Phol* or *Pol*. The universality all over Europe in heathen times of the worship of these personifications of the sun and of light through the kindling of fires and other rites, is testified by the yet surviving practice of periodically lighting *bonfires* (q. v.). The more marked turning-points of the seasons would naturally determine the times of these festivals. The two solstices at midwinter (see *YULE*) and midsummer, and the beginning and end of summer, would be among the chief seasons. The periods of observance, which varied, no doubt, originally, more or less in different places, were still further disturbed by the introduction of Christianity. Unable to extirpate these rites, the church sought to Christianise them by associating them with rites of her own, and for this purpose either appointed a church-festival at the time of the heathen one, or endeavoured to shift the time of the heathen observance to that of an already fixed church-festival. All over the south of Germany, the great bonfire celebration was held at midsummer (*Johannisfeuer*), [see JOHN'S, EVE or ST]—a relic, probably, of the sun-festival of the summer solstice: throughout the north of Germany, it was held at Easter. It is probable that this fire-festival (*Osterfeuer*) of Ostara—a principal deity among the Saxons and Angles—had been originally held on the 1st of May, and was shifted so as to coincide with the church-festival now known as Easter (q. v.; see also *WALPURGA*, ST). The seriousness and enthusiasm with which these observances continued to be celebrated in the 16th and 17th centuries, began afterwards to decline, and the kindling of bonfires has been mostly put down by the governments; the earlier interdicts alleging the unchristian nature of the rites; the later, the danger occasioned to the forests.

In Great Britain, St John's Eve was celebrated with bonfires; and Easter had its fire-rites, which, although incorporated in the service of the Roman Catholic Church, were clearly of heathen origin. But the great day for bonfires in the British islands was the 1st of November. Fewer traces of this are found in other countries, and therefore we must look upon it as more peculiarly Celtic. While the May festival of B. was in honour of the sun-god, in his character of god of war—who had just put to flight the forces of cold and darkness—the November festival was to celebrate his beneficent influence in producing the fruits which had just been gathered in. Hence it was called *Samhain* (peace-fire). If we may judge from the traces that still remain or have been recorded, the November observances were more of a private nature, every house having its bonfire and its offerings, probably of fruits, concluding with a domestic feast. The B. festival, again, was public, and attended by bloody sacrifices. Although the November bonfires, like B., were probably of Celtic origin, they seem to have been adopted by the inhabitants of the British islands generally. About the end of last century they were still kindled in various parts of England, and to this day, over whole districts of Aberdeenshire, every rural dwelling has its Hallowe'en bonfire lighted at nightfall in an adjoining stubble-field.

The Anglo-Saxon population of England had their own characteristic May-day rites; but there

exist traces also of the observance among them on that day of rites similar to the Celtic Beltane. An 'Old Holne Curate,' writing to *Notes and Queries* in 1853, says: 'At the village of Holne, situated on one of the spurs of Dartmoor, is a field of about two acres, the property of the parish, and called the Ploy (play) Field. In the centre of this stands a granite pillar (Menhir) 6 or 7 feet high. On May morning, before daybreak, the young men of the village assemble there, and then proceed to the moor, where they select a ram lamb (doubtless with the consent of the owner), and after running it down, bring it in triumph to the Ploy Field, fasten it to the pillar, cut its throat, and then roast it whole, skin, wool, &c. At mid-day, a struggle takes place, at the risk of cut hands, for a slice, it being supposed to confer luck for the ensuing year on the fortunate devourer. As an act of gallantry, in high esteem among the females, the young men sometimes fight their way through the crowd to get a slice for their chosen among the young women, all of whom, in their best dresses, attend the Ram Feast, as it is called. Dancing, wrestling, and other games, assisted by copious libations of cider during the afternoon, prolong the festivity till midnight.'

'The time, the place (looking east), the mystic pillar, and the ram, surely bear some evidence in favour of the Ram Feast being a sacrifice to Baal.'

Additional notices of this sun and fire worship will be found under YULE, CANDLEMAS, LAMMAS, and the other heads referred to in this article.

BELU'GA, a genus of *Cetacea* (q. v.), of the family of *Delphinidae* or Dolphins (q. v.), differing from the rest of that family in the blunt and broad head, which has no produced snout; the smaller number of teeth, the greater part of which often fall out before the animal is far advanced in age; and

Beluga.

the want of a dorsal fin. The only species found in the northern parts of the world is *B. arctica* (for which name there are unhappily many synonyms, as *B. leucas*, &c.), the White Whale and White Fish of whalers, often called by English writers the B., and the Round-headed Cachalot. The form of the B. is remarkably characterised by the softness of all its curves, and adapts it for rapid and graceful movements; its skin is usually of a clear white colour, and not very strong, so that it often fails to retain a harpoon. The B. attains a length of more than thirteen feet. The female brings forth two young ones at a birth, and displays the greatest solicitude for them. The food of the B. consists of fish, in pursuit of which it often ascends rivers to some distance. It is gregarious, and may be seen in herds of forty or fifty, which often gambol around boats; it abounds in most parts of the arctic seas, and sometimes, but not very frequently, visits the British shores. One was killed in the Firth of Forth in 1815, and one in the Medway in 1846. The Greenlanders take the B. with harpoons or with strong nets. Its flesh affords them a valuable supply of food, and is eaten by most of the inhabitants of arctic coasts; it affords also a considerable quantity of the very finest oil, and the skin is made into leather. Some of the internal membranes

are also employed for various purposes.—Another species of B. is found in the southern hemisphere. It is called *B. Ktagii*.

BEL'LUS. See BAAL.

BELVEDE'RE (It.) was originally an erection on the top of a house, for the purpose of looking out on the surrounding country, and enjoying the air, in which sense it is still understood in Italy. A part of the Vatican (q. v.) in Rome is known as the B., and gives name to the famous statue of Apollo. In France, and with us, the word has come to signify any kind of summer-house or place of refreshment.

BELVEDERE (*Kochia scoparia*, *Chenopodium scoparium*, or *Salsola scoparia*), an annual plant of the natural order *Chenopodiaceæ* (q. v.), a native of the middle and south of Europe, and of great part of Asia, which has long been very familiar in British gardens as an ornamental annual, not upon account of its flowers, which have no beauty, but of its close, pyramidal, rigid form, and numerous narrow leaves, which make it appear like a miniature cypress-tree. It is sometimes called SUMMER CYPRESS.

BELVI'SIA (also called NAPOLE'NA), a genus of exogenous plants, the type of the natural order *Belvisiaceæ*, of which order only a very few species have yet been discovered, natives of the tropical parts of Africa. They are large shrubs, with smooth, simple, leathery leaves. The flowers grow in three, sessile in the axils of the leaves, and are beautiful and extremely curious. The calyx is a thick, leathery cup, divided into five ovate segments. The corolla consists of three distinct rings; the outer one 5-lobed, and furnished with ribs, by means of which it is strongly plaited, turning back over and hiding the calyx when full blown; the second, a narrow membrane, divided into numerous regular segments like a fringe; the third, an erect cup-shaped membrane. The stamens are erect like another cup; the ovary 5-celled, with two ovules in each cell; the style short, thick, and 5-angled, with a broad, flat, 5-angled stigma. The fruit is a soft berry, crowned with the calyx, with large kidney-shaped seeds. The wood is soft, and contains numerous dotted vessels.—The pulp of the fruit of the best known species is mucilaginous and eatable, the rind very full of tannin; the fruit is as large as a pomegranate, and the seeds  $1\frac{1}{4}$  inch long.—The position of this remarkable order in the botanical system is not yet well determined. Lindley regards it as most nearly allied to *Rhizophoraceæ* (Mangroves, q. v.). It is supposed by some that the two inner rings of the corolla should be regarded as sterile stamens, and the place of the order is thus fixed near *Barringtoniaceæ* (q. v.).

BELZO'NI, GIOVANNI BATTISTA, the son of a poor barber, was born at Padua in 1778, and was educated at Rome, for the priesthood, but soon displayed a preference for mechanical science, especially hydraulics; and when the French republican troops took possession of the pontifical city, he quitted his religious studies altogether. About the year 1800, he visited Holland, and in 1803 came to England. For a time he gained a living by exhibiting feats of strength in the theatres. At Astley's, he played the part of Hercules, but he also continued his mechanical studies, and even gave numerous hydraulic representations in the most populous towns of the kingdom. After a sojourn of nine years in England, he went to Spain and Portugal, in his capacity of theatrical athlete. From the peninsula, he passed to Malta, and thence to Egypt in 1815, on the invitation of Mehemet Ali, who wished him to construct a hydraulic machine. After succeeding in

this undertaking, he was induced, by the travellers Burckhardt and Salt, to direct his attention to the exploration of Egyptian antiquities. He threw himself with ardour into his new vocation. He removed the colossal bust of the so-called 'Young Memnon' from the neighbourhood of Thebes to Alexandria, and was the first who opened the temple of Ipsambul. In the valley of 'the royal graves'—Bihān-el-Moluk—near Thebes, he discovered several important catacombs containing mummies, and among others, opened, in 1817, the celebrated tomb of Psammetichus, from which he removed the splendid sarcophagus, now, along with the 'Young Memnon,' and other results of B.'s labours, in the British Museum. But B.'s greatest undertaking was his opening of the pyramid of Cephren. An attempt made on his life caused his departure from Egypt, but previously he made a journey along the coast of the Red Sea, and another to the Oasis of Siwah, hoping there to find ruins of the temple of Jupiter-Ammon. In the course of his explorations, he discovered the emerald mines of Zubara and the ruins of Berenice, the ancient commercial entrepôt between Europe and India. In September 1819, he returned to Europe, visited his native town, Padua, and enriched it with two Egyptian statues of granite. He also published in London his *Narrative of the Operations and Recent Discoveries within the Pyramids, Temples, Tombs, and Excavations in Egypt and Nubia; and of a Journey to the Coast of the Red Sea in search of the ancient Berenice, and another to the Oasis of Jupiter-Ammon* (1821, with an atlas of 44 coloured engravings). In 1821, he opened in London an exhibition of his Egyptian antiquities, but soon afterwards undertook a journey to Timbuktu, in Central Africa. At Benin, he was attacked by dysentery, which compelled him to return to Gato, where he died, December 3, 1823. His original drawings of the royal tombs he had opened in Egypt were published by his widow (London, 1829).

BEM, József, commander of the army in Transylvania during the Hungarian revolution, 1848–9, was born at Tarnov, in Galicia, 1795. After a course of military adventure in Poland, he went to France, where he resided for a considerable time, earning a livelihood by teaching mechanics and mnemonics. In 1848, after failing in an attempt to organise an insurrection in Vienna, he joined the Hungarians, and was intrusted with the command of the army of Transylvania, amounting to 8000–10,000 men. He at first experienced some checks from the Austrian army, but afterwards defeated them at Hermannstadt and the bridge of Piski; and finally succeeded, in March 1849, in driving both them and their allies, the Russians, back into Wallachia. Having thus made himself master of Transylvania, he proposed, by amanuestic and general mild rule, to gain the adherence of the German and Slavonian population, especially in Wallachia; but his propositions were not entertained by Kossuth and the Hungarian commissariat. After expelling the troops under Puchner from the Banat, B. returned into Transylvania, where the Russians had defeated the Hungarians. Here he reorganised his forces, and did all that was possible in his circumstances to prevent the union of the Russians with the Austrians, but his efforts were unsuccessful. After failing in an attempt to excite an insurrection in Moldavia, he was defeated in a battle near Schäßburg, where he was opposed to three times the number of his own troops. At Kossuth's request, he now hastened into Hungary, where he took part in the unfortunate battle near Temesvar. Retreating into Transylvania, he here defended himself for some days against a vastly superior force,

and then made his escape into Turkey, where he embraced, from political motives, the profession of Islam, was raised to the dignity of a pasha, and obtained a command in the Turkish army. In February 1850, he was sent to Aleppo, where, after suppressing the sanguinary insurrection of the Arabs against the Christian population, he died of fever, December 10, 1850. B. was in private life characterised by the benevolence of his disposition, and, as a military leader, was distinguished by courage, presence of mind when in extreme danger, and remarkable rapidity of movement.

**BEMBATOO'KA, BAY OF**, a safe and commodious bay on the north-west coast of Madagascar, in lat. 16° S., and long. 46° E. Prime bullocks are sold here for less than 10s. each, and are bought extensively by agents of the French government, who have them driven to Fort Dauphin, on Antongil Bay, on the opposite side of the island, where they are killed and cured for the use of the French navy, and for colonial consumption. Rice is also sold very cheap at Bembatooka. Majunga, on the north side of the bay, is an important town, Bembatooka being but a village.

**BEMBE'CIDA'E**, a family of Hymenopterous insects of the division in which the females are furnished with stings. Along with *Sphagidae* (q. v.), and other nearly allied families, they receive the popular name of Sand-wasps. They very much resemble bees or wasps in general appearance. They are natives of the warmer parts of the world. Some of them are remarkable for the odour of roses which they emit. The females make burrows in sandy banks, in each of which they deposit an egg, and along with it the bodies of a few flies as food for the larva. The B. fly very rapidly, and with a loud buzzing noise. *Bembex rostrata* is common in the south of Europe.

**BEMBO, PIETRO**, one of the most celebrated Italian scholars of the 16th c., was born in Venice, May 20, 1470; having studied at Padua and Ferrara, he early devoted himself to polite literature. He edited the Italian poems of Petrarch, printed by Aldus, in 1501, and the *Terzerime* of Dante, 1502. In 1506, he proceeded to the court of Urbino, where he resided until 1512, when he went to Rome, where he was made secretary to Pope Leo X. On the death of that pope, B. returned to Padua, where he became a liberal patron of literature and the arts, as well as a fertile writer himself. In 1529, he accepted the office of historiographer to the republic of Venice, and was also appointed keeper of St. Mark's Library. In 1539, B., who had only taken the minor ecclesiastical orders, was unexpectedly presented with a cardinal's hat by Pope Paul III., who afterwards appointed him to the dioceses of Gubbio and Bergamo. He died January 18, 1547. B. united in his character all that is amiable. He was the restorer of good style in both Latin and Italian literature. His taste is said to have been so fastidious with regard to style, that he subjected each of his own writings to forty revisions previous to publication. Some of his writings are marred by the licentiousness of the time. Among his works may be mentioned the *Rerum Venetiarum Libri XII.* (Venice, 1551), of which he published an Italian edition (Venice, 1552); his *Prose*, dialogues in which are given the rules of the Tuscan dialect; *Gli Asolani*, a series of disputations on love, &c.; *Rime*, a collection of sonnets and canzonets; his Letters, Italian and Latin; and the work, *De Virgilii Culice et Terentii Fabula*. His collected works were published at Venice, in 4 vols., 1729.

**BEMBRIDGE BEDS** are a division of the Upper

Eocene strata, resting on the St Helen's, and capped by the Hempstead series. They are principally developed in the Isle of Wight. Ed. Forbes, who carefully examined them there, has arranged them in four subdivisions: 1. The upper marls and laminated gray clays, which form the basement bed of the 'black band,' the lowest member of the Hempstead series. They are distinguished by the abundance of *Melania turretenima*. 2. Unfossiliferous mottled clays, alternating with fossiliferous marls and clays, whose characteristic organisms are *Cerithium mutabile* and *Cyrena pulchra*. 3. The oyster-bed, consisting of greenish marl, and containing immense quantities of a species of oyster (*Ostrea Vectensis*), accompanied with *Cerithia*, *Mytilis*, and other marine mollusca. 4. The Bembridge limestone, generally a compact, pale-yellow, or cream-coloured limestone, but sometimes vesicular and concretionary, and containing occasionally siliceous or cherty bands. This is interstratified with shales and friable marls. All the beds are fossiliferous, containing numerous land and fresh-water shells. One bed is composed almost entirely of the remains of a little globular *Paludina*. Shells of *Lymnaea* and *Planorbis* are abundant, and are accompanied with the spirally striated nucules of two species of *Chara*, water-plants which have been well preserved because of the large quantity of lime which enters into their composition. In this division have been found the mammalian remains of the species of *Paleotherium* (q. v.) and *Anoplotherium* (q. v.) which characterize the gypseous deposits of Montmartre; it is consequently considered the British equivalent of these Parisian beds.

No marked line of distinction separates this series from the St Helen's beds on which it rests. The contained organisms indicate that both had the same fluvi-marine origin. The maximum thickness of the Bembridge series is 115 feet.

BEN, ABEN, AVEN, EBN, IBN, are all forms, in the different Semitic languages, of the same word, which means 'son,' and is used as a prefix to names. *Ben*, a Hebrew form, is familiar to us from its use in Bible names—e. g., Benhadad, the son or worshipper of Hadad, or Adod, the chief idol of the Syrians; Benoni, son of my pain; Benjamin, son of the right hand, &c. These examples shew that not only literal but metaphorical sonship is expressed by this prefix. This form of constructing a name by composition was common in the Semitic languages, on account of their lack of patronymics. The plural, *Beni*, is found in the names of many Arab tribes—as Beni Omayyah, the sons of Omayyah, the family known in history as the Ommiades; and sometimes in the names of places—as Beni-Hassan.

BEN, BEIN, or BHEIN, a Gaelic word signifying 'mountain' or 'mountain head.' It is prefixed to the name of a great many mountains in Scotland—as Ben Nevis, Ben Macdhui, Ben Cruachan, &c. The corresponding term in various parts of Europe is *Pen*, which is found in many of the names in Cornwall and Wales, in the Pennine Alps, and probably also in the word Apennines and the Cevennes of France.

BEN, OIL OF, a fluid fixed oil, obtained from the seeds of a tree found in India and Arabia, and known as the HORSERADISH TREE (*Moringa pterygoferma*). The seeds are called BEN NUTS, and are roundish, with three membranous wings. The oil is used by watchmakers, because it does not readily freeze; also by perfumers, as the basis of various scents; and other oils are often adulterated with it. See HORSERADISH TREE.

BENARES, a city on the left side of the Ganges, which here varies, according to the season, between

50 and 92 feet in depth, and in width between 600 yards and a little more than half a mile. It is in lat. 25° 17' N., and long. 83° 4' E., being 421 miles to the north-west of Calcutta, and 466 and 74 respectively to the south-east of Delhi and Allahabad. Without reckoning Secrole, which, at the distance of 2 or 3 miles to the westward, contains the official establishments, B. covers, as it were, an amphitheatre of 3 miles in front, and 1 mile in depth, the immediate margin of the river, which is comparatively steep, being chiefly occupied by flights of steps, or ghats, as they are called, where crowds of all classes spend the day in business, amusement, or devotion. This lively scene, backed by the minarets of about 300 mosques, and the pinnacles of about 1000 pagodas, presents a truly picturesque appearance to spectators on the opposite shore of the Ganges. On closer inspection, however, the city, as a whole, disappoints a visitor. The streets, or rather alleys, altogether impracticable for wheeled-carriages, barely afford a passage to individual horsemen or single beasts of burden; and these thoroughfares, besides being shut out from sun and air by buildings of several stories, are said to be shared with the numerous passengers by sacred bulls that roam about at will. The population in 1871 was 173,352.

In the traditions of the country, B. is believed to have been coeval with creation; and tolerably authentic history does assign to it a really high antiquity. In its actual condition, however, B. is a modern city. Both in extent and in embellishment, it owes much to the influence of Mahratta ascendancy, which dates from the close of the 17th c.; and it possesses, perhaps, not a single structure that reaches back to the close of the 16th. As the central seat of Hinduism, B., on high occasions, attracts immense crowds of pilgrims—sometimes as many as 100,000; and some years ago, during an eclipse of the moon, forty persons were trampled to death in the streets. Naturally enough, the Brahmins of B. have always been remarkable for bigotry. Now, however, Brahminism appears to be on the decline; and a result, which Mohammedan persecution vainly tried to produce, would seem to be gradually achieved, chiefly through the introduction of European literature and science. On the Sanscrit College, instituted in 1792, there was at a later date ingrafted an English department, comprising poetry, history, mathematics, and political economy. It is attended by numerous Hindus, and a few Mussulmans and native Christians. B., as Heber has observed, is very industrious and wealthy, as well as very holy. Besides having extensive manufactures of its own in cotton, wool, and silk, its commanding position on the grand line of communication—road, river, and rail alike—renders it the principal emporium of the neighbouring regions. It is the great mart for the shawls of the north, the diamonds of the south, and the muslins of the east; while it circulates the varied productions of Europe and America over Bundelcund, Goruckpore, Nepal, &c. For the general history of the city, see the following article on the district of the same name. The details of the mutiny of 1857 will be found under the head of SECROLE. At the same time, B. proper added its share to the fearful interest of the emergency through the proverbially fanatical character of its inhabitants, who, during the second siege of Bhurtpore, had got 30,000 sabres sharpened in anticipation of a second repulse of the British.

BENARES, the district mentioned in the immediately preceding article. It is under the lieutenant-governorship of the North-west Provinces, being bounded on the W. and N. by Jounpur; on the E. by Ghazepore and Shahabad; and on the S. and W.

by Mirzapore. It extends in N. lat. between  $25^{\circ} 7'$  and  $25^{\circ} 32'$ , and in E. long. between  $82^{\circ} 45'$  and  $83^{\circ} 38'$ ; and thus measuring about 30 miles by about 55, it embraces an area of 995 square miles. In 1871, the census gave a population of 793,699, or almost 800 to a square mile: the number of inhabited houses was 116,507. The district is traversed by the Ganges in a north-east direction for about 45 miles. Besides other rivers, such as the Karamnosa, the Goomtee, and the Burna, and several inferior streams, lakes and tanks are numerous, but small, the largest not exceeding a mile in circuit. The annual rain-fall, though averaging less than in the lower parts of the Ganges, is still considerable, always exceeding 30 inches, and amounting in 1823 to 89. Considering that the tract is barely beyond the tropics, and but little elevated above the sea, the range of the thermometer is unusually great, being between  $45^{\circ}$  in January, and  $111^{\circ}$  in May. The mean temperature is stated at  $77^{\circ}$ , pretty nearly the middle point between the two extremes. The soil, though here and there sterile, is in general characterised by great fertility, more particularly to the left of the Ganges. In the growth of opium, indigo, and sugar—more especially of the last—the district surpasses nearly every other portion of British India. In fact, the state of agriculture is such as may be expected from the density of the population. The rich fields, the thriving villages, and the luxuriant groves, render the aspect of the country very delightful; and perhaps the best proof of the presence of industry and civilisation is the fact, that elephants, rhinoceroses, buffaloes, lions, and tigers, which were hunted in 1529, have entirely disappeared. After a Hindu domination, according to popular faith, of 2400 years, the district sank under the Mussulman yoke in 1193; and, in the first half of the 16th c., it was annexed by Baber to the Mogul Empire. On the dismemberment of that dominion, it fell to the share of the Nawab of Oude, whose grandson, in 1775, ceded it to the East India Company, about ten years after that body had acquired the sovereignty of Bengal.

BENA'TEK, a small town of Bohemia, on the right bank of the Iser, a few miles distant from Prague. It is worthy of note as being for a long time the residence of the celebrated astronomer Tycho Brahe.

BENBECU'LA, one of the Hebrides or Western Isles of Scotland, between North and South Uist, 20 miles west of Skye, and belonging to Inverness-shire. It is 8 miles long, and 3 broad, low and flat, and consists chiefly of bog, sand, and lake, resting on a substratum of gneiss rock, with a very broken coast-line. Pop. (1871) 1563, consisting of fishermen and small farmers, who fertilise the soil with the sea-weed which is cast ashore on the island.

BENBOW, JOHN, a brave English admiral, was born in Shropshire in 1650. He first distinguished himself as captain of a merchantman, in a bloody action with Sallee pirates. He attracted the notice of James II., who gave him a commission in the navy. After the Revolution, he obtained the command of a large ship, and in the course of a few years was made rear-admiral. The high confidence reposed in him by King William is borne in memory by a very bad pun on his name, said to have been perpetrated by the taciturn monarch. Objecting to several names proposed for the command of an expedition, he said: 'No; these are all fresh-water *beaus*, we need another kind of *beau*: we must send *Benbow*' The most memorable of this gallant sailor's exploits was his last, where his stubborn valour contrasted nobly with the dastardly behaviour of his captains. Off St Martha, in the West

Indies, on the 19th August 1702, he came up with a superior French force under Admiral Du Casse. For four days he kept up a running-fight with the enemy, almost deserted by the rest of his squadron. On the morning of the 24th, his right leg was smashed by a chain-shot. His officers condoled with him. 'I had rather have lost them both,' said the sturdy admiral, 'than have seen this dishonour brought upon the English nation. But, hark ye—if another shot should take me off, behave like men, and fight it out!' As soon as his wound was dressed, he was carried to the quarter-deck, and directed the fight while it lasted. The enemy sustained severe loss; but the infamous cowardice of the other captains, who actually refused to obey the admiral's signals, made the contest hopeless, and B. sailed away to Jamaica. He died of his wound on the 4th November. The recusant officers were tried by court-martial, and two captains were shot. B.'s employment of explosive vessels at St Malo, seems to have been an anticipation of Lord Dundonald's method at Basque Roads.

BENCH, a hall or court where justice is administered. In this sense, however, it has in modern times received a more limited acceptation, signifying the dais or elevated part of a court-room or chamber where the judges sit to administer the laws. In English courts of justice, this seat is in form literally a bench or couch running along one end of the court-room, the number of judges and their places on this bench being marked by separate deaks, one for each judge; but in Scotland and Ireland, the arrangement is different, the judges in these countries sitting on chairs placed at a long and, as in Scotland, a semicircular, table, which is in a raised position. The term B. is also applied, by way of distinction, to the judges themselves as a class; thus, we speak of the *B. and bar*. It has likewise, popularly and conventionally, an ecclesiastical application, the bishops of the Church of England being, as a body, sometimes designated by it; hence the expression, 'B. of Bishops.' See BANC.

BENCH, COMMON, COURT OF. This is a technical name sometimes given to the Court of Common Pleas. See COURTS OF COMMON LAW.

BENCH, KING'S, or QUEEN'S, the supreme court of common law in the kingdom. See COURTS OF COMMON LAW.

BENCH, UPPER, the name given to the Court of King's Bench in the time of Cromwell. See preceding notice, and COURTS OF COMMON LAW.

BENCHERS. The governing bodies of the four great Law Societies in England, or Inns of Court—Lincoln's Inn, Inner Temple, Middle Temple, and Gray's Inn—are so called. They are generally Queen's counsellors or barristers of distinction; and they annually elect a president or treasurer, as he is called, who takes the chair at their corporate meetings, and speaks and acts in their name. See INNS OF COURT.

BENCH-WARRANT, is a warrant signed by a superior judge or two justices of the peace, during the assizes or sessions, to apprehend a defendant, against whom a bill of indictment has been found. See WARRANT.

BENCOO'LEN, capital of a Dutch residency on the west coast of Sumatra, lies in  $102^{\circ} 20'$  E. long., and  $3^{\circ} 48'$  S. lat. Pop. 7000. The residency B. has an area of 9567 sq. miles. Rice, coffee, maize, sugar-cane, the cocoa-nut, and other fruits are grown. About 400,000 lbs. of pepper are produced annually. B. was founded by the English (1686), but was given to the Dutch by the London Treaty, 11th March 1824.

**BEND**, one of the honourable ordinaries, or more important figures in Heraldry. It is formed by two parallel lines, which may be either straight, or indented, engrailed, &c. (q. v.), drawn from the dexter to the sinister base, and consequently passing athwart the shield. The B. occupies a fifth part of the shield in breadth, if plain; and a third part,

Bend. if charged. The B. is supposed to represent a shoulder-belt, or scarf

worn over the shoulder. When heralds speak of the B. simply, the B. dexter is understood, the B. sinister being always expressly mentioned.

**Bend Sinister** is the bend dexter reversed, and passing from the left to the right side of the shield, as the dexter does from the right to the left. See BAR and BASTARD BAR.

There are four diminutives of the Bend—viz., the bendlet, the garter, the cost, and the ribbon.

Bendlet.

Garter.

Cost.

Ribbon.

The terms *in bend*, *per bend*, *bendy*, &c., are of frequent occurrence in heraldic works, and signify that the charge is placed, or the shield divided, diagonally in the direction of the bend.

**BEND** is the name for one among many kinds of knot by which ropes are fastened on shipboard. Seamen imply this meaning when they speak of ‘bending the cable,’ ‘bending a sail,’ the ‘carrick-B.,’ the ‘fishermen’s B.,’ the ‘sheet-B.,’ &c.

**BENDEMANN, EDUARD**, one of the most distinguished painters of the Düsseldorf school, was born in Berlin in 1811. Although he had received a very careful scientific education, he devoted himself to art, became a pupil of Schadow’s, and soon proved that he had not mistaken his vocation. As early as 1832, his great picture of the Captive Jews was exhibited at Berlin, and at once acknowledged to be a master-piece. His next important work, in 1833, represented Two Girls at a Fountain. It was followed, in 1837, by Jeremiah at the Ruins of Jerusalem, a very large picture, which excited universal enthusiasm in Paris, where it was exhibited, and for which he obtained a prize-medal. In 1838, B. was summoned to Dresden as member of the Academical Council, and professor of the Academy of Art; and the execution of the larger frescoes in the palace was intrusted to his skill. An affection of the eyes, from which he suffered for several years, interrupted the work, which is now, however, completed, and embraces a wide range of historical and mythological subjects. B.’s artistic bias is characteristic of the Düsseldorf school, his pictures being rather lyrical than dramatic. But he is distinguished by a peculiar grace and charm of his own, arising from a most perfect symmetry in drawing and composition, an exquisite *natürlichkeit* in conception, and a tender, harmonious, yet truthful colouring. His portrait of his wife, a daughter of

Schadow, is one of his best works. In 1859, he became Director of the Düsseldorf Academy.

**BENDER**, a fortified town, with a citadel, in the province of Bessarabia, Russia. The town is situated on the right bank of the Dniester, 48 miles from its mouth, and has paper-mills, tanneries, forges, and saltpetre-works. Pop. (1867) 24,443, including many Armenians, Tatars, Moldavians, and Jews. In 1770, the Russians captured the place, and put the garrison and inhabitants, then amounting to about 30,000, to the sword. It was restored to the Turks in 1774, and again stormed by the Russians in 1809. The peace of Jassy gave it back to the Turks, from whom it was again taken by the Russians in 1811, who were confirmed in the possession of it by the treaty of Bucharest in the following year.—Charles XII. of Sweden lived for some time, 1709–1712, at Varnitz, a village near Bender.

**BENDIGO**, one of the most productive gold-fields in the colony of Victoria, having, in 1857, yielded, according to the official returns, 525,018 ounces. It is about 25 miles to the north of Mount Alexander, which, again, is about 75 miles inland from Melbourne.

**BE'NÉ**, a town of about 6000 inhabitants, in the province of Mondovi, Piedmont, 18 miles north-east of Coni. It occupies the site of the ancient *Augusta Bagiennorum*, destroyed by Alaric. Many interesting vestiges are found in the neighbourhood; and the ruins of an aqueduct, baths, and amphitheatre are still visible.

**BENEDEK, LUDWIG VON**, an Austrian general, born in 1804 at Odenburg, in Hungary, where his father was a physician of repute. He received his military education at the Neustadt Academy, and at its close entered the army as ensign in 1822. In 1843, he was promoted to the rank of senior lieutenant, and on the occasion of the insurrection in Galicia in 1846, had several opportunities of distinguishing himself. In August 1847, as commandant of Count Gyulai’s infantry-regiment, he moved to Italy, where a still more brilliant career awaited him. On the occasion of the retreat from Milan, and especially after Curtalone, where he had led on the assault with great skill and gallantry, his name was mentioned in the army reports by Marshal Radetsky in the highest terms; and, consequently, he received the cross of the Order of Maria Theresa. He afterwards distinguished himself at the taking of Mortara, and in the battle of Novara. In April 1849 he was made major-general and brigadier of the first body of reserve of the army of the Danube. He commanded the *avant-garde* at Raab and Ozony, and received a slight wound in the affair at Uj-Szegedin; which did not, however, prevent him from taking a most active part in the subsequent engagements of Szörny and Ozs Ivany, where he was wounded in the foot. At the close of the Hungarian campaign, he was ordered again, high in command, to Italy. In the Italian campaign of 1859, B. commanded the eighth corps of the Austrians. At Solferino, B. drove back the Piedmontese with great slaughter, and was the last to leave the field. He was governor of Hungary in 1860, and soon afterwards got the command of the Austrian army in that country. He commanded the Austrians in the war with Prussia in 1866, but shortly after the defeat of Sadowa, he was superseded.

**BENEDI'CITÉ**, a hymn or song of the three children in the fiery furnace, sung in the Christian Church as early as the time of St Chrysostom, and used in the Anglican Church in the morning-services when the Te Deum is not sung.

## BENEDICT.

**BENEDICT, SAINT**, the founder of monachism in the west, was born of a rich and respected family at Nursia, in Umbria, Italy, 480 A.D. At an early age B. was sent to the schools of literature and jurisprudence at Rome, but soon grew dissatisfied with the sterile character of the instruction dispensed. The world was full of distractions, impurities, and ignorance ; and it was difficult to resist by the ordinary safeguards of virtue, the colossal evils by which men were environed ; only, therefore, in the devotions of religion, in the holy silence of solitary meditation, did B. see a safe refuge from the sins of the time, and the possibility of realising a spiritual strength which would enable him to stem the tide of corruption that was setting in. He resolved to leave the city, and betake himself to some deep solitude in which the murmur of the world would be inaudible, and alone in the rocky wilderness wrestle with his own nature, until he had conquered it and laid it a sacrifice on the altar of God. In pursuance of this resolution, when he had only reached, according to some, the age of 14, he departed from Rome, accompanied for the first 24 miles by the nurse whom his parents had sent with him as an attendant to the city. B. then left her, and retired to a deserted country lying on a lake, hence called *Sublacum* (now Subiaco). Here, in a cavern (which afterwards received the name of the Holy Grotto), he dwelt for three years, until his fame spread over the country, and multitudes came to see him. He was now appointed abbot of a neighbouring monastery ; but soon left it, as the morals of the half-wild monks were not severe enough for his taste. This, however, only excited a livelier interest in his character, and as he lived in a period when the migration and interfusion of races and nations were being rapidly carried on, he could not fail to draw crowds of wanderers about him. Wealthy Romans also placed their sons under his care, anxious that they should be trained for a spiritual life. B. was thus enabled to found twelve cloisters, over each of which he placed a superior. The savage Goths even were attracted to him, and employed in the useful and civilising practice of agriculture, gardening, &c. He now sought another retreat, and, along with a few followers, founded a monastery on Monte Cassino, near Naples, afterwards one of the richest and most famous in Italy. Here he extirpated the lingering relics of paganism, and had his celebrated interview with Totila, king of the Goths, to whom he spoke frankly and sharply on his errors. In 515, he is said to have composed his *Regula Monachorum*, in which he aimed, among other things, at repressing the irregular and licentious life of the wandering monks, by introducing stricter discipline and order. It eventually became the common rule of all western monachism. The monasteries which B. founded were simply religious colleges, intended to develop a high spiritual character, which might beneficially influence the world. To the abbot was given supreme power, and he was told to acquit himself in all his relations with the wisdom of God, and of his Master. The discipline recommended by St B. is, nevertheless, milder than that of oriental monachism with regard to food, clothing, &c. ; but enjoins continual residence in the monastery, and, in addition to the usual religious exercises, directs that the monks shall employ themselves in manual labours, imparting instruction to youth, copying manuscripts for the library, &c. By this last injunction, St B., though this was not directly intended, preserved many of the literary remains of antiquity ; for the injunction, which he gave only with regard to religious books, was extended afterwards to many secular productions. It is

remarkable that the founder of the most learned of all the monastic orders was himself so little of a scholar, that St Gregory the Great described him as being '*scinter neaciens, et sapienter inductus*'—learnedly ignorant, and wisely unlearned. St B. died March 21, 543.

**BENEDICT** is the name of fourteen popes. Of these only the following are historically important enough to deserve special mention.—**BENEDICT VIII.**, son of Count Gregory of Tuscoli, was elected in 1012 ; but was driven from Rome by the anti-pope Gregory. In 1014, he was restored to the papal chair by the Emperor Henry II., and afterwards defeated the Saracens, and took from them, with the help of the Pisans and Genoese, the island of Sardinia ; and also various places in Apulia from the Greeks, by the help of Henry. He distinguished himself as a reformer of the clergy, and interdicted, at the synod of Pavia, both clerical marriage and concubinage. He died in 1024.—**BENEDICT IX.**, a nephew of the preceding, was elected pope at the age of 18, in 1033 ; but in 1038, the Romans rose in indignation, and banished him on account of his almost unexampled licentiousness. He was reinstated by Conrad II. ; again formally deposed by the Consul Ptolemaeus, who set up Sylvester III. in his place ; and after three months, was once more installed as pope by means of bribery. By a new simoniacal compact, John Gratianus was declared pope under the name of Gregory VI. The Emperor Henry III., to remove such gross scandals from the church, deposed all the three popes—B., Sylvester, and Gregory, and caused Suidger, bishop of Bamberg, to be elected as Clement II. ; but on his death, in 1047, the deposed B. IX. again corruptly regained the papal see, and held it eight months, until 1049, when he was displaced, first by Damasus II., and afterwards by Leo IX. He died in the convent of Grotta Ferrata in 1056.—**BENEDICT XIII.**, 1274—1270, was a learned and well-disposed man, of simple habits and pure morals, though rather strict in his notions of the papal prerogative. He unfortunately yielded himself to the guidance of Cardinal Coscia, a greedy, unscrupulous personage, who greatly abused the confidence reposed in him. B. always exhibited great moderation in politics, and an honourable love of peace, and was instrumental in bringing about the Seville treaty of 1279. During this pontificate, a remarkably large number of saints, chiefly from the monastic orders, were added to the calendar.—**BENEDICT XIV.** (*PROSPERO LAMBERTINI*), the most worthy to be remembered of all the pontiffs so named, was born at Bologna in 1675. Before his elevation, he had distinguished himself by extensive learning, and by ability in the several offices of *Promotor Fidei*, bishop of Ancona (1727), cardinal (1728), and archbishop of Bologna (1732). Succeeding Clement XII., he began his pontificate, in 1740, with several wise and conciliatory measures ; founded chairs of physic, chemistry, and mathematics in Rome ; revived the academy of Bologna, and instituted others ; dug out the obelisk in the *Campus Martius*, constructed fountains, rebuilt churches ; caused the best English and French books to be translated into Italian ; and in many other ways encouraged literature and science. His piety was sincere, enlightened, and tolerant, and his doctrines were well exemplified in his practice. He was extremely anxious that the morals of the clergy should be untainted ; and, to that effect, established a board of examiners for all candidates to vacant sees. In proof of his toleration, he shewed the frankest kindness to all strangers visiting his capital, whatever the nature of their religious opinions. The only accusation brought against him by his Roman subjects was,

'that he wrote and studied too much, but ruled too little,' or left affairs of business too much in the hands of the Cardinal Valentine. After a painful illness, B. XIV. died May 3, 1753.—His most important works are that *On the Diocesan Synod*; *On the Sacrifice of the Mass*; and *On the Beatification and Canonisation of Saints*. A complete edition of his writings was published under the care of the Jesuit de Azevedo (12 vols., Rome, 1747–1751), and in 16 vols., Venice, 1777.

BENEDICTINES, the general name of all the monks following the rule of St Benedict. The first Benedictine monastery was that founded at Monte Cassino, in the kingdom of Naples, about 529, by St Benedict himself. The order increased so rapidly, after the 6th c., that the B. must be regarded as the main agents in the spread of Christianity, civilisation, and learning in the west. They are said at one time to have had as many as 37,000 monasteries, and counted among their branches the great order of Clugny, founded about 910; the still greater order of the Cistercians, founded in the following century; the congregations of Monte Cassino in 1408, of St Venne in 1600, and of St Maur on the Loire, in 1627. To this last congregation all the Benedictine houses in France were affiliated. It had afterwards its chief seat at St Maur, near Vincennes, and more lately at St Germain-des-Prés, near Paris. Its fine conventional buildings at St Maur on the Loire, were destroyed during the revolutionary troubles. Numbering among its monks such scholars as Mabillon, Montfaucon, Sainte-Marthe, D'Achery, Martene, Durand, Rivet, Clemencet, Carpenterie, Toussaint, Constant, and Tassin, it has rendered services to literature which it would be difficult to overestimate. Besides admirable editions of many of the fathers, the world of letters owes to the B. of St Maur, the *Art de Vérifier les Dates* (1783–1787, in 3 vols. fol.); a much enlarged edition of Ducange's *Glossarium Media et Infima Latinitatis* (1733–1736, in 6 vols. fol.), with a Supplement (1766, in 4 vols. fol.); the *De Re Diplomatica* (1681 and 1709, fol.); the *Nouveau Traité de Diplomatique* (1750–1765, in 6 vols. 4to); *L'Antiquité Expliquée* (1719–1724, in 15 vols. fol.); the *Monuments de la Monarchie Française* (1729–1733, in 5 vols. fol.); the *Acta Sanctorum S. Benedicti* (1688–1702, in 9 vols. fol.); the *Annales Ordinis S. Benedicti* (1713–1739, in 6 vols. fol.); a new and much improved edition of the *Gallica Christiana* (1715–1856, in 14 vols. fol.); the *Veterum Scriptorum Spicilegium* (1653–1677, in 13 vols. 4to); the *De Antiquis Monachorum Ritibus* (1690, in 2 vols. 4to); the *De Antiquis Ecclesiis Ritibus* (1700–1702, in 3 vols. 4to); the *Thesaurus Novus Anecdotorum* (1717, in 5 vols. fol.); the *Veterum Scriptorum et Monumentorum Amplissima Collectio* (1724–1733, in 9 vols. fol.); the *Histoire Littéraire de la France* (1733–1749, in 9 vols. 4to). The B. were suppressed in France, along with the other monastic orders, at the Revolution in 1792; and their splendid conventional buildings at St Maur on the Loire were destroyed. They have lately been revived; and the B. of Solesmes, established in 1837, have resumed, under the direction of Dom Gueranger, Dom (now Cardinal) Pitra, and others, some of the works which the B. of St Maur left unfinished, and entered on literary enterprises of their own, such as the *Spicilegium Solemense*, in 10 vols. 4to, of which four have already appeared. The chief B. houses in Germany were those of Prüm, Ratisbon, Fulda, Ellwang, and Salzburg; in Spain, they had Valladolid, Burgos, and Montserrat; in Italy, Monte Cassino, Rome, Padua, and Capua. In England, most of the richest abbeys and all the cathedral priories (excepting Carlisle) belonged to this order. In Scotland the B. had the monasteries

of Dunfermline, Coldingham, Kelso, Arbroath, Paisley, Melrose, Newbattle, Dundrennan, and others. In Germany, several Benedictine monks distinguished themselves as promoters of education in the 10th c.; while in the latter half of the 11th c., the B. Lanfranc and Anselm, archbishops of Canterbury, laid the foundation of medieval scholasticism. In Italy, also, the B. gained distinction as literati, jurists, and physicians; but almost everywhere corruption of manners appears to have accompanied increasing wealth, until gradually it became the practice to receive, almost exclusively, the sons of noble and wealthy persons as novices among the 'Black Monks.' Several of the popes attempted a reformation of the order, and at the general Council of Constance, 1416, a plan of reform was laid down, but failed in being carried into practice. In the 15th c., the B. had 15,107 monasteries, of which only 5000 were left after the Reformation, and now not more than about 800 can be counted. As early as 1354, this order could boast of having numbered among its followers 24 popes, 200 cardinals, 7000 archbishops, 15,000 bishops, 1560 canonised saints, and 5000 holy persons judged worthy of canonisation, and 37,000 monasteries, besides 20 emperors, 10 empresses, 47 kings, above 50 queens, 20 sons of emperors, 48 sons of kings, 100 princesses, and an immense number of the nobility. Tanner (*Notit. Monast.*) enumerates 113 abbeys and other institutions of B. in England, and 73 houses of Benedictine nuns. From their dress—a long black gown, with a cowl or hood of the same, and a scapular—the B. were commonly styled 'Black Monks.' The institution of convents for nuns of this order cannot be traced back beyond the 7th c.

The rule of St Benedict was less severe than that which the eastern ascetics followed. Besides implicit obedience to their superior, the B. were to shun laughter, to hold no private property, to live sparingly, to exercise hospitality, and, above all, to be industrious. Compared with the ascetic orders, the B. both in dress and manners, may be styled the gentlemanly order of monks; and whatever may be said of their religion, they deserve a high tribute of respect for their artistic diligence and literary undertakings. Speaking of the great productions of the B. above noticed, Sir Walter Scott characterises them as 'works of general and permanent advantage to the world at large; shewing that the revenues of the B. were not always spent in self-indulgence, and that the members of that order did not uniformly slumber in sloth and indolence.' Among the chief works on the history of the B. are the *Annales Ordinis S. Benedicti*, and the *Acta Sanctorum S. Benedicti*, already referred to; Reyner's *Apostolatus Benedictinorum in Anglia* (Douai, 1626, fol.); the *Bullarium Cassinense* (Venice, 1650, 2 vols. fol.); Tassin's *Histoire de la Congrégation de Saint Maur* (Paris, 1770); *Chronica de la Order de San Benito* (Salamanca, 1609–1615, 7 vols. fol.); *Regula S. Benedicti et Constitutiones Congregationis S. Mauri* (Paris, 1770, 8vo); Montalembert's *Mémoires de l'Occident*.

BENEDICTION (from the Lat. *benedicere*, to speak well), signifies a solemn invocation of the Divine blessing upon men or things. The ceremony in its simplest form may be considered almost coeval with the earliest expressions of religious feeling. We know from Holy Writ that the Jewish patriarchs before they died invoked the blessing of God upon their children, and at a later period the priests were commanded to implore the Divine blessing upon the people. Christ sanctioned the custom, which was consequently carried forward into the primitive church, where it gradually developed itself in

different forma. In the eastern as well as the western church, it is considered an essential preliminary to almost all important acts. One of the most superb spectacles that a stranger at Rome can witness, occurs on Easter Sunday, when the pope, attended by his cardinals, pronounces after mass a solemn B. *urbi et orbi* (on the city and the world). The B., however, is not confined to a form of prayer, but is accompanied with sprinkling of holy-water, use of incense, making the sign of the cross, &c. The chief cases in which a B. is bestowed are—the coronation of kings and queens, the confirmation of all church dignitaries, and the consecration of church vessels, bells, and sacred robes; the nuptial ceremony, the abolution, and the last sacrament. The most solemn form of B. in the Roman Church is that ‘with the Most Holy Sacrament,’ which is administered by the bishop or priest with the monstrance or ostensorium containing the consecrated elements. Besides these, lands, houses, cattle, &c., often receive a B. from the priest. In the English church-service, there are two benedictions; in the Scotch, only one. In the Greek Church, when the B. is being pronounced, the priest disposes his fingers in such a manner as to convey symbolically to those of the faithful who are close enough to observe the arrangement, the doctrine of the Trinity and the twofold nature of Christ.

BENEDI'CTUS, the so-called ‘canticle of Zachary’ (Luke i. 68–79), which forms part of the office of lands in the Roman breviary. It has been set to music by all the most eminent composers.

BENEFICE, or BENEFICIUM (Lat. ‘a good deed,’ also ‘a favour,’ and hence ‘a grant,’ or ‘a provision’ generally, and now more especially, a provision made for an ecclesiastical person), was a term formerly applied to feudal estates, but is now used to denote certain kinds of church preferment, such as rectories, vicarages, and other parochial cures, as distinguished from bishoprics, deaneries, and other ecclesiastical dignities or offices. In this sense a distinction is accordingly taken by the 1 and 2 Vict. c. 106, a. 124, between *benefices* and *cathedral preferments*; by the former being meant all parochial or district churches, and endowed chapels and chapellries; by the latter, all deaneries, archdeaconries, and canopies, and generally all dignities and offices in any cathedral or collegiate church, below the rank of a bishop. See note in 3 Stephen’s Com., p. 27. By the 5 and 6 Vict. c. 27, a. 15, which is an act to enable incumbents to devise lands on farming leases, it is enacted that the word B. shall be construed to comprehend all such parochial preferment as we have above described, ‘the incumbent of which, in right thereof, shall be a *corporation sole*’ (q. v.); and by an act passed in the same session, chapter 108, being an act for enabling ecclesiastical corporations to grant long leases, it is, by section 31, declared that B. shall mean every rectory, *with or without cure of souls*, vicarage, &c., the incumbent or holder of which shall be a corporation sole. But by a later act, the 13 and 14 Vict. c. 98, which is an act to extend a former act, the 1 and 2 Vict. c. 106, against pluralities, the term B. is, by section 3, explained to mean B. *with the cure of souls and no other*, anything in any other act to the contrary notwithstanding. Benefices are also *exempt* or *peculiar*, by which is meant that they are not to be under the ordinary control and administration of the bishop; but, by section 108 of the 1 and 2 Vict. c. 106, above mentioned, it is provided that such exempt or peculiar benefices shall nevertheless, and so far as relates to pluralities and residence, be subject to the archbishop or

bishop within whose province or diocese they are locally situated.

There are, in general, four requisites to the enjoyment of a benefice. 1st, Holy orders, or ordination at the hands of a bishop of the established church or other canonical bishop (a Roman Catholic priest may hold a benefice in the Church of England on abjuring the tenets of his church, but he is not ordained again); 2d, Presentation, or the formal gift or grant of the B. by the lay or ecclesiastical patron; 3d, Institution at the hands of the bishop, by which the cure of souls is committed to the clergyman; and 4th, Induction, which is performed by a mandate from the bishop to the archdeacon to give the clergyman possession of the temporalities. Where the bishop is himself also patron, the presentation and institution are one and the same act, and called the *collation* to the benefice. In Scotland, the law on this subject is regulated by the 6 and 7 Vict. c. 61, passed in 1843, and commonly called Lord Aberdeen’s Act. See ESTATE, LIVING, PARISH, PLURALISM.

BENEFICIARY is a legal term sometimes applied to the holder of a benefice. It may also denote a person who is in the enjoyment of any interest or estate held in trust by others, in which latter sense it is strictly and technically used in the law of Scotland, all having right or interest in trust-funds and estate being in that system called beneficiaries. The technical term in the law of England corresponding to this latter meaning of the word is *cestui que trust* (q. v.). Patent rights and copyrights are denominated B. privileges. See TRUST.

BENEFIT SOCIETIES, associations for mutual benefit chiefly among the labouring classes, and of which there are now great numbers; being better known under the name of FRIENDLY SOCIETIES, we refer for an account of them to that head. Meanwhile, we confine attention to that peculiar species of associations called BENEFIT BUILDING SOCIETIES, which are much better described as Building Societies only. These are societies established for the purpose of raising, by periodical subscriptions, a fund to assist members in obtaining heritable property, freehold or otherwise. They were formerly regulated by an act passed in 1836, the 6 and 7 William IV., and continued under its provisions till November 1874, when a new act, which received the royal assent in July of that year, came into operation. All societies established thereafter must be governed by this later act, and those which were in existence at the time of its enactment may adopt it, but it is not compulsory upon them to do so. The act of 1836 declares that it shall be lawful to establish such societies, for the purpose of enabling the members to erect and purchase dwelling-houses, or acquire other real or leasehold estate, but which shall be mortgaged to the society until the amount or value of the shares drawn on shall be fully repaid with interest and all other appropriate payments. A share is not to exceed in value £150, and the corresponding monthly subscription is not to be more than twenty shillings. A majority of the members may make rules and regulations for the government and guidance of the society, such rules not being repugnant to the provisions of the act, nor to the general laws of the realm; and for offences against these rules and regulations, fines, penalties, and forfeitures may be inflicted. No member shall be allowed to receive any interest or dividend on his share until the same has been realised, except on the withdrawal of such member according to the rules of the society.

The new act considerably enlarges the scope and powers of B. S. Section 13 declares that any

## BENEFIT SOCIETIES—BENEFIT OF CLERGY.

number of persons may establish a society, either terminating or permanent, for the purpose of raising, by the subscriptions of the members, a stock or fund for making advances to members out of the funds of the society, upon security of freehold, copyhold, or leasehold estate, by way of mortgage; and any society under the act shall, so far as is necessary for the said purpose, have power to hold land, with the right of foreclosure, and may from time to time raise funds by the issue of shares of one or more denominations, either paid up in full or to be paid by periodical or other subscriptions, and with or without accumulating interest, and may repay such funds when no longer required for the purposes of the society. It will be seen that the restrictions of £150 and twenty shillings have disappeared, the contributions and ultimate value of a member's interest being at his own discretion. The liability of members, in respect of shares upon which an advance has been made, is limited to the amount actually paid or in arrear thereon; and in respect of shares upon which advances have been made, is limited to the amount payable under any mortgage or other security, or under the rules. Societies are empowered to receive deposits or loans, from members or other persons, corporate bodies, joint-stock companies, or terminating building societies, provided, in the case of permanent societies, that the total amount owing at one time shall not exceed two-thirds of the amount for the time being secured to a society by mortgages from its members; and in the case of terminating societies, shall not exceed two-thirds as aforesaid, or a sum not exceeding twelve months' subscriptions on the shares for the time being in force. Societies established under or adopting the act of 1874 are bodies corporate, having perpetual succession and a common seal, thus dispensing with the cumbrous and inconvenient system of trusteeship. Their rules must specify the society's name and place of meeting; mode of raising funds, with their purposes and mode of investment; terms of withdrawal and repayment; manner of alteration of rules; the appointment, remuneration, and removal of officers; provisions as to general and special meetings, and the settlement of disputes, custody of seal, mortgage deeds, and securities, powers of directors and other officers, fines, and mode of dissolution. Societies may unite with others, or one society may transfer its engagements to another. They may purchase, build, hire, or take on lease any building for conducting their business. Minors may be members, but cannot vote or hold office during nonage. Accounts are to be furnished to members and loan depositors annually. The societies are exempt from stamp-duties of every kind, except those upon mortgages; while those which continue under the act of 1836 retain their present exemption from stamp-duty upon mortgages also up to £500. It is not probable that this difference will be permitted to continue long; and even now the slight gain is more than counterbalanced by the privileges of incorporation, &c. conceded by the act of 1874. Receipts endorsed upon mortgages are sufficient discharges without reconveyance.

Two great divisions of building societies exist, the terminating and the permanent, but the latter are rapidly superseding the former. In the best-conducted societies, subscriptions are received at any time and to any amount, at the option of the member. The majority of members pay from ten to twenty shillings per month, and others pay smaller or much larger sums as convenient. Very large sums are received in some societies. Two societies in Bradford, Yorkshire, alone receive £900,000 per annum, and have 20,000 contributing

members. Other large towns in the provinces are not far behind, and in London the societies are numerous, and in the main prosperous. The Royal Commissioners on Friendly Societies, reporting on this branch of their subject in 1872, say that they are below the mark in assuming that building societies form a group of bodies with a subscribed capital of over £9,000,000, a loan or deposit capital of over £6,000,000, over £17,000,000 total assets, having over £16,000,000 advanced on mortgage, and an income of over £11,000,000.

The theory of these institutions is very simple. Money is collected in comparatively small sums from large numbers of people, and lent to others who borrow upon real security, either to build or trade, or for any other purpose. There was a time when members were only permitted to subscribe fixed sums at stated times, and every departure from rule was visited by heavy finea. Now, in the best-conducted societies at least, every facility is given for varying powers of investment to find a place for capital, little or much; and entrance and withdrawal are equally easy. In most cases, the repayments are upon a scale calculated to pay off both principal and interest in a certain number of years, usually about fourteen, but advances on private mortgage or repayable at the borrower's convenience are becoming more frequent every year. In fact, the almost limitless adaptability of the building society system has only been appreciated of late years, and every decade sees changes and improvements in it. Under the new legislation the societies may look forward to a still more prosperous future.

**BENEFIT OF CLERGY.** This expression relates to happily a former state of the law of England, which at once shewed the power of the clergy and the ignorance of the people. It was otherwise called *privilegium clericale*, and in the days of its real meaning and force, the benefit or privilege meant little short of the total exemption of the clerical order, in respect of crimes and offences, from the jurisdiction and authority of the secular magistrate—an exemption pretended to be founded upon the text of Scripture, 'Touch not mine anointed, and do my prophets no harm.' The only exception to this was the priest being held in custody by the king himself; but even in that case, he could only remain in such regal custody with the pleasure and consent of the bishop, who had entire control over his person, and over the inquiry into his offence. If a priest or 'clerk' happened to be imprisoned by the secular arm, on a criminal charge or capital felony, he was, on the bishop's demand, to be instantly delivered up without any further inquiry; not, indeed, to be let loose upon the country, but to be detained by the ordinary, till he had either purged himself from the offence, or, having failed to do so, had been degraded; and this state of things continued till the reign of Henry VI., when it was settled that the prisoner should first be arraigned, and might either then claim his B. of C. by plea declining the jurisdiction, or, as was most usually practised, after conviction, by way of arresting judgment. The test of admission to this singular privilege was the clerical dress and tonsure; and a story is told of one William de Bussey, a serjeant-at-law, 1259 A.D. (the practising lawyers then were all priests), who, being called to account for his great knavery and malpractices, claimed the benefit of his orders or clergy, which till then remained an entire secret, and to this end wished to untie his coif, that he might shew that he had the clerical tonsure; but this was not permitted, and the bystanders seizing him, not by the coif, but by the throat, dragged him to prison. See 1, Stephen, p. 17. But in course of time

## BENEFIT OF INVENTORY—BENEVOLENCE.

a much wider and more comprehensive criterion was established, all who could *read*, whether of the clergy or laity—a mark of great learning in those days—and therefore capable of becoming clerks, being allowed the privilege. But laymen could only claim it *once*, and upon so doing, were burned on the hand, and discharged; to be again tried, however, by the bishop, whose investigation usually resulted in an acquittal, which, although the offender had been previously convicted by his country, or perhaps by his own confession, had the effect of restoring him to his liberty, his credit, and his property—in fact, the episcopal acquittal so entirely whitewashed him, that in the eye of the law he became a new and innocent person. The mode in which the test of reading was applied was as follows: On conviction, the felon demanded his clergy, whereupon a book (commonly a psalter) was put into his hand, which he was required to read, when the judge demanded of the bishop's commissary, who was present, *Legit ut clericus?* and upon the answer to this question depended the convict's fate: if it were simply *legit*, the prisoner was burned on the hand, and discharged; but if *non legit*, he suffered the punishment due to his offence. But by 5 Anne, c. 6, the B. of C. was extended to all persons convicted of clerical offences, whether they could read or not; and by the same statute and several subsequent ones, instead of burning on the hand, a discretionary power was given to the judge to inflict a pecuniary fine or imprisonment. But all further attempts to modify and improve the law on this subject proving impracticable, the B. of C. was at last totally abolished, by the 7 and 8 Geo. IV. c. 28; and now by the 4 and 5 Vict. c. 22, the same is the law with regard to the peers.

This privilege had never any existence or legal meaning in Scotland; and a learned writer on the law of that country complains of its introduction into a statute applicable to Scotland (Hutchison's *Justice of the Peace in Scotland*, vol. ii., p. 191). See on the subject of this article generally, Kerr's *Blackstone*, vol. iv., p. 452; Hale's *Pleas of the Crown*, part 2, c. 45; and Reeves's *History of the English Law*.

**BENEFIT OF INVENTORY**, in the Scotch law, was a legal privilege whereby an heir secured himself against unlimited liability for his ancestor, by giving up, within the *annus deliberandi* (q. v.), an inventory of his heritage or real estate, to the extent of which, and no further, was the heir liable. But the *annus deliberandi* is now abolished, and the privilege in question is of the less consequence, seeing that by the 10 and 11 Vict. c. 47, ss. 23 and 25, decrees of service infer only a limited representation of a deceased party, and the heir is only liable to the extent of the inheritance descending to him. See **ANNUS DELIBERANDI**, **HEIR**, **INHERITANCE**, **DEBT**, and **MORTGAGE**.

**BENEKE**, FREDERIC EDWARD, professor of philosophy in Berlin, was born in that city in 1798, and studied theology and philosophy, first at Halle, and then at Berlin. In 1820, he commenced lecturing in the latter university, but his lectures were soon interdicted by the minister Altenstein, as his philosophical views were quite opposed to those of Hegel. After a few years his lectures were again allowed, and on Hegel's death, in 1832, he was appointed extraordinary professor of philosophy. In March 1854, B. disappeared suddenly from his residence, and nothing more was heard of him until June 1866, when his body was found in the canal at Charlotteburg in the same place in which he had sought his death. B. has more affinity with British thinkers than any other German philosopher. He

holds that the only possible foundation for philosophy lies in a strict adherence to the facts of our consciousness. His system of psychology is therefore what the Germans call 'empirical,' and his method is the Baconian as pursued in natural science. Of his numerous writings may be mentioned *Psychologische Skizzen* (2 vols. 1825—1827); *Lehrbuch der Psychologie als Naturwissenschaft* (Text-book of Psychology as a Natural Science, 2d ed. 1845); *System der Logik* (2 vols. 1842); *Kreisungs- und Unterrichtslehre* (A Treatise on Education, 1842). The best German educationists recommend B.'s psychology as more capable of practical application than the prevailing systems of Germany.

**BENEVENTO** (ancient *Beneventum*), a city of Southern Italy, capital of the province of the same name. It occupies the site of the ancient city, out of the materials of which it is entirely built, on the declivity of a hill, near the confluence of the Calore and Sabato, about 32 miles north-east of the city of Naples. B. is about two miles in circumference, is surrounded by walls, has a citadel, a fine old cathedral, some noteworthy churches, and a magnificent arch, erected to the honour of the Emperor Trajan, by the senate, 114 A.D., which, with the single exception of that of Ancona, is the best preserved specimen of Roman architecture in Italy. It is an archiepiscopal see, and has a population of (1872) 20,133. B. is a place of very great antiquity. Some writers attribute its origin to Diomed, and in the cathedral is a bas-relief representing the Calydonian boar adorned for sacrifice, said to be the gift of the Greek hero himself. Others give the credit of its origin to Auson, a son of Ulysses and Circe. It was, however, in the possession of the Samnites, when history first takes notice of it, and it appears to have been captured from them by the Romans, some time during the third Samnite war. It was certainly in the hands of the Romans 274 B.C., who changed its name from Maleventum to Beneventum, six years later, and made it a Roman colony. The Carthaginians under Hanno were twice decisively defeated in the immediate neighbourhood, during the second Punic war. It rapidly rose to a place of importance under the Roman empire, and was visited at various times by several of the emperors.

Under the Lombards, who conquered it in the 6th c., B. continued to flourish, and became the capital of a duchy which included nearly the half of the late kingdom of Naples. In the 9th c. the duchy was separated into three states—B., Salerno, and Capua. In 1077, the whole was taken possession of by the Normans, excepting the town and its present delegation, which had previously (1053) been presented to the pope, by the Emperor Henry III. During the 11th and 12th centuries, four councils were held at the city of Benevento. Since that time, with some slight intervals, it has remained under the direct dominion of the popes, who govern it through a resident cardinal with the title of Legata. In 1806, it was erected into a principality by Napoleon, who made Talleyrand Prince of B.; but it was restored to the pope at the peace of 1815. At the revolution of 1848—1849, B. remained faithful to the pope.

**BENEVOLENCE**, in the history of the law of England, was a species of forced loan, arbitrarily levied by the kings in violation of Magna Charta, and in consequence of which it was made an article in the Petition of Rights, 3 Car. I., that no man shall be compelled to yield any gift, loan, or B., tax, or such like charge, without common consent by act of parliament; and by the statute

## BENGAL.

1 Will and Mary, st. 2, c. 2, it is declared, that levying money for or to the use of the crown, by pretence of prerogative, without grant of parliament, or for longer time, or in other manner than the same is or shall be so granted, is illegal. See Hallam's *Constitutional History of England*, and 1 Stephen's *Com.*, p. 167.

**BENGAL**, the name of a presidency, and a province in Hindustan, the latter being distinguished as *B. Proper*. In 1765, the soubah or viceroyalty of this name was, along with Bahar and part of Orissa, ceded by the Great Mogul, virtually in full sovereignty, to the English East India Company. As a natural consequence of this acquisition of territory, the presidency of Calcutta, which had been separated from that of Madras in 1707, came to be styled the presidency of Bengal. Moreover, in 1773, this, the youngest of the three distinct governments of British India, was elevated above both its older rivals by an act of parliament, which declared its immediate ruler to be *ex officio* the governor-general of the whole of the Company's dominions. With its commanding position on and around the delta of the Ganges and the Brahmaputra, *B.*, as a presidency, grew almost as uninterruptedly as a tree, alike to the north-west and to the south-east—far beyond the basins of its own mighty rivers. Within less than 90 years, it had overleaped, without a break in its continuity, at once the Irrawaddy and the Indus. Benares in the one direction, was the first considerable increment, having been absorbed in 1775; while the last addition of importance—unless one should except Oude, which, however, had really become British in 1801—was Pegu, in the other direction, the Burmese war of 1852 filling up the gap on the coast which that of 1826 had still left between Assam and Aracan on the north, and Tenasserim on the south. From Tenasserim to the Punjab inclusive, *B.*, as a presidency, embraced about 29° of long., and about 21° of lat. Further, it comprised, to the south-east, the detached settlements of Penang, Malacca, and Singapore; while to the north-west it might, for a time at least, have claimed Afghanistan. The whole of this vast tract was, either directly or indirectly, under the immediate rule of the governor-general, advised, and in some cases, controlled, by a council of 5 members, of whom one was the commander-in-chief, and at least one other was not to be a Company's servant.

Some time ago, the presidency of *B.*, having proved to be too extensive for a consolidated administration, was divided into three portions—one portion remaining under the governor-general, and two being assigned to subordinate functionaries, the lieutenant-governors respectively of 'The North-western Provinces,' and of 'Bengal.' The first portion, under the direct sway of the governor-general, consisted of the Punjab (q. v.); the Cis-Sutlej states, 4 in number—Oude, Nagpoor, Pegu, Tenasserim; and the 3 detached settlements already mentioned in and near the Straits of Malacca. The two other portions, occupying, between them, the entire space from Pegu to the Cis-Sutlej states, met near the confluence of the Gogra and the Ganges, Patna being situated in 'Bengal,' and Benares in 'The North-western Provinces.' The presidency of *B.*, however, is now more confined. It is under a lieutenant-governor, whose territory comprises *B. Proper*, Bahar, Orissa, including the tributary Mehals, Assam, Chota Nagpore, and the native states of Hill Tipperah and Kooch Bahar. The lieutenant-governorship of the North-west Provinces is no longer included in the presidency of *B.*; the Punjab has likewise an independent lieutenant-governor; Oude is under a chief commissioner;

and Pegu and Tenasserim are embraced in British Burmah.

According to the census of 1871, the areas and populations of the presidency of *B.* were as follows:

	Square Miles.	Inhabitants.
Bengal Proper, . . . . .	89,836	36,769,735
Bahar, . . . . .	42,417	19,738,101
Orissa, . . . . .	23,901	4,317,999
Chota Nagpore, . . . . .	43,901	3,825,571
Assam and adjacent hills, . . . . .	35,623	2,207,453
Total, . . . . .	235,678	66,856,859

Thus *B.*, as a presidency, presents nearly twice the area, and more than twice the population of Great Britain. It extends from the meridian 82° to 97° E. of Greenwich, and lies within the parallels of 19° 40' and 28° 10' N. lat. It consists mainly of the lower plains of the Ganges, and the whole of the great delta, and also comprises the valleys of the Brahmapootra and the Soorma, and the sea-board district of Chittagong. Chota Nagpore and Orissa are beyond the western bounds of the plains of the Ganges. There are, in addition to these, large tracts of hill and jungle all round the frontiers of *B.*, inhabited by various aboriginal tribes, and full of wild animals.

In military matters, Hindustan is regarded as composed of the three presidencies of Bengal, Madras, and Bombay. When the army of *B.* is spoken of, we must therefore understand by *B.* a much larger area than that included in the above table. In 1871, the number of European soldiers in the army of *B.* was 35,122; native, about 65,000. Other features of *B.* as a presidency will fall naturally under more general heads. *B. Proper* alone, the ancient soubah, or the modern province, now claims more special notice.

*B. Proper*, then, is bounded on the N. by Nepaul, Sikkim, and Bhotan; on the E. by Assam; on the S. by the Bay of Bengal; on the S.-W. by Orissa and Gundwana; and on the W. by Bahar. Taking its widest range, it measures about 350 miles from west to east, by an average of about 300 from south to north, and covers an area of 89,836 sq. m., embracing about 30 administrative districts. In 1871, the population was 36,769,735. Thus Bengal Proper is somewhat smaller in extent and denser in population than Great Britain. Next to Calcutta, the cities of note are Moorschedabad, Dacca, Burdwan, Purneah, Hoogly, Midnapore, Rajmahal, Bancorah, Berhampore, &c. In *B. Proper*, within the district of Hoogly, there stands also the French settlement of Chandernagore, containing somewhat less than 4 sq. m., with a population of about 33,000. The Hoogly district, moreover, contained, at one time, two other dependencies of foreign countries, the Dutch Chinsura, and the Danish Serampore, respectively ceded to England in 1824 and 1845. *B. Proper*, as a whole, may be regarded as almost a dead level. It is only on the south-west frontier that it shews any hill-country, for towards the north it is said nowhere to reach even a single spur of the Himalaya. The principal rivers are the Ganges and the Brahmaputra, the former intersecting the country diagonally from north-west to south-east, and the latter crossing its more easterly portion in a direction to the west of south. During their lower courses, these main channels are so interlaced together as to form perhaps the most singular net-work of waters in the world; and their first point of confluence is said to be Jaffergunge—the head also of tide-water—in lat. 23° 52' N., and long. 89° 45' E., at a distance of 160 miles from the sea. But the thousand-isled delta commences 120 miles further up the Ganges, where the highest offset, the Bhagirathi, breaks off to the right, afterwards to join a similar offset, the

Jellinghee, in forming the Hoogly of Calcutta. Besides these two grand arteries, the province is watered by many less considerable rivers, chiefly northerly tributaries of the Ganges; so that even in the driest season there is scarcely any spot 20 miles distant from a navigable stream. During the rainy months, almost every water-course in the more level regions inundates the adjacent plains; while, down in the delta, the separate floods sometimes mingle themselves into a breadth of 100 miles. To say nothing of temporary inconvenience and loss, these visitations often inflict permanent damage such as is wholly irreparable. The soil, in most parts of the province, is so decidedly alluvial, that hardly a rock or a stone meets the ascending voyager within a distance of 400 miles from the sea—a soil offering but a feeble barrier to torrents which, besides gathering, as they rise, velocity and momentum, are liable to change their direction with each increase of depth and width. A twofold evil is the result. The Ganges and the Brahmaputra, resuming, as it were, their gifts of a former age, cut for themselves new passages, to the injury of private individuals, while their old ones become so many seething swamps, to the prejudice of the public health. To a partial extent, such calamities have been averted by embankments. In these circumstances, the intercourse is ordinarily carried on by water: the Bengalee, in fact, may be viewed as almost amphibious; and on the Lower Ganges alone, there are said to be—unless in so far as steam may have reduced the number—about 30,000 professional boatmen. Speaking generally, the communications by land are merely beaten paths. The only exception of note—and that certainly a noble one—is the Grand Trunk Road, which traverses the province from Calcutta upwards on its way to Delhi, Lahore, and the Indus. Much of the country is covered by thick woods and impenetrable jungles, which abound in wild animals, such as the jackal, the leopard, the tiger, and the elephant. The last is often tamed for domestic use, the more common beasts of burden being the camel and the horse, the latter of an altogether inferior variety. Lying, as B. Proper does, between the 21st parallel and the 27th, its climate and productions, so far as the latitude alone is concerned, may be expected to be tolerably uniform over the entire province. But other causes intervene to affect the result. Thus, the nearer any place is to the sea, the heavier are the rains, and the broader is the overflow; the difference of moisture, however, being, in the remoter localities, often made up by irrigation. Moreover, in an inverse proportion to the latitude, the alternate monsoons of the Bay of Bengal (see next article), with their respective influences on the thermometer and barometer, are more sensibly felt in the maritime tracts. Lastly, to these special causes must be added a cause of more general character—the difference of elevation. Hence, wheat and barley, for instance, grow only on the higher grounds, while rice cannot thrive unless within the range of the inundations, yielding, too, an endless diversity of varieties, according to the infinitely fluctuating conditions under which it may be cultivated. Besides grains and vegetables in great variety and abundance, B. Proper gives to commerce opium, indigo, silk, sugar, tobacco, coffee, and cotton. See CALCUTTA. Cotton manufactures, once extensively carried on, particularly in the district of Dacca, have latterly given way to British competition. The article of salt, to come up under another head in connection with revenue, claims separate notice. Most of what is consumed in B. Proper is made in deserts on the coast, alternately covered and

abandoned by every tide, where the singularly powerful evaporation—said to be sometimes an inch a day on the depth of the adjacent bay—imparts the health of the labourer in proportion as it facilitates his labour. Of all these commodities, indigo (q.v.) is, in one important view, the most valuable, as being more likely than any other to attract English agriculturists to India. From the earliest times the dye appears to have been cultivated on the Lower Ganges, which for ages enjoyed, in this respect, the monopoly of the European trade. But when once the cultivation of the plant was introduced into America, it gradually engrossed the market—the greater care in the preparation making up for a natural inferiority in the article itself; and it was only when British capital and skill undertook the manufacture, that B. began to resume her original supremacy in this branch of agriculture. The annual rainfall at Calcutta varies from 50 inches to 85, diminishing gradually towards the interior. At Calcutta also, in the year 1871, the mean temperature for May was 84° 12'; for July it was 83° 12'; and for December, 69° 48'. The prevailing winds were, from January to May of the same year, north-west to south; from June to September, southerly; from October to December, north-west. Iron and coal are understood to abound, though by no means continuously, in a tract as large as England, running to the west from Rajmahal—a tract, however, not wholly situated in Bengal Proper. In 1757, a single battle, gained against odds of twenty to one, transferred B. from the Mogul's viceroy to the English East India Company—the Mogul's own grant of 1765 ratifying the decision of Plassey. B. has 9 colleges belonging entirely to the government, which were attended in 1871 by 930 students; 5 private colleges receiving grants-in-aid, attended, the same year, by 394 students; and 2 unaided colleges. The number of government high-schools was 52, with 10,282 pupils; of aided high-schools, 78, with 8112 pupils. There are 1658 middle-schools, attended by 80,000; and about 13,500 indigenous rural schools. See INDIA.

BENGAL, BAY OF, a portion of the Indian Ocean, of the figure of a triangle, or rather of a quadrangle, for the northern extremity, instead of running to a point, measures about 250 miles from Balasore to Chittagong. Its southern side, drawn from Coromandel to Malacca, so as merely to leave on the right both Ceylon and Sumatra, may be stated at 1200 miles. The Bay of B. receives many large rivers—the Ganges and the Brahmaputra on the north, the Irrawaddy on the east, and on the west the Mahanuddy, the Godavery, the Kistna or Krishna, and the Cauvery. On the west coast, there is hardly anything worthy of the name of harbour; while on the east there are many good ports—such as Aracan, Cheduba, Negrais, Syriam, Martaban, Tavay River, King's Island, besides several more in the islands between Pegu and Sumatra. The evaporation, as stated in the previous article, sometimes amounts, in the hottest season, to about an inch a day. The monsoons prevail over the whole of the north part of the Indian Ocean, of which the Bay of B. is a part, and also over the maritime tracts of B. itself. The north-east monsoon is clearly the ordinary trade-wind of the northern hemisphere; while that from the south-west is shewn by Maury, in his *Physical Geography of the Sea*, to be a deflection of the ordinary trade-wind of the southern hemisphere. Generally speaking, the north-east and south-west monsoons prevail respectively in summer and winter. Maury, however, shews that, on different parallels, there are different seasons for the alternate changes.

**BENGAL ARMY.** A succinct account of the military forces in India, European and native, will be found under EAST INDIA ARMY; including a notice of the changes made consequent on the transfer of the Company's powers to the crown, in 1858.

**BENGAL LIGHT, BLUE LIGHT, or BEN GAL FIRE,** is a brilliant signal-light used at sea during shipwreck, and in ordinary pyrotechny for illuminating a district of country. It is prepared from nitre, sulphur, and the tarsphuret of antimony. The materials are reduced to fine powder, thoroughly dried, and intimately mixed in the following proportions by weight: nitre, 6; sulphur, 2; tarsphuret of antimony, 1. The mixture constitutes the B. L., and when kindled by a red-hot coal, red-hot iron, or flame, immediately bursts into rapid and vivid combustion, evolving a brilliant, penetrating, but mellow light which, during the darkness of night, readily overcomes the gloom for a considerable space. As the fumes evolved during the combustion of the B. L. contain an oxide of antimony, and are poisonous, the light cannot be used with safety in rooms or enclosed spaces.

**BENGALI' LANGUAGE.** See HINDUSTAN.

**BENGA'ZI,** a seaport town of Barca, North Africa, finely situated on the east coast of the Gulf of Sidra, in lat. 32° 6' N., and long. 20° 2' E. It has a population of about 2500, who carry on a trade with Malta and Barbary in oxen, sheep, wool, and corn. It has a castle, the residence of a bey, who governs it for the pasha of Tripoli. Its harbour is rapidly filling up with sand. B. is chiefly interesting to the traveller, as having been the site of the ancient city of Hesperis, in the neighbourhood of which were several singularly luxuriant dells of large extent, enclosed within steep rocks rising to the height of 60 or 70 feet. These were supposed to answer well the description of the fabled Gardens of the Hesperides. It first rose to importance under Ptolemy III., who called it Berenice, in honour of his wife. It had then a large population, chiefly of Jews. Justinian afterwards fortified it, and adorned it with baths.

**BENGEL, JOHANN ALBRECHT,** a distinguished German theologian and commentator, whose writings have exercised considerable influence in England, was born at Winnenden, in Würtemberg, June 24, 1687. His early life was chequered by many vicissitudes. After completing his theological curriculum in 1707, he became curate of Metzingen; a year after, he was appointed theological tutor at Tübingen. Later in life, he held several high offices; among others, that of Consistorial councillor and prelate of Alpirsbach, in Würtemberg, where he died 2d December 1752. He was the first Protestant author who treated the exegesis of the New Testament in a thoroughly critical and judicious style. He did good service also in the rectification of the text of the Bible, and in paving the way for classifying the sacred manuscripts into families. The short notes in his *Gnomon Novi Testamenti* (Tübingen, 1742) have been generally regarded as valuable, and translated into various languages. They were especially made use of by John Wesley, in his *Notes on the New Testament*, which forms one of the standards of Wesleyan Methodism. Indeed Wesley's work may be regarded as little more than an abridged translation from Bengel. An *Exposition of the Revelation of St John* (Stuttgart, 1740), and a chronological work—the *Ordo Temporum a Principio per Periodos Economico-Divinae Historicus atque Propheticus* (Tübingen, 1741), gained for B., in his time, a great reputation; some regarding him as an inspired prophet, but the majority as a visionary. In these works he calculated, on the basis he

supposed to be laid down in the Apocalypse, that the world would endure for the space of 7777½ years; and that the 'breaking loose and the binding of Satan' would take place in the summer of 1838.

**BENGUE'LA,** a country of Western Africa, the limits of which are not very definitely fixed. It is usually represented as lying between lat. 9° and 16° S., and long. 12° and 17° E. The river Coanza separates it from Angola on the N., the mountains behind Cape Negro bound it on the S., and the Atlantic Ocean on the W. Its surface is generally mountainous, rising from the coast-line inland, in a series of terraces; several important rivers flow through it in a north-west direction to the Atlantic. These rivers have numerous affluents, and water is everywhere so plentiful that it may be found by digging two feet beneath the surface. Vegetation of the most luxuriant and varied description is the consequence of this humidity. The fruit-trees, both of tropical and subtropical climates, succeed extremely well. The inhabitants, however, are too ignorant or indolent to take advantage of the productiveness of the soil. Animals of all kinds common to Western Africa abound in B., both on land and in water. Peacocks are said to be accounted sacred in B., and kept tame about the graves of the great chiefs. Sulphur, copper, and petroleum are found in the mountains, and also gold and silver in small quantities. The coast is unusually unhealthy, but the interior is more salubrious. B. is inhabited by a variety of petty tribes, some of which are cannibals, and barbarous beyond even the barbarism of Africa. As might be anticipated, religion exists only in the form of Fetichism. The Portuguese claim B., but they exercise no real power in the interior.

**BENGUE'LA, ST PHILIP DE,** the Portuguese capital of the above region, on the Atlantic, near the mouth of the river Catumbella. Lat. 12° 33' S., long. 13° 25' E. It is very unhealthy; so inimical to European life, indeed, that the Portuguese affirm their countrywomen could not live three months in it. It has a miserable appearance, being built of half-baked bricks, and made ruinous-like by a practice that prevails of never repairing the houses, which, whenever they exhibit symptoms of decay, are abandoned for new ones erected in the vicinity. Pop. 1500, chiefly free blacks or slaves. It was a great slave-station at one time, exporting annually 20,000 slaves. The trade has fallen off greatly of late years. The town was, some time ago, invaded by a herd of thirsty elephants in quest of water, and almost entirely destroyed.

**BENI'**, a river of South America, in the state of Bolivia, formed by the junction of all the streams that rush down from the Eastern Andes between 14° and 18° S. lat. Flowing through the province of Mojos, it joins the Mamore to form the Madeira, one of the largest affluents of the Amazon.

**BENICA'RLO,** a poor, dirty, walled town of Spain, in the province of Valencia. Pop. 6000, who manufacture 'full-bodied' wines for export to Bordeaux, where they are used in cooking clarets for the English market. Bad brandy is also manufactured here; and the town being situated on the Mediterranean, a little fishing is carried on.

**BE'NI-HA'SSAN,** a village of Upper Egypt, on the east bank of the Nile, in lat. 27° 53' N., and long. 30° 55' E. The place is remarkable for the numerous grottos in its vicinity, which are among the most interesting in Egypt. These catacombs are excavated in the calcareous bank—apparently, at one time, washed by the Nile, now flowing further west—in which the low hills that rise in this part of the valley terminate. The catacombs are about thirty

in number, and are supposed to have been used as sepulchres by the principal inhabitants of Hermopolis, a city that stood on the opposite side of the river. Some of the grottos consist of three apartments, the largest of which is 60 by 40 feet; and pillars are cut out of the rock in imitation of the columns that support the roofs of buildings. These shafts are polygons of sixteen sides, fluted except on the inner side, which is left smooth for a line of hieroglyphica. They are usually about 16 feet high, and from 3 to 5 feet in diameter at the base. The sides of the caverns are covered with paintings representing the industrial pursuits, sports, pastimes, &c., of the ancient Egyptians. The paintings, though not so artistic as those in the Theban catacombe, are of earlier date, and throw much curious light on the manners and customs of the people.

BENI-ISGUEN, a large town in the interior of Algeria, surrounded by a rampart, flanked with towers, and said to be nearly as populous as Algiers. It has some trade in grain.

BENI-ISRAEL (Sons of Israel), a remarkable race in the west of India, who preserve a tradition of Jewish descent, and have from time immemorial acknowledged the law of Moses, although in many respects conforming to the idolatry of the Hindus by whom they are surrounded. Dr Wilson estimates their whole number at not much more than 5000. Their original settlement was at Navagaum, about 30 miles from Bombay, where they were protected by the native princes; they have spread through the maritime parts of the Konkan, and some of them are now to be found in Bombay itself. Their features exhibit a resemblance to those of the Arabian Jews. Until recently, they were ignorant even of the names of many of the books of the Old Testament; and it was not without hesitation that they consented to receive those of the later prophets. Dr Wilson supposes them to be a remnant of the ten tribes, and to have settled in India long before the Jews of Cochin. See COCHIN (HINDUSTAN). They reject the name of Jews, and deem its application to them a reproach. They have no MS. of the law in their synagogues. Their communities are governed by a *mahudam*, or head-man of their own number; and their religious assemblies are presided over by a *kazi*, who also performs circumcision and other rites.

BENIN, a state in Guinea, Africa, above the mouth of the river Niger, situated in 4°—9° N. lat., and 4°—8° E. long. It takes its name from the western arm of the Niger—formerly supposed to be a main river, and styled Benin or Formosa—which leaves the Niger at Kirii, and, after a course of about 115 miles, forms an embouchure two miles wide. The country of B. is bounded on the N.E. and the E. by the Niger; on the S. by the Bay of Benin, into which Cape Formosa is projected; on the W. by Dahomey; and on the N.W. by Yariba. The coast is indented by numerous estuaries, and is generally level; but the land gradually rises towards the north, until it reaches an elevation of 2500 feet in the Kong Mountains. The soil is very fertile, producing rice, yams, palms, sugar, &c. The animals are the same as those in other states of Guinea, but the hippopotamus is more common. The population is so dense that the king—who is worshipped as a great  *fetish*—can bring into the field an army of 100,000 men. The government, customs, and superstitions of B. are similar to those prevailing in Ashantee. The capital, Benin, which is situated in lat. 6° 20' N., long. 5° 50' E., with about 15,000 inhabitants, has a considerable trade. Messrs Smith and Moffat, who visited it in 1838, describe its

market-place as very offensive, from the effluvia rising from a heap of human skulls; while in the outskirts of the town they were still more revolted by the sight of turkey-buzzards feeding on bodies of men recently decapitated. At Gato, a harbour lower down the river, where the traveller Belzoni died, European merchants formerly had factories. Warree is another principal place. The export trade of B. consists of palm-oil, salt, blue coral, jasper, wild-beast skins, slaves, &c. B. was discovered by the Portuguese Alfonso de Aveiro, 1486. In 1786, the French founded settlements at the mouth of the river, which were destroyed by the British in 1792.

BENIN, BIGHT OF, that portion of the Gulf of Guinea (q. v.) extending from Cape Formosa on the east to Cape St Paul's on the west, a distance of about 390 miles, with a coast-line of 460 miles. Several rivers empty themselves into the B. of B., the three principal of which, Benin, Escardos, and Forcados, are accessible to shipping. The coast along the Bight was blockaded in 1861 by the British fleet engaged in the suppression of the slave-trade. Palm-oil and ivory are the principal articles of trade at the towns on the coast.

BENI-SOUËF, a town of Central Egypt, on the right bank of the Nile, about 70 miles south-south-west of Cairo, one of the stations where travellers, making the tour of Egypt, usually stay. It is the entrepot of all the produce of the fertile valley of Fayoum, and has cotton-mills and quarries of alabaster. Pop. 5000.

BENITIER, or BENATURA, the name of the vase or vessel in which consecrated or 'holy water' is held in Roman Catholic churches. In England, the B. was known by the names of the 'holy-water font,' the 'holy-water vat,' the 'holy-water pot,' the 'holy-water stone,' the 'holy-water stock,' and the 'holy-water stoup.' Benitiers were either movable or fixed. Portable ones, commonly of silver, were used in processions. Fixed benitiers were placed near the doors of churches, so that the people might dip their fingers in the water, and cross themselves with it as they entered or left the church. The learned French ecclesiologist, M. Viollet-le-Duc, is disposed to think that, before the 12th c., there were no fixed benitiers, their place being served by vases of metal set down near the entrance of the church when the doors were opened. The fixed B. is usually placed either against a pillar, or upon a pedestal. It is of all shapes, and is of the most different materials, but oftenest of stone. The benitiers belonging to the church of St Sulpice, in Paris, are remarkable for their beauty. They are formed of magnificent shells, and bordered with gilt copper. In Great Britain, benitiers are found of every style, from Romanesque to late Third Pointed. On the continent, they range from Romanesque to Renaissance, those of the latter style being generally of marble, richly sculptured, and supported by figures.

BENJAMIN (a Hebrew proper name, signifying 'Son of my Right Hand,' or 'Son of Good Fortune'), the youngest and most beloved of the sons of Jacob. His mother, Rachel, who died soon after he was born, called him *Benoni* (Son of my Pain), but his father changed it to Benjamin. He was the head of one of the twelve tribes of Israel. The tribe in the desert reckoned 35,400 warriors above twenty years of age; and on the entrance into Canaan, 45,600. Its territory, which was small but fertile, lay on the west side of the Jordan, between the tribes of Ephraim and Judah. The chief places were Jericho, Bethel, Gibeon, Gilgal, and Jerusalem, the last of which was on the confines of Jndah. In the time of 'the Judges,' the tribe of B. became involved in

war with the eleven other tribes of Israel, on account of refusing to deliver up to justice the Gibonitish ruffians who had brutally abused the concubine of an Ephraimite. The result was dreadful. All the male descendants of B. were put to the sword (Judges xx. and xxi.), excepting 600, towards whom the hearts of their brethren finally relented. Saul, the first king of Israel, was of the tribe of B., which remained loyal to his son, Ishbosheth. After the death of Solomon, B., along with Judah, formed the kingdom of Judah; and on the return from the Captivity, these two constituted the principal element of the new Jewish nation.

**BE'NJAMIN OF TUDELA**, a Jewish rabbi, was born in Navarre, Spain. He was the first European traveller who gave information respecting the distant East. Partly with commercial views, and partly to trace the remnants of the 'lost tribes,' he made a journey, in the years 1159—1173, from Saragossa, through Italy and Greece, to Palestine, Persia, and the borders of China, returning by way of Egypt and Sicily. He died in 1173, the last year of his travels. His notes of foreign lands—originally written in Hebrew, and frequently republished in Latin, English, Dutch, and French—are occasionally concise and valuable; but on the whole must be accepted with qualifications. Like all the early travellers, B. had a greedy ear for the marvellous. His errors are also numerous. The latest edition by Asher (London, 1841) contains the original text, with an English translation and learned annotations.

**BE'NJAMIN TREE.** See BENZOIN.

**BEN LAWERS**, a mountain in Perthshire, Scotland, about 32 miles west-north-west of Perth, on the west side of Loch Tay. This mountain, which is easy of ascent, is rich in specimens of Alpine plants, and a magnificent view is commanded from its summit, which has an elevation of 3984 feet. Ore of titanium is found in the mountain.

**BEN LEFDI**, a mountain also of Perthshire, 4 miles west-north-west of Callander, with an elevation of 2882 feet. It received its name from the Druids, who are supposed to have had a place of worship on its summit—the Gaelic words *Beinn-le-Dia*, signifying 'Hill of God.' This mountain is celebrated in Scott's *Lady of the Lake*.

**BEN-LO'MOND**, a celebrated Scottish mountain in the north-west of Stirlingshire, on the east side of Loch Lomond, and about 27 miles west-north-west of Stirling. This mountain, forming the south extremity of the Grampian or Central Scottish Highlands, is 3192 feet high, and consists of mica slate, with veins of quartz, greenstone, and felspar porphyry. The summit is precipitous on the north side, with a gentle declivity on the south-east; it is covered with vegetation to the top. Though considerably surpassed in height by several other Scottish mountains, none are more imposing. Seen from Loch Lomond, it appears a truncated cone, and from between Stirling and Aberfoyle, a regular pyramid. It has perhaps been ascended by a greater number of tourists than any other of the Highland mountains. The magnificent view from the top, in clear weather, includes the whole length (30 miles) of Loch Lomond, with its diversified isles, and wooded and cultivated shores, the rich plains of Stirlingshire and the Lothians, the windings of the Forth, the castles of Stirling and Edinburgh, the heights of Lanarkshire, the vales of Renfrewshire, Ayrshire, Firth of Clyde, Isles of Arran and Bute, the Irish coast, Kintyre, and the Atlantic. The north semicircle of the horizon is bounded by Bens Lawers, Voilrich, Ledi, Cruachan, and Nevis;

while some of the beautiful Perthshire lochs are seen.

**BEN MACDHU'I**, a lofty mountain of Aberdeen-shire, belonging to the Grampian range, at one time regarded as the highest in Great Britain, but now ascertained to be the second—its elevation being 4296 feet.

**BEN NEVIS**, the highest mountain in Great Britain, is situated in the county of Inverness, Scotland. It has a height of 4406 feet, is exceedingly difficult of ascent, with a tremendous precipice of 1500 feet in depth on the north-east side. Here snow remains throughout the year. Granite and gneiss form the base of the mountain, which in its upper part is composed of porphyry.

**BENNETT**, Sir WILLIAM STERNDALE, MUS.D., D.C.L., English pianist and composer, was born at Sheffield, April 13, 1816. After studying under Crotch, Holmes, and Potter, in the Royal Academy, London, he attracted the notice of Mendelssohn at the Düsseldorf Musical Festival, appeared with success at Leipsic in the winter of 1837—1838, and was received with great applause when he returned to London. In 1838, he was elected member of the Royal Society of Music. In 1856, he succeeded Mr Walmsley as Professor of Music at Cambridge. At the opening of the International Exhibition, 1862, Tennyson's ode, *Uplift a Thousand Voices*, set to music by B., was fervidly sung. In 1868, he was appointed principal of the Royal Academy of Music; and was knighted in 1871. He died in 1875.

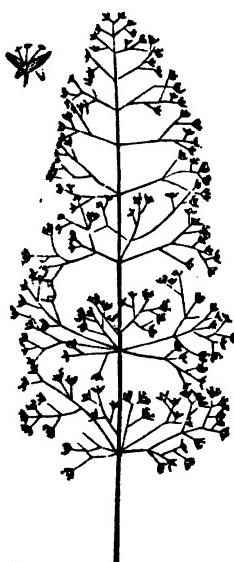

**BENNIGSEN**, LEVIN AUG. THEOPHILUS, COUNT, one of the most famous Russian generals, was born at Brunswick, February 10, 1745. His father was an officer in the Brunswick Guards; and B. himself entered the Hanoverian service for a time; but having squandered the property left him, he joined the Russian army in 1773, and in the Turkish war soon attracted the notice of the empress, Catherine, who employed him to carry out her designs against Poland. He was one of the leaders of the conspiracy against the Emperor Paul (1801); though he is said not to have been present at the catastrophe, but to have prevented the Empress Maria from rushing to her husband when she heard his cries. He fought with considerable success in the battle of Pultusk (1806), and held the chief command in the obstinate and murderous struggle at Eylau (1807). When Napoleon invaded Russia in 1812, B. commanded the Russian centre on the bloody field of Borodino, and gave his voice for fighting a second battle before the walls of Moscow. Before the French began their retreat, he gained a brilliant victory over Murat at Woronowa (18th October). Differences with Kutusov, who would not adopt B.'s plan to prevent the French from crossing the Beresina, made him retire from the army; but after Kutusov's death, he took the command of the Russian army of reserve, which entered Saxon in July 1813, fought victoriously at the battle of Leipzig, and was created Count by the Emperor Alexander on the field. When Leipzig was taken, it was he that was commissioned by the allies to announce to the king of Saxony that he was a prisoner. Failing health made him retire from the Russian service in 1818 to his paternal estate in Hanover, where he died October 3, 1826.—His son, ALK. LEVIN B., became a leading Hanoverian statesman.

**BEN-RHY'DDING**, a celebrated hydropathic establishment in the West Riding of Yorkshire, in a beautiful situation on the right bank of the river Wharf, 16 miles north-west of Leeds. The building, erected 28 years ago at the cost of nearly £30,000, is

a very imposing pile, on an eminence midway up the side of the valley. There is accommodation for 80—100 patients and visitors, and extensive pleasure-grounds around. In addition to the usual appliances of the water-cure, and a variety of gymnastic exercises, Dr M'Leod has introduced the Compressed-air Bath (q. v.); and some time ago, a sumptuous Turkish bath was added to the other attractions of the establishment.

**BENSHIE**, or **BA'NSHEE**, an imaginary being in the superstitions of the Irish. The B. is a female, who is called the wife of the fairies, and she makes herself known by wailings and shrieks, premonitory of a death in the family over which she is presumed to exercise a kind of guardianship. The name of this tutelary demon is supposed to be from the Irish Celtic *ben* or *bean*, a woman; and *sigh*, a fairy. A similar superstition prevailed, and is perhaps not yet extinct, in the Highlands of Scotland.

**BENT GRASS** (*Agrostis*), a genus of grasses, distinguished by a loose panicle of small, one-flowered, laterally compressed spikelets; the glumes unequal, awnless, and longer than the paleae, which are also unequal, and of which the inner one is sometimes wanting, and the outer sometimes has and sometimes has not an awn; the seed free. (For explanation of these terms, see **GRASSES**.) The species are numerous, and are found in almost all countries and climates; several are natives of Britain. All of them are grasses of a slender and delicate appearance. Some are very useful as pasture-grasses and for hay, upon account of their adaptation to certain kinds of soil, although none of them is regarded as very nutritious.—The **COMMON B. G.** (*A. vulgaris*)

Bent Grass (*Agrostis vulgaris*).

forms a principal part of the pasture in almost all the elevated districts of Britain, and is equally abundant in many parts of the continent of Europe. It resists drought better than almost any other grass, but is only sown by agriculturists on soils unsuitable for the more luxuriant grasses. It is also regarded as very suitable for lawns; but in light, dry, cultivated grounds, it is often a troublesome weed, known as Black Squinch, or Quick-grass, and frequent harrowing is resorted to for the removal of

its creeping perennial roots. It is as frequent on wet as on dry soils, and varies much in size and appearance.—The **MARSH B. G.** (*A. alba*), also very common in Britain, forming a large part of the natural pasture in many moist situations, is very similar to the species just described, but generally taller and stouter. Of this also there are many varieties, but in all of them, the *ligule* (the little membranous tongue at the junction of the blade of the leaf with its sheathing base) is elongated and acute, whilst in *A. vulgaris* it is very short, and appears as if cut off. A variety, so little different as scarcely to deserve the name, but with somewhat broader leaves and more luxuriant habit of growth, was at one time much celebrated among agriculturists, under the name of **FIORIN GRASS**, or *Agrostis stolonifera*. It was unduly lauded, and the consequent disappointment led to its being unduly disparaged. It is a useful grass in moist grounds, newly reclaimed bogs, or land liable to inundation. The first three or four joints of the culms lie flat on the damp soil, emitting roots in abundance, and it was formerly propagated by chopping these into pieces, and scattering them, but now generally by seed.—**HERD GRASS** (*A. dispar*) is a native of the United States, with broader leaves than either of the preceding species, very creeping roots, and large panicles almost level at top. It was at one time strongly recommended for cultivation, but has gone out of repute in Britain. It is however, more highly esteemed in France, particularly upon account of the great crop which it yields on deep sand and on moist calcareous soils.—**BROWN B. G.** (*A. canina*), a common perennial British grass, abundant in moist heath and moorish grounds, is valuable for mixing with other grasses to form permanent pasture on poor wet peaty soils.—**SILKY B. G.** (*A. Spica venti*) is a beautiful grass, with very slender branches to its ample panicle, which, as it waves in the wind, has a glossy and silky appearance. It is a rare native of sandy grounds in England, common in Southern and Central Europe; an annual grass, occasionally sown in spring to fill up blanks in grass-fields.

**BENTHAM, JEREMY**, an eccentric but eminent writer on ethics and jurisprudence, was the son of a wealthy solicitor in London, where he was born (in Red Lion Street, Houndsditch) on the 15th February 1748. He received his early education at Westminster School; and when yet a boy, being little more than twelve years of age, he went to Queen's College, Oxford, where he took his Master's degree in 1766. But though his years were so tender, he appears not to have been so unprepared as might be supposed to benefit by the university; for before entering it, he had already, by his precocious tendencies to speculation, acquired the title of 'philosopher.' On graduating, his father, who expected his son to become Lord Chancellor, set him to the study of the law at Lincoln's Inn, where he was called to the bar in 1772. He never practised in his profession, however, for which he had a strong distaste, which is paraded in many of his writings. Turning from the practice of law to its theory, he became the greatest critic of legislation and government in his day. His first publication, *A Fragment on Government*, 1776, was an acutely hypercritical examination of a passage in Blackstone's *Commentaries*, prompted, as he has himself explained, by 'a passion for improvement in those shapes in which the lot of mankind is meliorated by it.' The *Fragment* abounds in fine, original, and just observation; it contains the germs of most of his after-writings, and must be highly esteemed, if we look away from its disproportion to its subject and the writer's disregard of method. The *Fragment* procured him the acquaintance of

Lord Lansdowne, in whose society at Bowood he afterwards passed perhaps the most agreeable hours of his life. It was in the Bowood society that he conceived an attachment to Miss Caroline Fox (Lord Holland's sister), who was still a young lady, when B., in the 54th year of his age, offered her his heart and hand, and was rejected 'with all respect.' In 1778, he published a pamphlet on *The Hard Labour Bill*, recommending an improvement in the mode of criminal punishment; which he followed in 1811 by *A Theory of Punishments and Rewards*. In these two works, B. did more than any other writer of his time to rationalise the theory of punishments by consideration of their various kinds and effects, their true objects, and the conditions of their efficiency. He published in 1787 *Letters on Usury*; in 1789, *Introduction to the Principles of Morals and Legislation*; in 1802, *Discourses on Civil and Penal Legislation*; in 1813, *A Treatise on Judicial Evidence*; in 1817, *Paper Relative to Codification and Public Instruction*; in 1824, *The Book of Fallacies*. These were followed by other works of less consequence. His whole productions have been collected and edited by Dr Bowring and Mr John Hill Burton, and published in eleven volumes. It is well, however, for B.'s reputation, that it does not rest wholly on his collected works; and that he found in M. Dumont, Mr James Mill, and Sir Samuel Romilly, generous disciples to diffuse his principles and promote his fame. In his early works, his style was clear, free, spirited, and often eloquent; but in his later works, it became repulsive, through being overloaded and darkened with technical terms. It is in regard to these more especially that M. Dumont has most materially served his master by arranging and translating them into French, through the medium of which language B.'s doctrines were propagated throughout Europe, till they became more popular abroad than at home. Mr James Mill, himself an independent thinker, did much in his writings to extend the application in new directions of B.'s principles, a work in which, apart from his original efforts, he has achieved a lasting monument of his own subtlety and vigour of mind. Criticisms of B.'s writings will be found in the *Edinburgh Review*, by Sir Samuel Romilly; and in the *Ethical Dissertation*, in the *Encyclopædia Britannica*, by Sir James Mackintosh. But the most valuable contribution in English to his reputation is unquestionably *Benthamiana*, by Mr John Hill Burton, advocate, containing a memoir, selections of all the leading and important passages from his various writings, and an appendix embracing an essay on his system, and a brief clear view of all his leading doctrines.

In all B.'s ethical and political writings, the doctrine of utility is the leading and pervading principle; and his favourite vehicle for its expression is the phrase, 'the greatest happiness of the greatest number,' which was first coined by Priestley, though its prominence in politics has been owing to Bentham. 'In this phrase,' he says, 'I saw delineated for the first time a plain as well as a true standard for whatever is right or wrong, useful, useless, or mischievous, in human conduct, whether in the field of morals or politics.' It need scarcely be remarked, that the phrase affords no guidance as to how the benevolent end pointed at is to be attained; and is no more than a quasi-concrete expression of the objects of true benevolence. In considering how to compass these objects, B. arrived at various conclusions, which he advocated irrespective of the conditions of society in his day, and of the laws of social growth which, indeed, neither he nor his contemporaries understood. He demanded nothing less than the immediate remodelling of the government, and the

codification and reconstruction of the laws; and insisted, among other changes, on those which came at a later day to be popularly demanded as the points of the 'Charter'—viz., universal suffrage, annual parliaments, vote by ballot, and paid representatives. However impossible some of these schemes were, it cannot be denied that B. did more to rouse the spirit of modern reform and improvement in laws and politics, than any other writer of his day. Many of his schemes have been, and many more are, in the course of being slowly realised; the end and object of them all was the general welfare, and his chief error—apart from his over-estimate of the value of some changes which he proposed—lay in conceiving that organic changes are possible through any other process than that of growth and modification of the popular wants and sentiments. It was this error that led the philosopher, in his closet in London, to devise codes of laws for Russia (through which country he made tour in 1788) and America, the adoption of which would have been equivalent to revolutions in these countries, and then bitterly to bewail the folly of mankind when his schemes were rejected.

In ethics, as in politics, he pressed his doctrines to extremes. It has been said that his doctrine of utility was so extended that it would have been practically dangerous, but for the incapacity of the bulk of mankind for acting on a speculative theory.

By the death of his father in 1792, B. succeeded to property in London, and to farms in Essex, yielding from £500 to £600 a year. He lived frugally, but with elegance, in one of his London houses (Queen Square, Westminster); and, employing young men as secretaries, corresponded and wrote daily. By a life of temperance and industry, with great self-complacency, in the society of a few devoted friends (who, says Sir James Mackintosh, more resembled the hearers of an Athenian philosopher than the proselytes of a modern writer). B. attained to the age of eighty-four. He died in June 1832.

**BENTHAMIA**, a genus of plants of the natural order *Cornaceæ* (q. v.), consisting of Asiatic trees or shrubs, of which the fruit is formed of many small drupes grown together. *B. frugifera*, a native of Nepaul, is a small tree, with lanceolate leaves, and a reddish fruit, not unlike a mulberry, but larger; not unpleasant to the taste. It has ripened fruit in the south of England, and will probably be found to succeed in the open air, wherever the winters are so mild that fuchsias are not cut down by frost. The flowers are fragrant.

**BENTINCK, LORD WILLIAM GEORGE FREDERICK CAVENDISH**, commonly called Lord George B., at one time the leader of the agricultural Protection party, third son of the fourth Duke of Portland, was born 27th February 1802, and entering the army when young, eventually attained the rank of major. He subsequently became private secretary to his uncle, the Right Hon. George Canning. Elected in 1826 M.P. for Lynn-Regis, he sat for that borough till his death. At first, attached to no party, he voted for Catholic Emancipation and for the principle of the Reform Bill, but against several of its most important details, and in favour of the celebrated Chandos Clause (q. v.). On the formation of Sir Robert Peel's ministry in December 1834, he and his friend Lord Stanley, afterwards Earl of Derby, with some adherents, formed a separate section in the House of Commons. On the resignation of Sir Robert Peel in April following, Lord George openly joined the great Conservative party, which acknowledged that statesman as its head, and adhered to it for nearly eleven years. On Peel's return to power in 1841, Lord George received an offer of office, which he

declined, being at that time deeply interested in the sports of the field and the race-course. When Peel introduced his free-trade measures in 1845, a large portion of his supporters joined the Protection party then formed, of which Lord George became the head, and a leading speaker in the debates. His speeches in the session of 1845—1846 were most damaging to the government of Sir Robert Peel, and contributed in no small degree to hasten its downfall in July of the latter year. Lord George supported the bill for the removal of the Jewish disabilities, and recommended the payment of the Roman Catholic clergy by the landowners of Ireland. In the sporting world he is understood to have realised very considerable gains, and he shewed the utmost zeal at all times to suppress the dishonest practices of the turf. He died suddenly of a spasm of the heart, 21st September 1848, while crossing his father's park at Welbeck Abbey, Nottinghamshire.

**BENTINCK, LORD WILLIAM HENRY CAVENDISH,** a general officer and statesman, uncle of the preceding, and second son of the third Duke of Portland, was born 14th September 1774, and became an ensign in the Coldstream Guards in 1791. Having served with distinction in Flanders, Italy, and Egypt, he was in 1803 appointed governor of Madras, where he advocated several useful reforms; but his proscription of beards and the wearing of turbans and earrings by the sepoys when on duty, led to the mutiny and massacre of Vellore, and his own immediate recall. In August 1808, he was placed on the staff of the army in Portugal under Sir Harry Burrard. Subsequently selected to proceed on an important mission to the supreme Junta of Spain, he accompanied the army under Sir John Moore in its retreat, and at Corunna commanded a brigade. He next commanded a division of Lord Wellington's army, and shortly after was sent as British minister to the court of Sicily, and commander-in-chief of the British forces in that island. At the head of an expedition, he landed in Catalonia in July 1813, penetrated to Valencia, and afterwards laid siege to Tarragona, but was repulsed at Villa Franca. Early in 1814, quitting Sicily, he repaired to Tuscany, published at Florence a proclamation inviting the Italians to shake off the French yoke, and afterwards made himself master of Genoa. Between 1796 and 1826, he held a seat in parliament as member for Camelford, Nottinghamshire, and Ashburton. In 1827, he was appointed governor-general of India, and sworn a privy-councillor. His policy in India was pacific and popular, and his viceroyship was marked by the abolition of Sutti (q. v.), and by the opening up of the internal communication, as well as the establishment of the overland route. After his return in 1835, he was elected M.P. for Glasgow. He died at Paris, June 17, 1839.

**BENTLEY, RICHARD,** a distinguished classical scholar, was born at Oulton, in Yorkshire, January 27, 1662. In 1676, he entered St John's College, Cambridge, in the humble capacity of subizar. Little is known of his university career, except that he shewed early a strong taste for the cultivation of ancient learning. At the usual time, he took the degree of Bachelor of Arts; and on leaving the university, he was appointed head-master of the grammar-school of Spalding, Lincolnshire. About a year afterwards, he resigned this situation to become tutor to the son of Dr Stillingfleet, then Dean of St Paul's, and subsequently Bishop of Worcester. B. accompanied his pupil to Oxford, where he had full scope for the cultivation of classical studies; and, that he succeeded in acquiring there some local reputation, is evinced by his having been twice appointed to deliver the Boyle Lectures on the

Evidences of Natural and Revealed Religion. He entered the church, and owed to the patronage of the Bishop of Worcester various good ecclesiastical appointments, and through the same influence became librarian of the King's Library at St James's. In 1690, he published his *Dissertation upon the Epistles of Phalaris*, which established his reputation throughout Europe, and may be said to have commenced a new era in scholarship. The principles of historical criticism were then unknown, and their first application to establish that the so-called Epistles of Phalaris, which professed to have been written in the 6th c. B.C., were the forgery of a period some eight centuries later, filled the learned world with astonishment.

In 1700, B. was appointed Master of Trinity College, Cambridge; and in the following year, he married Mrs Joanna Bernard, the daughter of a Huntingdonshire knight. The history of B.'s Mastership of Trinity is the narrative of an unbroken series of quarrels and litigations, provoked by his arrogance and rapacity, for which, it must be confessed, he was fully as well known during his lifetime as for his learning. He contrived, nevertheless, to get himself appointed Regius Professor of Divinity, and, by his boldness and perseverance, managed to pass scathless through all his controversies. Notwithstanding that at one time the Bishop of Ely, the visitor of Trinity, pronounced sentence depriving him of his mastership, and that at another the senate of the university pronounced a similar sentence of his academic honours, he remained in full possession of both the former and the latter till the day of his death. This stormy life did not impair his literary activity. He edited various classics—among others, the works of Horace—upon which he bestowed vast labour. He is, however, more celebrated for what he proposed than for what he actually performed. The proposal to print an edition of the Greek New Testament, in which the received text should be corrected by a careful comparison with all the existing MSS., was then singularly bold, and evoked violent opposition. He failed in carrying out his proposal: but the principles of criticism which he maintained have since been triumphantly established, and have led to important results in other hands. He is to be regarded as the founder of that school of classical criticism of which Porson afterwards exhibited the chief excellences, as well as the chief defects; and which, though it was itself prevented by too strict attention to minute verbal detail from ever achieving much, yet diligently collected many of the facts which men of wider views are now grouping together, to form the modern science of comparative philology. B. died in 1742, leaving behind him one son, Richard, who inherited much of his father's taste with none of his energy, and several daughters, one of whom, Joanna, married, and was the mother of Richard Cumberland the dramatist.—Monk's *Life of Richard Bentley*, 1830.

**BENUÉ**, or **BINUÉ**, or, as Dr Barth prefers to spell it, **BENUWE**, called also Chadda and Tchadda; an important river of Central Africa, forming the eastern branch of the Quorra or Niger, which it joins about 230 miles above the mouth of that river in the Gulf of Guinea. At its junction with the Faro, in lat. about 9° 33' N., long. 12° 40' E., the point where Dr Barth crossed, he describes the B. as being 800 yards across, with a general depth in its channel of 11 feet, and 'a liability to rise under ordinary circumstances at least 30 feet, or even at times 50 feet higher.' In 1854, an expedition under the command of Dr Baikie explored the B. as far as Dulti, a place about 350 miles above its confluence with the Niger, and

some 80 or 100 miles from where Dr Barth crossed. Dr Barth regards this river as offering the best channel for the introduction of civilisation into the heart of Central Africa. If not actually connected in some way with the Shari (q. v.), and consequently with Lake Tsad, 'the breadth of the water-parting between these two basins [the Niger and the Tsad], at the utmost, cannot exceed 20 miles, consisting of an entirely level flat, and probably of alluvial soil.... The level of the Tsad, and that of the river B. near Gewe, where it is joined by the Mayo Kebbi, seem to be almost the same; at least, according to all appearance, the B., at the place mentioned, is not more than 850 or 900 feet above the level of the sea.' In a second expedition, 1862, Dr Baikie explored as far north as Kano, in Haussa.

**BENYOWSKY, MAURICE AUGUSTUS, COUNT DE**, a man of remarkable character and extraordinary fortunes, was born at Verbova, in Hungary, 1741. He served in the Seven Years' War, and during his youth displayed that restless love of adventure which marked his subsequent career. He went to Dantzig for the purpose of studying navigation, and from thence made several voyages to Hamburg and Plymouth. When about to start for the East Indies in 1767, he received a pressing invitation to join the Polish Confederation, with which he complied, and shared most of the dangers and glories of the campaign against the Russians until he was taken prisoner in May 1769. After being transferred from one Russian prison to another, he was, in December 1769, banished to Siberia, and from thence, in a few months, to Kamtchatka. During the voyage, his exertions and skill saved the vessel that carried him. This recommended the prisoner to the governor, Nilov, who was further pleased by B.'s skill as a chess-player, and made him tutor in his family. In this capacity he gained the affections of Aphanasia, daughter of the governor, by whom he was assisted in his plans for escape; which, however, was not effected without a struggle, in which the governor was killed. B., with ninety-six companions, in a ship well armed and provisioned, and with a considerable amount of treasure, set sail from Kamtchatka in May 1771. Having visited some of the islands of Japan and Formosa, B. arrived at Macao on the 22d of September, where he remained until the 14th January, and then sailed for France. He had not been here long when the French government proposed that he should found a colony at Madagascar, and he at once acquiesced. B. arrived on the island in February 1774, and was made king in 1776 by the chiefs in conclave, he adopting the native costume. Returning to Europe with a view to establish commercial relations between France and Madagascar, B. met with a very cold reception from the French government, and returned to the service of Austria, in the hope that the emperor would assist him in his schemes—a hope not fulfilled. He next made unsuccessful overtures to the British government, but at length receiving assistance from private persons in England and America, departed again for Madagascar, where he arrived in 1785; and, involving himself in contention with the French government of the Isle of France, was killed in battle, May 23, 1786. B. was a man of remarkable resources, great decision of character, courage, and sagacity. He was particularly well versed in human nature, a knowledge which proved of essential service to him during his brief but most remarkable career.—*Memoirs and Travels of Count de Benyowsky, Written by Himself, and Edited by W. Nicholson* (2 vols 4to. London. 1790).

**BENZERETA, LAKES OF**, the ancient *Hipponitis*

*Palus* and *Sicars Palus*, two lakes within the dominions of Tunis, from which town they are about 30 miles distant, in a north-west direction. They are each about  $9\frac{1}{2}$  miles long, and the larger one, which is clear and salt, is about  $5\frac{1}{2}$  miles broad; the smaller, which is turbid and fresh,  $3\frac{1}{2}$ . They are about two miles apart, but united by a channel with a general depth of 6 feet and breadth of 75. Tunis is supplied with fish mainly from these lakes. So valuable is the fishing, that a wealthy Arab rents it from the Bey of Tunis for £4000 per annum.

**BENZILE, BENZOILE, or BENZOYLE**, is the radicle or root of the group of substances which comprehends as members the hydrate of benzoyl (oil of bitter almonds), benzoic acid, benzoin, and benzole. It is prepared by passing a stream of chlorine gas through fused benzoin, or by heating one part of benzoin with two parts of concentrated nitric acid. B. floats to the upper part of the liquid mixture as a liquid oil, which solidifies on cooling. B. is a tasteless solid, insoluble in water, but readily dissolved by ether and alcohol, and on concentration of the ethereal or alcoholic solution, the B. crystallises in regular six-sided prisms, of a yellow colour. When heated to  $194^{\circ}$  to  $198^{\circ}$ , it fuses. Its composition is expressed by the chemical formula  $C_{14}H_{10}O_4$ , and many chemists name the substance possessing this formula benzile, reserving the title benzole, or benzoyl, for a substance polymeric (see POLYMERISM) with benzile, which has not yet been isolated, but which may be represented by  $C_{14}H_8O_4$ .

**BENZOIC ACID**, or the *Flowers of Benzoin and Benjamin*, occurs naturally in many balsamiferous plants, and especially in Benzoin (q. v.), from which it may be readily obtained by several processes, which it is not necessary here to describe. B. A. is always in the form of snow-white, glistening, feathery crystals, with a fairy aspect of lightness. It has a very fragrant and pleasant aromatic odour, due to the presence of a trace of an essential oil, and a hot bitter taste. It is readily dissolved by alcohol and ether, but sparingly soluble in water. B. A. is one of the materials present in *Tinctura Camphora Composita*, and has been administered in chronic bronchial affections; but the benefit derivable from its use in such cases is questionable. B. A. taken into the stomach, increases within 3 or 4 hours the quantity of hippuric acid in the urine. It forms a numerous class of compounds with the oxides of the metals, lime, &c., called benzoates. The chemical formula for crystallised B. A. is  $HO.C_{14}H_8O_3$ .

**BENZOIN, BENJAMIN, or BENZOIC GUM**, a fragrant resinous substance, formed by the drying of the milky juice of the Benzoin or Benjamin Tree (*Styrax*, or *Lithocarpus Benzoin*), a tree of the natural order *Styracaceæ*, and a congener of that which produces STORAX (q. v.), a native of Siam, and of Sumatra and other islands of the Indian Archipelago. The tree grows to nearly two feet in diameter; the smaller branches are covered with a whitish rusty down; the leaves are oblong, acuminate, and entire, downy and white beneath; the flowers are in compound racemes. B. comes to us in reddish-yellow transparent pieces. Different varieties, said to depend upon the age of the trees, are of very different price; the whitest, said to be the produce of the youngest trees, being the best. There is a variety known in commerce as *Amydaloïdal Benzoin*, which contains whitish almond-like tears diffused through its substance, and is said to be the produce of the younger trees. B. is obtained by making longitudinal or oblique incisions in the stem of the tree: the liquid which exudes soon hardens by

exposure to the sun and air. B. contains about 10—14 per cent. of Benzoic Acid (q. v.); the remainder of it is resin. B. is used in perfumery, in pastilles, &c., being very fragrant and aromatic, and yielding a pleasant odour when burned. It is therefore much used as incense in the Greek and Roman Catholic Churches. Its tincture is prepared by macerating B. in rectified spirit for seven to fourteen days, and subsequent straining, when the Compound Tincture of Benjamin, Wound Balsam, Friar's Balsam, Balsam for Cuts, the Commander's Balsam, or Jenisi's Drose, is obtained. It is frequently applied to wounds directly; or still better, when the edges of the wound are brought together, and bound with lint or plaster, the tincture of B. may be used as an exterior varnish. In the preparation of Court-plaster, sarcenet (generally coloured black) is brushed over with a solution of izinglass, then a coating of the alcoholic solution of benzoin. The tincture is likewise employed in making up a cosmetic styled *Virgin's Milk*, in the proportion of two drachms of the tincture to one pint of rose-water; and otherwise it is used in the preparation of soaps and washes, to the latter of which it imparts a milk-white colour, and a smell resembling that of vanilla. B. possesses stimulant properties, and is sometimes used in medicine, particularly in chronic pulmonary affections. It may be partaken of most pleasantly when beaten up with mucilage and sugar or yolk of egg. The name *Asa dulcis* (q. v.) has sometimes been given to it, although it is not the substance to which that name seems properly to have belonged.—The milky juice of *Terminalia Benzoin*, a tree of the natural order *Combretaceae*, becomes, on drying, a fragrant resinous substance resembling B., which is used as incense in the churches of the Mauritius. It was at one time erroneously supposed that B. was the produce of *Benzoin odoriferum*, formerly *Laurus Benzoin*, a deciduous shrub, of the natural order *Lauraceæ*, a native of Virginia, about 10—12 feet high, with large, somewhat wedge-shaped, entire leaves, which still bear in America the name of *Benzoin*, or *Benjamin Tree*, and is also called *Spice-wood* or *Fever-bush*. It has a highly aromatic bark, which is stimulant and tonic, and is much used in North America in intermittent fevers. The berries are also aromatic and stimulant, and are said to have been used in the United States during the war with Britain as a substitute for pimento or allspice. An infusion of the twigs acts as a vermifuge.

**BENZOLE, BENZINE, or PHENE**, is a compound of carbon and hydrogen ( $C_6H_6$ ), formed during the destructive distillation of coal (see GAS; COAL), and found dissolved in the naphtha which is condensed from the vapours evolved from the gas retort. It may be prepared from coal-tar naphtha by subjecting the tar to a temperature of 32° F., when the B. solidifies, while the other naphtha constituents remain liquid. Two gallons of the naphtha yield a pint of pure rectified benzole. It can also be obtained (1) by subjecting oil-gas to a pressure of 30 atmospheres; (2), by the dry distillation of konic acid (q. v.); and (3) by cautiously heating a mixture of one part of benzoic acid and three parts of quick-lime, when the material which distils over is impure benzola. At ordinary temperatures, B. is a thin, limpid, colourless liquid, evolving a characteristic and pleasant odour. At 32° F., it crystallises in beautiful fern-like forms, which liquefy at 40°; and at 177°, it boils, evolving a gas which is very inflammable, burning with a smoky flame. It readily dissolves in alcohol, ether, turpentine, and wood-spirit, but is insoluble in water. It is valuable to the chemist from the

great power it possesses of dissolving caoutchouc, gutta-percha, wax, camphor, and fatty substances. It is thus of service in removing grease-stains from woollen or silken articles of clothing. When heated, it also dissolves sulphur, phosphorus, and iodine. B., when acted upon by chlorine, nitric acid, &c., gives rise to a very numerous class of compounds.

**BE'NZOYLE, HYDRIDE OF**, is the volatile or essential oil belonging to the benzoic series. It is represented by the formula  $C_6H_5O_2H$ , and has been already considered under ALMONDS, VOLATILE OIL, or ESSENTIAL OIL OF (q. v.).

**BEOWULF**, an Anglo-Saxon epic poem, which is one of the greatest literary and philological curiosities, and one of the most remarkable historical monuments in existence. The date of the events described is probably about the middle of the 5th c.; and as the legends refer to the Teutonic races which afterwards peopled England, it is believed that the poem, in its original shape, was brought by the Anglo-Saxons from their original seats on the continent. Only one MS. of the poem is known to exist; that, namely, in the Cottonian Library, which was seriously injured by the fire of 1731. This MS. consists of two portions, written at different times and by different hands, and is manifestly a copy, executed perhaps about the beginning of the 8th c., from an older and far completer version of the poem. But, even in the form in which it came from the hands of its last recaster, B. is the oldest monument of considerable size of German national poetry, and notwithstanding the Christian allusions which fix the existing text at a period subsequent to 597 A. D., a general heathen character pervades it, which leaves little doubt as to the authentic nature of the pictures which it presents of Teutonic life in ante-Christian times. Much learned labour has been bestowed on this strange relic by Sharon Turner (*Hist. of Anglo-Saxons*, vol. iii.); Conybeare (*Illustrations of Anglo-Saxon Poetry*); Dr G. J. Thorkelin of Copenhagen, who first published the entire work in 1815; and above all, by Mr Kemble, whose beautiful edition was published by Pickering in 1833, and was followed in 1837 by a translation, with glossary, preface, and philosophical notes.

At first Mr Kemble was disposed to regard B. as an historical epic, but his view of it latterly came to be, that though to some extent historical, it must be regarded, in so far as the legends are concerned, as mainly mythological; and this remark he conceived to apply to the hero not less than to the incidents related. But Beowulf, the god, if such he was, occupies only a small space in the poem, and seems to be introduced chiefly for the purpose of connecting Hrothgar, king of Denmark, whom Beowulf, the hero, comes to deliver from the attacks of the monster Grendel, with Scœf or Sceaf, one of the ancestors of Woden, and the common father of the whole mythical gods and heroes of the north. Sceaf is traditionally reported to have been set afloat as a child on the waters, in a small boat or ark, having a *sheaf* (Ang. Sax. *sceaf*) of corn under his head; whence his name. The child was carried to the shores of Slesvig, and being regarded as a prodigy, was educated and brought up as king. Between Sceaf and Beowulf, Scyld intervened, according to the opening canto of the poem; but when compared with kindred traditions, the whole genealogy becomes involved in extreme obscurity, and Scyld seems sometimes to be identified with Sceaf, and sometimes with Woden. But the view of the connection between Beowulf and Sceaf is strengthened by the following considerations. The old Saxons, and most likely the other conterminous tribes, called their

harvest month (probably part of August and September) by the name Beo or Beowod, in all probability their god of agriculture or fertility. Whether, or to what extent, this divinity is identical with the mythical hero of the poem, Mr Kemble does not venture to determine, though he indicates a strong leaning to the affirmative.

But in so far as the main points of historical interest are concerned—viz., the date of the legends, and the race and regions to which they belong—the results of the historical and of the mythological view seem to be pretty nearly the same. The poem falls entirely out of the circle of the Northern Sagas, and probably belongs to Slesvig. All the proper names are Anglo-Saxon in form, but not the slightest mention is made of Britain, the Ongle mentioned being manifestly Angeln (see ANGLES), and not Anglia. From these and many other considerations, the learned editor infers that B. records the mythical beliefs of our forefathers; and in so far as it is historical, commemorates their exploits at a period not far removed in point of time from the coming of Hengest and Horsa, and that in all probability the poem was brought over by some of the Anglo-Saxons who accompanied Cerdic and Cyneric, 495 A.D.

The poem opens with an incident which reminds us of one of the most beautiful of Mr Tennyson's earlier poems, the *Morte d'Arthur*, and seems to shew a similarity between British and Germanic traditions. We give it in the simple words of Mr Kemble's prose translation.

'At his appointed time then Scyld departed, very decrepit, to go into the peace of the Lord; they then, his dear comrades, bore him out to the shore of the sea, as he himself requested, the while that he, the friend of the Scyldings, the beloved chieftain, had power with his words; long he owned it! There upon the beach stood the ringed-prowed ship, the vehicle of the noble, shining like ice, and ready to set out. They then laid down the dear prince, the distributor of rings, in the bosom of the ship, the mighty one beside the mast; there was much of treasures, of ornaments, brought from afar. Never heard I of a comelier ship having been adorned with battle-weapons and with war-weeds, with bills and mailed coats. Upon his bosom lay a multitude of treasures which were to depart afar with him, into the possession of the flood. They furnished him not less with offerings, with mighty wealth, than those had done who in the beginning sent him forth in his wretchedness, alone over the waves. Moreover they set up for him a golden ensign, high over head; they let the deep sea bear him; they gave him to the ocean. Sad was their spirit, mournful their mood. Men know not in sooth to say (men wise of counsel, or any men under the heavens) who received the freight.'

The following is a brief outline of the story: B. is introduced to us, preparing for a piratical adventure. After a vivid description of the embarkation of the hero and his 'friendly Scyldingi,' the scene changes, and the palace of Hrothgar rises before us. Here the Danish king has assembled his warriors, and holds a feast, unconscious of the deadly peril in which he is placed. The 'scop' ('shaper,' from *scapan*, 'to shape' or 'create') sings a poem on the origin of things, and how evil came into the world. This is deftly used to bring upon the stage the 'grim stranger' Grendel, a mighty haunter of the marshes, one that held the moors, fen, and fastness, the dwellings of the monster-race.' Malignant and cruel, he hears with envious hate the sounds of joy echoing from the hall, and stealing into the palace after dark, when the revel is over, he seizes and destroys thirty of the sleeping thegna. In the morning, when the havoc wrought by Grendel becomes known, there is a fierce outcry,

42

and Hrothgar is loudly blamed. Yet twelve winters pass by before the outrage is avenged. The king is continually 'seethed in the sorrow of the time;' but help is at hand. B. has heard of the crimes of the monster, and comes with his Geats (Jutes) to inflict punishment. The voyage over the waves, and the landing of the brave adventurers on the shores of Hrothgar's dominions, is finely told. After some parley with the coast-guards, an interview takes place between the monarch and the hero, who almost pleads to be allowed to deliver the land from the ravages of Grendel. Most tender and pathetic is the passage in which he asks—if fortune should be adverse to him ('if Hilda'—i. e. 'the goddess of slaughter'—should take him away), that they would not mourn over the 'solitary rover,' but plant a 'simple flower' on his cairn, and send back his 'garments of battle' to his lord and kinsman, Higelac. The inevitable feast follows, in the course of which the 'scop' sings of the peace that is to be, and B. enlarges upon his past exploits. Then we have an exquisite picture of the Danish queen: 'There was laughter of heroes, the noise was modulated, words were winsome; Wealthow, Hrothgar's queen, went forth; mindful of their robes, she, hung round with gold, greeted the men in the hall; and the freeborn lady gave the cup first to the prince of the East Danes; she bade him be blithe at the service of beer, dear to his people. He, the king, proud of victory, joyfully received the feast and hall-cup. The lady of the Haimings then went round about every part of young and old; she gave treasure-vessels, until the opportunity occurred, that she, a queen hung round with rings, venerable of mood, bore forth the mead-cup to Beowulf. Wise of words, she greeted the Geat, she thanked God because her will was accomplished, that she believed in any earl, as a consolation against the crimes.' That night, when the shadows of darkness have fallen, Grendel comes swiftly to the palace from the misty moors, and assails Beowulf. A fierce struggle ensues, but the monster is baffled, and obliged to flee. Next day a second feast is held in honour of the hero's success, magnificent gifts are showered upon him by the grateful Hrothgar, the services of the 'scop' are again called into request, music and sports follow, and the queen once more moves through the crowd of warriors with courtesy and grace. The night, however, is not to pass without its tragedy. The mother of the monster secretly enters, and destroys one of the king's dearest thegna. B., in a magnanimous speech, undertakes to avenge him. Having sought the wild haunts of the 'hateful one,' he first slays the mother after a furious combat, in which he would have been vanquished but for the apparition of a magic sword 'over the waves,' which came into his grasp. Grendel is then destroyed, and his head carried off as a present to Hrothgar. B. then returns home, and after a variety of other but less interesting adventures, succeeds to the throne on the death of his kinsman Higelac. Besides the editions and versions referred to above, we may notice Ettmüller's translation of B. into German (*Zür.* 1840); Wackerbarth's metrical version in modern English (*Lond.* 1849); Thorpe's Anglo-Saxon Poems of B., &c. (*Oxford*, 1856); Karl Simrock's German version (*Stuttg.* 1859); Grundtvig's (*Copenhagen*, 1861); Heyne's (*Paderb.* 1863); Grein's (*Cassel*, 1867).

**BEQUEATH**, to leave personal property by will or testament to another. In the case of *real estate*, the proper term to employ is *devise*. But although it is usual and safe so to use these words, neither of them is essential to the validity of an English will, but other words, shewing clearly the intention of the testator, will suffice. In the Scotch law, the term

*B.* can only apply to personal estate. Real estate, indeed, according to the existing regulations of that system, cannot be left or conveyed by will or testament; a testamentary disposition or settlement, expressed in certain technical terms of present conveyance, being necessary for the purpose. See WILL; LEGACY; DISPOSITION (*Mortis Causa*); SETTLEMENT; REAL; PERSONALITY.

REQUEST, a legacy of personal property left by will. See BEQUEATH and its references.

BÉRANGER, JEAN-PIERRE DE, a celebrated French poet, was born in Paris, 19th August 1780, in the house of his grandfather, a tailor in the Rue Montorgueil, to whose care he was left entirely by his father, a scheming and not over-scrupulous financier. After living some time with an aunt at Péronne, to whom he appears to have been indebted for those republican principles which afterwards made him so obnoxious to successive French governments, B., at the age of fourteen, was apprenticed to a printer in that place, where he remained three years, devoting all his leisure hours to the acquirement of knowledge. He now returned to Paris, where his father, a zealous royalist, was engaged in some questionable schemes of money-getting, which were mixed up with conspiracy. B. assisted him in his money affairs, so far as he honourably could, and kept his political secrets; but he did not disguise his contempt for the royalist cause, nor fail to express his opposite sympathies. The business, however, was not one to the taste of B., who was throughout the whole of his life a man of the most sensitive honour, and he soon left it. He had ere this begun to write, but his poems were not successful; and reduced almost to destitution, he, in 1804, enclosed some of his verses to M. Lucien Bonaparte, with a letter explaining his circumstances, and with a request for assistance—the one solitary instance of solicitation during a long life of independence, marked by the refusal of numerous offers of lucrative patronage. The appeal was not made to a deaf ear. M. Bonaparte obtained employment for the poet, first as editor of the *Annales du Musée*, and afterwards as a subordinate secretary in the University; a post which he held for twelve years, when the government, provoked at his satire, and alarmed at his popularity, dismissed him. During the 'Hundred Days,' Napoleon offered B. the remunerative post of censor—a singular office for such a man. He refused it. But though he scorned to accept favour from, or to flatter Napoleon, at a time when it was alike fashionable and profitable to do so, he was of much too noble a nature to join in the sneers and reproaches which greeted the hero on his fall. Above the fear of power, he was incapable of taking advantage of misfortune. In 1815, B. published his first collection of songs, which soon attained a very wide popularity. In 1821, he published another collection, which was followed shortly after by some fugitive pieces, which subjected him to a government prosecution, a sentence of three months' imprisonment, and a fine of 500 francs. In 1825, a third collection, and in 1828, a fourth appeared, still more withering in its sarcasm on those in power; and the penalty of B.'s outspokenness was a fine of 10,000 francs, and nine months' confinement in La Force. The fine was soon paid by the poet's friends, and his prison became the resort of the most eminent men in the kingdom, and a very armoury in which he forged those keen-piercing bolts which galled so terribly, and contributed so much to the overthrow of the Bourbons. But B. refused to profit by the new state of things he had been instrumental in bringing about. Rejecting the emoluments and honour which his friends, now in

power, were anxious to bestow, he retired to live in privacy at Passy. In 1833, he published a fifth collection of songs, when he took a formal leave of the public; and from that time until the day of his death, twenty-four years after, he remained silent. In 1848, B. was elected a member of the Assemblée Constituante by more than 200,000 votes; but after taking his seat, to shew his appreciation of the honour conferred on him, he almost immediately resigned. He consistently rejected all the offered favours of the late Emperor, as well as a graceful overture on the part of the Empress, which he owned it cost him much to refuse. B. died at Paris, July 17, 1857. The cost of his funeral was defrayed by the French government, and his remains were attended to the grave by the most distinguished men in all departments of literature. B. was as emphatically the poet of the French people as Burns was the bard of the Scottish peasantry. The same stanch and fearless independence, genuine manliness, sound common sense, and contempt for everything mean and hypocritical, characterised both men; and as poets, they differ in excellence only as the sentiments of the French and Scottish people differ in their capacity to be turned into song. 'Neither friend nor enemy has as yet disclosed to us any speck on the heart, the honour, the genius, or the good sense of Béranger.' Since his death, his *Last Songs*, written between 1834 and 1851, have been published, and also *My Biography* (Paris, M. Perrotin; London, Jeffs). See *My Biography*; and *Memoirs of Béranger*, by M. Lapointe (Paris, 1857).

BERA'R, a valley situated locally in the Nizam's territories, but annexed politically to British India, for the maintenance of what is called the Nizam's Contingent. It is bounded on the N. by a detached portion of Scindia's dominions and the Narbuda provinces; on the E., by Nagpoor; on the W., by Candesh; and on the S., by two of the Nizam's remaining districts—Maiker Bassim and Mahur. It lies between 20° 15' and 21° 40' N. lat., and between 76° and 78° 2' E. long., having an area of about 9000 square miles. It is traversed in its length by the Poornah—itself a tributary of the Taptee—which, with its numerous affluents, affords an ample supply of water to the valley, and, on other grounds, is peculiarly suitable to the cultivation of cotton. The transfer in 1853 from the Nizam to the British has proved favourable to this production: about 25 per cent. of the area is devoted to cotton. In the east part there is a coal-field of 40 square miles, and at Akolah, in Purana, there are salt wells fed by a subterranean lake. Though Ellichpore is the chief town, yet it is inferior to Comrawattee, the dépôt for the raw cotton.

BERA'T, a town of Albania, European Turkey, in the pashalic of Avlona, situated on the banks of the Tuberathi or Ergent, about 30 miles north-east of the seaport of the same name. It has a population of from 8000 to 10,000, two-thirds of whom are Greeks; the remainder, Turks. The valley in which B. stands is very fertile, producing large quantities of grain, oil, and wine. B. has a citadel, and traces of ancient Greek buildings, and gives title to a Greek archbishop.

BERBERA, a seaport station of Somali, Eastern Africa, with a good harbour, on a bay of the Gulf of Aden. Lat. 10° 26' N., long. 45° 8' E. It is celebrated as the scene of a large annual fair, which brings nearly 20,000 people together from all quarters in the East. Coffee, grains, ghee, gold-dust, ivory, gums, cattle, ostrich-feathers, slaves, &c., are brought down to this place from the interior on strings of camels, sometimes numbering as many as 2000, and exchanged for cotton, rice, iron, Indian

piece-goods, &c. As soon as the fair—which usually extends from November to April—is over, the huts are carefully taken down, and packed up, and nothing remains to mark the site of the town but the bones of animals slaughtered for food during the continuance of the fair.

**BERBERIDEÆ**, or **BERBERIDA'CEÆ**, a natural order of exogenous plants, of which the different species of Barberry (q. v.) afford the best known examplea. Many of the plants of this order are spiny shrubs; some are perennial herbaceous plants. Their leaves are alternate, their flowers sometimes solitary, sometimes in racemes or panicles. The calyx consists of 3, 4, or 6 deciduous sepals; the corolla, which arises from beneath the germen, consists of petals equal in number to the sepals, and opposite to them, or twice as many; the stamens are equal in number to the petals, and opposite to them; the anthers are 2-celled, each cell opening curiously by a valve which curves back from bottom to top; the carpel is solitary and 1-celled; the fruit is either a berry or a capsule. This order, which is nearly allied to *Vitaceæ* (q. v.), (Vines, &c.), contains more than 100 known species, chiefly belonging to the temperate parts of the northern hemisphere, and of South America.

**BERBERS**, the general name usually given to the tribes inhabiting the mountainous regions of Barbary and the northern portions of the Great Desert. It is derived, according to Barth, either from the name of their supposed ancestor, *Ber*, which we recognise in the Lat. *A-ser*, an African (see letter B); or from the Greek and Roman term *Barbari*. The name by which they call themselves, and which was known to the Greeks and Romans, is *Amâzigh*, or *Mazigh*, *Mazys*, *Amoshagh*, &c., according to locality, and whether singular or plural. These tribes have a common origin, and are the descendants of the aboriginal inhabitants of Northern Africa. They appear to have been originally a branch of the Semitic stock; and although they have been conquered in succession by the Phoenicians, Romans, Vandals, and Arabs, and have become, in consequence, to some extent, a mixed race, they still retain, in great part, their distinctive peculiarities. Till the eleventh century, the B. seem to have formed the larger portion of the population inhabiting the southern coast of the Mediterranean, from Egypt to the Atlantic Ocean; but, on the great Arab immigrations which then took place, they were driven to the Atlas Mountains, and to the desert regions where they now live. In Tripoli, the allegiance they pay to the Turks is little more than nominal; in Algeria, where they usually are termed Kabyles, they are yet unconquered by the French; and in Morocco, where they are called 'Shellooh,' they are only in form subject to the emperor. The B. occupying the desert, who are called Tuasic, or Tawarek, by the Arabs, have become much mixed with the negro race. The number of the B. is estimated at between three and four millions. They are of middle stature, sparingly but strongly built. The complexion varies from a red to a yellow brown, and the shape of the head and of the features has more of the European than the oriental type. The hair is, in general, dark, and the beard small. The eyes are dark and piercing. Their manners are austere, and in disposition they are cruel, suspicious, and implacable. They are usually at war either with their neighbours or among themselves; are impatient of restraint; and possessed of a rude, wild spirit of independence, which makes it impossible for them to unite for any common purpose, or to make the advances in civilisation which one might otherwise

expect from their high physical organisation. They live in clay-huts and tents; but, in their larger villages, they have stone-houses. They have herds of sheep and cattle, and practise agriculture, and are especially fond of the cultivation of fruit-trees. They possess water-mills and oil-presses. The mines of iron and lead in the Atlas are wrought by them, and they manufacture rude agricultural implements, as well as swords, guns, and gunpowder. They formerly professed the Christian religion; but since the Arabs drove them from the fertile plains between the mountains and the sea, they appear to have retrograded in every way, and they are now among the most bigoted adherents of the religion of Mohammed; although their former creed has left a few traces, as in the names *Mesi* for God, and *angelus* for angel, and many curious customs still observed among them. See Barth's *Africa*, vol. i.

**BERBI'CE**, the east division of British Guiana, having its middle division, Demerara, on the W.; the Atlantic on the N.; Dutch Guiana or Surinam on the E.; and on the S., the basin of the Amazon, or rather, perhaps, the upper waters of the Surinam. From being a Dutch possession, this part of the coast, between the Amazon and the Orinoco, fell under the power of England in 1796. It was, however, soon restored to Holland at the peace of Amiens, but only to be recaptured in 1803. It stretches in long. between 57° and 58° W., and in lat. indefinitely southward, from about 6° 30' N. B. is subdivided into six parishes. The population is above 27,000, of whom nearly 4000 are whites; and the principal products are sugar, coffee, and cotton. But details generally of trade and statistics, and of climate also, may be more easily and satisfactorily treated under the general head of BRITISH GULANA, than under the separate divisions of B., Demerara, and Essequibo. New Amsterdam, standing on the right bank of the river near its mouth, is at once the chief town and the seaport of the district. The Berbice river, though by no means the largest in the colony, is navigable certainly to the greatest distance from the sea. While the vastly more considerable Essequibo is interrupted by rapids within 50 miles of the coast, the Berbice admits a draught of 12 feet for 100 miles, and one of 7 feet for 60 more, the influence of the tide reaching nearly the whole way; and even as far as lat. 3° 55' N.—175 miles from its outlet by the crow's flight—it was found to have still a width of 100 feet, with a depth of from 8 to 10.

**BERCHE'MIA**. See SUPPLE JACK, in SUPP.

**BERCHTA** (in Old German, *Peracta*, and the original form of the name *Bertha*, being from the same root as the English word *bright*, and meaning 'shining,' 'white') is, in German mythology, the name given in the south of Germany and in Switzerland to a spiritual being, who was apparently the same as the *Hulda* (gracious, benign) of Northern Germany. This being represented originally one of the kindly and benign aspects of the unseen powers; and so the traditions of *Hulda* (q. v.) in the north continued to represent her. But the B. of the south, in the course of time, became rather an object of terror, and a bugbear to frighten children; the difference probably arising from the circumstance, that the influence of Christianity in converting the pagan deities into demons was sooner felt in the south than in the north. Lady B. has the oversight of spinners. The last day of the year is sacred to her, and if she find any flax left on the distaff that day, she spoils it. Her festival is kept with a prescribed kind of meagre fare—oatmeal-gruel, or pottage, and fish. If she catches any persons eating other food on that day, she cuts them up, fills their

paunch with chopped straw and other such agreeable stuffing, and then sews up the wound with a plough-share for a needle, and an iron chain for a thread. In some places, she is the queen of the crickets. She is represented as having a long iron nose and an immensely large foot. That she was once an object of worship, is testified by the numerous springs, &c., that bear her name in Salzburg and elsewhere. It is likely that many of the Sagas of B. were transferred to the famous Berthas (q. v.) of history and fable. The numerous stories of the 'White Lady' who appears in noble houses at night, rocks and nurses the children while the nurses are asleep, and acts as the guardian angel of the race, have doubtless their root in the ancient heathen goddess Berchta.

**BERCHTESGADEN**, a village of Bavaria, charmingly situated on a mountain slope, about 15 miles south of Salzburg. Pop. 1900. It has a royal hunting-lodge, but the place is most remarkable for its government salt-mines, from which 16,000 cwt. of rock-salt is annually obtained. During the residence of the court, the mine is sometimes illuminated, and its chambers are then seen to great advantage.

**BERCY**, a town of France, in the department of the Seine, situated on the right bank of the river of the same name. B. forms a suburb of Paris, and its population is reckoned as a portion of that of the capital. It has a large business in wines and other liquors.

**BERDIANSK**, a well-built seaport town of Southern Russia, government of Taurida, on the northern coast of the Sea of Azov. B. has the finest roads in the Sea of Azov, and is a place of commercial activity, being the entrepot for the products of surrounding governments. It trades in fish, wood, grain, coal, and salt; there are extensive coal-mines and salt-lakes in its vicinity. Pop. (1867) 12,465. In 1855, during the Crimean campaign, Captain Lyons destroyed government property to a large amount, but the town was spared.

**BERDITCHEV**, a town of Russia, in the government of Kiev, famous for its four annual fairs. At these, cattle, corn, wine, honey, leather, &c., are disposed of. The average annual value of the sales is £600,000. Pop. (1867) 52,786, chiefly Jews.

**BERE'ANS**, an almost extinct sect of Christians, who originated in Scotland in the 18th c. Their name is derived from the circumstance that the inhabitants of Berea 'received the word with all readiness of mind, and searched the Scriptures daily.'—Acts xvii. 11. The founder of the B. was the Rev. John Barclay, a native of Perthshire, b. 1734, d. 1798. From him they also received the name of Barclayans. They believe that the knowledge of God's existence and character is derived from the Bible alone, and not from reason or nature; that the Psalms of David do not relate to David at all, but exclusively to Christ; that assurance is of the essence of faith; and that unbelief is the unpardonable sin. In the ordinary points of doctrine, they are Calvinistic.

**BERENGAR I.**, king of Italy, was the son of Eberhard, Duke of Friuli, and of Gisela, the daughter of the Emperor Louis the Pious. He and Guido, Duke of Spoleto, were the two most powerful and ambitious nobles in Italy at the close of the 9th c. After the deposition of Charles the Fat in 887, B., Guido, and Adalbert, Count of Tuscany, became candidates for the Carlovingian throne. B. was crowned king of Italy at Pavia in 888, while Guido attempted to secure the realm of France. The former soon irritated the nobles against him by condescending to hold his territory in fief from Arnulf, king of Germany, against whom he found it

vain to maintain his independence; and when Guido returned from his unsuccessful expedition to France, he was persuaded to put himself in opposition to B., and was chosen king of Italy. With the help of Arnulf, however, B. ultimately prevailed. After the death of Guido in 894, his son Lambert compelled B. to share with him the sovereignty of North Italy; but, on the assassination of Lambert in 898, B. contrived to obtain possession of the whole of Lombardy. His influence quickly sank. He could check neither the plundering incursions of the Hungarians across the Alps in the north, nor those of the Arabs, who laid waste the shores of the south. The nobles now called in Louis, king of Lower Burgundy, who was crowned at Rome in 901; but he proved no better, and was finally overpowered by Berengar. In 915, B. was crowned emperor by Pope John X.; but the nobles, who appear to have kept themselves during his reign in a state of chronic disaffection, again revolted, and, in 919, placed themselves under the banner of Rodolf of Burgundy, who completely overthrew B. on the 29th July 923. The latter, in his extremity, called in the Hungarians to his aid, which unpatriotic act alienated the minds of all Italians from him, and cost him his life, for he was assassinated in the following year, 924.

**BERENGAR II.**, the son of Adalbert, Count of Ivrea, and grandson of Berengar I., succeeded to his father's possessions in 925, and married Willa, niece of Hugo, king of Italy, in 934. Incited by his ambitious and unscrupulous wife, he conspired against Hugo, and in consequence was compelled to flee to Germany, where he was received in a friendly manner by the Emperor Otto I. In 945, he recrossed the Alps at the head of an army. The nobles and the townspeople both welcomed him; but, instead of assuming the crown himself, he handed it over to the weak Lothaire, the son of Hugo. On the death of Lothaire, who was probably poisoned by Willa, B. allowed himself to be crowned along with his son Adalbert, in 950. To establish himself firmly in his new position, he wanted Adelheid, the youthful widow of Lothaire, to marry his son. She refused, and was subjected to a most cruel imprisonment, but ultimately found a helper and husband in the Emperor Otto himself, who, at the imperial diet of Augsburg in 952, compelled B. to acknowledge Italy to be a fief of the German empire. B. soon after engaged in war with the emperor, who sent his son Ludolf against him. Ludolf was successful, but died in 957, of poison administered, as was believed, by Willa. B. again mounted the throne, but behaved with such intolerable tyranny that his subjects and Pope John XII. called in the aid of the emperor, who marched into Italy in 961, and took possession of the country. B. took refuge in a mountain-fortress, where he held out till 964, when hunger compelled him to capitulate. He was sent as a prisoner to Bamberg, in Bavaria, where he died in 966. His wife, Willa, retired into a convent, and his three sons died in exile.

**BERENGA'RIOUS OF TOURS**, a distinguished scholastic theologian, was born at Tours, in France, 998 A.D. His master, Fulbert de Chartres, is reported to have prophesied on his death-bed that B. would prove a dangerous man. In 1030, he was appointed preceptor of the school of St Martin, in Tours, and in 1040, made Archdeacon of Angers. Here he continued to deliver his metaphysico-theological prelections, and drew upon himself the charge of heresy, in reference to the doctrine of transubstantiation. He held the doctrine of Scotus Erigena, that the bread and wine in the sacrament of the eucharist remained bread and wine, and that

the faith of the believer who recognised their symbolic meaning only transformed them subjectively into the body and blood of Christ. This interpretation was condemned by Pope Leo IX., 1049—1050, and also by King Henry I. of France. In 1054, he retracted his opinion before the Council of Tours, but what B. meant by 'retraction' it is not easy to see, for he immediately returned to his conviction, and recommenced the advocacy of it. For this he was cited to appear at Rome, where he repeatedly abjured his 'error,' but never seems to have really abandoned it. Hildebrand, who was then pope, treated him with great moderation; and at last, when he discovered how hopeless it was to bind down B. by abjurations or declarations, he conceived it best to let him alone. Harassed and weakened by the attacks of the orthodox party, headed by Lanfranc of Canterbury, he finally retired to the isle of St Cosmas, near Tours, in 1080, where he spent the last years of his life in devotional exercises. He died in 1088. The greater number of his works are lost; such as are extant have been collected and published by the Vischers (Berlin, 1834).

**BERENICE**, the name of several celebrated women of ancient times.—1. B., daughter of Lagos and Antigone, and the second wife of the Egyptian king, Ptolemy I. (Soter), (323—284 B.C.). She is described by Plutarch as the first in virtue and wisdom of the wives of Ptolemy. Theocritus celebrates her beauty, virtue, and deification in his *Idylls* 15 and 17.—2. B., daughter of Ptolemy II. (Philadelphus) and Arsinoë, was married to Antiochus II. of Syria, after he had divorced his wife Laodice, whom, however, he again took back, putting B. away. Laodice having no faith in her husband, poisoned him, and caused B. and her son to be murdered.—3. B., daughter of Magas, king of Cyrene, granddaughter of B. No. 1, was to have been married to Demetrius the Fair, but he having slighted her for her mother, she caused him to be murdered, and then went to Egypt and married Ptolemy III. (Euergetes), in accordance with the terms of a treaty between her father and Ptolemy II. During the king's wars in Asia, the queen B. made a vow to offer her beautiful hair to the gods when her husband returned safely—a vow which she fulfilled. The hair was suspended in the temple of Venus, whence, it is said, it was taken away to form a constellation, *Coma Berenica*. B. was put to death by her son, Ptolemy IV. (Philopator), when he succeeded to the throne.—4. B., also called Cleopatra, daughter of Ptolemy IX. (Lathyrus), was, on her succession to the throne, married to Alexander II., by whom she was murdered 19 days after marriage.—5. B., daughter of Ptolemy XI. (Auletes), eldest sister of the renowned Cleopatra, was raised to the throne after her father's deposition, 58 B.C., but was put to death when her father was restored, 55 B.C. She was first married to Selenus, whom she caused to be put to death, and afterwards to Archelaus, who was put to death with her.—There were, besides, two Jewish Berenices—the one, daughter of Salome, sister of Herod the Great and Costobarus, and mother of Agrippa I.; the other, and more famous, was daughter of this monarch. She was three times married: first, at a very early age, to Marcus, son of Alexander the Alabaz; afterwards to her uncle, Herod, king of Chalcis, who dying, left her for the second time a widow, at the age of 20; and again to Polemon, king of Cilicia, whom she soon deserted to return to her brother, King Agrippa II., the same before whom Paul defended himself at Caesarea. After the capture of Jerusalem, she went to Rome, and Titus, who was much in love with her, would have married her but for the opposition of the people. The intimacy

of B. and Titus forms the subject of a tragedy by Racine.

**BERENICÉ** (modern name, Sakfyt-el-Kublee, 'Southern Sakyt'), a town of Egypt, on a bay in the Red Sea, 20 miles south-west of Ras Bernass. It was founded by Ptolemy Philadelphus, and was in ancient times the emporium of the trade with India, but it is now ruined, and interesting only for its antiquities, which include hieroglyphica, sculptures, and a temple dedicated to Serapis. There are emerald mines in its vicinity that have been worked since the time of the ancient Egyptians.

**BERESFORD**, WILLIAM CARE, VISCOUNT, a distinguished military commander, natural son of the first Marquis of Waterford, was born 2d October 1768, and entered the army in 1785. After serving in various parts of the world, he bore a conspicuous part in the reconquest of the Cape of Good Hope in 1806, and subsequently, with the rank of brigadier-general, was with the British force that took possession of Buenos Ayres. In August 1803, he joined the British army in Portugal, and proceeded into Spain with Sir John Moore's force; was present at the battle of Corunna; and, after covering the embarkation of the troops, returned with them to England. In February 1809, Major-general B. was ordered a second time to Portugal, to take the command of the Portuguese army, with the local rank of lieutenant-general; and he succeeded in improving its discipline so greatly, as soon to render it highly efficient for active service. Appointed Marshal of Portugal in March, at the head of 12,000 men, he attacked the French in the north of that kingdom, crossed the river Douro, drove Loison's division back to Amarante, and uniting with the force under Sir Arthur Wellesley, pursued it in its retreat till it was utterly disorganized. For his services at the battle of Busaco, 27th August 1810, B. was nominated a Knight of the Bath. He commanded at the bloody battle of Albuera, May 16, 1811; and for the victory there gained over Soult, he received the thanks of parliament. He was present at Badajoz; at Salamanca, where he was severely wounded; at the various battles on the Pyrenees; at Nivelle, where he led the right of the centre; at Nive; and at Orthez. He was in command of the British troops which took possession of Bordeaux, and subsequently distinguished himself at the battle of Toulouse. In May 1814, he was created Baron, and in 1823 Viscount Beresford. By the Portuguese government, he was sent, in 1814, to Rio Janeiro, to suppress a formidable revolt there. In the Wellington administration, January 1828 to November 1830, he was Master-general of the Ordnance. He bore the title of Marquis of Campo Mayor and Duke of Elvas in Spain, Conde de Francoso in Portugal, and was knight of several foreign orders. He died, without issue, 8th January 1854, when the title became extinct.

**BERESINA**, or BEREZINA, a river of Russia, having its rise in the north of the government of Minsk. It flows in a southward direction for about 240 miles to the Dnieper, which it joins above Redchitska. It is connected with the Dina, or Dwina, by a canal, a communication between the Black and Baltic Seas being thus established. The B. is memorable on account of the disastrous passage of the French army, November 1812, during the retreat from Moscow. Two bridges over the B.—one for troops, the other for baggage and artillery—were hastily constructed. Many of the pontoniers died from the hardships endured in making these bridges. On the 27th, the passage of the French commenced, and was continued

during the whole of the day. Victor's rear-guard of 7000 men, under Partonneaux, were, however, intercepted by the Russians, and had to capitulate. On the 28th, a vigorous attack was made by the Russians on the French on both sides of the river, but too late to prevent the latter securing the road to Zembin. The Russians, however, established a battery of twelve pieces to command the bridge; and the panic and confusion of their enemies now became dreadful. The artillery bridge broke, and all rushing to the other, it was soon choked; multitudes were forced into the stream, while the Russian cannon played on the struggling mass. On the 29th, a considerable number of sick and wounded soldiers, women, children, and sutlers, still remained behind, despite the warnings of Marshal Victor and General Ebé, until preparations were made for burning the bridges. Then a fearful rush took place; and as the fire seized the timbers, men, women, and children threw themselves in desperation into the flames or the river. 12,000 dead bodies found on the shores of the river, when the ice thawed, attested the magnitude of the French disaster. The Russians took 16,000 prisoners and 25 pieces of cannon.

**BERETTYO-UJFALU'**, a market-town of Hungary, county Bihar, with a pop. (1869) of 5760.

**BEREZNA**, a town of Russia, in the government of Tchernigov, on the Dneiss. Pop. (1867) 9678.

**BEREZO'V, or BERESOFF** ('the town of birches'), a town of Siberia in the government of Tobolak, on the left bank of the Sosva, a branch of the Obi, in lat. 63° 30' N. It is a small place, but important as the sole fur and skin trading station in a vast extent of country. Its annual fair is largely attended. It is the favourite residence of the Ostiaks and Voguls. Prince Menschikoff, the favourite of Peter the Great, who was banished to B., died and was buried here in 1731. His grave was opened 90 years afterwards, when his body, clothed in the uniform of the time, was found as free from decay as on the day it was buried, the frost, which at B. penetrates the soil to the depth of several feet, having preserved it. Pop. 1561.

**BERG, BURG, BURGH**, roots entering into the composition of many names of places. *Berg* (Ger.), *Beorg* (Ang.-Sax.), means 'hill,' 'mountain'; and *burg*, or *bryg*, means 'fort,' 'castle,' 'citadel,' probably from being situated on a hill or eminence. See **BOURGUE, BURGE**.

**BERG**, formerly a duchy of Germany, now incorporated with the Prussian dominions, and divided into the circles of Düsseldorf, Solingen, Elberfeld, Lennep, and Duisburg. After various vicissitudes, B. had merged in the electorate of Bavaria. In 1806, Bavaria ceded it to France; and Napoleon the same year adding to it large adjoining territories, made its area about 6700 square miles, and erected it into a grand duchy, constituting his brother-in-law, Murat, sovereign. Two years afterwards, Murat, being transferred to the throne of Naples, Napoleon's nephew, then Crown Prince of Holland, was made grand duke. The peace of 1815 gave B. to Prussia.

**BERGA'MA** (ancient *Pergamos*), a city of Asiatic Turkey, pastoral Anatolia, situated in a beautiful and fertile valley, on the right bank of the Caucasus, about 40 miles north-north-east of Smyrna. Lat. 39° 4' N., and long. 27° 12' E. In early times, the city was the capital of the kingdom of Pergamus (q. v.). Many ruins still exist to attest the former magnificence of Bergama. The present population of B. is about 15,000, four-fifths of whom are Turks.

**BERGAMO** (the ancient *Bergomum*), a fortified town of Lombardy, situated on some low hills between the Serio and the Brembo, about 29 miles

north-east of Milan, in lat. 45° 42' N., and 9° 37' E. B. consists of two parts—the upper city, wherein the nobility, an exclusive class, reside; and the Borgo, a suburb where business is transacted. Pop. (1872) 37,363. B. is well built, has a castle occupying the most elevated part of the town, and a cathedral. Silk, cotton, linen, woollen fabrics, and iron goods, are manufactured. It has also an extensive trade in grindstones, quarried in the vicinity. Annually, in the month of August, the largest fair in Northern Italy is held here, at which money to the estimated amount of £1,200,000 is turned over. Under the Roman empire, B. became a municipal town of importance. It was destroyed by Attila, 452 A.D.; and after the fall of the Roman empire, it became one of the chief towns of the Lombard kings in this part of Italy, and capital of a duchy. After numerous changes, its inhabitants placed themselves under the protection of the Venetian Republic in 1427, and formed an integral portion thereof (with one exception of 9 years) until the subversion of the republic by Napoleon in 1797. Bernardo Tasso, the father of Torquato, and Tiraboschi, author of *The History of Italian Literature*, were natives of Bergamo. B. is the capital of the province of the same name, which has an area of 928 square miles, a pop. (1871) of 368,152, and good pasture for sheep and goats; iron, marble, lignite, and whetstones, are also found.

**BERGAMOT** is the name of various kinds of pear, to which, however, no common distinctive character can be assigned. The name is used both in Britain and upon the continent of Europe. The proper B. pear is probably the *B. Crassane*, a flattish, rough-skinned pear with a long stalk. It has a very juicy pulp, as soft as butter, of an extremely pleasant flavour, and is esteemed as one of the best dessert pears. Metzger, in his work on the pomaceous fruits (*Kernobotsorien*) of the south of Germany (Frankfort, 1847), describes no fewer than 47 kinds of pears, which all bear the name of B., although some of them differ very widely from each other.

**BERGAMOT** is also the name of a species or variety of the genus *Citrus* (q. v.), also called the *B. ORANGE, or MELLAROSA*; by some botanists regarded as a variety of the orange (*C. Aurantium*); by others, as a variety of the lime (*C. Limetta*); and elevated by Risso to the rank of a distinct species, under the name of *C. Bergamia*. Of its native country or origin, nothing can be told, except that it was probably derived, like its congeners, from the East. It is now cultivated in the south of Europe; and from the rind of its fruit, the well-known Oil or B. is obtained, which is extensively used in making pomades, fragrant essences, eau de Cologne, liqueurs, &c. The fruit is pear-shaped, smooth, of a pale-yellow colour, and has a green, subacid, firm, and fragrant pulp. The essential oil is obtained by distillation, or by grating down the rinds, and then subjecting them to pressure, which is the better method. The oil is also obtained from other varieties or species of the same genus. It is of a pale-yellow colour, or almost colourless. One hundred B. oranges are said to yield about  $\frac{1}{2}$  ounces of oil. Oil of B. is frequently employed for diluting or adulterating the very expensive blue volatile oil of chamomile (q. v.).

**BERGEN**, a seaport town of Norway, in the province of the same name, situated on a promontory at the head of a deep bay, called Vaagen. Lat. 60° 24' N., long. 5° 18' E. With the exception of the north-east side, where lofty mountains enclose it, B. is surrounded by water. It is walled, and additionally protected by several forts, mounting in all upwards of 100 guns. The entrance to

## BERGEN-OP-ZOOM—BERGHEM.

the harbour is dangerous without a pilot; but within, it is safe and commodious. B. is built in a semicircular form round the harbour, and has a picturesque appearance from the sea. A close inspection discovers it to be generally well and substantially built, but many of the streets are crooked and narrow. It has a cathedral, various churches, hospitals, refuges for the poor, public libraries, &c.; is the seat of a secondary judicial tribunal, of one of the three national treasures, the diocese of a bishop, and the station of a naval squadron. Its chief manufactures are tobacco, porcelain, and cordage. It has numerous distilleries, and some ship-building yards. The principal trade of B., however, is its export of stock-fish (dried fish of the cod family) and cod-liver oil, which it obtains from the northern provinces. Twice a year, the Norlandmen come to B. with their fish, receiving in exchange for them such articles of necessity or luxury as they require. In March and April, as many as 600 or 700 vessels are to be seen in the harbour of B. at once, laden with the produce of the winter-fishing, and with skins and feathers. The summer-fishing is not quite so productive. The annual value of the stock-fish exported from B. is about 2,000,000 specie dollars (£450,000). In addition, it exports about half a million barrels of herrings, and 20,000 barrels of cod-liver oil, the finest of which is used for medicinal purposes and for lamps, the coarsest for dressing leather. The chief imports are brandy, wine, corn, cotton, woolens, hemp, sugar, coffee, &c. The climate of B. is exceedingly humid, but not unhealthy. B. was founded in 1069 or 1070, by Olaf Kyrre, who made it the second city in his kingdom, and it was soon raised to the first rank. In 1135, King Magnus had his eyes put out here by his rival, Harald Gille, who was himself murdered in B. a year after. In 1164, the legate of the pope crowned King Magnus Erlingson here; and here, a century afterwards, King Hakon was crowned. The black pestilence, which ravaged Norway, first made its appearance in B. in 1348, and the city has since been several times devastated by it. The first treaty entered into with any foreign nation by England, was made with B. in 1217. But the English and Scottish traders were soon displaced by the merchants of the Hanse towns, who continued to exercise and abuse their monopoly until their supremacy was broken by an act issued by Frederick II. of Denmark, in 1560; and in 1763, their last warehouse fell into the hands of a citizen of Bergen. B. is still the most important trading-town of Norway, but Christiania is rapidly making up to it. Pop. (1870) 30,252.

BERGEN-OP-ZOOM, a strong fortress in the province of North Brabant, Holland, about 20 miles north of Antwerp, stands on the little river Zoom, at its entrance into the east branch of the Scheldt. Lat. 51° 29' N., long. 4° 17' E. The importance of its position has rendered it the object of many a contest. The Netherlanders made it one of their strongholds in their struggles with Spain. The Prince of Parma besieged it in vain in 1588; three assaults by the Spaniards in 1605 also failed, as did the siege by the Marquis of Spinola, in 1622, which, after a duration of 78 days and a loss of 10,000 men, was raised on the arrival of Prince Maurice of Orange. The fortifications were afterwards strengthened by the engineer Coehorn, so as to give it the reputation of being impregnable. Yet the French, under Count Löwendal, in 1747, after a siege of two months, and the springing of 41 mines by the assailants, and 38 by the defenders, took the place by storm. In the winter of 1794, it capitulated to Fichegru. Being incorporated with France in 1810,

it was blockaded by the English in 1814, who, under Sir Thomas Graham, attempted to surprise the fortress on the night of the 8th of March, with a force of 4000, but after carrying the greater part of the works, they were, through remissness in sending support, overpowered by the brave garrison, and either slain or forced to surrender. The French gave up the fortress under the Treaty of Paris. B. has manufactures of earthenwares, and a large trade in anchovies. Pop. 8500.

BERGERAC, a town of France, in the department of Dordogne, about 25 miles south-south-west of Périgueux. It is situated in a fertile plain on the right bank of the river Dordogne, which is here crossed by a fine bridge of five arches. Its principal manufactures are paper, serges, hosiery, hats, earthenware, and iron and copper articles. It is the entrepot of the trade of the department. The department of Dordogne is celebrated for its wine, which is called B. wine, and also *small champagne*. It is both white and red in colour, and takes a high place among the Garonne and Bordeaux wines. B. was taken and fortified by the English in 1345, who, after being driven out by Louis of Anjou, again got possession of it, and retained it until 1450. B. suffered greatly in the religious wars. It was dismantled by Louis XIII. in 1621. Pop. (1872) 8024.

BERGHAUS, HEINRICH, one of the most active promoters of geographical knowledge, was born at Cleves, in Rhenish Prussia, 3d May 1797, and educated at the gymnasium of Münster. As conductor of the road and bridge corps in the department of the Lippe, then (1811) part of the French empire, and afterwards in the Prussian army, he had opportunity to advance his knowledge of geodesy. In 1816, he was made 'geographical engineer' in the war department in Berlin, and was employed on the trigonometrical survey of Prussia, and became (1824) professor of mathematics in the Architectural Academy of Berlin (a post he held till 1855), and (1836) director of the Geographical School in Potsdam. The best known of his chartographical works is his *Physical Atlas* (90 plates, Gotha, 1838—1848), which forms the basis of Johnston's work with the same title published in Edinburgh. He has been employed on an ethnographical map of Germany since 1848. As a writer, he has edited several geographical periodicals. His *Geog. Jahrbuch* (Geog. Annual), published since 1849, forms a supplement to the *Physical Atlas*. Of a more popular nature are his *Physicalische Erdbeschreibung* (Physical Description of the Earth), *Grundlinien der Staatenkunde* (Outlines of the Political Character of States), and *Ethnographie*, all of which appeared at Stuttgart between the years 1846—1850. In 1855, he published a work entitled *Was man von der Erde weiß* (What is known of Earth). In 1855—1856, appeared an *Atlas der Österreichischen Monarchie*, and *Landbuch der Mark Brandenburg*. In 1862 appeared his *Landbuch von Pommern*; and in 1863, *Briefwechsel Alexander von Humboldt's mit H. Bergbau*.

BERGHEM, NICHOLAS, one of the finest of the Dutch painters, was born at Haarlem, 1624, and studied painting first under his father, afterwards under Van Goyen, Weenix the Elder, and other masters. He soon acquired an extraordinary facility of execution; and his industry, naturally great, was stimulated by the cravings of his avaricious wife, who thought he could never earn too much. Accordingly, he scarcely ever left his studio, and we might wonder where he found all the materials for his landscapes, which now decorate the best collections of Europe; but he had carefully studied nature during his long residence at the castle of Bentheim.

Warm colouring, natural and original grouping, and a general happy arrangement, are the leading features in B.'s landscapes. Strict criticism may object to some traces of lightness in execution, and may demand greater natural truth in some points, especially the outlines of animals; but these defects are lost in the general excellence of B.'s pictures. His etchings are highly esteemed. B. died in his native place, 1683.

**BERGLER, JOSEPH**, a historical painter of considerable note, was born at Salzburg, 1753. Having studied under Martin Knoller at Milan for several years, B. went to Parma, where, in 1784, his picture of Samson being delivered by Delilah into the hands of the Philistines, obtained the chief prize of the academy there. Returning to Germany, he, in 1786, settled at Passau, where he was appointed painter to Cardinal Auersperg, prince-bishop, and in this capacity painted many fine altar-pieces. B., having been made director of the Academy of Prague in 1800, removed to that city, where he continued to reside until his death in 1829. The impetus which he gave to the fine arts in Bohemia was very marked, and his school furnished a goodly number of eminent artists. His principal works are a *Cyclo*, or series of important events drawn from the history of Bohemia, in sixty-six sheets: 'Libissa, Queen of the Fairies, deciding a Dispute between two Brothers for the heritage of their Father'; 'The Deliverance of Charles IV.'; and 'Hermann and Thusnelda'.

**BERGMAN, TORBERN OLÖF**, a celebrated chemist of the 18th c., was born at Katharinberg, West Gothland, Sweden, March 9, 1735. He was sent at seventeen years of age to the university of Upsala, with a view to prosecute studies qualifying him either for the church or the bar; but disliking both these professions, he devoted himself to natural history, physics, and mathematics, and soon made some interesting discoveries in entomology, while he also distinguished himself as an accurate astronomical observer. In 1767, B. was elected to the chair of chemistry at Upsala, and continued to fill it until his death, which took place at Medevi, in July 1784. B. published a vast number of dissertations, the most important of which are collected into six octavo volumes under the title of *Opuscula Torberni Bergman Physica et Chemica* (Leip. 1779—1781). His essay on *Elective Attractions* was translated into English by Dr Beddoe.

**BERGMELH**, or MOUNTAIN-FLOUR, is a recent deposit of a white or cream-coloured powder of extreme fineness, composed almost entirely of the indestructible silicious frustules or cell-walls of *Diatomaceæ* (q. v.). From its resemblance to flour, it has been mixed with ordinary food, in seasons of scarcity, and thus used by the inhabitants of Norway and Sweden, who suppose it to be nutritious. When subjected to a red heat, it loses from a quarter to a third of its weight, the loss consisting probably of organic matter, and this would make it in itself nutritious; but it seems to derive its chief value from its increasing the bulk of the food, and rendering the really nutritious portion more satisfying. On the other hand, there have been experiments tending to shew that B. does contain a very small proportion—3 or 4 per cent.—of positive nutrient.

Similar deposits occur at Dolgelly in North Wales, at South Mourne in Ireland, and in Mull and Raasay in the Hebrides. The contained organisms shew that these beds have been deposited in fresh water.

**BERGUES**, a town of France, in the department of the Nord, about 5 miles south-south-east from Dunkirk. It is situated on the Colme, at the foot of

a hill, was strongly fortified by Vauban, and has the means of laying the valley under water. The canal of B., which admits vessels of 300 tons burthen, unites it with Dunkirk and the sea, and its favourable situation makes it the entrepôt of the produce of the adjoining country. It has manufactures of soap, tobacco, and earthenware, and also sugar and salt refineries. B. was first walled and fortified by Baldwin II., Count of Flanders; and Baldwin IV. erected a splendid abbey, of which two towers only remain, in honour of St Winnoc, who retired here in the beginning of the 10th c. Between the 13th and 16th centuries, B. suffered much from war, and changed masters several times. Pop. (1872) 5174.

**BERGYLT** (*Sebastes Norvegicus* or *Scorpaena Norvegica*), a fish of the Mailed Cheek family, or *Sclerogendidae* (q. v.)—the family to which gurnards and sticklebacks belong—but so much resembling a perch in appearance, that it was formerly called *Perca marina*, or Sea-perch. It is sometimes called the Norway Haddock, although it has no resemblance to the haddock. It is an inhabitant of all the northern seas, and is occasionally found on the British coasts at least as far south as Berwick. It is of a red colour, dark on the upper parts, reddish-white beneath. Its gill-covers are armed with short spines; the anterior rays of the dorsal fin are strong spines, the posterior portion of the fin has soft rays. The B. attains a length of two feet or upwards. It is good for food, and the Greenlanders use it not only in a fresh but in a dried state. They take it by long lines and baited hooks in the deep bays of their coast.

**BERHAMPORE**, the name of two towns in British India.—1. B., in the presidency of Madras, is a military station in the district of Ganjam. It is in N. lat. 19° 20', and E. long. 84° 50', being 525 miles to the north-east of Madras, and 325 to the south-west of Calcutta. The cantonments, themselves on a rocky ledge, have to the south and east a plain of considerable extent, on the nearer edge of which is the native town, with a population of about 20,000.—2. B. or Burhampore, in the presidency of Bengal, is in the district of Moorshedabad, being on the left bank of the Bhagirathi or Bhagruette, which, itself the first great offset of the Ganges, afterwards joins another great offset, the Jellinghee, to form the Hoogly. B. is in N. lat. 24° 5', and E. long. 88° 17', being distant from Calcutta by land and water respectively 118 miles and 161. It has long been one of the principal military stations in British India. The grand square, enclosing a spacious parade-ground, is particularly striking; and the quarters of the European officers form handsome ranges of brick-built and stuccoed edifices. There are here a college, hospitals, and mission churches. B. is the seat also of a civil establishment; and the houses of its chief members, erected in convenient spots in the neighbourhood, give the place an air of grandeur and importance. B., though at one time extremely unhealthy, from its low and moist site on the delta of the Ganges, has yet been so much improved by sanitary measures, as to be second to no spot of Bengal in salubrity. In the spring of 1857, B. acquired an unenviable celebrity, as being the cradle of the disaffection which so speedily led to the massacre of Meerut. Pop. (1871) 27,110.

**BERJA**, a town of Spain, in the province of Andalusia, at the foot of the Sierra de Gador, about 22 miles west of Almeira. It has manufactures of linen fabrics, hats, hardware, and leather, and a trade in wine and oil. Population about 8000, who are chiefly engaged in mining lead, which is plentiful in

the Sierra de Gador. Agriculture is also prosecuted to some extent.

**BERKELEY**, a small town of Gloucestershire, 15 miles south-west of the town of Gloucester, on the small river Avon, a mile and a half east of its junction with the estuary of the Severn. Pop. of borough (1871), 1161; of parish, 5690. The town lies in the fine vale of B., which is 25 miles long, and 4 broad, between the Severn on the west, and beech-covered hills on the east. This vale consists of rich meadow pasture-land, on a deep, fat loam, and is celebrated for its dairies and cheese. The latter is the far-famed 'Double Gloucester,' of which each cow yields 340 lb. a year. Near B. is the entrance to the B. and Gloucester Canal, navigable for vessels of 600 tons. Some trade exists in timber and malt. B. Castle is an embattled building on an eminence south-east of the town, and which, about 1150, was granted by Henry II. to Robert Fitzhardinge, with power to enlarge and strengthen it. Here Edward II. was murdered in 1327 by Maltravers and Gourney. In the civil wars of Charles I., the castle held out for the king, but was taken after a nine days' siege by the Parliamentarians. In the castle is preserved the cabin-furniture of Drake the navigator. Dr Jenner, the discoverer of vaccination, was a native of B., and is buried in the parish church of St Mary here.

**BERKELEY SOUND**, the most frequented inlet of the East Falkland Island, near its north-east extremity. It is in lat. 51° 30' S., and long. 57° 56' W. Though it is difficult to enter, yet it contains several excellent harbours. Its shores yield ample supplies of water, cattle, and vegetables.

**BERKELEY**, GEORGE, Bishop of Cloyne, and a distinguished philosopher, was the eldest son of William B., a cadet of the family of the Earl of Berkeley. He was born on the 12th March 1684, at Kilcrin, near Thomastown, county of Kilkenny, Ireland. As a boy, he studied at the school of Kilcrin, at which Swift also received his early education; and in his fifteenth year he followed his great countryman to Trinity College, Dublin, where, in 1707, he obtained a fellowship. At Trinity, he enjoyed the society of Swift, who patronised him, as he did almost everybody, and who subsequently had a great deal to do in shaping his fortunes.

B.'s career as an author began in 1707 (the year in which he obtained his fellowship) by the publication of a work written three years before, at the age of twenty, entitled *Ariithmetica absque Algebra et Euclide Demonstrata*. This was followed, in 1709, by the celebrated essay, *Towards a New Theory of Vision*, in which he demonstrated the dependence of the perceptions of distance, magnitude, and situation on the sense of touch. This essay led to considerable controversy at the time, though its conclusions may now be considered as not admitting of doubt. In 1733, B. produced a pamphlet in vindication of it—viz., *The Theory of Vision or Visual Language, shewing the Universal Presence and Providence of the Deity Vindicated and Explained*. By this time he had propounded his system of absolute idealism. His *Treatise concerning the Principles of Human Knowledge* appeared so early as 1710. Its object was to undermine the materialism of the age, by denying, on received principles of philosophy, the reality of an external world. If there is no external world, he argued, the phenomena of sense can be explained only by supposing a Deity continually necessitating perception. B. has since been laughed at by many who could not see how the premises laid in the philosophy of the day led to his system; by many he will always be laughed at as an idle dreamer;

but, in point of fact, his system is a monument at once of marvellous subtlety of mind and of the most pious devotion of the intellectual powers to the cause of religion. The object was, as the full title of the book itself sets forth, to inquire into and remove the causes of scepticism, atheism, and irreligion. It is only an illustration of the truth of the old saying, that extremes meet, if, in following out this pious purpose, he prepared the way for a subtler form of scepticism (in Hume's philosophy) than the world had previously known. The reader will find valuable assistance to the apprehension of B.'s system in Sir William Hamilton's Discussions, and in his dissertations and notes to Reid's *Philosophy of the Human Mind*. It must suffice to mention here that B. was the first philosopher who proposed a scheme of absolute idealism.

In 1713, B. went to reside in London, where, in the same year, he published a defence of his ideal system, *Three Dialogues between Hylas and Philo-sous*. Shortly after this he was appointed chaplain and secretary of legation under Lord Peterborough, whom he accompanied to Italy. In 1721, he returned to London; and in 1724, he became Dean of Derry, with an income of £1100, and resigned his fellowship.

B. was not a man to settle in the enjoyment of leisure and opulence. The Dean of Derry set to devising schemes of usefulness, fixing at last on one by which his deanery and income were to be exchanged for exile and £100 a year. This was the Bermudas College scheme for training pastors for the colonies, and missionaries to the American Indians. Swift, failing to induce him to give the project up, made influence with ministers to support it, which they promised to do. Full of hope, B. prepared for his exile; he married in August 1728, Anne Elvert, daughter of Right Hon. John Forster, Speaker of the Irish House of Commons, and soon after sailed for Rhode Island. The support promised by government was never given to him, and, after six years, he returned to England heartbroken with failure, and harassed by creditors. He had barely returned, however, when (1734) he received the bishopric of Cloyne, as a mark of favour from the queen. He was now once more in the enjoyment of leisure for literature. Soon appeared the *Minute Philosopher*, followed by various letters and pamphlets on the state of the country, and in 1749 by *A Word to the Wise*. In 1744, he gave the world his notions of the virtues of tar-water in a book entitled *Siris*. Tar-water appears to have been in his thoughts as in his system—which must have been saturated with it—from this time till his death. His last work was *Farther Thoughts on Tar-water*, published in 1752. The fact is, he was hypochondriacal for many years before his death. He died, 14th January 1753, at Oxford, whither he had gone to live with his son, who was studying at Christ Church. A genial companion, an affectionate and steady friend, he was loved by all of his contemporaries who enjoyed his society; a graceful writer, a subtle philosopher, and an active churchman, his whole life was devoted to usefulness, and ennobled by the purity of his aspirations. The best edition of his works is that of Prof. Fraser, LL.D., Edinburgh, published at the Clarendon Press, Oxford, in 1871.

**BERKSHIRE**, a midland county of England, bounded N. by Gloucester, Oxford, and Bucks; E. by Middlesex; S.E. by Surrey; S. by Hampshire; and W. by Wiltshire. Greatest length, 50 miles; average breadth, 15. Area, 752 square miles, nearly one-half of which is under tillage, one-fourth in pasture, and one-sixteenth in wood. B., which is one of the most beautiful of the English counties, lies in the valley of the Thames, and has an undulating surface, rising in some parts into hills.

Older tertiary strata, consisting of the London clay, occupy the east part of the county; cretaceous strata, the middle; and oolitic, the west. A range of chalk-hills, or downs, connected with the Chilterns on the east, and the Marlborough Downs on the west, crosses the country into Wiltshire, from Reading to Wallingford, attaining at White Horse Hill (so called from the gigantic figure of a horse rudely defined in the chalk—a relic of ancient times) a height of 893 feet. Between this range—the west part of which is occupied by sheep-walks—and a smaller oolitic one skirting the valley of the Thames, is the Vale of White Horse, the richest part of the county, and drained by the Ock. To the south of the Downs is the fertile Vale of Kennet, drained by the river of that name, and its feeder, the Lambourn. To the east is the forest district, comprising Windsor Forest, part of Bagshot Heath, &c. The forest chiefly consists of hazel, oak, beech, ash, and alder. The Thames skirts the whole north border of the county, winding through a course of 100 miles, but in a direct line, only 52, and navigable nearly the whole way. It is the chief river of B., the other rivers of the county being its tributaries; of which the chief are the Kennet, Leddon, and Ock. The Kennet is navigable for 30 miles. The climate of B. is very healthy, being mild in the valleys, and bracing on the high lands. The soil varies greatly: in the valleys, it is generally a fertile loam, with a subsoil of chalk, gravel, or clay. The country between the valleys of Kennet and White Horse consists chiefly of sheep-walks; and along the Thames, and to the west of the Ridge Way, or Downs, it is chiefly dairy and pasture land. The chief crops are oats and wheat. 'Double Gloucester' and 'pineapple' cheese are exported in large quantities to London. There is a superabundance of horses. Swine are extensively reared, especially near Faringdon, the breed being one of the best in England. Property is very much divided, and the number of gentlemen's seats and villas is very great. The farms are generally of moderate size. The county is traversed by the Great Western Railway and its branch-lines, and by two canals. B. is divided into 20 hundreds, 151 parishes, and 12 poor-law unions. It returns 8 members to parliament, 3 for the county, 2 for Reading (the county town), and 1 each for Windsor, Wallingford, and Abingdon. Besides these towns, there are the municipal boroughs of Newbury (the scene of two severe conflicts in the civil war) and Maidenhead, and the market-towns of Faringdon, Hungerford, Wantage, Wokingham, East Ilsley, and Lambourn. The population of B. in 1871 was 196,475 (97,078 males and 99,397 females), shewing an increase of 20,219 since 1861, when the population was 176,256, and of 38,995 or 78 per cent. since the first census in 1801. The county has no manufactures of any importance. The British and Roman remains are numerous, including Roman roads, and many camps and barrows. Of the old castles, the principal relic is Windsor (q.v.); of monastic establishments, the abbeys of Abingdon and Reading. The churches are small, and from the scarcity of building-stone, are often constructed of chalk and flint. There are many Norman churches, erected in the 12th and 13th centuries.

**BERLENGAS**, a group of rocky islands in the Atlantic Ocean, off the west coast of the Portuguese province of Estremadura, and 10 miles north-west of Peniche. The principal one, named Berlenga, is fortified, and has been used as a state-prison.

**BERLICHINGEN**, GOETZ or GOTTFRIED VON, 'of the Iron Hand,' a German knight of the 16th

c., may, with Ulrich von Hutten, be considered as the last worthy representative of the chivalry of the middle ages, then expiring. He was born at Jaxthausen, in Württemberg, in the ancestral castle of his family, which may be traced back into the 10th c. His education was conducted by his uncle Kuno, with whom he attended the diet of Worms in 1495. He gratified his passion for war at first by taking part in several of the quarrels between German princes, and at the siege of Landshut lost his right hand, which was replaced by one of iron, yet shewn at Jaxthausen. When the general peace of the country had been established under Maximilian I, Goetz retired to his castle. But a restless spirit, and the general turbulence of the time, involved him in continual feuds with the neighbouring barons and free cities, in which he displayed a mixture of lawless daring and chivalrous magnanimity. Having joined Duke Ulrich of Württemberg against the Swabian league, on the duke's expulsion, he was taken prisoner, and had to pay a ransom of 2000 florins. In the Peasants' War of 1525, he took part with the insurgents, and was chosen leader of a part of their forces. In his narrative, he ascribes this step to compulsion; more likely it was his own restless and turbulent spirit, and a desire for revenge on his old enemies of the Swabian league. On the unfortunate issue of the war, he at first made his escape, but was afterwards fallen upon unawares by a band of leaguers, who extorted an oath that he would appear before the league when summoned. Accordingly, he had to appear at Augsburg, where he was kept in arrest for several years, and at last sentenced to perpetual imprisonment in his own castle, and, in case of his breaking this condition, to a fine of 20,000 florins. He passed eleven years in this state, and was only pardoned on the dissolution of the league. He died July 23, 1562, after having still taken part in campaigns in Hungary and in France. He wrote an account of his own life, published by Pistorius (Nurn. 1731; Breal 1813), which furnishes an excellent picture of the social life and manners of the period, and on which Goethe grounded his drama of *Goetz von Berlichingen*, translated by Sir Walter Scott.

**BERLIN**, the capital of Prussia, and seat of the imperial government of Germany, one of the finest and most important cities of Europe, is situated on the Spree, in lat. 52° 30' N., long. 13° 24' E. The city is built upon a flat sandy plain, which, though cultivated, is far from being fertile. The Spree, at this place about 200 feet wide, with a current so sluggish as scarcely to be perceptible, divides the city into two nearly equal parts, and communicates with the Oder and the Baltic by canals. A more unlikely site, in some respects, could hardly have been selected for a city, as, from its flatness, and the sandy character of the soil, much inconvenience results to the inhabitants: in summer, the heat reflected from the sand is very intense, and clouds of dust rise continually; while in winter, the cold is equally great. There being little or no declivity, water stagnates in the streets, producing effects which can easily be imagined. In the Friedrichsstrasse, about 2 miles long, there is not a foot of descent from one end to the other. Notwithstanding these natural disadvantages, however, the advance of the city, especially in late years, has been extraordinary. In 1861, the city covered an area of 14,000 acres, and its population in 1858 was 455,000, while in 1871 its area was 24,000 acres, and population 825,389, including a garrison of 21,000 soldiers. Although, as far back as the 13th century, the central part of the present city was inhabited, B. was long little more than a fishing-village; it was not till the great elector, Frederick-

William (1640—1688) had united the separate duchies of which Prussia is now formed, that B. became of consequence as the most central town, and the capital of a large state. His successor, Frederick I., the first king of Prussia, followed the footstep of his predecessor in enlarging and beautifying the capital; and at the close of his reign, in the end of the 17th century, the population numbered about 50,000. In the next century, it received accessions of French and Bohemian colonists, driven into exile by religious persecution. Every inducement was then held out to bring foreigners to settle in the rising city. Under Frederick the Great, B. continued to prosper. At his death, the inhabitants numbered 145,000. After the peace of 1815, B. increased with extraordinary rapidity, and, being the seat of government, a focus of the arts and sciences, and a great centre of commercial enterprise, it has gradually risen to a position which fairly entitles it to its present rank as the metropolis of the German empire.

The centre of the city is now devoted almost exclusively to commerce, and round this part, extending considerably beyond the city boundaries, are congregated the residences of the citizens. Small towns and villages are gradually being incorporated with the great city; Moabit has already disappeared as a separate community, and Charlottenburg, a town of 18,000 inhabitants, is likely soon to follow. B. consists of ten different quarters and six suburbs, containing about 480 streets, 58 squares, 700 public buildings (including 60 churches), and 15,000 private houses (comprising 169,000 dwellings or suites of apartments). The houses are built of brick, plastered or stuccoed outside, and they soon acquire a faded appearance. The style of these has very much altered since 1864. Prior to that, the greater portion of the houses were of one, two, or three stories, but these are fast giving way to houses of four, five, and more stories, the larger ones predominating. The increase in the value of house-property has been enormous, and the result is that great numbers of the people are driven to take up their abode in cellars underground. About one-tenth of the population live in these cellars, huddled together in a manner that proves deleterious alike to their moral and their physical well-being. B. possesses a large number of very fine buildings. Of these may be mentioned the Royal Palace, the Emperor's Palace, and that of the crown prince; the Royal Library, which contains upwards of 700,000 volumes and 15,000 MSS.; the museums, the Arsenal, and the Guard-house. Most of those named are situated in the street 'Unter den Linden' (so called from its double avenue of limes), one of the finest and most spacious streets in Europe. The city is further adorned throughout with numerous statues of military heroes, the equestrian statue of Frederick the Great, by Rauch, being the most remarkable. In regard to educational institutions, B. occupies a high position; in 1870, there were 10 gymnasia, 54 arts and higher schools, 99 middle and elementary schools, 48 under the special superintendence of churches and other institutions, making in all 211, of which 115 were public and 96 private. In addition to these, there were in the same year 64 Kinder-garten (infant-schools). The university, established in 1810, possesses a very high reputation. Among the professors whose talents have rendered it famous are to be found such names as those of Fichte, Hegel, and Schelling. The number of students attending the university averages about 2000. Among the numerous institutions of B. may be mentioned the Academy of Sciences, by far the most important of the kind in Germany; the

Academy of Architecture; the Naval and Engineering Colleges; several seminaries for teachers and missionaries; asylums for the deaf, dumb, and blind; besides many learned societies. In 1870, there were 18 theatres in Berlin. About 90 per cent. of the population are Protestants, 6 per cent. Roman Catholics, and 4 per cent. Jews. Church-going, however, seems to be very much neglected: of the total number of Protestants, fewer than 2 per cent., on an average, attend divine worship on Sundays!

The Old Museum contains antiquarian specimens, collections of coins, the Gallery of Ancient Sculpture, the Picture Gallery, with about 1500 paintings. The New Museum contains a very extensive and valuable collection of casts arranged in 12 saloons; the Egyptian Museum, a fine collection of engravings numbering upwards of 500,000; &c. Outside the celebrated Brandenburg Gate (erected in imitation of the Propylea at Athens, 70 feet high, and 200 feet wide) extends the Thiergarten, the largest and most important park near the town. To the south-west of this lies the Zoological Garden, which has recently been considerably extended. Other places of interest worthy of mention are the aquarium, the new synagogue, the exchange, the opera-house, the royal château of Monbijou, the Warrior's Monument, and the Monument of Victory, 190 feet high, recently erected in commemoration of the great victories of 1870—1871, &c.

The commerce and manufactures of B. have increased so rapidly of late years, that it now ranks among the most important mercantile places of continental Europe. The staple commodities are grain, spirits, and wool. In 1869, 36,000,000 quarts of spirits were produced, of which 23,000,000 were exported, and 13,000,000 retained for home-consumption. The principal branches of industry are engine-building, iron-casting, and the manufacture of woollen and silk goods, and fancy articles; calico-printing is also largely engaged in. There are in operation 46 large works (giving employment to upwards of 14,000 hands) for the production of iron, steel, and zinc.

#### BERLIN DECREES. See CONTINENTAL SYSTEM.

BERLIOZ, HECTOR, a fertile musical composer, was born December 11, 1803, at La-Côte-St-André, in the department of Isère, France, where his father was a physician. Against his father's wishes, who intended him to follow the medical profession, he devoted himself to music, and proceeding to Paris, studied at the Conservatoire de Musique under Lesueur and Reicha. In 1828 the second prize at the Conservatoire was awarded to him; and in 1830, his cantata of *Sardanapalus* won the first. He now went to Italy, where he resided about two years; and on his return, published several compositions, the merits of which were much canvassed. His works are too numerous for specification; but among the most successful are the symphonies of *Harold*, *Romeo et Juliette*, and the *Symphonie Funèbre et Triomphale*, the requiem for the funeral of General Damrémont, 1837; the overture to *Carnaval Romain*, and the *Hymne à la France*, performed August 1, 1844, by an orchestra of almost a thousand musicians. B. afterwards conducted many concerts in Russia, Germany, and England. In 1839, he was made a Chevalier of the Legion of Honour; and in 1856, was elected a member of the Institute at Paris. He was also librarian to the Conservatoire. The peculiarity of the compositions of B. consists in their endeavour to make instrumental music the exponent of particular feelings as well as general emotions. Some critics are of opinion that this notion has led the composer into extravagance and

incoherence; while others speak in high terms of the freshness and individuality which characterise his style, and look upon him as the chief of the romantic school of music. B. died 9th March 1869.

**BERM**, in Fortification, is a ledge or pathway, from 3 to 8 feet in width, at the bottom of the outside of a rampart, where it joins the scarp or inner side of the ditch. It is almost on a level with the natural surface of the ground; and serves in part as a passage-way for the troops of the garrison, and in part as a means of preventing the ditch from being filled with earth and rubbish, when the rampart is battered by the besiegers.

**BERMONDSEY**, a south-east suburb of London, on the south bank of the Thames, and traversed by the Greenwich Railway. It has extensive tan-yards and wharfs. Pop. of parish (1871), 80,429.

**BERMUDAS**, or **SOMMERS'S ISLES**, were so named respectively from Bermudez, a Spaniard, who first sighted them in 1527, and from Sir George Sommers, an Englishman, whose shipwreck here in 1609 was the immediate occasion of their being colonised from Virginia—itself only 4 years old—in 1611. This low and lonely archipelago is a mere group of specks, for, though it numbers perhaps 500 islets, yet it measures only about 12,000 acres in all; the whole occupying a space of about 20 miles in length by little more than 6 in breadth. The value of this natural fortress, which can hardly be overrated, arises from its situation. In lat.  $32^{\circ} 20' N.$ , and long.  $64^{\circ} 50' W.$ , the B. occupy, commercially and politically, a singularly commanding position. At a distance of 600 miles from Cape Hatteras, in North Carolina, they are about equally remote from the north of Maine and from the south of Florida; again, between the two grand divisions of British America, they form an almost indispensable bond of union; and lastly, they flank, on either side, the two living highways which respectively lead from the North Atlantic to the Gulf of Mexico, and from the Gulf of Mexico to the North Atlantic. The four principal islands are—St George's,  $\frac{3}{4}$  mile in length; Bermuda, 15; Somerset, 3; and Ireland, 3—the breadth ranging between 2 miles and 1 furlong. The minor islands of St David, Cooper, Smith, Long-Bird, Nonsuch, &c., form numerous picturesque creeks and bays of great size and depth, such as the Great Sound, Castle Harbour, Harrington Sound, and others. Most of the other members of the group are individually insignificant, many of them indeed without name or inhabitant. St George's Isle, the military station of the colony, commands the entrance of the only passage for large vessels—the narrow and intricate channel, which leads to its landlocked haven, being defended by strong batteries. From the strange shapes of most of the islands, and the number of spacious lagoons, the communications are almost as necessarily by water as those of Venice; while the cedar-boats glide under the bluest sky, through an element so clear as to reveal, even to its lowest depths, the many varieties of excellent fish sporting among the coral rocks, and the exquisitely variegated shells. On the structure and formation of the archipelago, it is necessary merely to add, that it is the most northerly point on the globe where the living zoophyte still piles up its submarine architecture. The climate may be said to complete the paradise, resembling that of Persia, with the peculiar addition of a constant sea-breeze. Between December and March, the thermometer ranges from  $60^{\circ}$  to  $66^{\circ}$ ; in June, from  $63^{\circ}$  to  $86^{\circ}$ ; and between April and September, from  $75^{\circ}$  to  $79^{\circ}$ . As the dew-point ranges high, the air is moist at all seasons. With respect to productions, the entire soil presents

under tillage of every description only 1227 acres; in grass for cattle-fodder, 33; and in wood or pasture, 10,339. Of the cultivated grounds, the main crops are potatoes, onions, and other garden-vegetables, arrow-root, maize, &c. Besides being useful as a station for those British vessels of war which are charged with the care of the West Indies on the one side, and the northern provinces on the other, B. forms an important depot for convicts, who are lodged in a large prison, and employed in various kinds of labour. Between B. and Halifax, Nova Scotia, there is a regular steamer carrying the mails. In 1871, the total population was 12,121. The numbers of white and coloured persons are approximately in the proportion of five of the former to seven of the latter. The value of the exports for the year 1870 was £36,756, against £33,624 in the previous year; and that of the imports, £232,300 against £212,811. The governmental expenditure in the same year amounted to £33,302. The revenue from rum shews a marked and progressive increase from the year 1865. In the B., emancipation has been decidedly beneficial, though here, as in Antigua, it was carried at once into full effect without the intermediate stage of apprenticeship. The group is under the authority of a governor, a council of 9 members, and an assembly of 36. There are 12 free, and 9 private schools. With regard to religion, more than three-fourths of the population belong to the Church of England, which has 4 clergymen. The Presbyterians, Wealeyans, and Roman Catholics, have one minister each.

**BERN**, or **BERNE**, the most populous, and next to that of the Grisons, the most extensive canton of Switzerland; its area being nearly 2600 square miles. It lies between lat.  $46^{\circ} 20'$  and  $47^{\circ} 30' N.$ , and long.  $6^{\circ} 50'$  and  $8^{\circ} 27' E.$  It has France on the north; on the other three sides, it is surrounded by its sister-cantons. B. is one of the three governing cantons of the Swiss Confederation (since 1848, it has been the permanent seat of the Swiss government), and had, in 1870, a population of 506,465—about one-fifth of the total inhabitants of Switzerland. Of these, 66,000 were Roman Catholics, the rest Protestants. The fertile valleys of the Aar and the Emme divide the mountainous Alpine region in the south from the Jura Mountains in the north. The valleys of Simmenthal, Lauterbrunnen, Grindelwald, and Hasli, in the south, called the *Bernese Oberland*, are celebrated for their beauty. The lakes of Thun, Brienz, Neuchatel, and Biel are in B., which is watered by the Aar and its several tributaries. The climate, from the great difference in the elevations of the territory, is necessarily very variable, and subject to sudden changes, and frequent rains and fogs, but it is generally healthy. The districts of the Aar and the Emme are the most fruitful, producing corn and fruits of various kinds, and affording excellent pasturage for cattle, which, with dairy produce, form the chief agricultural wealth of Bern. Corn and potatoes are not raised in sufficient quantities for home consumption. The vine grows in some districts, and hemp and flax in small quantities are raised. The horses of the Emmenthal are much prized. The lakes abound with salmon and trout. Iron, lead, and copper are found in the canton, which has also quarries of gypsum, marble, freestone, and granite. Its manufactures, which are not extensive, consist chiefly of linen, coarse woollens, leather, iron and copper wares, articles of wood, and watches. The canton is traversed by good roads, and its lakes and the river Aar are well supplied with steam-packets. The educational condition of the canton is good. B. entered the Swiss Confederation, in which it now

holds the second rank, in 1352. In the 15th and 16th centuries, it added to its possessions Aargau and Vand, which it lost during the wars of the first Napoleon; but it received in return Biéne and its territory, and the greatest part of the bishopric of Basel. It furnishes a contingent of 5824 men to the federal army.

BERN, capital of the above canton, is situated in lat. 46° 57' N., and long. 7° 28' E., on a lofty sandstone promontory, more than 1700 feet above the sea, formed by the winding Aar, which surrounds it on three sides, and is crossed by two stone-bridges, one of which is a magnificent structure, upwards of 900 feet long, with a central arch 150 feet wide and 93 feet high. The fourth side was defended by fortifications, but these have been converted into public walks. B. has an imposing appearance from a distance, and a nearer view discloses one of the best and most regularly built towns in Europe, as it is the finest in Switzerland. The houses are massive structures of freestone, resting upon arcades, which are lined with shops, and furnish covered walks on both sides of the street. Rills of water flow through the streets, which are also adorned with numerous fountains. There are many fine public promenades in the environs, and the view of the Alpine peaks from the city is magnificent. The principal public buildings are a Gothic cathedral, founded in 1421, with some interesting tablets and reliques; a new and magnificent structure, designed to accommodate the Swiss diet and administration; the mint, the hospital, and the university. B. has an interesting museum, and a valuable public library of 40,000 volumes. The manufacturing industry of B. is not great—gunpowder, firearms, leather, straw-hats, and paper, are the chief articles. It has a considerable trade in the produce of the surrounding district. Pop. (1870) 36,000. B. was founded by Berthold V., in 1191, who gave it the name B., because he had killed a bear on the spot. A charter from Frederick II., in 1218, made it a free imperial city, and it gradually extended its possessions until it became an independent state; and between 1298 and 1339, successfully resisted the attacks of Rudolf of Hapsburg, Albert his son, and Louis of Bavaria. When the French entered B. in 1798, they found 30,000,000 of francs in the treasury. The corporate property of B. is very large—sufficient to defray all municipal expenses, provide the whole of the citizens with fuel gratis, and besides, to leave a surplus for annual distribution among them. B. is the residence of foreign ministers; and since 1849, the permanent seat of the Swiss government and diet. Haller, the distinguished physiologist, was born at Bern. Owing to a tradition which derives the name of the city from *bären* (the German for bear), bears have for several centuries been maintained in B. at the expense of the community. The French, when they captured B. in 1798, took possession of the bears, and sent them to the Jardin des Plantes, Paris; but the Bernese have since secured other specimens of their favourite animals, which are one of the 'sights' of the city.

BERNADOTTE. See CHARLES XIV.

BERNARD, SAINT, of Clairvaux, one of the most influential theologians of the middle ages, was born at Fontaine, near Dijon, in Burgundy, 1091; became a monk of Citeaux in 1113; founded a new branch of that order at Clairvaux, in Champagne, and himself became its first abbot in 1115; died August 20, 1153; and was canonised by Alexander III., 1174. His ascetic life, solitary studies, and stirring eloquence, made him, during his lifetime, the oracle

of Christendom. He was honoured with the title of the 'mellifluous doctor,' and his writings were termed 'a river of paradise.' He rejected the doctrine of the immaculate conception, which had been introduced into the French Church, and rose above the cruel prejudices of his age in repressing the monkish persecutions of the Jews in Germany. B. is perhaps most widely known in connection with the disastrous crusade of 1146. Charged by the pope to excite the religious zeal of the people of France and Germany, he accomplished his mission with fatally memorable success. Fields, towns, cities, and castles were in many places almost depopulated, and innumerable legions, fired by his prophetic eloquence, hurried to the East, nine-tenths of whom never saw their homes again.

Regarding B. in his more spiritual aspect, we may say that his mystic, but at the same time practical, Christian doctrine was a wholesome antidote to the dry and cold scholasticism which prevailed among the churchmen of his age, although the intolerance with which he treated Abelard (see ABELARD) and Gilbert de Poerée must be reprobated. Luther says of St B.: 'If there ever lived on the earth a God-fearing and holy monk, it was St B. of Clairvaux.' In the course of his life, he founded 160 monasteries. His writings are exceedingly numerous. They consist of epistles, sermons, and theological treatises. Of the first, we possess 439; of the second, 340; and of the third, 12. They are all instinct with genius, though it is difficult for us now to appreciate their extraordinary influence. The best edition of the works of St B. is that of Mabillon, printed at Paris in 1690 (2 vols. fol.), reprinted at Venice in 1750 (6 vols. fol.), at Paris in 1835–1840 (4 vols. 8vo), and again in 1854 (4 vols. 8vo). The monks of the reformed branch of the Cistercians, which he instituted, are often called, after him, Bernardines. He gave name also, in France, to the nuns of the Cistercian order, of which his sister, St Humbeline, is said to have been the founder.

BERNARD, GREAT SAINT, *Mons Jovis*, a famous mountain-pass in the Pennine Alps, between Piedmont and the Valais. The pass attains an elevation of more than 8000 feet above the sea-level; and almost on its very crest, on the edge of a small lake, which is frozen over nine months out of the twelve, stands the *Hospice*, founded, in 962, by Bernard de Menthon, a Savoyard nobleman, for the benefit of pilgrims to Rome, and now largely taken advantage of by travellers across the Alps. The hospice, said to be the highest habitation in Europe, is occupied by ten or twelve St Augustine monks, who, with their noble dogs of Saint Bernard breed, have rescued many hundred travellers from death by exposure to cold, or burial in the snow, which in winter ranges from 10 to 40 feet in depth. The humanity of the monks shortens their own lives very considerably, the rigorous cold—which has been known to be 29°, and is frequently as low as 18° and 20° below zero F.—and the difficulty of respiration, often compelling them to leave with ruined health before they have completed the period of their vow—fifteen years. They enter on their humane mission at the age of eighteen. The hospice is a substantial stone-building, capable of affording sleeping-accommodation to 70 or 80 travellers, and shelter to about 300. As many as 500 or 600 persons have taken advantage of the hospitality of the monks in one day, and it is calculated that 8000 or 9000 travellers are annually indebted to their kindness. The resources of the monks are mainly derived from voluntary subscriptions and gifts, but they draw some trifle from independent property. Formerly, they had much more

from this latter source, but a forced contribution of £4000 to the government of the canton of Valais impaired their revenues very much. The pass, which was traversed in early times by the Romans, Charlemagne, and Frederick Barbarossa, is celebrated for the passage of 30,000 French troops under Napoleon, in May 1800.—LITTLE SAINT B., which forms part of the chain of the Graian Alps, is the most convenient of the Alpine passes, and is supposed to have been the one by which Hannibal led his forces into Italy. It also possesses a hospice, which is situated 7192 feet above the sea.

BERNARD DOG, GREAT SAINT, a race or variety of dog deriving its name from the hospice of St Bernard, where it has been long kept by the monks for the purpose of assisting them in the rescue of perishing travellers. Dogs of different races are employed in the same manner at other passes of the Alps. The Saint B. dog is remarkable for great size, strength, and sagacity. The dogs not only accompany the monks and servants of the hospice in the benevolent excursions which they regularly make through the most dangerous parts of the pass, but are sent by themselves to search for travellers who may have wandered, and this their extremely acute scent enables them admirably to do. They learn to know what places are most proper to be searched, and some of them shew great alertness when the weather assumes a threatening aspect, as if desirous to be at their work. They carry a small flask of wine or brandy attached to their neck, of which the traveller may avail himself. When they find a traveller benumbed with cold, or discover by the scent that one has been overwhelmed in an avalanche, they endeavour by loud barking to attract the monks to the spot: if they fail in this, and if the traveller is too much exhausted to proceed by their guidance to the hospice, or if they cannot by their own efforts dig away the snow which has covered him, they run to give the alarm by signs which are at once understood. One famous dog, called Barry, in the earlier part of the present century, was instrumental in saving the lives of no fewer than forty human beings. His most memorable achievement was the rescue of a little boy, whose mother had been destroyed by an avalanche, and whom he induced to mount his back, and so carried him safe to the hospice. The skin of this dog is preserved in the Museum of Bern.—The origin of this valuable race of dogs is not well ascertained, although they are supposed to have sprung from the progeny of a Danish dog left at the hospice by a traveller, and of the Alpine shepherds' dogs. Another account represents an English mastiff as one of their progenitors. There are two subvarieties, however; one with rough hair, like that of the Newfoundland dog, and of a white colour, with black or tawny spots; the other, with close, short hair, more or less clouded with gray, liver-colour, and black. Of the former breed, the number is now small. The head and ears resemble those of a water-spaniel, and the Saint B. dog has therefore been sometimes classed with spaniels (q. v.).

BERNARDIN, SAINT, of Sienna, born in 1380 at Massa-Carrara, of a distinguished family, made himself famous by his rigid restoration of their primitive rule amongst the degenerate order of the Franciscans, of which he became a member in 1404, after having already, in 1397, joined the brotherhood of the *Disciplinati Mariae*. In 1438, he was appointed vicar-general of his order for Italy. B. was unwearied and devoted in his activity during the great Italian plague of 1400, both as an impressive preacher and an attendant upon the sick and dying. He founded the *Frates de Observantia*, a branch

of the Franciscan order, which already numbered more than 300 monasteries in Italy during his day. B. died in 1444, and was canonised by Pope Nicholas V. in 1450, his festival being on the 20th of May. His eminently mystical works were published by Rudolf (4 vols., Venice, 1591), and by De la Haye (5 vols., Paris, 1636).

#### BERNARDINES. See CISTERCIANS.

BERNAUER, AGNES, the beautiful daughter of a poor citizen of Augsburg, in the 15th c., whose sad story looks like romance than history. Duke Albrecht of Bavaria, only son of the reigning Duke Ernst, saw the maiden at a tournament at Augsburg, given in his honour by the nobility, and fell violently in love with her. Albrecht was young, handsome, and manly, and Agnes was not insensible to his attractions and his rank; but she was too pure to listen to his overtures till he promised to marry her. They were then secretly united, and Albrecht carried his young wife to the castle of Vohburg, which he inherited from his mother. Here they enjoyed their matrimonial happiness undisturbed, till Albrecht's father formed the plan of marrying his son with Anna, daughter of Erich, Duke of Brunswick. The determined opposition he met with soon made him aware of his son's attachment to the Augsburger's daughter, and of the strength of his passion for her; and he resolved to take energetic measures to break it off. He accordingly contrived that, at a tournament at Regensburg, the lists were shut against his son, as one that, against the rules of chivalry, was living with a woman in licentiousness. Albrecht swore that Agnes was his wife, but in vain; he was still excluded. He now made Agnes be openly honoured as Duchess of Bavaria, gave her a numerous retinue of servants as a princess, and the castle of Straubing for a residence. She, full of sad forebodings of a dark fate, erected in the Carmelite convent of the place an oratory and a tomb. As long as Duke William, Albrecht's uncle, lived, who was greatly attached to his nephew, nothing further was attempted against the happiness of the lovers. But after his brother's death, Duke Ernst no longer restrained his anger, and, in the absence of Albrecht, ordered Agnes to be arrested and executed without delay. Accused of sorcery, by which she was alleged to have bewitched Albrecht, she was carried, bound hand and foot, by the executioners to the bridge of the Danube, and in the presence of the whole people thrown into the river (October 12, 1435). The current having floated her again to the side, one of the executioners ran with a long pole, and fastening it in her golden hair, held her under the water till she was drowned. Maddened at this atrocity, Albrecht took up arms against his father, and, in league with his other enemies, wasted the country. It was in vain that Duke Ernst entreated his son to relent. It was not till the Emperor Sigismund, and the other friends of the family, united their exhortations, that Albrecht at last returned to his father's court, where, after a time, he consented to marry Anna of Brunswick. To regain the forfeited regard of his son, Duke Ernst had a chapel erected over the grave of the murdered lady, and Albrecht founded in the year of her death daily masses for her in the Carmelite monastery at Straubing; even after twelve years he renewed the foundation, and had the bones of his 'honoured wife' transferred to the tomb provided by herself, and covered with a marble monument. The unhappy loves of Albrecht and Agnes were long the theme of popular song; and the story has been made the subject of at least three tragedies, one by Jul. Körner (Leip. 1821), another by A. Böttger (3d ed. Leip. 1860).

**BERNAY**, a thriving town of France, in the department of Eure, 25 miles west-north-west of Evreux. It has manufactures of woollens, linens, cotton-yarn, paper, &c., and tanneria. One of the largest horse-fairs in France, attended by upwards of 40,000 jockeys and others interested in horses, is held here annually on the Wednesday of the fifth week in Lent. Pop. (1872) 5695.

**BERNBURG**, capital of the duchy of Anhalt-Bernburg, North Germany, is situated on the Saale, 23 miles south of Magdeburg, in lat.  $51^{\circ} 47' N.$ , long.  $11^{\circ} 45' E.$  Two parts of B., surrounded by walls, lie on the left bank of the river, and are united by a bridge with the third part on the opposite side, which has a castle, but is not walled. B. is well built, has several literary and charitable institutions, and manufactures of porcelain, paper, and starch. Pop. (1871) 15,715.

**BERNHARD**, Duke of Weimar, a celebrated German general, was born 6th August 1604. He was the youngest of the eight sons of John, third Duke of Saxe-Weimar. On the outbreak of the Thirty Years' War, he took the side of Protestantism against the emperor, and first distinguished himself in 1622 at the bloody battle of Wimpfen. Subsequently, he became colonel in the army of Christian IV., king of Denmark; took part in the bold expedition of Mansfield through Silesia to Hungary; and, after the sudden death of the latter, reunited himself with the Danes under the markgraf of Baden-Durlach. At the solicitations of his brothers, however, he now withdrew from the Danish service, and returned to Weimar in March 1628. Three years later, Gustavus Adolphus made his appearance in Germany, and B. was one of the first who flew to his standard. After a brilliant career, he became suddenly ill, and died at Neuburg on the Rhine, 8th July 1639; according to some, of a pestilential disorder then prevalent in the camp; but according to B.'s own opinion, and that of others, of poison, administered by his physician, Blandini, who is supposed to have been in the pay of France.

**BERNI**, FRANCESCO, called also **BERNA** or **BERNIA**, a favourite Italian poet, from whom comic or jocular poetry has the name of *Versi Bernesi*, was born at Campovecchio, in Tuscany, about 1490. He first entered the service of Cardinal Dovizio da Bibbiena, and was afterwards for several years secretary to Ghiberti, chancellor to Clement VII., and Bishop of Verona. About 1533, he betook himself to Florence, where he was made a canon, and lived in favour with the two Medici, Duke Alessandro, and Cardinal Ippolito, till his death in 1536. His *Opere Burlesche* (2 vols., Flor. 1548; Lond. 1721) are to be found in the *Classici Italiani* (Mil. 1806). His recast or rifacimento of Boiardo's *Orlando Innamorato* was received with such favour that it was thrice reprinted from 1541—1545. A critical edition was published at Florence, 1827. Berni's version, or dilution, is still read in Italy, in preference to the original.—**COUNT FRANCESCO BERNI**, b. 1610, d. 1693, the author of eleven dramas, and some lyric pieces, is not to be confounded with the former Berni.

**BERNIER**, FRANÇOIS, a French physician and traveller, was born at Angers, in France. Having taken his degree of Doctor at Montpellier, he departed for the East about 1654, and visited Syria, Egypt, Arabia, and India, in the last of which countries he resided for twelve years in the capacity of physician to Aurungzebe. On his return to France, he published an account of his travels in India in 1670—1671. The work is delightful in style, accurate in the delineation of manners and customs, as well as in the descriptions of places,

and clear in the exposition of the causes of those political events that carried Aurungzebe to the throne. He visited England in 1685, and died at Paris on the 22d of September 1688.

The titles of his chief works are as follows: *Voyages de M. Bernier contenant la Description des Etats du Grand Mogol, de l'Indoustan, du Royaume de Cachemire, &c.; Mémoire sur le Quétisme des Indes; Abrégé de la Philosophie de Gassendi; Sentiment de M. Descartes.*

**BERNI'NA**, a mountain of the Rhaetian Alps, upwards of 13,000 feet high, in the Swiss canton of Grisons, with a remarkable and extensive glacier, Morteratsch. The B. Pass, which attains an elevation of 7695 feet, and over which a carriage-road has been constructed, unites the valleys of the Engadine and Bregaglia on the north with the Valtelina on the south, but is dangerous on account of avalanches.

**BERNI'NI**, GIOVANNI LORENZO, a famous Italian sculptor and architect in the time of Pope Urban VIII., was born at Naples, 1598. He early devoted himself to sculpture, and in his eighteenth year finished his admired group of Apollo and Daphne, which gave promise of greater excellence than was afterwards realized by the artist. Pope Urban VIII. employed B. to produce designs for the embellishment of the Basilica of St Peter at Rome. The bronze *baldaccino*, or canopy, covering the high-altar of that edifice, the palace Barberini, the front of the College de Propaganda Fide, the church of Sant' Andrea a Monte Cavallo, and numerous ornaments in St Peter's, are by Bernini. His greatest work in architecture is the colossal colonnade of St Peter's. In 1665, B. accepted the flattering invitation of Louis XIV., and travelled to Paris with a numerous retinue and great pomp. In Paris, he resided above eight months; but not wishing to interfere with the designs of Claude Perrault for the Louvre, he confined himself entirely to sculpture. His visit, however, proved a highly remunerative one. Richly laden with gifts, he returned to Rome, where he died, November 28, 1680, leaving a large fortune (about £100,000) to his children. Besides his works in sculpture, B. also left numerous paintings behind him. No artist, perhaps, was ever so much admired and rewarded during his lifetime as B.; but time has rather subtracted from than added to his fame.

**BERNOUILLI** was the name of a family that produced a succession of men, who became famous over all Europe for the successful cultivation and extension of various branches of mathematical and physical science. The family originally resided in Antwerp, whence, in 1583, its attachment to the reformed religion forced it to seek an asylum in Frankfort. Afterwards, the Bernoullis settled in Basel, where they achieved the highest professional honours. Eight of them became highly distinguished; but special mention can be made here only of the three most celebrated—James, John, and Daniel.

**JAMES B.** was born at Basel, 25th December 1654, where he also died, 16th August 1705. He devoted his life to the study of mathematics, of which he became professor, in the university of Basel, succeeding in that chair the distinguished Megerlin. Among his first works were, *A Method of Teaching Mathematics to the Blind*, and *Universal Tables on Dialling*. These were followed by *Conamen Novi Systematis Cometarum*, being an essay on comets, suggested by the appearance of the comet of 1680; and an essay *De Gravitate Aetheris*. Besides a variety of memoirs on scientific subjects, he published no other work of importance. *De Arte Conjectandi* was a posthumous work concerning the

extension of the doctrine of probabilities to moral, political, and economical subjects. His memoirs will be found in the *Journal des Savans* and *Acta Eruditorum*; his collected works were published in 2 vols. 4to, at Geneva, in 1744. Among his triumphs are to be recorded his solution of Leibnitz's problem of the isochronous curve, his determination of the catenary, and investigation of the properties of isoperimetical figures. At his request, a logarithmic spiral was engraved on his tomb, with the motto, *Kadem mutatis resurgo*.

JOHN B., brother of the preceding, was born at Basel, 27th July 1667. He and James were the first two foreigners honoured by being elected associates of the Academy of Sciences at Paris, and members of the Academy of Berlin. John devoted himself to chemical as well as to mathematical science. In 1694, he became a Doctor of Medicine, and soon after Professor of Mathematics at Gröningen, whence he only removed to succeed his brother James in the university of Basel. His forte was pure mathematics, in which he had no superior in Europe in his day. He died 1st January 1748. Among his achievements are the determination of the 'line of swiftest descent,' and the invention of the 'exponential calculus.' His collected works were published at Geneva, in 4 vols. 4to, 1742; and his correspondence with Leibnitz, in 2 vols., 1745.

DANIEL B., born at Gröningen, 9th February 1700, died at Basel, 17th March 1782, was the son of John. Like his father, he devoted himself to medicine as well as to mathematics. The family reputation early helped him to the professorship of mathematics at St Petersburg, which he held for several years. Thence, however, he ultimately retired to Basel, much against the will of the czar. At Basel, he occupied in succession the chairs of anatomy and botany, and of experimental and speculative philosophy. He published various works between 1730 and 1756, of which the chief are concerned with pneumatical and hydrodynamical subjects.

BERNSTEIN, GEORGE HEINR., a distinguished orientalist, Professor of Oriental Languages in the university of Breslau, was born, 12th January 1787, at Kospeda, near Jena, where his father was pastor. In 1806 he entered the university of Jena, where he devoted himself to the study of theology, philosophy, and Eastern languages. In 1812 he was appointed extraordinary professor of Oriental Literature in Berlin, and in 1821, regular professor. In 1843, he was appointed to Breslau. Besides a number of lesser treatises, and of contributions to scientific and critical journals, he established his reputation as an oriental scholar by the publication of an Arabic poem of Szafieddin of Hilla (Leip. 1816). But his greatest achievements were in Syriac literature. Besides several pamphlets, expository and critical, which appeared between 1837 and 1847, B. has given in his lexicon to Kirsch's *Chrestomathia Syriaca*, of which he brought out a new edition (2 vols., Leip. 1832—1836), proofs of his diligent and successful research in the domain of Syriac lexicography. He contemplated publishing a great Syriac lexicon, but did not live to complete the work. He died 7th April 1860.

BERÖE, a genus of *Acalepha* (q. v.), of a division distinguished as *Ciliograde*, i. e., moving by means of cilia (q. v.), very different from the Medusae, and of higher organisation. This genus is now the type of a family, characterised by a nearly globular or oval body, of a delicate jelly-like substance, with an alimentary canal passing through its axis, which is vertical as the animal floats in the water; the body strengthened by bands of somewhat firmer texture,

'which run like meridian lines from pole to pole.' These bands are covered with rows of large cilia, the motion of which is extremely rapid, and is evidently controlled by the will of the animal, so that it swims with rapidity, and easily changes its course. The motion of the cilia causes a beautiful iridescence: the animals also are phosphorescent by night. *B. (or Cydippe) pileus* (figured in the article *ACALEPHE*) is a beautiful little creature, very abundant in the sea on many parts of the British coasts. It is provided with two very long and slender tentacula, which proceed from the sides of the body, and are covered with a great number of still finer filaments. These organs are probably employed for seizing food. This, and other kinds of *B.*, form a great part of the food of whales.

BEROSUS, an educated priest of Babylon, who had a knowledge of the Greek language, and probably lived about 260 B.C. He wrote, in Greek, three books of Babylonian-Chaldean history, in which he made use of the oldest temple archives of Babylon. The work was highly esteemed by Greek and Roman historians, but unfortunately only a few fragments have been preserved by Josephus, Eusebius, Syncellus, and others. Even these fragments are of great value, as they relate to the most obscure portions of Asiatic history. They have been edited by Richter in his *Berosi Chaldaeorum Historia quae supersunt*, 1825. The *Antiquitatum Libri Quinque cum Commentariis Joannis Annii*, first published in Latin by Eucharius Silber (Rome, 1498) as a work of B., and often republished, was the pseudonymous work of the Dominican, Giovanni Nanni of Viterbo.

BERRE, ETANG DE, an extensive lagoon of France, department Bouches-du-Rhône, with large salt-works and eel-fisheries. It discharges its surplus waters into the sea by the Port-du-Bouc.

BERRY (*Bacca*), the term employed in botany to designate a description of fruit more or less fleshy and juicy, and not opening when ripe. The inner layers of the pericarp (q. v.) are of a fleshy or succulent texture, sometimes even consisting of mere cells filled with juice, whilst the outer layers are harder, and sometimes even woody. The seeds are immersed in the pulp. A B. may be one-celled, or it may be divided into a number of cells or compartments, which, however, are united together not merely in the axis, but from the axis to the rind. It is a very common description of fruit, and is found in many different natural families, and both of exogenous and endogenous plants. As examples, may be mentioned the fruits of the gooseberry, currant, vine, barberry, bilberry, belladonna, arum, bryony, and asparagus, which, although agreeing in their structure, possess widely different properties. Some of them, which are regarded as more strictly berries, have the calyx adherent to the ovary, and the placentas—from which the seeds derive their nourishment—parietal, that is, connected with the rind, as the gooseberry and currant; others, as the grape, have the ovary free, and the placentas in the centre of the fruit.—The orange and other fruits of the same family, having a thick rind dotted with numerous oil-glands, and quite distinct from the pulp of the fruit, receive the name *hesperidium*; the fruit of the pomegranate, which is very peculiar in the manner of its division into cells, is also sometimes distinguished from berries of the ordinary structure by the name *balausta*. See POMEGRANATE. Fruits, like that of the water-lily, which at first contain a juicy pulp, and afterwards, when ripe, are filled with a dry pith, are sometimes designated *Berry-capsules*. The gourds, also, which at first have 3—5 compartments, but when ripe, generally consist of only

one compartment, are distinctively designated by the term *pepo*, *peponium*, or *peponida*, to which, however, *gourd* may be considered equivalent.

BERRY, or BERRL, one of the old French provinces (now forming the departments of Indre and Cher, q. v.), in lat  $46^{\circ} 10'$ — $47^{\circ} 40'$  N., and long.  $1^{\circ} 3^{\prime}$  E., its greatest length being about 100 miles, and its greatest breadth 90. Having come into the possession of the French crown, it gave title at various times to French princes, the younger son of Charles X. being the last who held it.

BERRY, CHARLES FERDINAND, DUKE DE, second son of the Count of Artois (afterwards Charles X.) and of Maria Theresa of Savoy, was born at Versailles, January 24, 1778. In 1792, he fled with his father to Turin; fought with him under Condé against France; afterwards visited Russia, and lived for some time in London and Edinburgh. In 1814 he returned to France, and the following year was appointed by Louis XVIII. commander of the troops in and around Paris. In 1816, he married Caroline Ferdinande Louise, eldest daughter of Francis, afterwards king of the Two Sicilies. On this marriage the continuance of the elder Bourbon line depended. The Duke de B. was assassinated on the 13th February 1820, as he was conducting his wife from the Opera-house to her carriage, by a person named Louvel. He left only one daughter, Louise-Marie-Thérèse d'Artois, Mademoiselle de France, born 1819; but on the 29th September 1820, the widowed duchess gave birth to the prince, Henry, Duke of Bordeaux, afterwards styled Count of Chambord. After the July revolution, 1830, in which the duchess exhibited immense force of character and courage, offering herself to lead on the troops against the insurgents, she, with her son, followed Charles X. to Holyrood, but left a considerable party in France in favour of the pretensions of her son as Henry V. of France. During a visit to Italy, the duchess was so far encouraged in her ambition, that a project was formed for reinstating the Bourbons in France; and, accompanied by several friends, she landed near Marseilles, April 29, 1832. After many adventures, she was betrayed, and was imprisoned in the citadel of Blaya. The confession of the duchess, that she had formed a second marriage with the Neapolitan marquis, Lucchesi-Palli, destroyed at once her political importance, and the government restored her to liberty.

BERRYER, PIERRE ANTOINE, a distinguished French advocate and party politician, was born in Paris, 4th January 1790, and first distinguished himself by his defence of victims of the restoration. In 1829 he was chosen deputy, and has ever since steadily represented the rights and policy of the elder Bourbons. His legitimist tendencies kept him for a time in the political background under Louis Philippe; but as the legitimist party in the chamber increased, his position grew in importance. He repeatedly undertook the defence of persons prosecuted by the government, not only of his own party, but republican leaders. It was he who defended Louis Napoleon in the Chamber of Peers after the Boulogne *attentat*. With the elder Bourbons he was in constant communication, and was one of the heads of the legitimist party who made a pilgrimage to the Count of Chambord in London, in 1843. After the revolution of 1848, he represented the Bouches-du-Rhône; seemed inclined to support the government of the president, Louis Napoleon; and became a member of his privy-council. But this did not hinder him from going to Wiesbaden, in 1850, to do homage to the Count of Chambord. On that occasion, he was openly spoken of as the future minister of Henry V. When Changarnier

was removed from his command, B. united with Thiers and others to oppose the pretensions of the president, and he was one of the few who boldly protested against the *coup d'état*. In 1854, he was elected a member of the French Academy. His inaugural speech contained some uncomplimentary allusions to the Lower Empire, and its publication was prohibited, the prohibition, however, being removed in 24 hours. B. added greatly to his reputation as an orator by his defence of Montalembert (q. v.) against the government prosecution in November 1858. He died 29th November 1868.

BERSAGLIERI is the Italian name for the riflemen or sharpshooters of the Sardinian army. After the disastrous campaign of Charles Albert against the Austrians in 1848—1849, and the abdication of that monarch, his son, Victor Emmanuel, commenced a remodelling of the Sardinian army. One improvement, brought about by General Alessandro della Marmora, was the formation of a corps of bersaglieri. These are light active soldiers, dressed in a picturesque but serviceable dark-green uniform, and armed with long rifles. Two battalions of these riflemen formed part of the Sardinian army during the Crimean war. On the 16th of August 1855, they took part in the battle of the Tchernaya. During the Italian war of 1859, the B. were engaged in many operations requiring dash and brilliancy.

BERSERKER (*ber*, bare, and *serkr*, shirt of mail), a redoubtable hero in Scandinavian mythology, the grandson of the eight-handed Starkader and the beautiful Alfhilda. He despised mail and helmet, and, contrary to the custom of those times, went always into battle unharnessed, his fury serving him instead of defensive armour. By the daughter of King Swafurlam, whom he had slain in battle, he had twelve sons, who inherited the name of B., along with his warlike fury.

BERTH, or BIRTH, in nautical language, is nearly equivalent to room or space. A ship's B. is the space which she occupies when at anchor, including a small breadth of sea all around her. The same name is also given to a messing or sleeping room on board ship, in a sense not very different from that of the word *cabin*. To 'B.' a ship's crew, is to allot to each man the place where his hammock, &c., are to be placed. In the third-class cabins of passenger-steamers, where many sleep in one room without partitions or divisions, each one's crib or bed-place is his berth.

BERTHA, the name of several famous women of the middle ages, half-historical, half-fabulous (see BERCHITA). ST BERTHA, whose day is kept on the 4th July, was the beautiful and pious daughter of Charibert, king of the Franks, who having married (560 A. D.) Ethelbert, king of Kent, became the means of his conversion, and of the spread of Christianity among the Anglo-Saxons. In the romances of the Charlemagne cycle, there figures a BERTHA, called also Berthrade with the Big Foot, as the daughter of Count Charibert of Laon, wife of Pepin the Little, and mother of Charlemagne. In the romances of the *Round Table*, again, BERTHA is the name of a sister of Charlemagne, who makes Milo d'Angleois the father of Roland. Better known is BERTHA, daughter of Burkhard, Duke of the Alemanni, and wife of Rudolf II., king of Burgundy beyond Jura, who, after Rudolf's death (937), acted as regent for her infant son, Konrad; afterwards married Hugo, king of Italy; and died towards the close of the 10th c. This queen had the character of an excellent housekeeper, and is represented on seals and other monuments of the time as sitting on her throne spinning.

**BERTHIER, ALEXANDRE**, Prince of Neuchâtel and Wagram, and Marshal of the French Empire, was born at Versailles, November 20, 1753. His father, a military engineer, trained him for the army, which he entered in 1770, and fought with Lafayette in the American War of Independence. At the outbreak of the French Revolution, he was appointed major-general of the National Guard of Versailles, and rose to be a general of division, and chief of the staff in the Army of Italy, 1796; and in 1798, in the absence of Bonaparte, entered the papal territory, and proclaimed the republic in Rome. He accompanied Napoleon to Egypt in the same year as chief of the staff, a post which he also held in all the subsequent campaigns. At the revolution of 18th Brumaire (1799), he became war-minister, and (till 1808) as such signed many important treaties and truces. He always accompanied the emperor, and often rendered important services; for the part he took in the battle of Wagram, he received one of his many distinctions. B. was Napoleon's proxy in the marriage of Maria Louisa, at Vienna, 1810. In the campaigns of 1812, 1813, and 1814, he was constantly by the emperor's side, and acted both as chief of the staff and as quartermaster-general. It was only B.'s love of order, quick insight, and activity that could have superintended the movements of so many armies. Napoleon did him full justice on this score, asserting at the same time that he was incapable of leading the smallest *corps d'armée* alone.

On the fall of Napoleon, B. hardly shewed due gratitude for the favours heaped upon him. He had to surrender the principality of Neuchâtel; and not to lose more, he submitted to Louis XVIII., who made him a peer and marshal, with the title of Captain of the Guards. Napoleon, who never doubted his secret attachment, made overtures to him from Elba: these he neither answered nor yet revealed to Louis, which made him suspected by both. On the return of Napoleon from Elba, in a fit of irresolution B. retired to Bamberg, in Bavaria, to his father-in-law, Duke William, where his mind became unengaged with the conflict. On 1st July 1815, while looking from the balcony of the palace at a division of Kessian troops marching towards the French frontier, the bitter sight was too much—he threw himself down into the street, and thus ended his life. His *Mémoires* appeared in 1828.—He had two brothers, Victor Leopold, and César, who both served with distinction, and rose to be generals.

**BERTHOLLET, COUNT CLAUDE LOUIS**, one of the most distinguished theoretical chemists of his time, was born at Talloire, a village of Savoy, near Annecy, on the 9th December 1748. He studied at the university of Turin, and obtained a medical degree there in 1768. He afterwards went to Paris, where he was appointed physician to the Duke of Orleans. He now applied himself with great assiduity to chemistry; in 1781, he was elected a member of the Academy of Sciences, and, some time after, the government made him superintendent of dyeing processes. In this situation he published a very valuable work on dyeing. In 1785, he announced his adherence to the antiphlogistic doctrines of Lavoisier, with the exception that he did not admit oxygen to be the acidifying principle, and herein he has proved to be right. In the same year, he published a paper on 'dephlogisticated marine acid'—now called chlorine—pointing out its use for bleaching purposes; and following up the experiments of Priestley, he shewed ammonia to be a compound of three volumes of hydrogen gas, and one volume of azotic gas. During the early part of the French Revolution, B. travelled through the country, giving instruction as to the best means

of extracting and purifying saltpetre to be used in the manufacture of gunpowder, and also as to the process of smelting and converting iron into steel. His joining the expedition of Napoleon to Egypt led to the formation of the Institute of Cairo. On his return from Egypt, he was made a senator by Bonaparte, who also conferred on him several marks of honour, and made him a count. Notwithstanding, he voted for the deposition of Napoleon in 1814. On the restoration of the Bourbons, he was made a peer; but all his honours never made him other than a simple and unassuming gentleman. Besides the additions to chemical knowledge already mentioned, he, in conjunction with Lavoisier, and two other chemists, promulgated a new chemical nomenclature which has proved valuable to science. He died at Paris, 7th November 1822.

#### BERTHOLLETIA. See BRAZIL NUTS.

**BERTIN, LOUIS FRANÇOIS**, called Bertin l'Aîné, an eminent French journalist, was born in Paris, 1766. He began writing for the press in 1793, and in 1799 set on foot the *Journal des Débats* (q. v.). B.'s royalist principles offended the government of Napoleon, and cost him imprisonment and banishment to Elba; whence, however, he escaped to Rome, where he formed a friendship with Châteaubriand. In 1804, he returned to Paris, and resumed the editorship of the *Débats*, but was much hampered by Napoleon, who imposed on the paper the title of *Journal de l'Empire*, and by subjecting it to police revision, gave it almost an official character. When B., in 1814, became free to follow his own bent, the journal reverted to its royalist principles. During the Hundred Days, it fell into other hands, till the return of the Bourbons restored it once more to B., who, in the meantime, had taken part in the *Moniteur de Gand*. Throughout the restoration, B. gave almost constant support to the ministerial party. Though he did not join in the protest of the liberal journals against the ordinances, he gave his adhesion to the July monarchy, and continued faithfully to support it. He continued to edit the *Débats* till his death, 13th September 1841.

**BERTIN, LOUIS MARIE ARMAND**, son of the former, was born in Paris, 1801, and became, after the restoration, secretary to Châteaubriand during his embassy in England. In 1820, he joined the editorial staff of the *Journal des Débats*, and at his father's death assumed the chief direction. As a journalist, he contrived, as well as his father, to maintain a certain independence of the government. B. died at Paris, January 11, 1854.

**BERTRAND, HENRY GRATIEN, COUNT**, one of Napoleon's generals, known for his faithful attachment to the emperor through all his fortunes, was born at Châteauroux, 1773, and early entered the armies of the Revolution as engineer. He accompanied the expedition to Egypt, and directed the fortification of Alexandria. Returning with the rank of general of brigade, he distinguished himself at Austerlitz, and became the emperor's adjutant; and, after the battle of Aspern in 1809, for establishing bridges over the Danube, he was created Count and governor of Illyria. After sharing with credit in the subsequent campaigns, he retired with the emperor to Elba, was his confidant in carrying out his return to France, and finally shared his banishment to St Helena. On Napoleon's death, B. returned to France, where, though sentence of death had been pronounced upon him—a sentence which Louis XVIII. had wisely recalled—he was restored to all his dignities, and, in 1830, appointed commandant of the Polytechnic School. He formed

part of the expedition which, in 1840, brought back the remains of Napoleon to France. His death took place at Châteauroux, 31st January 1844.

**BERVIC, CHARLES CLEMENT BALVAY**, a celebrated French engraver, was born at Paris in May 1756. In 1790, he made himself famous by a full-length engraving of Louis XVI., from the picture by Callet, one of the finest works of the kind ever produced. The engravings of the Laocoön, Regnault's 'Education of Achilles,' and Guido's 'Rape of Deianira,' also from B.'s graver, display equal beauty of manipulation, and fully higher power. B. died March 23, 1822.

**BERWICK, JAMES FITZ-JAMES, DUKE OF**, was the natural son of James II., by Arabella Churchill, sister of the Duke of Marlborough. He was born in 1670, in France, where he was educated, and entered the army. After serving in Hungary under Charles of Lorraine, he returned to England shortly before the revolution of 1688, which he exerted himself to prevent. In 1689, he accompanied his father in his Irish expedition, and after the death of St Ruth, had the nominal chief command. He next served in Flanders, under Marshal Luxembourg, and afterwards under the Duke of Burgundy and Marshal Villeroi. In 1706, he was created a marshal of France, and sent at the head of an army to Spain, where he established the throne of Philip V. by the decisive victory of Almanza. For this important service, he was made a grandee of Spain, under the title of Duke of Liria and Xerica. After several years of inactivity, he received the command, in 1734, of an army intended to cross the Rhine. While besieging Philipburg, he was killed by a cannon-ball. Contemporary testimony, confirmed by his military conduct, shews B. to have possessed some of the best qualities of a great commander. His defensive campaign in 1709, in Provence and Dauphiné, against the superior force of the Duke of Savoy, has always been regarded as a triumph of strategic skill. He was twice married. His son by the first marriage succeeded to the dukedom of Liria; his dukedom (De Fitz-james) and estates in France passed to his children by the second marriage.

**BERWICK, NORTH**, a seaport town in Haddingtonshire, at the entrance to the Firth of Forth, 19 miles east-north-east of Edinburgh. Corn is exported from it, and it is frequented as a bathing-place. It unites with Lauder, Dunbar, Jedburgh, and Haddington, in returning one member to parliament. Pop. (1871) of burgh, 1408; of parish, 2373. The parish includes the Bass Rock, North Berwick Law, and the ruins of Tantallon Castle. The castle is graphically described in Scott's *Marmion*. It is an irregular pile, two miles east of the town, on a high rock, surrounded by the sea on three sides, with a ditch on the land-side, where there was formerly a drawbridge. It was a stronghold of the Douglas family. N. Berwick Law is a conical hill of an elevation of 940 feet, on the south, close to the town.

**BERWICKSHIRE**, a maritime and border county in the south-east extremity of Scotland, is bounded N. by Haddington; S. and S.E. by Roxburgh and Northumberland, having a detached portion of Durham on its S.E. limits; E. by the German Ocean and Berwick-on-Tweed; and W. by Mid-Lothian and Roxburgh. It extends from E. to W. 35 miles, from N. to S. 22 miles, and has an area of 464 sq. m., or 297,161 statute acres. B. is divided into three districts—the Merse, the Lammermoors, and Lauderdale. The largest and most fertile district is the luxuriant valley of the Merse, believed to be the most extensive and richest piece of level land in Scotland, extending to nearly 130,000 acres.

The Lammermoors, consisting of 90,000 acres, chiefly pastoral, divide the valley of the Tweed from Mid-Lothian and Haddington. Lauderdale, in extent about 67,000 acres, comprising a mixture of hill and dale, runs along the banks of the Leader Water. From its commencement at Lamberton to St Abb's Head, the coast line of B. extends to 8½ miles, or allowing for headlands, 9½. The coast is rocky and bold, with only two bays, at Eyemouth and Coldingham respectively. Geologically, as well as topographically, B. possesses numerous interesting features—the Lammermoors (the principal summits of which are Lammer Law, Crib Law, Sayer's Law, and Flint Hill, ranging from 1500 to 1600 feet high), consist of Silurian strata, stretching to St Abb's Head; in the south, carboniferous rocks are found, while an extensive bed of red sandstone extends easterly from the centre of the county to the sea-coast. On the coast porphyry is found, and some traps and syenite in the interior. Ironstone and thin seams of coal occur, as well as gypsum, clay, and shell-marl. The Blackadder, Whitedder, and Leader streams, the river Eye being the only exception, are tributaries of the Tweed. Population (1871), 36,486; inhabited houses, 6491; constituency, 1654; parishes, 31; 46 day-schools, with 4500 scholars under the jurisdiction of schoolboards, and about 30 independent schools, attended by nearly 2000 children; 68 places of worship (32 Established, 16 Free, 17 U.P., and 3 of other denominations). B. returns one member to Parliament. Agriculturally, B. occupies a prominent position, and the science of agriculture has in this county found great development. 190,545 statute acres are farmed by 1005 tenants or owners. B. is, however, almost entirely barren of hives of manufacturing industry. The principal towns are Dunse, the most populous, and the birthplace of John Duns Scotus, Thomas Boston, and Dr M'Crie; Greenlaw, the county town; Lauder, a royal burgh; Eyemouth, a prosperous fishing-station; Coldstream, where General Monk first raised the Coldstream Guards; Ayton; and Earlston, the Ercildoune of Thomas the Rhymer. Dunse being more central than Greenlaw, the great bulk of the county business has been transferred thither. Many names famous in Scottish annals are closely associated with B.; amongst others, ancestors of the royal Stuarts; the noble family of Douglas; the Earl of Bothwell, who was sheriff of B.; the brave but unfortunate son of James II., styled Duke of B.; the great Marlborough (Baron Eyemouth); and the records of the Court of Session shew that no fewer than 23 judges were natives of B. The antiquities of the county are few, the chief being the ruins of Dryburgh Abbey, Coldingham Priory, Fast Castle, and the remains of British and Roman camps, and barrows.

**BERWICK-ON-TWEED**, a seaport town at the mouth of the Tweed, 58 miles S.S.E. from Edinburgh. It is the frontier town of England and Scotland, and with its liberties, comprising an area of about 8 miles, forms an independent borough and county by itself separate from England and Scotland; and since the Municipal Reform Act of 1835, its proper designation is 'County of the Borough and Town of Berwick-upon-Tweed.' It has its own quarter sessions and recorder, its own magistrates and petty sessions, and maintains its own police staff. The municipal and parliamentary boroughs are co-extensive. Pop. (1871) 13,282, an increase since 1861 of 17; inhabited houses, 2092, increase, 209; constituency, 1143, returning two members of parliament. The past history of B. is full of interest, especially in regard to the Border wars. The authentic records of B. begin in the reign of Alexander I., 12th c.,

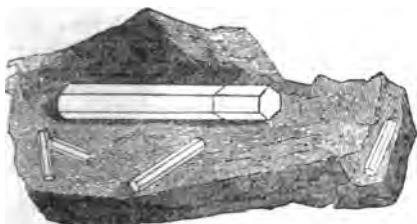

## BERYL—BESANCON.

when it was one of the principal seaports in the kingdom. B. finally passed into the possession of England in 1482. The town has an antiquated and somewhat decaying appearance. It is girded with old fortifications, and has large barracks. Tweed-mouth and Spittal (the latter a favourite watering-place), on the south side of the Tweed, both within the municipality of B., are reached by an old stone bridge, and a magnificent viaduct of 23 arches spans the river, and connects the North-eastern with the North British Railway. The trade and shipping of B. are inconsiderable. The harbour commissioners have, with the view of resuscitating the trade of the port, obtained parliamentary powers to construct a wet dock, at a cost of £40,000, and this undertaking has been commenced. Of recent years the salmon fishings have improved, but the herring fishing has been less productive than formerly. For the manufacture of agricultural implements B. stands high, and in Spittal there are several large artificial manure works. 18 places of worship in borough, 4 belonging to Church of England, 3 to Church of Scotland, 4 English F.C., 4 U.P., and 5 of other denominations. 14 day-schools, including corporation's academy. Public institutions include infirmary and dispensary (in course of erection), museum, literary institute, and subscription library. Besides several new ecclesiastical edifices and schools erected of late years, a freemasons' hall, a good templars' hall, and a mission hall were built in 1873.

**BERYL**, a mineral which scarcely differs except in colour from Emerald (q. v.), never exhibiting the bright rich green which characterises that gem, but colourless, yellowish, greenish-yellow, or blue. The finer varieties, which are transparent and of beautiful colour, are distinguished as *Precious B.*, and are sometimes called *Aquamarine*. These occur in crystals similar in form to those of emerald; but the regular hexagonal prism is more frequently modified by truncation on the angles or edges, acumination, &c. The prisms are often long. Their sides are longitudinally striated, often deeply so; but the

preparatory natural sciences, especially chemistry. After being some time employed in medical practice and lecturing, he was appointed (1806) lecturer on chemistry in the Military Academy of Stockholm, and, in the following year, professor of medicine and pharmacy. He was shortly after chosen president of the Stockholm Academy of Sciences; and from 1818 till his death, 7th August 1848, held the office of perpetual secretary. The king raised him to the rank of baron; other honours from learned societies were conferred on him; and the directors of the Swedish Ironworks, in consideration of the value of his researches in their particular branch of industry, bestowed on him a pension for life. In 1838, he was made a senator; but he took little part in politics. The field of his activity lay in his laboratory, where he acquired a name of which his country is justly proud. His services to chemistry are too vast to be described here. The science of chemistry, as at present organised, rests in a great measure upon the discoveries and views of B., although in not a few points he has been controverted, or found wrong. His multiplied and accurate analyses established the laws of combination on an incontrovertible basis; and to him we owe the system of chemical symbols. He discovered the elements selenium and thorium, and first exhibited calcium, barium, strontium, columbium or tantalum, silicium, and zirconium, in the metallic form. The blowpipe in the hands of B. became a powerful instrument in the analysis of inorganic substances. The multitude and accuracy of his researches in every branch of chemical inquiry make it difficult to conceive how one man could have accomplished so much. Of his numerous writings, the most important is his *Lærebok i Kemien* (Text-book of Chemistry, 3 vols., Stock. 1808—1818), which has since passed through five large editions, on each occasion being almost wholly rewritten. The best known edition is that published in 8 vols. at Brussels in 1835. The book has been translated into every European language. His essay *On the Use of the Blowpipe* exhausts the subject, while his *Annual Reports on the Progress of Physics, Chemistry, and Mineralogy*, undertaken at the request of the Academy of Sciences in 1822, have proved very valuable to science. Scarcely less so have been the *Mémoire Relative to Physics, Chemistry, and Mineralogy*, of which he was one of the originators and conductors, and to which, during the twelve years they were published, from 1806 to 1818, he contributed forty-seven original papers.

**BESANCON** (*Vesontio*), capital of the French department of Doubs, and formerly capital of Franche-Comté, is situated on the river Doubs, which divides it into two parts, about 45 miles east of Dijon. Lat. 47° 14' N., long. 6° 3' E. It was strongly but irregularly fortified by Vauban, the citadel being considered impregnable. Since that time, the fortifications have been extended and strengthened, and B. is now considered one of the strongest military positions in Europe. It was the ancient Vesontio, Besontium or Visontium, and was a considerable place even in the time of Cæsar, who, in 58 B.C., expelled from Vesontio the Sequani, and, in the neighbourhood of the city, gained a victory over Ariovistus. It then became an important Roman military station. In modern times, after undergoing many changes, it finally came into the possession of France in 1674. Several streets and places in B. still bear old Roman names; and in the neighbourhood are found ruins of a triumphal arch of Aurelian, an aqueduct, an amphitheatre, and a theatre which must have been large enough to contain 20,000 spectators. Among the modern structures, the Cathedral and the churches of St

Beryl, in its primary form.

truncating or terminating planes are smooth. The coarser varieties of B. (*Common B.*) are also found crystallised, but often massive. B. occurs chiefly in veins that traverse granite or gneiss, or imbedded in granite; sometimes it is found in alluvial soils formed from such rocks. Common B. is found in a number of places in Europe; Rubislaw, near Aberdeen, is a British locality. The mountains of Aberdeenshire, and those of Mourne in Ireland, yield Precious B., which is also found in several parts of the continent of Europe and of New England, but principally in Brazil and Siberia. It is much valued as a precious stone, although not so much as the emerald.

**BERZELIUS, JOHANN JACOB, BARON**, one of the greatest of recent chemists, was born at Westerlösa, in East Gothland, Sweden, 20th August 1779. While studying for the medical profession at the university of Upsala, he was more attracted by the

John and the Magdalen, with the Prefecture, and the half-Gothic, half-Roman palace of Cardinal Granvella, are most remarkable. B. has considerable manufactures, chiefly watches (of which more than 60,000 are made annually), porcelain, carpets, iron-wire, and beer, and is an important entrepôt for the produce of part of Switzerland and the south of France. 600,000 bottles of Saltæer-water are annually manufactured. Pop. (1872) 33,158.

**BESA'NTS**, or **BEZA'NTS**, circular pieces of bullion, generally gold, without any impression, supposed to represent the old coinage of Byzantium, brought home by the Crusaders, and hence of frequent occurrence as heraldic charges. B. are generally introduced into the arms of banks, and also into those of individuals who have been specially connected with money. Similar figures, when not coloured or (gold), or *argent* (silver), are known in heraldry by the general term of *rouelles*. A *bezant cross*, is a cross composed of B.; and *bezanty*, or *bezantise*, is the term used when the shield, or any particular charge, is strewed with bezants.

**BESIEGING**. See **SIEGE**.

**BESSARA'BIA**, a province in the south-west of Russia, in lat.  $44^{\circ} 45'$ — $48^{\circ} 40'$  N., and long.  $26^{\circ} 35'$ — $30^{\circ} 30'$  E. Area, 17,000 square miles (about 1000 square miles were ceded to Turkey in 1856), with a population, in 1867, of 1,052,013, composed of Russians, Poles, Wallachians, Moldavians, Bulgarians, Greeks, Armenians, Jews, Germans, and Tatars, with a sprinkling of Gipsies. The Dniester flows along the whole of its northern and eastern boundaries; the Pruth separates it from Moldavia on the west; and it has the Danube on the south. B. is also intersected by several considerable streams; which are, however, much reduced by the summer heats. The climate is, on the whole, mild and salubrious. In the north-west, the country is traversed by offshoots from the Transylvanian branch of the Carpathian Mountains, and mostly covered with wood. Generally, however, B. is flat and fertile; but for want of proper cultivation, the land does not yield the rich returns it is capable of doing. Wheat, barley, and millet are raised to some extent, as well as hemp, flax, and tobacco, fruit and wine; but the breeding of cattle forms the chief business of the inhabitants; consequently, the greater part of the land is in pasture. The lakes in the district of B., called the Budjak, yield immense quantities of salt; which, together with cattle, wool, tallow, and cheese, form the principal articles of export. The manufacturing industry of B. is confined almost entirely to leather, soap, and candles. B., which formerly belonged to Turkey, was ceded to Russia in 1812 by the treaty of Bucharest.

**BESSA'RION**, JOHANNES, or BASILIUS, born at Trebizond, on the Black Sea, 1395, is remembered as one of the earliest of those scholars who, in the 15th c., transplanted Greek literature and philosophy into the west, and rescued the mind of Christendom from the trammels of scholasticism. B. imbibed his love of Plato's writings from his tutor, Gemistus Pletho. As Bishop of Nicæa, B. accompanied the Greek emperor, John Paleologus, to Italy; and effected, at the council of Florence in 1439, a union between the Greek and the Romish Churches, which, however, was of short duration. Soon afterwards, he joined the Romish Church, but always retained a glowing love of his native land. He was made cardinal by Pope Eugene IV. in 1439. Ten years after, Nicholas V. created him Cardinal-bishop of Sabina, and in the same year Bishop of Frascati. For five years, also, he discharged the duties of papal legate at Bologna. After the fall of

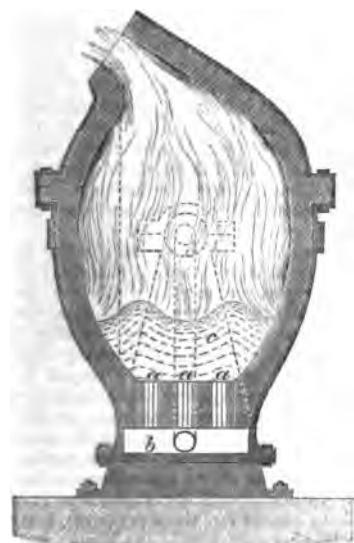

Constantinople, B. visited Germany; and at the diets of Nuremberg, Worms, and Vienna, endeavoured to promote a crusade against the Turks. In philosophy, he professed to be a follower of Plato, but without depreciation of Aristotle. His writings, consisting of Latin translations of Greek authors, defensive treatises on the Platonic philosophy, with discourses and letters, have never been published collectively. Twice he was nearly elected pope; but his partiality for the heathen philosophy was probably regarded as some disqualification by the sacred college. B. died at Ravenna, November 19, 1472, leaving his collection of 600 valuable Greek MSS. to the St Mark's Library, Venia.

**BESSEL**, FRIEDRICH WILHELM, one of the most distinguished of modern astronomers, was born at Minden, July 22, 1784. In 1806 he was, on the recommendation of Olbers, whom he had greatly assisted by his remarkable expertise in calculation, appointed assistant to Schröter at Lilienthal. In 1810, he published his researches on the orbit of the great comet of 1807, which gained for him the Lalande prize of the Paris Academy of Sciences. In the same year he was appointed director of the new observatory to be erected by the king of Prussia at Königsberg; and repairing thither immediately, superintended the erection and the mounting of the instruments. The establishment was completed in three years. In 1818, B. published his *Fundamenta Astronomiae*—giving the results of Bradley's Greenwich observations—a work upon which he had been engaged for eleven years. This work is one of the highest value to astronomers. It is described by a competent authority as having laid the foundations of the principal improvements which have been made in astronomy since the date of its publication. In 1830 appeared his *Tabula Regiomontana*, forming a kind of supplement to the above work. Besides numerous papers of an important character (nearly 200 in all) scattered through various scientific journals, he also published an inquiry on the seconds' pendulum for Berlin (1828, and again in 1837), *Astronomical Researches* (2 vols., Königsb. 1841—1842). His paper on the precession of the equinoxes gained him the prize of the Berlin Academy. After a series of three years' observations he succeeded in determining the annual parallax of the fixed star 61 Cygni (see STARS), an achievement honourable not only as the first of its kind, but for the marvellous skill and patience necessary for its accomplishment. In the years 1824—1833, B. made a series of 75,011 observations in 536 sittings, and completed a catalogue of stars (extending to the ninth magnitude) within the zone from  $15^{\circ}$  N. to  $15^{\circ}$  S. declination. These were afterwards reduced by Weiss. In one of his lectures, delivered at Königsberg in 1840, B. indicated the existence of the new planet afterwards discovered by Le Verrier, and named Neptune; and but for the death of a favourite son, he in all probability would have undertaken the investigation of the problem. B.'s *Popular Lectures on Astronomy*, given at Königsberg, 1832—1844, were edited by his friend Schumacher, and published at Hamburg in 1848, two years after his death, which took place March 7, 1846. All scientific associations, both on the continent and in England, were eager to confer honour on themselves by enrolling B. as one of their members. He was a thoroughly practical man of science, never allowing himself to be carried away by any theory, however inviting, and particularly remarkable for the precision of his calculations, being satisfied with nothing less than perfect exactness.

## BESSEMER PROCESS FOR MAKING IRON—BESSIERES.

**BESSEMER PROCESS FOR MAKING STEEL.** The boldest and most noted attempt which has yet been made to improve on the older methods of making both malleable iron and steel, is that of Mr Henry Bessemer, whose process was patented in 1856. Bessemer's first idea was to blow air through molten cast-iron till the whole of the carbon was oxidised when malleable iron was required, and to stop the blowing when a sufficient degree of decarbonisation was effected in order to produce steel. He has hitherto failed to produce malleable iron of the least service by his process, so that, as a metallurgical operation, it is at present confined to the manufacture of steel. But neither can serviceable steel be made by the plan first specified by Bessemer, except from the best charcoal iron, such as the Swedish. In England, where charcoal iron is not used for this purpose, the process can only be successfully conducted by first oxidising the whole of the carbon and silicon, and then restoring the proper amount of carbon by the addition of a small quantity of a peculiar cast-iron of known composition, called *spiegeleisen*. Moreover, haematite pig is the only kind of English iron which can be employed, as that made from clay iron-stone contains too much phosphorus and sulphur. The getting rid of these two elements and silicon is the most formidable difficulty which the steel-manufacturer has to encounter.

The various steps in the Bessemer process, as at present conducted, are as follow : Pig-iron is melted either in a cupola or reverberatory furnace, and run in the liquid state into a converting vessel, such as

Bessemer Converting Vessel :  
a, a, a, tuyères; b, air-space; c, melted metal.

is shewn in section in the figure. This converter, or 'kettle,' as it is called in Sheffield, is of wrought-iron, lined either with fire-brick or with a siliceous material called 'ganister,' and is suspended on trunnions, so as to admit of its being turned from an upright to a horizontal position by means of hydraulic apparatus. The capacity of a converter varies from three to ten tons. In the bottom there are seven tuyères, each with seven holes of one half-inch in diameter, through which atmospheric air is blown with a pressure of from 15 to 20 lbs. per square inch by a blowing-engine. The molten

iron in the converter is therefore resting, from the first, on a bed of air, the strength of the blast being sufficient to keep it from falling through the tuyères into the blast-way. During the blowing off of the carbon at this stage, a striking and magnificent effect is produced by the roar of the blast, and the volcano-like shower of sparks and red-hot fragments from the mouth of the converter, as well as by the dazzling splendour of the flame. In about fifteen or twenty minutes, the whole of the carbon is dissipated. This first 'blow' being over, the converter is lowered to a horizontal position, and presently a red stream of molten spiegeleisen is run into its mouth, till it amounts to from 5 to 10 per cent. of the whole charge. As already stated, the spiegeleisen restores the proper amount of carbon to produce steel; and after it is added, the blast is again turned on for a few minutes to secure its thorough incorporation. There is a circular pit in front of every two converters, with a hydraulic piston in its centre, and on its counterpoised arm a large ladle is hung, so that it can sweep the whole circumference. Round this the ingot-moulds are arranged, and the hydraulic machinery is so conveniently planned that, simply by moving levers, a man standing on a small platform can empty the contents of the huge converters into the ladle, raise or lower the ladle itself, and turn it round from point to point, so as to fill the moulds by means of a plug in its bottom. Steel made in this way is not sufficiently dense, and accordingly the moulds are lifted off the ingots by means of a hydraulic crane, and the latter removed while still hot, and condensed under heavy steam-hammers. After this, they are rolled into rails, tires, plates, and other heavy objects, for which this steel is suitable. Although, as already said, Bessemer steel will not do for tools and cutting instruments, nor even for such comparatively coarse objects as the springs of railway waggon, yet the great value of the invention is unmistakably shewn by the fact that 500,000 tons of steel are now annually made by this process in Great Britain, the total number of converting vessels in use being 91, and their aggregate capacity 467 tons. Large quantities are also manufactured by it in Sweden, Russia, Austria, Prussia, Belgium, and France. It is likewise extensively employed in America. In a recent experimental trial, said to be quite fairly conducted, a Bessemer steel rail lasted fully longer than twenty iron ones.

**BESSIÈRES.** JEAN BAPTISTE, Duke of Istria, and Marshal of the French Empire, was born at Preissac, in the department of Lot, August 1768. After serving for a short time in the constitutional guard of Louis XVI., in November 1792, he entered the army of the Pyrenees as a private soldier. In less than two years, he had attained the rank of captain, and passing into the Army of Italy, he distinguished himself greatly in the battles of Roveredo and Rivoli. Having been made chief of a brigade in 1798, he in that year accompanied Bonaparte to Egypt, and made himself conspicuous at the siege of St Jean d'Acre, and at the battle of Aboukir. Afterwards, he took a prominent part in the battles of Marengo, Olmütz, Austerlitz, Jena, Friedland, and Eylau; and within five years (from 1800 to 1805), he was made successively general of brigade, general of division, and marshal of France. For his gallant behaviour in Spain, he was, in 1809, created Duke of Istria. In the Russian campaign, he commanded the cavalry of the Guard, and during the disastrous retreat from Moscow, the services he rendered were of the utmost importance. In 1813, he received the command of the whole of the French cavalry. On the morning of the battle of Lützen,

while leading on foot the *tirailleurs* to reconnoitre the field from the defile of Rippach, he fell mortally wounded by a bullet. The news of his death was kept concealed from the army throughout the day. Bonaparte lost in B. one of his ablest officers and his most faithful friend.

BESTIAIRES (Fr.), the name given to a class of written books of great popularity in the middle ages, describing all the animals of creation, real or fabled, and generally illustrated by drawings. They were most in fashion during the 11th, 12th, and 13th c. They served as encyclopedias of the zoology of those ages, but they had also another use. The symbolism which was then so much in vogue fastened spiritual meanings upon the several animals, until every quality of good or evil in the soul of man had its type in the brute world. It is in this way to the B. that we must look for explanation of the strange, grotesque creatures which are found sculptured on the churches and other buildings of the middle ages. There were B. both in prose and in verse, in Latin and in the vernacular. A few sentences from *Le Bestiaire Divin de Guillaume, Clerc de Normandie, Trouvère du XIII<sup>e</sup> Siècle* (Caen 1852), may help to give some notion of the class of works of which it is a fair example. ‘The unicorn,’ he writes, ‘has but one horn in the middle of its forehead. It is the only animal that ventures to attack the elephant; and so sharp is the nail of its foot, that with one blow it rips up the belly of that most terrible of all beasts. The hunters can catch the unicorn only by placing a young virgin in the forest which it haunts. No sooner does this marvellous animal descry the damsel, than it runs towards her, lies down at her feet, and so suffers itself to be taken by the hunters. The unicorn represents our Lord Jesus Christ, who, taking our humanity upon him in the Virgin’s womb, was betrayed by the wicked Jews, and delivered into the hands of Pilate. Its one horn signifies the gospel truth, that Christ is one with the Father,’ &c.

BESTUSCHEW, ALEXANDER, a Russian novelist, born about 1795, was captain in a dragoon regiment, and adjutant to Alexander, Duke of Württemberg. Having been involved with his friend Rylejew in the conspiracy of 1825, he was degraded to the ranks, and exiled to Yakutsk, but after long entreaty, permitted to enter the army of the Caucasus as a private in 1830. In June 1837, he fell in a skirmish with the as yet unconquered mountaineers. Two years before his exile he, together with his friend Rylejew, who was executed in 1825, had published the first Russian almanac, *The Pole Star*. His later works, consisting chiefly of novels and sketches, written under the name of Cossack Marlinski, bore the impress of his own life and adventures in the Caucasus. They excel in depicting the wilder aspects of nature and the excitements of a soldier’s life, but fail in the delineation of character, and are often exaggerated, and sometimes absurd. His principal works are the tale of *Mullah Nur*, and the romance of *Ammalath Beg*, which last relates the treachery of a Circassian chief, and gives interesting pictures of the scenery of the Caucasus. Several of his novels were translated into German by Seebach (Leipzig, 1837), and his collective works appeared at St Petersburg in 1840, under the name of Marlinski’s Tales. His three brothers were implicated in the military conspiracy of 1825, and hanged by the special order of the emperor.

BETA’NZOS (anciently *Brigantium Flavium*), a town of Spain, province of Corunna, 10 miles south-east of the city of the same name. Ancient granite gateways still defend its narrow streets. It has

manufactures of linen, leather, and earthenware. Pop. between 4000 and 5000.

BETEL, BETLE, or PAWN, a narcotic stimulant, much used in the east, and particularly by all the tribes of the Malay race. It consists of a leaf of one or other of certain species of pepper, to which the name of betel-pepper is indiscriminately applied, plucked green, spread over with moistened quick-lime (*chunam*) generally procured by calcination of shells, and wrapped around a few scrapings of the areca-nut (see ARECA), sometimes called the betel-nut, and also known as *Pinang*. This is put into the mouth and chewed. It causes giddiness in persons unaccustomed to it, excoriates the mouth, and deadens for a time the sense of taste. It is so burning, that Europeans do not readily become habituated to it, but the consumption in the East Indies is prodigious. Men and women, young and old, indulge in it from morning to night. The use of it is so general as to have become matter of etiquette; a Malay scarcely goes out without his betel-box, which one presents to another as Europeans do their snuff-boxes. The chewing of B. is a practice of great antiquity, and can certainly be traced back to at least the 5th c. B.C. It gives a red colour to the saliva, so that the lips and teeth appear covered with blood; the lips and teeth are also blackened by its habitual use, and the teeth are destroyed, so that men of twenty-five years of age are often quite toothless. Whether the use of B. is to be regarded as having any advantages, except the mere pleasure afforded to those who have acquired the habit of it, to counterbalance its obvious disadvantages, is a question upon which difference of opinion subsists. Some have represented it as beneficially promoting the secretion of saliva, strengthening the digestive powers, and warding off the attacks of fever; whilst others pronounce against it an unqualified condemnation. Sir James Emerson Tennent, in his valuable work on Ceylon, recently published, expresses the opinion that it is advantageous to a people of whose ordinary food flesh forms no part, and that it is at once the antacid, the tonic, and the carminative which they require.

The name B. is often given to the species of pepper of which the leaves are ordinarily chewed in the manner just described, which are also called B.-PEPPER or PAWN. Some of them are very extensively cultivated, particularly *Chavica Belli*, *C. Siraboa*, and *C. Malamiri*, climbing shrubs with leathery leaves, which are heart-shaped in the first and second of these species, and oblong in the third. They are trained to poles, trellises, or the stems of palms, and require much heat with moisture and shade; upon which account, in the north of India, where the climate would not otherwise be suitable, they are cultivated with great attention in low sheds, poles being placed for their support at a few feet apart. Hooker mentions in his Himalayan Journal, that these sheds are much infested by dangerous snakes, and that lives are therefore not unfrequently lost in the cultivation of betel.—The genus *Chavica* is one of those into which the old genus *Piper* (see PEPPER) has recently been divided. The requisite qualities of B. are probably found in the leaves of numerous species not only of this but of other genera of the same family. The leaf of the *Ava* (q. v.) is sometimes used.

BETHANY, meaning a ‘boat-house;’ called ‘Lazariyeh,’ or ‘Town of Lazarus,’ by the natives of Palestine, in reference to the event narrated in Scripture. It is a retired spot, beautifully situated on the southern slope of the Mount of Olives, 3 miles from Jerusalem, with a population of about 500,

principally Latins. There is nothing remarkable about the village except some ruins, among which are some which are said to have been the house of Martha and Mary, and the cave or grave of Lazarus, the descent into which is effected by 26 steps cut in the solid rock, leading to a small chamber, about 5 feet square, also excavated. The appearance of the cave certainly corresponds with what is said about it in Scripture—'It was a cave, and a stone lay upon it' (St John xi. 38). Near to the cave are the ruins of a fort built by Queen Melisinda in 1132, to protect the nunnery founded by her in honour of Martha and Mary.

**BETHEL**, called Betein by the natives, about 10 miles from Jerusalem, mentioned in Scripture as the scene of Jacob's dream. Here also Abraham pitched his tent. Now a heap of ruins, almost entirely deserted, or only inhabited by a few straggling Arabs.

**BETHELL, THE RIGHT HON. RICHARD, BARON WESTBURY**, an eminent lawyer, born at Bradford, Wiltshire, in 1800, son of a physician at Bristol. From Bristol grammar-school, he went, at the age of 14, to Wadham College, Oxford, where he was first class in classics, and second class in mathematics, and took his degree of B.A. at the early age of 18. After being a private tutor at Oxford, he studied law, and was called to the bar at the Middle Temple in November 1823. In 1840, he was made a Queen's counsel. Elected, in April 1851, M.P. for Aylesbury, on the formation of the Aberdeen ministry in December 1852, he was named Solicitor-general, and shortly after knighted. From November 1856 to March 1858, he was Attorney-general. In 1861, he was made Lord Chancellor, and at the same time raised to the peerage. He resigned the great seal, however, in 1865, and on July 20, 1873, he died. B. was conspicuous for his exertions in the cause of law reform, in improving the system of education for the bar, and in abolishing the ecclesiastical courts, &c.

**BETHESDA**, POOL OF, meaning 'House of Pity.' The scene of Christ's cure of the impotent man (St John v. 2-9), and resort of the 'impotent, blind, halt, and withered,' once filled with water, 'which an angel went down at certain seasons and troubled,' is now dry and used as a deposit for dirt and rubbish. It is situated within the gates of Jerusalem, near the St Stephen's gate and the Temple of Omar; measures 460 feet in length, by 130 in breadth, and 75 in depth.

**BETHLEHEM**, or **BEIT-LAHAM**, meaning 'House of Bread,' celebrated in Scripture as the birthplace of our blessed Saviour, and of King David, is now a small unwalled village, situated at a distance of 5 miles south of Jerusalem. The population, about 3000 souls, is wholly Christian—that is, Latin, Greek, and Armenian. The village is situated in the centre of a most interesting country; and the roof of the Latin monastery—the only public building of any importance, enclosing the cave which is the alleged place of our Lord's nativity—commands a beautiful and extensive view of the surrounding country: in the distance, east, are the mountains of Moab and the plains of the Jordan; south, stands the hill of Tekoa, familiar as the scene of the pastoral life of the prophet Amos; beyond, and rather more to the east, lies the wilderness of Engedi, to which David retreated for the purpose of concealing himself against the pursuit of Saul, and where the allied armies of the Amorites, Moabites, and others, encamped when they came forth against Jehoahaphat; north, is the road to Jerusalem, with the mountains of Judea and Rachel's tomb. The Convent of the Nativity,

which encloses the supposed manger, &c., is a large square building, more resembling a fortress than the quiet habitation of the recluse, was built by the Empress Helena, 327 A.D., but destroyed by the Moalms in 1236, and, it is supposed, restored by the Crusaders. Within it is the Church of the Nativity, which, like and in connection with the Church of the Holy Sepulchre at Jerusalem, is subdivided among the Latins, Greeks, and Armenians, each community having a separate portion of the edifice for devotional purposes. The church is built in the form of a cross; the nave, which is by far the finest part of the building, belongs to the Armenians, and is supported by 48 beautiful Corinthian columns of solid granite, each between 2 and 3 feet in thickness, and about 17 in height. The other portions of the church, forming the arms of the cross, are walled up. At the further end of that section, which forms the head of the cross, and on the threshold, is a sculptured marble star, which the Bethlehemites say covers the central point of the earth! Here a long intricate passage descends to the crypt below, where the blessed Virgin is said to have been delivered. The walls of the chamber are hung with draperies of the gayest colours; and a silver star, with the words, 'Hic de virgine Maria Jesus Christus natus est,' marks the spot of the nativity. The manger stands in a low recess cut in the rock, a few feet from this star.

The other objects of interest in the church are the chapel and tomb of St Jerome, who became a monk of this convent towards the end of the 4th c.; the chapel and tomb of Santa Paula, a Roman lady, and the founder of several nunneries at Bethlehem; the tomb of St Eudoxia; and the pit into which it is supposed the bodies of the murdered innocents were cast. B. is under the jurisdiction of the pasha of Jerusalem. The Bethlehemites chiefly gain their subsistence by the manufacture and sale of crucifixes, beads, boxes, shells, &c., of mother-of-pearl and olive-wood. Much wine is made at B. which is considered all over Palestine next best to the Lebanon wine.

**BETHLEHEM** is the name of the chief settlement of Moravians or United Brethren in Pennsylvania, U.S.

**BETHLEHEMITES**, or **BETHLEHEMITE BROTHERS**, the name of an order of monks at Cambridge in the 13th c.; also of an order founded in Guatemala, 1673. The followers of Jerome Huss were styled B., from Bethlehem Church in Prague, where their leader preached.

**BETHNAL GREEN**, an eastern suburb of London, in Middlesex, including Victoria Park. Pop. (1871) 120,104, many being silk-weavers.

**BETHSAI'DA**, on the lake of Galilee, mentioned in Scripture as the city of Peter and Andrew and Philip, now a heap of ruins almost overgrown with grass.

**BETHSHE'MESH** ('House of the Sun,' or 'Sun Town,' modern name, *Ain-es-Sheh*, 'Fountain of the Sun,' now distinguishable by neither house nor fountain from which it was likely to derive its name), a ruined city of Palestine, 15 miles west-south-west of Jerusalem, finely situated on the point of a low ridge, commanding an extensive view of the country, rendered interesting by the exploits of Samson. B. was a sacerdotal city belonging to the tribe of Judah, bordering alike on the possessions of Dan and of the Philistines, and fixed by Eusebius ten Roman miles from Eleutheropolis, on the Nicopolis road. It is interesting as the place where the Ark of the Lord first rested, after the Philistines had sent it back (1 Sam. vi.). One of Solomon's twelve purveyors resided at B., where also was

fought the battle between Judah and Israel, in which Jehoash captured Amaziah (2 Kings xiv. 11, 13). B. was taken by the Philistines during the reign of Ahaz, and from that time disappears from sacred history.

**BETHUNE**, a town of France, in the department Pas-de-Calais, situated on a rock overlooking the river Brette, and the canals of Liane and Aire, 16 miles north-north-west of Arras. It is strongly fortified, part of the works and the citadel having been constructed by Vauban. It has manufactures of linen and cloth, and a considerable trade in the agricultural produce of the surrounding country. Taken by the French in 1645, it was retaken by the allies in 1710, but was restored to France by the Treaty of Utrecht. The first artesian wells are said to have been bored here. Pop. (1872) 4204.

**BETICK**, or **BETIK**, on the river Oxus, Central Asia, 'one of the greatest ferries between Persia and Turkistan.' Lieutenant Burnes, who in 1834 published an account of his travels in Central Asia, says the Oxus is here 650 yards broad and 25 to 29 feet deep.

**BETJUANS**, or **BECHUANAS**, the name of an extensive nation of Southern Africa, occupying the country between 23° and 29° E. long., and extending from 28° S. lat. northward beyond the tropic of Capricorn. The B. are generally of a peaceful, indeed cowardly disposition, and are divided into many tribes under the government of chiefs who exercise a kind of patriarchal authority over them. According to Dr Livingstone, the different tribes take their names from certain animals, 'shewing probably that in former times they were addicted to animal worship. The term Bakatla means, "they of the monkey;" Bakuema, "they of the alligator;" Batlapi, "they of the fish;" each tribe having a superstitious dread of the animal after which it is called. They also use the word "hins," to dance, in reference to the custom of thus naming themselves, so that when you wish to ascertain what tribe they belong to, you say, "What do you dance?" It would seem as if that had been part of the worship of old.' Many tribes formerly existing are extinct, as is evident from names that have now no living representatives. The B. have a vague notion of a Supreme Being, but no intelligent idea of his attributes. Dr Livingstone describes the tribe to which he attached himself—the Bakuena or Bakwains—who are favourable specimens of the nation, as generally slow 'in coming to a decision on religious subjects; but in questions affecting their worldly affairs they are keenly alive to their own interests.' In all agricultural matters they are very acute, exhibiting a wonderful knowledge of the properties of the soil, as well as of the nature and habits of animals. They have a superstitious reverence for a class of impostors calling themselves 'rain-doctors,' who profess to be able to bring down rain in dry seasons by a certain specific, composed of all kinds of disgusting animal and vegetable substances. One peculiarity of the B. is their inability to build their houses square; all erections take a circular form.

**BETROTHMENT**, a mutual engagement by a man and woman with a view to marriage. This anciently consisted in the interchange of rings, kissing, joining hands, and the testimony of witnesses; and the ecclesiastical law punished the violation of such B. by excommunication; but such a spiritual consequence was abolished by the 26 Geo. II. c. 33. A previous B. had also been regarded as a legal impediment to marriage with another. 'It was not,' says Mr Macqueen, in his *Treatise on the New Divorce Jurisdiction*, 1858, p. 73, 'by the

axe that the promoter of the English Reformation extinguished his marriage with Anne Boleyn. He first carried her into the Ecclesiastical Court, and there obtained a sentence, on the ground of her alleged precontract with Northumberland.' The aggrieved party, since the 26 Geo. II., has been left to the only remedy of an action for breach of promise. In Scotland, there is the same mode of redress consequent on a refusal to proceed to matrimony; but in that country, where the B. or engagement can be shewn to have been a clear, free, and deliberate present consent on the part of both the man and woman to form the relationship of husband and wife, such a contract may be enforced against the recusant party; and indeed it constitutes marriage itself. See MARRIAGE, PROMISE, HUSBAND AND WIFE.

**BETTERTON**, THOMAS, a celebrated actor, for about half a century the chief ornament of the English stage, was born in London, 1635, and died there in 1710. The best contemporary judges, such as Addison, Cibber, &c., bear admiring witness to his dramatic powers, which overcame the natural disadvantages of a low voice, small eyes, and an ungainly figure. His private character was highly estimable, cheerful, modest, and generous. After a retirement of many years, it became known that his circumstances were very straitened, and it was determined to give him a public benefit. On the 6th April 1709, the spirited veteran (then in his 74th year) appeared with immense éclat in the youthful part of Valentine in Congreve's *Love for Love*. He acted several times again. Mrs B. took the same rank among contemporary actresses as her husband did among actors.

**BETTING**, or **WAGERING**, is an inveterate practice of the English, which is exemplified in almost all classes of society, but more particularly in relation to horse-racing; bets as to which will be the winning horse at a particular race, being entered into by the highest as well as the lowest of the people. Sanctioned by fashion, betting on horses is carried on to so ruinous an extent in the metropolis, that the legislature has interfered to check the evil. The haunts of betters, called *Betting-Houses*, are suppressed by the 16 and 17 Vict. c. 119. The act declares them to be a common nuisance, and contrary to law, and prohibits them under very severe penalties. But it provides that its enactments shall not extend to stakes or deposit due to the winner of any race, or lawful sport, game, or exercise. The act was extended to Scotland in 1874. See GAMBLING.

**BETTO'LA**, a town of Northern Italy, in the province of Piacenza, about 20 miles south-west of the town of the same name. It is situated on the Nure, in a fertile district. Pop. 5668.

**BETULA**. See BIRCH.

**BETULA'CEAE**, or **BETULINEAR**. See AMMEN-TACEAE and BIRCH.

**BETWAH**, a river of India, which, after a north-east course of 340 miles, joins the Jumna on the right, about 30 miles to the east-south-east of Calpee. It rises in the Vindhya Mountains, which, uniting the West and the East Ghauts at their northern extremities, form the dividing ridge between the basins of the Nerbudda and the Ganges. It runs through beds of iron ore, and waters the towns of Bileah and Jhansi. The source of the B. is in lat. 23° 14' N. and long. 77° 22' E., and its mouth in lat. 25° 57' and long. 80° 17'. It is described as a very great river, being, even in the dry season, half a mile wide at its junction with the Jumna. It is, however, not navigable in any part of its course.

**BEUKELZON**, WILLIAM, a person in humble

## BEVEL—BEWICK.

life, belonging to the small town of Biervliet, in Holland, was the first who succeeded in salting and preserving herrings in a satisfactory manner. This improvement, which is said to have taken place in the year 1386, communicated a great impetus to the industry of the fisherries of Holland. It is related that the emperor, Charles V., made a pilgrimage to the tomb of B., and there ate a herring in expression of his gratitude for the invention. B.'s name, which is otherwise written as Beukels, Bokel, &c., is said to be the origin of the word pickle. B. died in 1397.

**BEVEL**, a term used by builders to describe a sloped or canted surface. See **SPLAY**.

**BEVELAND, NORTH and SOUTH**, two islands in the estuary of the Scheldt, in the province of Zealand, Netherlands, separated by a channel on the west from the island of Walcheren. The estimated area is about 120 square miles, with a population of 23,000. South B. is the most extensive and fertile, being about 25 miles in length, and from 8 to 9 broad. Its capital, Goes, on the north side—lat. 51° 30' N., and 4° E.—is a well-built and fortified town, with 5500 inhabitants. North B. is about 13 miles in length; its greatest breadth, 4 miles. South B. produces corn and fruit abundantly, and fish are plentiful on the coast. North B. is low and marshy. Both islands have suffered dreadfully from inundations. In 1532, North B. was completely covered with water, many of the inhabitants perishing; and it remained submerged for several years. At the same time, the flourishing town of Romerswaal was separated from South B., and afterwards so encroached on by the sea, that the whole of the inhabitants had to leave it. The islands also suffered considerably from inundation in 1808. Within recent years, much good has been effected by drainage.

**BEVELLED-GEAR.** See **GEARING**.

**BEVERIDGE, WILLIAM**, Bishop of St Asaph, was born at Barrow, Leicestershire, in 1638. Entering St John's College, Cambridge, at the age of fifteen, he at once became remarkable for his diligence and piety, and particularly for his devotion to the study of oriental languages, a treatise on which he published at the age of twenty. In 1660, having obtained his degree of M.A., he was ordained both deacon and priest. After many excellent preferments, in which he was remarkable for his devotion to his pastoral duties, he was, in 1704, appointed to the bishopric of St Asaph, having previously refused to accept that of Bath and Wells, on the deprivation of Dr Thomas Kenn, for not taking the oaths to the government of William III. He died March 5, 1708, leaving the great bulk of his property to the Societies for the Promotion of Christian Knowledge, and the Propagation of the Gospel in Foreign Parts, and a reputation for sincere piety and great learning. His works, which, besides the treatise mentioned, include another on chronology, a collection of canons from the time of the apostles to that when the synod of Constantinople restored Photius, and various sermons and works of a religious kind, with a life, were collected and published in 9 vols. 8vo in 1824, by the Rev. Thomas Hartwell Horne.

**BEVERLAND, ADRIAN**, a Dutch scholar who, by several of his writings, but more especially by his unorthodox interpretation of the Fall, caused great excitement among the theologians of his day. He was born at Middelburg, in Zeeland, about the middle of the 17th c.; had studied law, visited the Oxford University, and was settled as an attorney in Holland, when, in 1678, he published his pamphlet, *Peccatum Originale*, which was not only burnt at the Hague, but led to his own imprisonment, and to his expulsion from Utrecht and Leyden, whither

he had wished to betake himself. On his return to the Hague, he wrote *De Stolata Virginitatis Jure* (The Hague, 1680), which gave still greater offence than his first work. Soon after, he came to England, where he found a supporter in Isaac Vossius, and probably received his degree as doctor of civil law in Oxford. But it would appear from his virulent attacks against several dignitaries of the English Church, that he met with a good deal of theological opposition in England also. Probably it was the death of his benefactor, Isaac Vossius, in 1689, that led him in 1693 to repudiate his earlier writings, and to regret their tone. Having become insane, he appears to have died in England soon after 1712. In spite of his numerous enemies, B. stood high in the friendship of some of the most distinguished men of his time. His views respecting original sin have been often expressed by others, both before and after his day, though in a less flippant style. His works are now mere bibliographical curiosities.

**BEVERLEY**, the chief town of the E. Riding of Yorkashire, 1 mile west of the river Hull, with which it communicates by canal, and 10 miles north-north-west of the city of Hull. B. returns two members to parliament. Its trade consists in corn, coal, and leather, and there are several whiting and agricultural implement manufactories. The finest object in B. is the superb Gothic minster, or the Collegiate Church of St John, ranking next to York Minster among the ecclesiastical structures of the country, and exhibiting different styles of Gothic architecture; the oldest part being of the 13th c. The choir contains the celebrated Percy shrine, of the most exquisite workmanship. The grammar-school of B. is so old, that the date of its foundation is unknown. B. arose out of a priory founded about the year 700, and received its name from Beveriac, 'lake of beavers,' from the great number of these animals in a neighbouring lake or morass. Pop. (1871) 10,218.

**BEVERLOO'**, a village of Belgium, in the province of Limbourg, 12 miles north-west of Hasselt. On the extensive heaths near is the permanent military camp for the instruction of the Belgian army.

**BEVERWYK**, a town of the Netherlands, North Holland, about 7 miles north of Haarlem. Pop. 2500. It is situated in the midst of what might be described as a vast and beautiful meadow, and is quite a model of Dutch neatness and cleanliness. In his country-house, in the immediate vicinity, the Prince of Orange planned the expedition which resulted in the English Revolution of 1688.

**BEWDLEY** (formerly Beawle, from its pleasant situation), a town on the right bank of the Severn, in the north-west of Worcestershire, 14 miles north-north-west of Worcester. Pop. (1871) 7614. B. returns one member to parliament. It has manufactures of leather, combs, lantern leaves, carpets, and iron and brass wares. The chief transit for goods is by the Severn. Near the town is a public park of 400 acres, with fine groves of elm, oak, and plane.

**BEWICK, THOMAS**, a celebrated wood-engraver, was born at Cherryburn, near Newcastle-on-Tyne, in 1753. Apprenticed to Beilby, an engraver in Newcastle, he displayed such extraordinary aptitude in his art, that, at the age of 17, he was intrusted with the cutting of the whole of the diagrams in Hutton's treatise on Mensuration. He afterwards illustrated Gay's *Fables*, obtaining in 1775, for one of the cuts, the 'Old Hound,' the prize which the Society of Arts had offered for the best wood-engraving. In 1790, B., who had entered into partnership with Mr Beilby, completed, along with his brother John, who was his pupil, the illustrations

for a *General History of British Quadrupeds*, a work which raised his reputation far above that of any of his contemporaries, and gained for him the honourable and not undeserved appellation of the reviver of wood-engraving. Considered as works of art, these illustrations are still unrivalled in graphic force of expression and fidelity to nature, though the great mechanical improvements in the art introduced since B.'s time have rendered them inferior in clearness and delicacy of execution to some of the best cuts of the present day. Assisted by his brother, B. illustrated Goldsmith's *Traveller* and *Deserted Village*, Parnell's *Hermit*, and Somerville's *Chase*; and in 1797 appeared the first volume of his *History of British Birds*, which was followed in 1804 by the second. This splendid work was entirely B.'s own, his brother having died in 1795. B.'s last work, the unfinished proofs of which he received the Saturday before his death, which took place at Gateshead, November 8, 1828, is called 'Waiting for Death,' and represents an old worn-out horse, with great pathos and truth. It was designed to assist in the prevention of cruelty to animals. A large cut of a bull—the of the Caledonian breed—is considered B.'s *chef-d'œuvre*. B. had many pupils, some of whom are now among our best engravers.

BEX, a village of (1870) 3804 inhabitants, in the Swiss canton of Vaud, situated on the high road to the Simplon, about 26 miles south-east of Lausanne. It is remarkable for its extensive salt mines, salt works, and sulphur baths. One of the mines, called *Du Bouillet*, has a gallery  $\frac{7}{4}$  feet high, and 5 feet wide, extending horizontally into the mountain a distance of more than 2000 yards. The quantity of salt annually produced at B. is between 2000 and 3000 tons.

BEXA'R, SAN ANTONIO DE, a thriving town of Texas, on the San Antonio River, and at a distance of 110 miles to the south-west of Austin city. It is growing rapidly in population (which amounted in 1870, to 12,256), and of course in wealth. The place contains a United States arsenal, with two newspapers and several seminaries and churches. San Antonio de B. was famous in the conflicts between the Mexican authorities and the American adventurers, more especially for the indiscriminate slaughter by the former of Colonel Crockett and his garrison.

BEYERLAND, or BEI'GERLAND, an island of South Holland, lat.  $51^{\circ} 46' N.$ , long.  $4^{\circ} 26' E.$  It is formed by the junction of the Old Maas with Holland Diep on the one side, the river Spui uniting the Old Maas with the Haringvliet on the other. It has several villages, one of which, Old B., is a thriving place of nearly 4000 inhabitants.

BEY'ROUT, or BEIRUT, the Berothai or Berothah of the Old Testament (2 Samuel viii. 8, and Ezekiel xviii. 16); and the Berytus of the Romans. It was besieged and captured by Baldwin I., king of Jerusalem, in 1111; recaptured from the Christians in 1187. In 1197, it again came into the hands of the Christians, and then successively under the Saracen, Seljukian, and Turkish sultans. In course of the operations to support the Turkish claims against the assumed power of the pasha of Egypt, B., in 1840—1841, was bombarded by the English fleet under Sir C. Napier, taken, and delivered over to the Turks. There are three castles still standing out in the sea, whose battered walls bear witness to the efficacy of the British cannon. There are no ancient monuments worth visiting.

B. is a flourishing commercial town, situated in a most picturesque position on the coast of Syria, and at the foot of Lebanon, 55 miles from Damascus,

and 147 from Jerusalem. It is the chief seaport, market-town, and emporium of all the trade with the shores of Syria, Palestine, and Cilicia; and has a population of about 70,000 (the majority of whom are Christians) against 12,000 in 1835. A considerable increase in population is due to the settlement, in 1860, of numbers of the Christian refugees from Damascus. Several British merchants are established in B., and there is a branch here of an English bank (the Ottoman). B. supplies the Lebanon, Damascus, and the north of Syria to Antioch and Joppa, with European manufactures and goods. French steamers, carrying mails, leave B. every week for Marseille. British steamers ply regularly between England and B. every fortnight, bringing Manchester manufactures, prints, chintzes, Birmingham and Sheffield cutlery, &c., and returning to England with madder roots, wool, silk, and bitumen. The number of vessels that arrived from England in 1871 was 47. Since 1859, a direct trade has been carried on between B. and the United States of America, the articles sent to the United States being wool and olive-oil. There is good anchorage in the roadstead, with shelter during stormy weather in the Beyrout River, about 3 miles from the town; about 350 merchant vessels of different nations visit and leave B. every year. The commerce is steadily increasing. In 1848, the imports were only £546,268; in 1871 they were £1,240,000. The exports in 1848 amounted to £253,648; in 1871 they were £530,000. In 1853, the imports into B. from Great Britain were £225,875; in 1871, they had increased to £676,900. A commercial tribunal, composed of European and native merchants, to adjudicate all mercantile disputes and bankruptcies, has lately been established; and consuls from all nations reside at Beyrout. Ship-building has begun to attract the attention of the natives, who have built and launched at B. several vessels of fifty to eighty tons within the last few years. At a village called Shemlan, a few miles from B., Mr Scott, an enterprising Scotchman, has lately built and established a silk factory, worked by steam; the silk produced is fine, and much esteemed in the London and Lyon markets. In 1859, a line of omnibuses, the first ever seen in Syria, was established at Beyrout. The natives at first regarded them with great astonishment, and crowded from all sides to see them pass. A French company completed in 1862 a good road from B. to Damascus. In the summer months, B. experiences a scarcity of fresh water, which has to be brought in jars on the back of mules and donkeys from the river of B., a distance of about three miles. The town has lately been improved by the removal of the walls which formerly surrounded it. From its proximity to the mountains of Lebanon, on which the climate is most agreeable and salubrious, B. is an attractive place of residence; and it might rise into importance but for its odious Turkish custom-house arrangements and system of government.

BEZA, THEODORE (properly, De Bèze), next to Calvin the most energetic and influential of the Genevese reformers, was born of a noble family at Vezelai, in Burgundy, 24th June 1519. He received an admirable education in Orleans, from Melchior Wolmar, a German, who was especially learned in the Greek language, and also imbued with the principles of the Reformation, which he communicated to his pupil. As early as 1539, B. became known as a writer of witty and elegant but indecent verses, the publication of which (1548) caused him many bitter regrets in after-days, when his heart was purer. In his twentieth year, he obtained his degree as licentiate of civil law, and went to live in Paris, where he appears to have spent several years

in a kind of fashionable dissipation, though he does not accuse himself of any gross profligacy. B. possessed a handsome figure, which, together with his fine talents and good birth, opened to him the most brilliant prospects. Although not a priest, he pocketed the revenues of two benefices, while his income was largely increased by the death of an elder brother. It was the desire of his relatives that he should enter the church, but a private marriage which B. had contracted, rendered this impossible. A severe illness now attacked him, during the lapse of which, the folly and sinfulness of his career vividly presented themselves to his conscience; he repented, and on his recovery, in order to avoid the perils and perplexities of his position, he went to Geneva along with his wife, October 1548. Shortly after, he was appointed Greek professor at Lausanne, an office which he held for ten years. In 1550, he published with success a melodrama, entitled *The Sacrifice of Abraham*, and delivered lectures on the Epistle to the Romans and the Epistles of Peter to crowded audiences. Out of these lectures ultimately sprang his Translation of the New Testament into Latin. In 1559, he went to Geneva, where he became Calvin's ablest coadjutor, and was appointed a theological professor and president of the college. He had already signalled himself by his work *De Hereticis a Civilis Magistratu puniendis*, in which, like many other good but mistaken men, he approved of the burning of Servetus. His diplomatic tact was particularly good. He induced the king of Navarre to exert his influence on behalf of the persecuted French Protestants, and was persuaded by the latter to attend the conference of Catholic and Protestant divines, held at Poissy in 1561. Here his courage, presence of mind, and dexterity made a very favourable impression on the French court. Catharine de' Medicis entertained so high an opinion of his abilities, that she desired him to remain in France. While in Paris, he often preached before the king of Navarre and Condé. On the outbreak of the civil war, he accompanied the latter as a kind of military chaplain, and after his capture attached himself to Coligny. In 1563, he once more returned to Geneva. In the following year, Calvin died, and the care of the Genevese church now fell principally upon his shoulders. He presided over the synods of French Reformers, held at Rochelle in 1571, and at Nîmes in 1572. In 1574, he was deputed by Condé to transact important business at the court of the Palatinate; and in 1586 measured himself with the Wurtemberg divines, especially Jacob Andreæ, at the religious conference held at Montbeliard. In 1588, his first wife died, and although verging on seventy, he married another—an awkward circumstance, it must be confessed, and one which his enemies, the Jesuits, tried to make a handle of; but B., who still retained complete mastery over his faculties, retorted with his accustomed liveliness and skill. In 1597, his columnists spread the extremely foolish report that B. was dead, and at the last hour had returned to the bosom of the church. The witty patriarch replied in a poem full of sparkling vigour. He died 13th October 1605, at the ripe age of 86.

B. was thoroughly grounded in the principles of his master, Calvin, in whose spirit he vigorously ruled the Genevan Church for forty years, exercising the influence of a patriarch. To secure its unity, strength, and permanence, he spared no pains, sacrificing even his personal possessions. By his abundant learning, his persevering zeal, his acute intellect, his fine eloquence, and his impressive character, he rendered it important services. His numerous theological writings, however, cannot be

said to have proved attractive to posterity. They have almost ceased to be read. The works by which he is best known are his translation of the New Testament into Latin, and his *History of the French Protestants from 1521 to 1563*.

#### BEZA'NT. See BEZANT.

BEZIERS, a city of France, in the department of Hérault, lat. 43° 21' N., and long. 3° 13' E. It is pleasantly situated on a hill, in the midst of a fertile country, at the junction of the Orb and the Canal du Midi, about 38 miles south-west of Montpellier. It contains some interesting architectural and antique buildings—the principal being the cathedral, a noble Gothic edifice; the churches of La Madeleine and St Aphrodise; and the ancient episcopal palace. The old citadel has been destroyed, but the walls still remain, and are made use of as a promenade. B. has manufactures of silk stockings, woollens, gloves, parchment, glass, soap, leather, and much esteemed confectionaries. It has also extensive brandy distilleries, and is the centre of most of the trade of the district. The town is supplied with water raised from the Orb by means of a steam-engine. Pop. (1872) 27,533.

B. is a place of great antiquity, and still contains Roman remains. It is historically interesting in connection with the massacre of the Albigenses, its inhabitants having been indiscriminately put to the sword by Simon de Montfort and the pope's legate, for having afforded protection to the fugitives in 1209. B. suffered also in the religious wars of the 16th c.

BEZOAR (Pers. *pazar*, a goat; or *pa*, against, and *zachar*, poison), a concretion found in the stomachs of goats or antelopes, and formerly much valued on account of imaginary medicinal virtues, particularly as an antidote to poisons. Concretions of various kinds are found in the stomachs of herbivorous quadrupeds, very generally having for their nucleus some small indigestible substance which has been taken into the stomach. Sometimes they are of a radiating structure; sometimes formed of concentric layers; sometimes they are principally composed of superphosphate of lime, sometimes of phosphate of ammonia or magnesia. Other concretions found in the intestines, &c., of various animals are sometimes also called bezoar. See CALCUL. The value of a B. being supposed to increase with its size, the larger ones have been sold, particularly in India, for very great prices.

BHADRINA'TH, a town of Gurhwal, in the lieut.-governorship of the North-western Provinces, India, situated in a valley of the Himalaya, 25 miles to the south of the Manah Pass, which leads into Tibet. Lat. 30° 44' N., long. 79° 32' E. Its highest point is 10,294 feet above the level of the sea; while, about 12 miles to the west, there is a group of summits, called the Bhadrinath Peaks, having the respective elevations of 23,441, 23,236, 22,934, 22,754, 22,556, and 21,895 feet; the east also, and the south-west, presenting detached mountains of similar magnitude. B. is situated on the right bank of the Vishnuganga, a feeder of the Aluknunda, which itself again unites with the Bhageerettee to form the Ganges. The chief attraction of the place is its temple, which, though the actually existing edifice is modern, is said to be an establishment of great antiquity. This temple overhangs a tank of about 30 feet square, which is supplied, by a subterranean passage, from a thermal spring in the neighbourhood. As ablution in these waters is held to cleanse from all past sins, B. is a grand resort of pilgrims, every year bringing large numbers, but every twelfth year, when a periodical festival is celebrated, collecting fully 50,000. From

November to April, the temple and its deity are abandoned even by the attendant Brahmins, on account of the cold.

**BHAGAVAD-GITĀ** (i. e., Revelations from the Deity) is the title of a religious metaphysical poem, interwoven as an episode in the great Indian epic poem of the *Mahābhārata* (q. v.). Two hostile armies, the nearly related Kurus and Pāndus, are drawn up in opposition, ready for battle; the trumpets sound the opening of the combat; and the Pāndu Ardhuna mounts his chariot, which is guided by the Deity himself, as charioteer, in the human form of Krishna. But when Ardhuna perceives in the hostile army his relatives, the friends of his youth, and his teachers, he hesitates to commence the struggle, held back by the doubt whether it were lawful for him, for the sake of the earthly gain of reconquering his father's kingdom, to transgress the divinely approved ordinances for the government of the state. Upon this, Krishna sets forth, in a series of eighteen poetic lectures, the necessity of proceeding, unconcerned as to the consequences. In the progress of his long discourse, a complete system of Indian religious philosophy is developed, in which the highest problems of the human mind are treated with as much clearness of thought as elegance of language. It is impossible to determine exactly when and by whom the work was composed. It is not, however, one of the first attempts of Indian philosophy, for it is rather of an eclectic nature; and before it could have been composed, there must have been a period of long-continued intellectual cultivation in many philosophic schools. It is not unlikely that it was written in the first century after Christ. The work is looked upon with great reverence in India, and it has accordingly been made the subject of numerous commentaries (the best is that of Sridhara-Svāmin, published in Calcutta in 1832), and it has likewise been translated into various Indian dialects. Five different metrical versions in Hindi appeared in Bombay in 1842; a translation into the Telugu dialect in Madras, 1840; into the Canarese, Bangalore, 1846, &c. The best critical edition of the Sanscrit text is that of A. W. von Schlegel (2d ed., Bonn, 1846), to which is added a Latin translation. Among the other translations may be mentioned that into English by Wilkins (Lond. 1785), who had the credit of first making the work known in Europe; that into German, by Peiper (Leip. 1834); and the Greek translation by Galanos (Athens, 1848). W. von Humboldt's treatise, *Upon the Episodes of the Mahābhārata, Known under the Name of the Bhagavad-Gītā* (Berlin, 1827), contains an admirable exposition of the philosophy of the poem.

**BHAGULPORE**, the capital of the district of the same name in Behar, presidency of Bengal, in lat. 25° 11' N., and long. 87° E. It stands on the right bank of the Ganges, which is even here 7 miles wide in the rainy season. A seminary for English instruction has been here established by the British government. It is the headquarters of the troops for keeping in check the Sonthal tribes. Pop. (1871) 69,678. In the vicinity of the town are two antiquarian curiosities, being round towers of about 70 feet in height, of the origin or object of which nothing is known.—2. B., as a district, contains 4327 sq. m. and (1871) 1,826,290 inhabitants. It lies south of Nepaul, in lat. 24° 17'—26° 20' N., and in long. 86° 15'—88° 3' E. About a fifth of the whole is covered by hills, which, stretching away towards the south-west, connect themselves with the Vindhya Mountains, the grand dividing-ridge between the Nerbudda and the Ganges.

20

**BHAMO'**, a town of Burmah, on the Upper Irrawaddy, 40 miles to the west of the Chinese frontier, and 180 to the north-north-east of Ava. It contains 2000 houses, and has round it many populous villages. It is the chief mart of the trade with China, the imports being woollens, cottons, and silks, which are brought principally by winter caravans. B. has also a considerable trade with the tribes of the neighbourhood, who resort to the town, exchanging their native produce for salt, rice, and a sauce made of dried fish.

**BHANG**, the eastern name for Hemp (q. v.).

**BHARTRIHARI** is the name of a celebrated Indian writer of apothegms. Little is known regarding the circumstances of his life. A legendary story makes him the brother of King Vikramaditya, who lived in the 1st c. B.C., and relates of him, that after a wild licentious youth, he betook himself in later years to the ascetic life of a hermit. His name has been given to a collection of 300 apothegms—whether it be that he actually wrote them, or, as is more probable, that the apothegms were popular works, written by many various authors, but ascribed, according to the Indian custom, to some personage well known among the people in legends and tales. Cheerful descriptions from nature, and charming pictures of love, alternate in these apothegms, with wise remarks upon the relations of life, and profound thoughts upon the Deity and the immortality of the soul. Bohlen has published an excellent critical edition (Berlin, 1833), with a supplement *Variae Lectiones* (Berlin, 1850), as well as a successful metrical translation into German (Hamburg, 1835). B. has a certain special interest as having been the first Indian author known in Europe, 200 of his apothegms having been translated in 1653, by the missionary, Abraham Roger, in a learned work published at Nuremberg, under the quaint title, *Open Gates to Hidden Heathenism*.

**BHAVANI-KUDAR**, or **BHOVANI-KUDAR**, a town in the presidency of Madras, in the district of Coimbatore, 58 miles to the north-east of the city of that name. It takes its name from its position at the confluence of the Bhavani or Bhovani, and the Cauvery. It is worthy of notice chiefly for its temples of Vishnu and Siva.

**BHAWLPOOR**, the capital of the protected state of the same name in India, is situated on a tributary of the Ghara, which, formed by the junction of the Sutlej and the Beas, falls into the Chenab about fifty miles further down, in lat. 29° 24' N., and long. 71° 47' E. It has a circuit of four miles—part, however, of the enclosed space being occupied by groves of trees; and its population is estimated at 20,000. B. has manufactures of scarfs and turbans, chintzes and other cottons, and the immediate neighbourhood is remarkably fertile in grain, sugar, indigo, tobacco, and butter, with an abundance of mangoes, oranges, apples, and other fruits, in perfection. For external commerce, too, B. is favourably placed, standing at the junction of three routes respectively from the east, south-east, and south; while, towards the north, the Hindu merchants, who are very enterprising, have dealings with Bokhara, and even with Astrakan.—2. The state of B. lies in lat. 27° 41'—30° 25'; and long. 69° 30'—73° 58' E. The area is about 15,000 square miles—the population being approximately estimated at 472,800 in 1871. The country is seven inhabitants to a square mile. The country is remarkably level: only about one-sixth is capable of cultivation. The fertile portion, skirting the Ghara and the Indus, has a purely alluvial soil; but the remainder, though presenting many traces of former cultivation and population, is now, from want of

water, an irreclaimable desert either of hard dry clay, or of loose shifting sands. Besides beasts of chase, such as tigers, boars, &c., B. abounds in domestic animals, such as camels, kine, buffaloes, goats, and broad-tailed sheep. In few parts of the world are provisions finer or cheaper. The principal exports are cotton, sugar, indigo, hides, drugs, dye-stuffs, wool, ghee or butter, and provisions in general. The principal imports are the wares of Britain and India. In 1866, the state, at the request of the leading men, was taken under British management till the young nabob should be of age. The great majority of the inhabitants are Mohammedans.

BHEL, or BAEL. See EAGLE.

BHOOJ, the capital of Cutch, in India, situated at the foot of a fortified hill of the same name, where a temple has been erected to the cobra da capella, in lat.  $23^{\circ} 15'$  N., and long.  $69^{\circ} 44'$  E., about 35 miles from the sea. It contains about 20,000 inhabitants. Its mosques and pagodas, interspersed with plantations of dates, give to the town an imposing appearance from a distance. In 1819 it suffered severely from an earthquake. It is celebrated over India for its manufactures in gold and silver.

BHOPAL, the capital of the territory of the same name, in India, lies in lat.  $23^{\circ} 14'$  N., and long.  $77^{\circ} 33'$  E. It is surrounded by a dilapidated stone-wall of about two miles in circuit. The fort, which is the residence of the nawab, stands on a huge rock outside the town. B. is worthy of notice mainly in connection with two immense tanks in the immediate neighbourhood—one of them being 2 miles in length, and the other measuring  $\frac{1}{4}$  miles by  $1\frac{1}{2}$ . As each sends forth a river, they have most probably been formed by the embanking and damming up of their respective streams.—The territory of B. is a protected state, under the immediate superintendence of the governor-general. It is situated within the basins of the Ganges and Nerbudda, in lat.  $22^{\circ} 32'$ — $23^{\circ} 46'$  N., and long.  $76^{\circ} 25'$ — $78^{\circ} 50'$  E.; its area being estimated at 6764 square miles, and its population, on an assumed average for Central India, at 662,872. Though the vast mass of the people are Hindus, yet the government is Mohammedan, and is understood to be more popular in its character than any other in India.

BHOTAN, or BOOTAN, a territory in the north-east of India, said to be partly dependent on Tibet, in lat.  $26^{\circ} 15'$ — $28^{\circ} 2'$  N., and long.  $88^{\circ} 32'$ — $92^{\circ} 30'$  E., being bounded on the N. by the main ridge of the Himalaya, on the E. by Assam, on the S. by Bengal, and on the W. by Sikkim. With an area of 64,500 square miles—more than equal to that of England and Wales—it is said to contain only 1,500,000 inhabitants. The whole surface may be described as mountainous, with a gradual slope from north to south. Generally speaking, the middle ranges are the most productive. While the south presents but a scanty vegetation, and the north rises far above the limit of perpetual snow, the central regions, at an elevation of 8000 or 10,000 feet above the sea, are covered with the finest forests of oak and pine. Nearly all sorts of grain—wheat, barley, rice, maize, and buckwheat—are here and there cultivated on favourable spots; but much grain is still imported from Bengal, being obtained, as well as sugar and tobacco, in return for native cloths, rock-salt, rhubarb, Tibet goods, mules, and ponies. The religion is Buddhism, the monastic endowments of its priests absorbing a large part of the national property. The government, almost purely ecclesiastical, is in the hands of an

oligarchy. The Dherma Rajah, the nominal head, is treated rather as a god than as a sovereign; while the Deb Rajah, the actual head, is controlled in almost everything by a council of eight. Polyandry and polygamy equally conspire to keep down the numbers of the population.

BHURTPORE, the capital of the protected state of the same name in India, is a large town, measuring about eight miles in circuit, and containing, it is said, about 100,000 inhabitants, in lat.  $27^{\circ} 12'$  N., and long.  $77^{\circ} 33'$  E. It is worthy of notice chiefly on account of its two sieges in 1805 and 1825. The strength of the place lay in a mud-wall, which was practically shot-proof, and a surrounding ditch, which might at any time be filled with water from a neighbouring lake. On the first occasion, Lord Lake's assaults were all baffled by this trench thus flooded. On the second occasion, however, Lord Combermere, having arrived in time to cut off the communications of the garrison with the lake above mentioned, overcame his principal difficulty; but even then the mud-wall would yield only to mining.—2. The protected state of B. is situated in lat.  $26^{\circ} 48'$ — $27^{\circ} 50'$  N., and in long.  $76^{\circ} 54'$ — $77^{\circ} 49'$  E.—its area being estimated at 1978 square miles. The population in 1871 was 743,710, giving an average of less than 400 to a square mile. The country suffers from want of water, having only three perennial streams, of which two, however, are mere rills in the dry season; and yet, in many parts, the soil is rendered highly productive by means of irrigation. The principal crops are grain, cotton, and sugar. In the height of summer, the climate has been compared to the extreme glow of an iron-foundry, the thermometer having been known to stand at  $130^{\circ}$  F. in the shade. The rajah's revenue is stated at £242,375 a year; and his military force is said to amount to 5400 men of all arms.

BIAFRA, BIGHT OF, a large bay of the Atlantic Ocean, on the west coast of Africa, at the head of the Gulf of Guinea, between Cape Formosa (which divides it from the Bight of Benin) on the north, and Cape Lopez on the south. Its extreme width between these two points is nearly 600 miles, its depth, to the mouth of the Old Calabar River, about 250 miles. The northern shores of the Bight, comprehended under the general name of the Calabar coast, and the eastern coast, south of Cape St John, are low and flat. Near Old Calabar, the country becomes hilly, and opposite Fernando Po, it rises into the lofty range of the Cameroons. The principal rivers flowing into the Bight are the Niger, or Quorra, the New and Old Calabar Rivers, the Rio del Rey, the Cameroon, and the Gaboon. The creeks and estuaries of the rivers are generally lined with dense thickets of mangrove, which sometimes grow in the water, their lower branches covered with oysters. In the Bight of B. are the three islands of Fernando Po, St Thomas, and Prince's Island. The chief European stations on the coast are Duke Town, in Old Calabar, where there is a flourishing missionary station, and Naango, or George's Town, a small commercial town on the estuary of the Gaboon.

BIALYSTOK, a fortified town of Western Russia, in the government of Grodno. It is situated on the Bialy, an affluent of the Narew, 45 miles southwest of Grodno, in lat.  $53^{\circ} 8'$  N., long.  $23^{\circ} 18'$  E. B. is well built; lime-trees border several of the streets, and give it a very pleasant aspect. It has a palace and park, now belonging to the municipality, but formerly belonging to the Counts of Branicki, and called the 'Versailles of Poland,' a commodious market, and several churches. It has manufactures

of woollens, hats, leather, soap, tallow, &c. Pop. (1867) 16,985.

**BIANCAVILLA**, a town of Sicily, in the province of, and about 14 miles north-west of the city of Catania. It is about 10 miles distant from Mount Etna, on the south-west declivity of which mountain it is situated. It has a trade in grain, cotton, and silk. Pop. 9328.

**BIANCHINI, FRANCESCO**, celebrated for his antiquarian and astronomical investigations, was born December 13, 1662, at Verona, where he received his early education in the Jesuits' College. At Padua he studied theology, mathematics, and above all, botany; and then proceeded to Rome, where he became intimate with the most distinguished savans of the day, and devoted himself to the study of jurisprudence and foreign languages. Alexander VIII bestowed upon him a rich benefice, and Clement XL appointed him secretary to the commission for reforming the calendar. B. was employed to draw a meridian line in the church of Santa Maria degli Angeli, in Rome, which he successfully accomplished. After travelling through France, Holland, and England, he returned to Italy, with the design of drawing a meridian line from the Adriatic to the Mediterranean like that drawn by Cassini across France. The operations connected with this project occupied him eight years; but a variety of other labours, as well as want of means, prevented its completion. Besides several memoirs and dissertations on antiquarian and astronomical subjects, we may mention his *Istoria Universale Provata coi Monumenti e Figure coi Simboli degli Antichi* (Rome, 1694), and his fine edition of the work of Anastasius, *De Vitis Romanorum Pontificum*, which was completed by his nephew Giuseppe B. (4 vols., Rome, 1718–1734). B. died in March 1729, and a monument was erected to his memory in the cathedral of Verona.

**BIARD, AUGUSTE FRANÇOIS**, a French painter, known in almost every department of his art, but chiefly distinguished for his animated and often comical representations of ordinary life and manners (*peinture de genre*). B.'s merits, and the school to which he belongs, will be sufficiently understood when we mention that his countrymen have styled him the Paul de Kock of painting! He was born at Lyon in 1800, and was at first destined for the church; but subsequently educated at the School of Art of his native city. He travelled in early life in Malta, Cyprus, Syria, and Egypt, where he made sketches, and stored his memory with images which he used in after-years. In 1839, he visited Greenland and Spitzbergen, and of this journey one of the fruits was his famous picture of a battle with polar bears. The first picture which gained him distinction was his 'Babes in the Wood' (1828); and one of his best is the 'Beggar's Family,' exhibited in 1836; both of which pictures were purchased by the town of Lyon. Many other continental galleries possess examples of B.'s pictures, and in England they have always been much sought after.

**BIARRITZ**, a maritime village of France, in the department of the Basses-Pyrénées, about 5 miles south-west of Bayonne. The late emperor and the empress, attracted by its pleasant situation and salubrity, latterly made it a summer residence; and the presence of the court of course tended to increase greatly the fame of its baths and singular grottoes. Pop. (1872) 3164.

**BI'AS**, one of the seven sages of Greece, lived in the time of the Lydian king, Alyattes, and his son, Croesus, about 570 B.C. He was generally employed as a political and legal adviser in difficult questions.

At the overthrow of Croesus, when the Ionians dreaded an invasion by Cyrus, they were advised by B. to take their personal property and colonise Sardinia; but this advice was rejected, and the Ionians, after a vain defence, were subjugated by the generals of Cyrus. When the people of Priene—the birthplace of B.—were making preparations to escape from their besieged city, B., in reply to one who asked why he was not occupied like other citizens, employed the words which have become a Latin proverb, *Omnia mea mecum porto*, 'I carry all my goods with me.'—Orelli, *Opuscula Greco-Roman Vetera*, &c., 1819.

**BIB, POUT, or WHITING POUT** (*Gadus luscus* or *Morrhua lusca*), a fish of the same genus with the Cod (q. v.) and Haddock (q. v.), pretty common on many parts of the British coasts, found also on those of Norway, Sweden, Greenland, &c. It is seldom more than a foot long, but remarkably differs from all other British fishes of the same family (*Gadidae*, q. v.) in the great depth of its body, which equals at least one-fourth of the entire length. The back is arched, and the nape exhibits a rather sharp ridge. The eyes and other parts of the head are invested with a singular loose membrane, which the fish can inflate at pleasure. There is a dark spot at the origin of each of the pectoral fins, as in the Whiting (q. v.). The names Bib and Pout, both originally local English names, were at one time supposed to belong to distinct species (called *G. lusca* and *G. barbata*), but it appears now to be pretty certain that these are really one. In Scotland, this fish is generally called *Brassy*. It is well known in the London market, is in best condition in November and December, and is much esteemed for the table.

**BITBERACH**, a town of Württemberg, in the circle of the Danube. It is situated on the Reis, in the charming valley of the same name, about 23 miles south-south-west of Ulm; and is surrounded by a ditch and by walls flanked with towers. It has manufactures of paper, linen, and fustians, leather, children's toys, &c. Pop. (1871) 7091. In October 1796, Moreau won a great victory over the Austrian general Latour at B., the latter losing 4000 prisoners and 18 pieces of cannon. Here also, in 1800, Moreau again defeated the Austrian general Kray. B. fell into the possession of Baden in 1802, but four years afterwards, was ceded to Württemberg. Wieland the poet was born in the immediate vicinity.

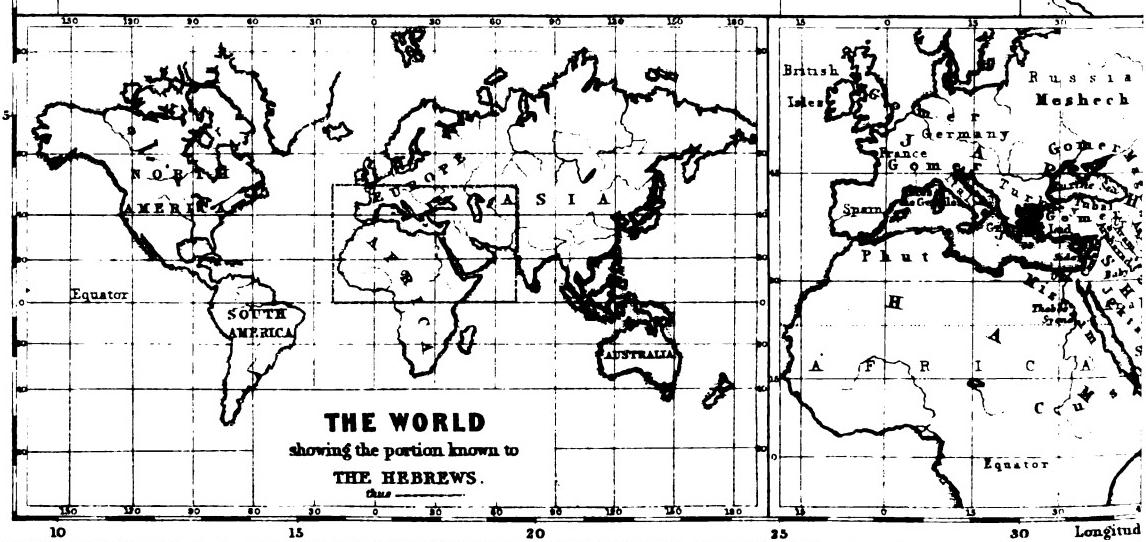

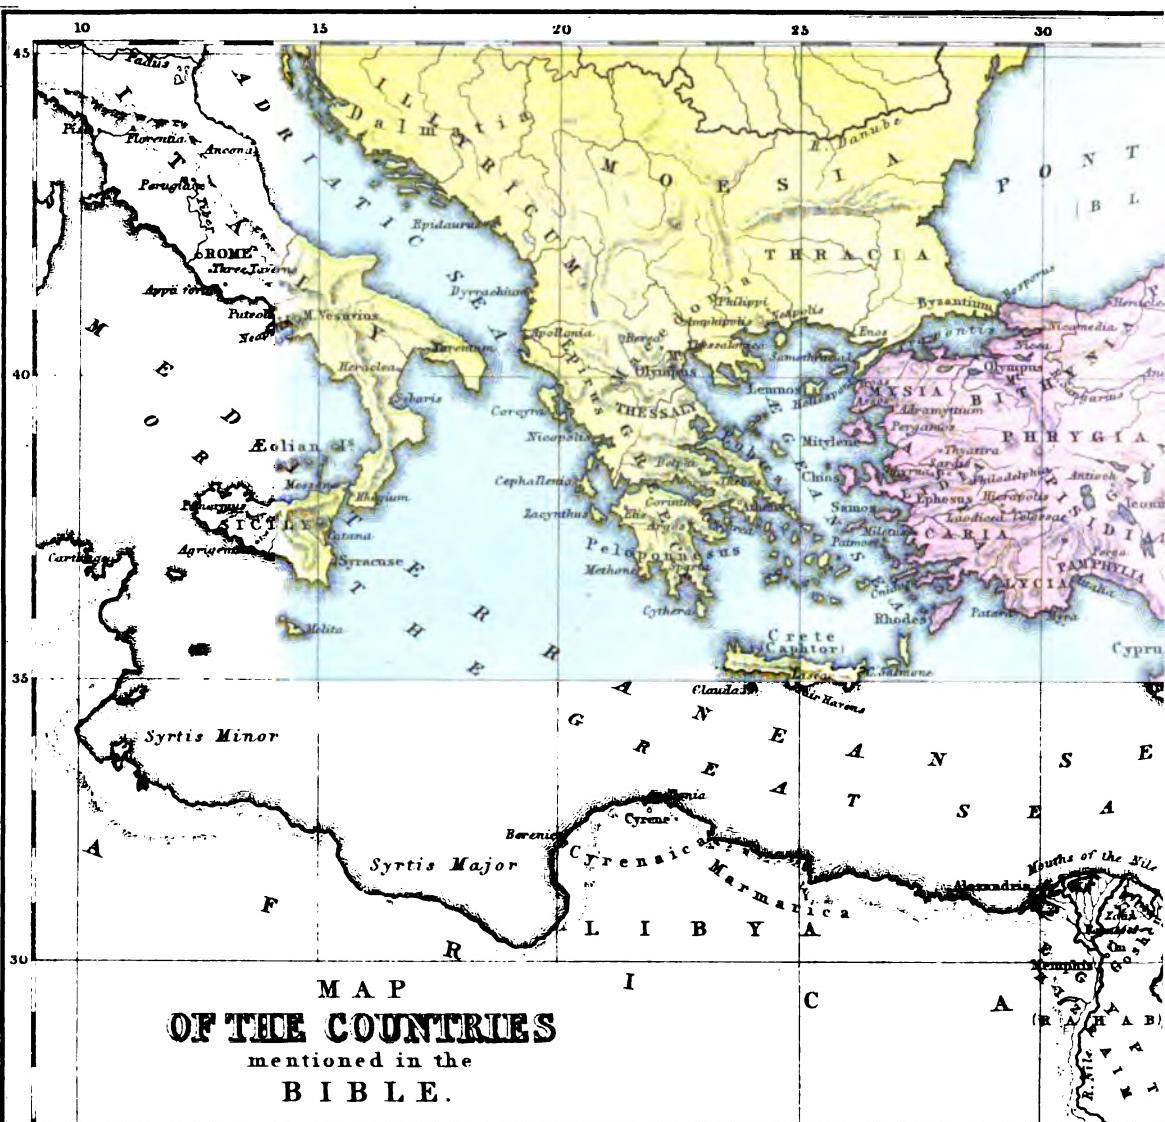

**BITBERICH**, a village in the province of Hesse-Nassau, on the right bank of the Rhine, and about 4 miles from Wiesbaden, is noted for its splendid palace. The views of the river-scenery from B. are unrivalled. Pop., including Mosbach (1871), 6642.

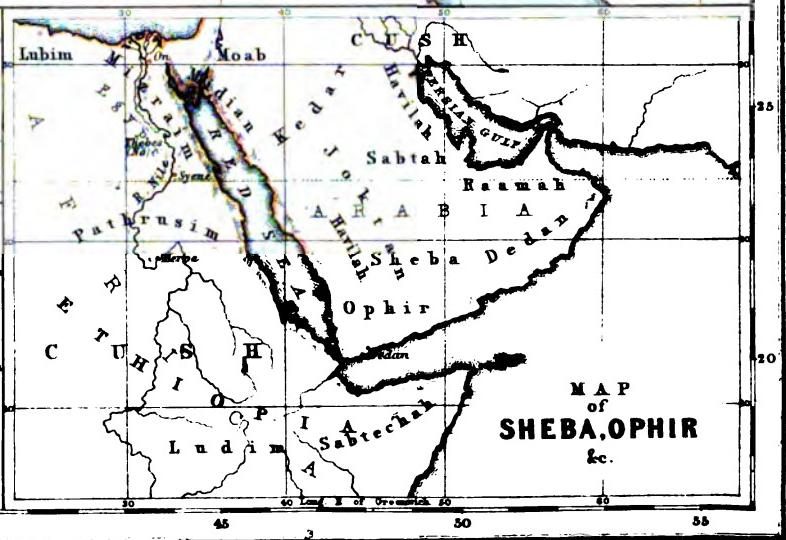

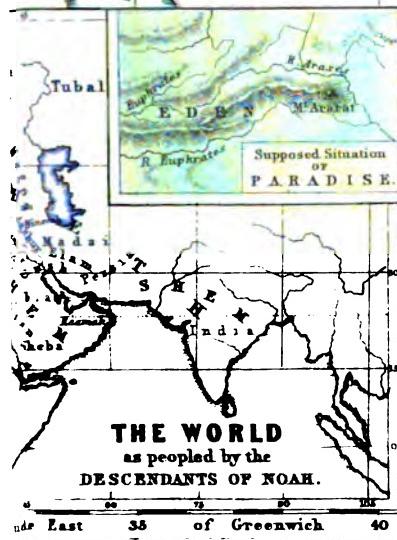

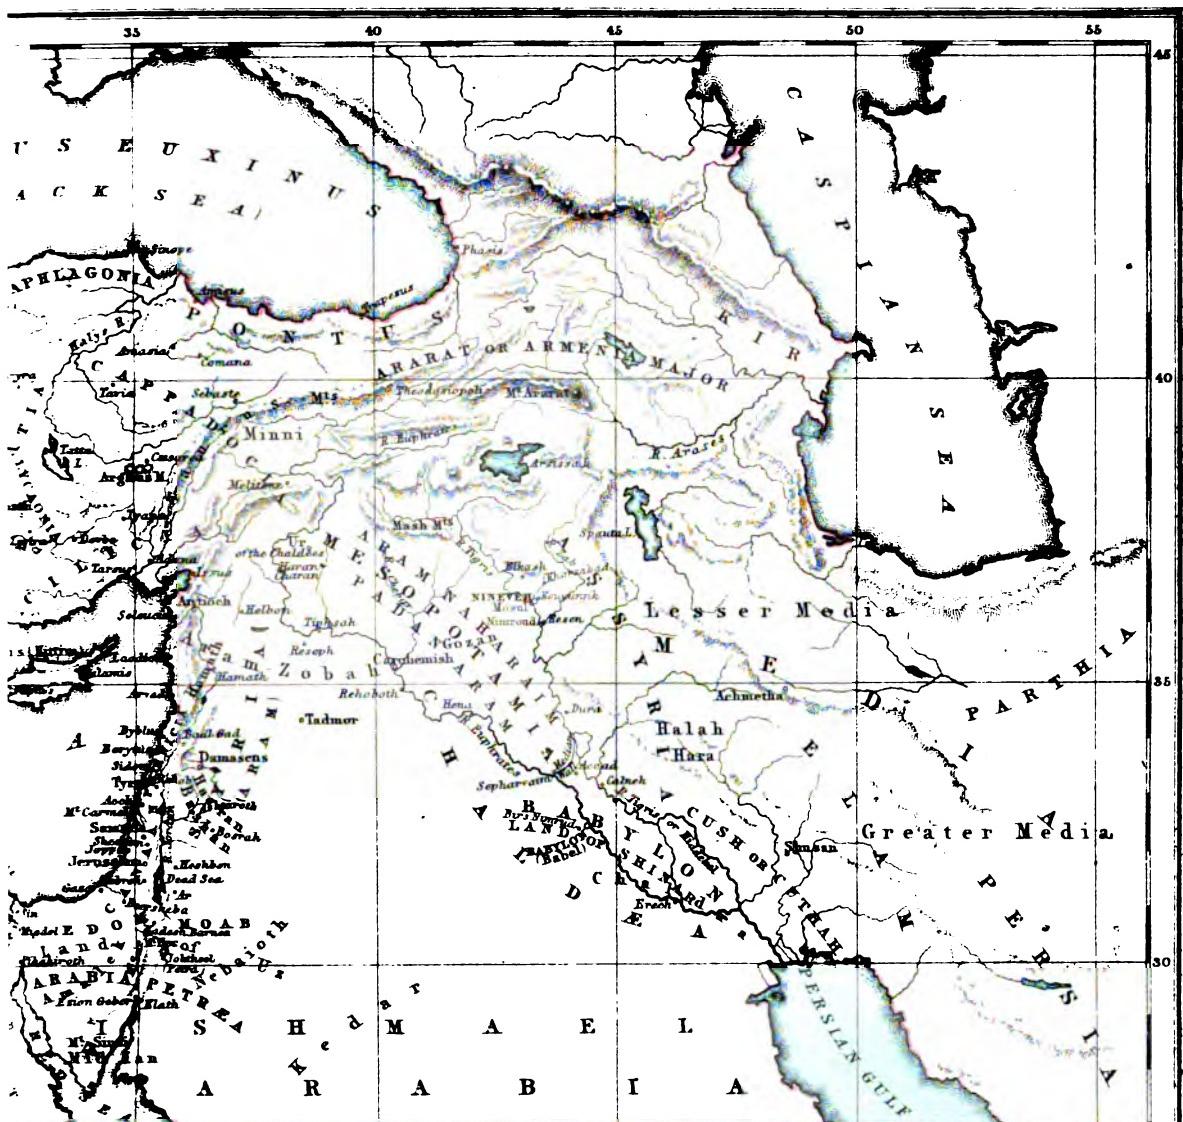

**BI'BIRI, BI'BIRI BARK, AND BI'BIRINE**. See GREENHEART.

**BIBLE** (Gr. *Ta Biblia*, 'The Books'—see Book) is the name given by Chrysostom in the 4th c. to that collection of sacred writings recognised by Christians as the documents of their divinely revealed religion. Both as regards language and contents, they are divided into two parts—the Old and New Testament, or rather, the Old and New Covenant; for the word *testamentum* is only a translation into the later Latinity of the 2d c. of the Greek *diatheke*, 'covenant.' The history of the Old Testament is connected with that of the New by a series of writings not received by Protestants as canonical, and collectively styled the *Apocrypha* (q. v.).

The OLD TESTAMENT is a collection of 39 books, written partly in the Hebrew, and partly in the Chaldaic language, and containing all the remains

of Hebrew-Chaldaic literature down to the middle of the 2d c. B.C. By an artificial arrangement under the letters of the Hebrew alphabet, the number of books has been limited among the Jews to 22. These writings were spoken of in the time of Christ, and for some indefinite period before his time, as *graphé*, Scripture, or Holy Scripture, or, as 'the Law and the Propheta.' Sometimes the Psalms and the remaining holy writings (*hagiographa*) are distinctively noticed. The *usus loquendi* of the New Testament (Matt. xi. 13, xxi. 40; Acts xiii. 15; Luke xxiv. 44, &c.) is evidence of this. The Law comprised the Pentateuch, or the first five books. The Prophets were subdivided into earlier and later: the former including the books of Joshua, Judges, Samuel, and Kings; and the latter containing the three great prophets, Isaiah, Jeremiah, and Ezekiel—as well as the twelve minor prophets. The third division of the Old Testament embraced the hagiographa, consisting of the books of Job, Proverbs, Psalms, the Song of Solomon, Ecclesiastes, Ruth, Lamentations, and Esther, together with the books of Daniel, Ezra, Nehemiah, and 1 and 2 Chronicles. With regard to the order of these several books, the Alexandrine translation, the Fathers of the Church, and Luther, on one side, differ from the Jews; again, among the Jews, the Talmudists differ from the Masoretes, while a difference is also found between Spanish and German MSS. Hence have sprung the different arrangements of the books of the Old Testament.

The Septuagint is generally adduced in proof of the existence of these books in a collected form as early as 285 B.C., but an examination of the Aristean fiction (see ARISTEAS and SEPTUAGINT) is sufficient to shew that at that period no more than the Pentateuch was translated into Hellenistic Greek. The earliest indubitable notice is found in the prologue to the Alexandrine translation of the book of Jesus, son of Sirach, written by his grandson probably about 130 B.C., which demonstrates that the Law and the Prophets then existed in a collective form; but this language does not prove that the third division was then concluded, though neither does it disprove it. This conclusion is first definitely ascertained from the catalogue given by Josephus, who flourished after the middle of the first century of the Christian era, while Philo, who flourished 41 A.D., quotes casually from nearly the whole of them.

As regards the genuineness and authenticity of the Old Testament, there has been much discussion in modern times. The generally received opinion is, that the various books were originally written wholly or chiefly by the persons whose names are affixed to them, except Judges (Samuel), Ruth (Samuel), Esther (Mordecai), Kings and Chronicles (Ezra and Jeremiah), and perhaps Job (Moses?); but that these MSS. having perished in the destruction of the first temple, when Nebuchadnezzar took Jerusalem, the members of the Great Synagogue (q. v.)—which included Ezra, Nehemiah, Haggai, Zechariah, Malachi, and afterwards Simon the Just—50 years after the building of the second temple, acting in accordance with a divine commission, rewrote the Old Testament; or rather made a recension of other existing copies, to which were subsequently added the books of Ezra and Nehemiah. Thus the canon was concluded. This was the belief of the Jews themselves at a later period; the *Pirke Abot* (Sayings of the Fathers), one of the oldest books of the Talmud, as well as other Jewish records, distinctly assert it. It is, however, simply a tradition, and though possibly true, is necessarily incapable either of demonstration or refutation. In the absence of any direct and conclusive evidence on this point, the contents of the Old Testament have been

minutely analysed by modern German critics, who have attempted to shew that they bear internal evidence of having been composed generally at a later period than is ordinarily believed. Their work has now been taken up by English, Dutch, and French scholars, of whom perhaps the most notable are Colenso (see NATAL) and Kuennen, and prosecuted with keenness and vigour.

The Samaritans, who were at enmity with the Jews, recognised only the five books of Moses, and a corrupt version of the book of Joshua, as canonical. On the other side, the Egyptian Jews, for whom the Alexandrine version of the Old Testament was made, received as canonical several writings which were rejected, or subordinated as apocryphal (see APOCYRPHAS), by the Jews of Palestine. The primitive church, in the period which elapsed before the canon of the New Testament was completed, referred to the Old Testament for proof of doctrines; but, on account of the prevalent ignorance of the Hebrew and Chaldee languages among the early Christians, the Alexandrine Greek version was the authority employed. As this included the apocryphal books, rejected by the Jews of Palestine, the earliest Christian Fathers made the same use of these writings as of the others; but the growth of criticism during the next two centuries was fatal to their reputation, or at least to their authority. We do not find, however, that they were formally designated 'apocryphal' until the time of Jerome (5th c.), though the Greek Church, in the previous century, had approximated to this mode of viewing them, by affirming them to be *not* canonical, but only edifying, and also by issuing lists or catalogues of those books which were recognised as canonical. In the Latin Church, on the other hand, these writings were received as canonical after the 4th c., though Jerome, Hilarius, Rufinus, and Junilius wished to distinguish them from the canonical books by the name of *libri ecclesiastici*. The Protestants, at the Reformation, returned to the distinction originally made by the Palestinian Jews between the Hebrew Scriptures of the Old Testament and the apocryphal works included in the Alexandrine version and the Latin Vulgate. Luther, in his translation of the B., included the Apocrypha as 'books not to be placed on a level with the canonical Scriptures; but profitable for reading.' The Council of Trent, which seemed to think that the only safe path for Catholicism to pursue was the exact opposite of that on which Protestantism moved, declared that whoever denied the canonical character of the Apocrypha should be *anathema*.

The NEW TESTAMENT, or the collection of canonical scriptures containing the history and doctrines of Christianity, may be divided into three chief sections: 1. The historical books, or the four gospels, and the Acts of the Apostles. 2. The didactic and pastoral writings, which include the Epistles of Paul to the Romans, Corinthians, Galatians, Ephesians, Philippians, Colossians, Thessalonians, Timothy, Titus, and Philemon, the Epistle to the Hebrews (which does not state the writer's name), the two Epistles of Peter, the three epistles of John, the Epistles of James and Jude. 3. The prophetic section, consisting only of one book, the Apocalypse, or Revelation of St John the Divine. The primitive Christians referred for proof of doctrine, &c., only, so far as we are aware, to the Old Testament, and quotations from it by the apostolic Fathers are numerous enough; but we find few clear and certain references to the didactic portions of the New Testament. The reason of this appears to be, that the lapse of time had hallowed the Old Testament, and given to it that superior authority which springs from venerable age. The generation which immediately

succeeded that of the apostles—and indeed, so far as we can see, the same may be said of the apostles themselves—did not consider the apostolic writings of equal importance as *writings* with the sacred books of the Old Testament. Besides, most of the epistles were of little use in controversy, for the earliest heretics denied the apostleship of St Paul; while both parties admitted the authority of the Septuagint, and found in it their common weapons of argument. Nevertheless, we occasionally find references to the didactic portions of the New Testament, such as those to Romans, 1st Corinthians, Ephesians, Hebrews, and James, in Clemens Romanus; to 1st Corinthians and Ephesians, in Ignatius; to Romans, 1st Corinthians, 2d Corinthians, Galatians, Philippians, 1st Timothy, 2d Timothy, 1st Peter, and 1st John, in Polycarp. Still more uncertain are the references of the apostolical Fathers to the gospels. The notices found in Barnabas, Clemens Romanus, Ignatius, and Polycarp are only sufficient to indicate that all the great facts of Christ's life were known to the churches, and that the doctrinal significance of these had begun to be realized. They do not, however, demonstrate the existence of written gospels, but they prove that Christianity rests on a historic basis. Their silence in relation to the written gospels now constituting a portion of the canon of the New Testament, is at first sight singular; but when we reflect that the facts of the Saviour's life and teaching were apparently quite familiar to the churches—so familiar, indeed, that no explanation was needed in alluding to them—we see that the necessity of the apostolical fathers quoting from the Evangelists ceases. It is contended, that any specific quotations would have been a work of supererogation; whereas, in the case of the didactic epistles, which were written originally for the benefit of particular churches, and conditioned by their special circumstances, and the contents of which, therefore, could not be so well or widely known, quotations or allusions might more naturally be looked for. But evidence of this negative character for the existence of the evangelical records, however probable, is very uncertain, and its uncertainty is increased by the use made of writings which, at a later period, were rejected as apocryphal. First, in the second half of the 2d c., more distinct references to the gospels are found in Papias (died 163), in Justin Martyr (died 166 A.D.), in his pupil Tatian (died 176), in Athenagoras (died 180), and in Theophilus, who wrote about the year 180. None of these writers, however, name the authors from whom they quote, though Papias—the earliest, but not the most trustworthy of them—bears direct and minute testimony to the existence of gospels by St Matthew, St Mark, St John, the catholic epistles, and the Apocalypse, whence it has been concluded that the authenticity of the apostolico memoirs was not then settled, and perhaps not even investigated; but anonymous quotation seems to have been a characteristic carelessness of the time, for of this kind are 117 of Justin Martyr's references to the Old Testament. The great fact on which a constructive Christian criticism leans in regard to the evidence of these writers is, that they do not speak of the gospels or apostolico memoirs as things which had only recently made their appearance, but as well known and long established. Justin even states that the 'apostolico memoirs' were regularly read in the churches for the edification of believers—a fact which clearly indicates their superior sanctity and general reception. The Tübingen school contend that these apostolico memoirs could not have been the canonical gospels, but must rather have been the primitive evangelical

records out of which the canonical gospels were formed; but it cannot be said that the criticism of Baur and his followers, in spite of its profound and searching character, has seriously imperilled the claim to apostolic antiquity put forth on behalf of the New Testament Scriptures.

Nevertheless, the idea of a strict and pure New Testament canon (see CANON) is not discernible in the church in Justin Martyr's time. There is no positive evidence in favour of its existence; but this is not to be wondered at, for the consciousness of freedom in the Holy Spirit, which penetrated the Christians of the 1st c.; the opposition of what in continental theology are termed the Petrine and Pauline (q. v.), i.e., the Judaizing and anti-Judaizing parties, which does unquestionably appear to have existed; the still living tradition of the apostles; the difficulty of diffusing apostolic writings sent only to particular churches; the absence of criticism; the vacillation in determining the point where the apostolic men ceased; the use in the worship of God of the Old Testament, and, in particular churches, of casual Christian writings not now looked upon as canonical: all these causes together operated in hindering, till the middle of the 2d c., a formal collection of New Testament writings of any compass or critical value, though it seems quite clear that they existed separately, and were regarded as the most authoritative records of the new dispensation. The earliest trace of such a collection (the ten Pauline epistles without the pastoral epistles) appears after the middle of the 2d c. in opposition to that gnostic perversion of primitive Christianity which had been introduced by Marcion of Pontus. The *Muratorian Canon* in the West, and the *Peshito* (q. v.) in the East, both belonging to this period, which has been called the 'Age of the Apologists,' furnish important evidence in regard to the New Testament canon, for both refer to nearly every book now received as authoritative, the exceptions being, in the former, the Epistle of James, the Epistle to the Hebrews, and 2 Peter; in the latter, Jude, 2 Peter, 2 and 3 John, and the Apocalypse. In the close of the 2d, and in the beginning of the 3d c., Irenaeus, Clemens Alexandrinus, and Tertullian bear testimony to the recognition of the four gospels, the Acts of the Apostles, the thirteen Pauline epistles, the 1st Epistle of Peter, the 1st Epistle of John, and the Apocalypse, as canonical writings. But they do even more than bear testimony to their recognition—they appeal to antiquity for proof of the authenticity of the books which they used as Christian Scriptures. On this point Tertullian is especially precise, and his most convincing argument on behalf of the 'surety of the gospels' is, that 'the very heretics bear witness to them.' They did not, it is admitted, acknowledge the whole of the New Testament canon, but this is explicable on the hypothesis, which is justified by investigation, that the portions rejected were those that seemed alien to their own opinions. Two distinct collections of writings are now noticed—the *Instrumentum Evangelicum*, containing the four gospels; and the *Instrumentum Apostolicum*, containing the Acts of the Apostles, along with the Pauline and other epistles. Respecting several parts of the New Testament canon, differences of opinion prevailed in early times, nor was the war of criticism closed until the 6th c., for considerable difference of opinion existed in regard to the value of the testimony of the early apologetic authors. Origen doubted the authority of the Epistle to the Hebrews, of the Epistle of James, of Jude, of the 2d of Peter, and the 2d and 3d of John; while, at the same time, he was disposed to recognise as canonical certain apocryphal

scriptures, such as those of Hermas and Barnabas, which were decidedly rejected by the Church. The *Apocalypse* was treated as a dubious part of the canon down to the 7th c. The learned and circumspect Father, Eusebius, in the 4th c., in a passage of his *Church History*, distinguishes three classes of New Testament Scriptures: 1. Universally received Scriptures (*homologoumena*), the four gospels, the Acts of the Apostles, the fourteen Pauline epistles, the 1st Epistle of John, the 1st of Peter, and, with a certain reservation, the *Apocalypse* of John. 2. Scriptures not universally received, or not received at all. These he calls 'disputed' (*antilegomena*), and subdivides them into such as were generally known and approved by most—viz., the epistles of James, Jude, 2 Peter, 2 and 3 John; and such as were 'spurious' (*notac*)—viz., the Acts of Paul, the Shepherd, the *Apocalypse* of Peter, the Epistle of Barnabas, the Institutes of the Apostles, and the Gospel of the Hebrews. 3. Heretical forgeries, such as the gospels of Peter, Thomas, Matthew, which Eusebius pronounces to be 'altogether absurd and impious.'

The Western Church, which was more conservative and less critical than the Eastern Church, completed the canon with greater rapidity. Although the eastern Council of Laodicea (360—364), in determining the canon of the New Testament, excluded the *Apocalypse*, the western synods of Hippo-Regium (393), Carthage (397), the Roman bishop, Innocent I. (in the beginning of the 5th c.), and the *Concilium Romani* under Gelasius I. (494), recognised the entire canon of the New Testament as we find it in the present day. The doubts entertained by individuals respecting some parts of the canon had become exceptional and unimportant at the close of the 7th c. Owing to the want of Greek scholarship, as also, perhaps, to the growing idea of an infallible church papacy, there was no criticism worthy of the name during the middle ages. Doubts, therefore, respecting the Epistle to the Hebrews and the Epistles of James and Jude were first revived, after a long quietude, at the time of the Reformation. Erasmus denied the apostolic origin of the Epistle to the Hebrews, 2 Peter, and the *Apocalypse*. Luther ventured to declare the Epistle to the Hebrews and the *Apocalypse* 'apocryphal.' Melanchthon, Gerhard, and Chemnitz went in the same direction, and even Calvin denied the Pauline authorship of the Epistle to the Hebrews. But biblical criticism, for reasons both political and ecclesiastical, soon became dormant, and so remained for nearly two centuries, when it was revived by a liberal Catholic writer, Richard Simon (died 1712), who first conceived the plan of 'an historico-critical introduction' to the B.; afterwards, the labours of Lowth, Semler, Herder, Griesbach, Michaelis, Eichhorn, and others, gave a new impulse to scriptural exegesis. In Germany, we may name among writers on the conservative and orthodox side, the Catholic divines Jahn and Hug, with the Protestant writers, Hengstenberg, Hävernick, Guarke, Delitzsch, and Caspari: on the other side, Berthold, De Wette, Credner, Beuss; and since the publication of the *Life of Jesus* by Strauss, the 'New Tubingen school,' with F. Baur (q. v.) at its head, has questioned the authenticity and apostolical antiquity of all the New Testament scriptures, except the four larger Epistles of Paul—to the Romans, the Corinthians (1st and 2d), and the Galatians; while more recently, Bruno Bauer (q. v.) has even denied the authenticity of the Epistle to the Galatians.

But, as might have been expected, the effects of the strife could not always remain confined to Germany.

They have been felt more or less over all Protestant countries, England, Holland, and America, and even Catholic France, which has no theology to contend for, shews the influence of the new movement. Renan (q. v.), who in his *Vie de Jésus* excited a sensation as vivid, though not as lasting, as Strauss in his *Leben Jesu*, has followed up his first work by another. In England, during the 18th c., several valuable apologetic works were published, such as Lardner's *Credibility of the Gospel History*, and Paley's *Horae Paulinae*. In the early part of the 19th c. appeared Horne's *Introduction to the Study of the Scriptures*, which has been frequently reprinted. Since then, Tregelles, Davidson, Westcott, and numerous other scholars, have entered the field; and it is not too much to affirm, that, among the more earnest class of British theologians, there exists at this moment a keener spirit of impartial inquiry, as regards the foundations of biblical criticism, than Britain has ever previously witnessed. The practical tendencies of the Anglo-Saxon mind long restrained it from interfering in what seemed to be a mere maze of unprofitable speculation; but now that its deep and vital relations to the groundwork of men's actual and possible beliefs have begun to be felt, these very practical tendencies are manifestly asserting themselves, and we may confidently anticipate that a large measure of attention on the part both of the clergy and laity will soon be given to this most important of all branches of knowledge.

**EDITIONS OF THE BIBLE: HISTORY OF THE TEXT.**—As both the Old and the New Testament were written in ancient languages, and transcribed in times when philological criticism hardly existed, the examination and comparison of various editions, with a view to obtain the greatest possible purity of text, forms an important part of theological study.

**Text of the Old Testament.**—The first duty of an impartial critic of this question is to lay aside both of the extreme and untenable opinions regarding the Hebrew text of the Old Testament, viz.—1st, that it has come down to us in an absolutely faultless condition, by miraculous preservation; and 2d, that it has been wilfully and unscrupulously falsified by the Jews. That there are erroneous readings, nobody doubts. The real task devolving on a student of this branch of theological science is to explain these on natural principles, and by collating the various recensions, to endeavour to obtain a pure text, or as close an approximation to that as may be possible. The following is a tolerably complete classification of the causes of errors. 1. Errors arising from *imperfect sight or occasional inattentiveness*; as when transcribers substituted one letter for another similar in appearance, transposed letters, words, and sentences, and omitted the same; of which there are various examples. 2. Errors arising from *imperfect hearing*, of which there are not many examples. 3. Errors arising from *defective memory*; as when a transcriber fancied that he knew certain words, phrases, or clauses, on account of their having occurred before; of these there are occasional examples. 4. Errors arising from *defective judgment*; as when words were wrongly divided, or abbreviations wrongly resolved; also from the *custodes lineorum* (i. e., the letters which filled up the occasional vacant space at the end of lines) and marginal remarks being sometimes incorporated with the text. These not unfrequently happen. 5. Errors arising from a *well-meant desire* on the part of the transcriber to explain or amend a text, really or apparently obscure. In this respect the Samaritans are greatly to blame. A very knotty point is, the condition of the text before and at the close of the canon. The opinion of Eichhorn, De

Wette, and others is, that while the books circulated singly in a sphere of uncertain authority, they were greatly corrupted; in support of which, considerable evidence is adduced, but still the probabilities are, on the whole, against such a supposition, and it is better to suppose that the conflicting accounts of the same events which are to be met with, especially in the historical books, arise not from the carelessness or corruptions of copyists, but rather from the original authors or compilers having consulted differing documents.

From recent investigations, it appears clear that the strict dogmatic Jews of Palestine and Babylon were generally far more careful in their preservation of sacred records than the Samaritans and the Alexandrines, the latter of whom were remarkable for their free, philosophising, non-textual spirit. In the schools of learning in Jerusalem at the time of Christ, presided over by Hillel, who had come from Babylon, and Shammai, and in those which flourished elsewhere in Palestine, after the fall of the metropolis, for instance, at Lydda, Caesarea, Tiberias, &c., as also in the academies of Sora, Pumpedith, and Nahardea, near the Euphrates, at a later period, the text of the Old Testament was defined with great care, first by the Talmudists, who seem to have adhered very closely to the ancient text, and after the completion of the Talmud at the close of the 5th c. by the *Masorites*. See MASSORAH. This care was at first bestowed only on the consonants of the Hebrew text. The Masoretic vowel system, which sprang from that already existing among the Syrians and Arabians, was developed from the 7th to the 10th centuries at Tiberias. By the 11th c. it appears to have been completed, while the Spanish rabbis of the next century seem ignorant of its then recent origin. (For proof of this, see Davidson's *Text of the Old Testament Considered*, 1856.) After the 11th c., the Masoretic text, with its perfected system of vowels and accents, became the standard authority among Jewish scholars. The comparative values of the different readings in the various MSS. had by that time been carefully determined, and the chief business of copyists, henceforth, was to make faithful transcripts.

The earliest printed editions of the Hebrew B. bear a close resemblance to the MSS. 'They are without titles at the commencement, have appendices, are printed on parchment with broad margin, and large ill-shaped type, the initial letters being commonly ornamented either with wood-cut engravings or by the pen. These letters, however, are often absent. With vowels, the editions in question are very imperfectly supplied. Separate parts of the B. were first printed.' The Psalms appeared in 1477, probably at Bologna; the Pentateuch at Bologna in 1482; the Prophets in 1486; the Hagiographa in 1487. To most of these were subjoined the rabbinical commentary of Kimchi. The whole of the Old Testament appeared in small folio at Soncino, 1488, and appears to have been followed by the edition of Breasia (1494), which was used by Luther in his translation of the Old Testament. The *Biblia Polyglotta Complutensia* (1514—1517), the *Biblia Rabbinica* of Bomberg edited by Rabbi Jacob-Ben-Chajim (Venice, 1525—1526), which has been adopted in most of the subsequent editions—the Antwerp *Biblia Polyglotta* (8 vols., 1569—1572), also the editions by Hutterus (Hamburg, 1587, and frequently reprinted), Buxtorf (Basel, 1611), and especially that by Joa. Athias (Amsterdam, 1661—1667)—all these are celebrated, and have supplied the basis of later editions by Simon, Hahn, Theile, and others. In the 17th c., a vehement controversy arose regarding the integrity of the Hebrew text; one party maintained that the Masoretic text was

greatly corrupted, and contrasted it unfavourably with that of the Samaritan Pentateuch. The chief advocates of this view were Vossius, Whiston, Morin, and Capellus. On the other hand, Buxtorf, Arnold Bootius, Wasmuth, and others, defended the absolute purity of the Masoretic text, even to the inspiration of the vowel-points, which Buxtorf, in the preface to his grandfather's *Tiberias*, gravely asserts to have been first invented by Ezra. This controversy had at least one good result. It led to an extensive examination of Hebrew MSS. in the next century. Kennicott collated 630, 258 throughout, the rest in part; De Rossi, 751, of which all but 17 were collated for the first time. Many still remain uncollated. The result of this elaborate investigation has been to convince scholars that the Masoretic text is substantially correct. All known codices confirm it; the oldest of the professedly literal versions, as well as the Targums of the time of Christ, furnish similar satisfactory evidence; and when we consider the *bibliolatrous* tendencies of the Jews *after* their return from exile, whatever may have been the case before, we may safely conclude that we now possess the text of the Old Testament much in the same condition as it was at the close of the canon.

At first, there were no intervening spaces between Hebrew words; afterwards, small intervals appear to have been occasionally allowed. With the introduction of the square character, the use of small interstices to separate words became general. The Talmud prescribes how much space should be between words in sacred MSS. designed for the synagogue. Various divisions according to the sense were also introduced at an early period. In the Pentateuch there were two, termed respectively open and closed. The former were intended to mark a change in the matter of the text; the latter, slight changes in the sense. Of these, the Pentateuch contained 669, named *parshiot* (sections). This division is probably as old, or nearly so, as the practice of reading the Law. It is found in the Talmud, while the division into 54 great *parshiot* is first found in the Massorah, and is not observed in the rolls of the synagogues. The poetical books were also subjected, from a very early period, to a stichometrical division, according to the peculiarities of Hebrew versification. In order to facilitate the reading and understanding of the prose books, a division into logical periods was also made, which is mentioned in the *Mishna* (q.v.), while in the *Gemara* (q.v.) its authorship is ascribed to Mosea. From it sprang our present division of the Scriptures into verses. It is highly probable that these divisions were long handed down orally. Our present division of the Old Testament into chapters is a later invention, and, though accepted by the Jews, is of Christian origin: it may be dated as far back as the 13th c., some assigning it to Cardinal Hugo, others to Stephen Langton, Archbishop of Canterbury. It was first employed in a concordance to the Vulgate, whence it was borrowed by Rabbin Nathan in the 15th c., who made a similar concordance to the Hebrew Bible. Nathan's divisions are found in Bomberg's Hebrew B. of 1518. Verses were first introduced into editions of the Hebrew B. by Athias of Amsterdam, 1661, but were employed in the Vulgate as early as 1558. The first English B. divided into verses was published at Geneva in 1560.

*New Testament*.—The original MSS. of the New Testament were probably all written on papyrus, the cheapest, but least durable material that could be obtained for the purpose. It was therefore impossible, considering the constant handling to which the documents must have been subjected by the

eager converts, that they could have lasted for any length of time. Indeed no authentic notices of them have come down to us, and it is a curious fact that, in the controversies of the 2d c., no appeal is made to the apostolic originals. But the number of copies was very great. The text of these, however, did not always agree. Variations originated, to a considerable extent, from the same causes as operated in the case of the Old Testament, viz., imperfect vision or hearing, misunderstanding, carelessness, or an uncritical judgment on the part of transcribers; but it is natural to suppose that, on account of the greater freedom of spirit and thought which characterised primitive Christianity, compared with Judaism, a latitude of conviction in regard to the value of the *letter* of Scripture, also influenced the churches. The idea of inspiration (q. v.), it is now admitted by the most enlightened theologians, was progressively developed. In the earliest ages it did not exist in any dogmatic form whatever. Christians were content to believe that the evangelists and apostles spoke *truth*, by the help of the Holy Spirit, without perplexing themselves with the question, whether the words were purely divine or purely human in their origin. They had a gospel to preach, and a world to convert, and were therefore not in a mood to discuss mechanical notions. This also must have operated in producing the textual variations referred to, many of which are of such a nature as to clearly prove that the commentators or transcribers thought themselves at liberty to alter or improve the expression. Nor must we overlook the fact, that the different culture and tendencies of the Eastern and Western Churches also caused very considerable changes. Modern criticism reckons no less than 80,000 variations in the existing MSS. Nevertheless, one fact stands out, solid and imperishable, amid all the tiny fluctuations of verbal criticism, viz., that, with one or two exceptions, no material difference exists, or in all probability ever did exist, in New Testament MSS. The general Christian consciousness, which was the real guardian of their integrity, had been grounded too deeply in the facts, doctrines, and ethics of a historic Christianity to follow in the wake of sectarian or heretical modifications of the truth. It instinctively turned, as it were, from a sense of affinity to those apostolic records, the tone of which most closely corresponded to its own spiritual character and development, and thus unconsciously prevented any incongruous changes from being effected in the mass of MSS. Of these MSS., upwards of 1400 are known to scholars, and have been collated, and no essential discrepancy has been detected. Of course, it can be urged that all the MSS. belong to a period when the Church had gathered itself up into two great wholes—the Latin and Greek, and when, therefore, a general conformity in MSS., as in other things, is only to be expected; but the fragments which are found in the earliest Church Fathers exhibit substantially, though not verbally, the same text, and we may therefore fairly infer that this unintentional harmony in part argues the general harmony of the earlier and later MSS.

Some slight attempts seem to have been made, during the early history of the Church, to obtain a correct text. One Lucian, a presbyter of Antioch, and Hesychius, an Egyptian bishop, are said by Jerome to have undertaken a recension of the New Testament, and both Origen and Jerome himself were of considerable service in this respect. It is to modern criticism, however, that we owe almost everything in regard to the regulation of the text. Bengel and Semler first started the idea of arranging the MSS. of the New Testament into families or

classes. After these came Griesbach, who, following out the idea, propounded his famous threefold division of the MSS. into Western, Alexandrian, and Byzantine. The first two he considers the oldest; the third, a corrupt mixture of both. Griesbach himself preferred the Alexandrian: he believed that the Byzantine transcribers had taken great liberties with the text, and held that a few Alexandrian MSS. outweighed, in critical value, a large number of the other. The accuracy of Griesbach's division has subsequently been questioned by many eminent German scholars, each of whom has in turn favoured the world with a theory of his own in regard to the probable value of the various families of MSS. Recently, Lachmann has applied, with excessive strictness, a principle first hinted by Bentley, viz., that no weight ought to be attached to any MSS. except those written in the old or Uncial (q. v.) character. The exact value of each manuscript is still a matter of dispute; but a great deal has been done to place the knowledge of the various lines of evidence within the reach of all scholars. Tischendorf carefully examined the most important of the uncial MSS., and published them separately somewhat after the fashion of a fac-simile. He also published a fac-simile of the *Codex Sinaiticus*, which he found in a monastery in Mount Sinai. Scrivener has collated a considerable number of cursives, and collated again the *Codex Bezae*. And great attention is being paid to quotations from the Fathers. Rösch, for instance, has given all the quotations from the New Testament in Tertullian, and Tischendorf made large use of them in his last or eighth edition.

The whole of the New Testament was first printed in the Complutensian Polyglott, 1514. From 1516 to 1535, five editions appeared at Basel, under the care of Erasmus, but without any great pretensions to critical accuracy. The subsequent numerous editions were, for the most part, either founded on the editions of Erasmus or on the Complutensian, or on a collation of both. Among these editions we may mention those of Simon de Colines or Colineus (Paris, 1543), of the elder Stephen (1546, 1549, and 1550), of the younger Stephen (1569). Beza was the first who, by several collations founded on the third edition by Stephens, made any considerable progress in the critical treatment of the text, and thus supplied a basis for the present received text (*textus receptus*), which was first printed by Stephens with the Vulgate and critical annotations at Geneva, 1565; afterwards was frequently reprinted by Elzevir (Leyden, 1624) and others. The labours of the English scholar Walton, in the London Polyglott (1657), of Fell (Oxford, 1675), and especially Mill (Oxford, 1707), were of great importance for the criticism of the New Testament. Bengel exhibited great tact and acumen in his edition of 1734, Wetstein much industry and care in the editions of 1751—1752, as also Semler, 1764. But all these recensions were surpassed in value by the labours of Griesbach (1st ed. 1774; 2d and best ed. 1796—1806). The more recent contributions to the criticism of the New Testament by Scholz, the *Lucubratio Critica* (Basel, 1830), and the critical edition by Rinck (2 vols., Leip. 1830—1836), the edition by Lachmann (Berl. 1831), with especial use of oriental MSS., and, subsequently, the labours of Buttman (1842—1850), Tregelles (1854—1863), Tischendorf (1841—1873), and Scrivener (1861), are also worthy of high praise.

Among the MSS. of the New Testament, the oldest are not traced back further than the 4th c., and are written in the so-called *uncial* characters. The modern MSS., dating from the 10th c. downwards, are distinguished by the *cursive* char-

acters in which they are written. The most important MSS. are the *Codex Sinaiticus* (at St Petersburg), the *Codex Alexandrinus* (in the British Museum), *C. Vaticanus* (in the Vatican at Rome), *C. Ephraemi* (in the Imperial Library at Paris—a fac-simile of which was edited by Tischendorf, Leipzig, 1843), and *C. Cantabrigiensis*, or *C. Beza* (given by Beza to the university of Cambridge, a fac-simile being issued by Th. Kipling, 1793). Of these, the *Codex Vaticanus* was long considered to be the oldest, but the discovery of the *Codex Sinaiticus* by Tischendorf at the monastery of St Catharine, Mount Sinai, in 1859, has now transferred the honour to that invaluable document, the age of which cannot be older than the middle of the 4th century. A fac-simile of the *Codex Vaticanus*, edited by Cardinal Mai, was published at Rome in 1858.

The earliest division of the New Testament into verses of which we read is that made by Euthalius, Deacon of Alexandria, 462 A.D. He arranged those words that were related to each other by the sense into *sicchoi* or lines. Subsequently, to save space, a colon or point was substituted, until, finally, a complete system of punctuation arose. In the 13th c., as we have already seen, the division into chapters took place, and in the 16th the versicular division was perfected by Stephens. The arguments or contents prefixed to the several chapters are also of modern origin.

*B. Versions or Translations.*—These may be divided into ancient and modern. The ancient translations of the Old Testament from the original Hebrew may be classed as follows: 1. *Greek*.—The earliest of these is the Alexandrine or Septuagint (q. v.), after which come respectively the translations by Aquila (q. v.), Theodotion, and Symmachus. The whole of these, with fragments of others by unknown authors, were given by Origen in his *Hexapla* (q. v.). The *Versio Venera*, a Greek translation of several books of the Old Testament, made in the 14th c., and preserved in the St Mark's Library, Venice, was published by Villoison at Strasburg, in 1784. Several early versions were also based on the Septuagint; but for that reason do not possess an independent value, being for the most part simply translations of a translation. Among these may be mentioned the old Latin version or *Italic* (q. v.), though the term *Italic* is strictly applicable to the New Testament only, improved by Jerome (382 A.D.); the Syriac, including the *Versio Figurata*, partially preserved and collated by Jacob of Edessa, in the beginning of the 8th c.; and that by Paul, bishop of Tala (617 A.D.); the *Ethiopic*, made by certain Christians in the 4th c.; the threefold *Egyptian* (3d or 4th c.), one being in the language of Lower Egypt, and termed the *Coptic* or *Memphitic*; another in the language of Upper Egypt, and termed the *Sahidic* or *Thebaic*; and a third, the *Basmuric*, whose locality is uncertain: the *Armenian*, by Miesrob and his pupils in the 5th c.; the *Georgian*, of the 6th c.; the *Slavonian*, commonly ascribed, but for unsatisfactory reasons, to the missionaries Methodius and Cyril in the 9th c.; the *Gothic*, ascribed to Uphilas, and executed in the 4th c., only some few fragments of which are extant: lastly, several Arabic translations of the 10th and 11th centuries.—2. The *Chaldaic translations* or *Targums*. These had an early origin; but, with the exception of those of Onkelos and Ben Uzziel, are unsatisfactory in a critical point of view. See *TARGUM*.—3. The remarkably literal translation into the Aramaic dialect of the later Samaritans, of the ancient copy of the Pentateuch, possessed by the Samaritans (see *SAMARITAN PENTATEUCH*).—4. The Church translation, known as the *Peshito* (q. v.), received by all

the Syriac Christians. It was undoubtedly executed from the original Hebrew text, to which it closely adheres. Several Arabic versions were founded on the *Peshito*.—5. The later Arabic versions, executed during the middle ages, partly from the Hebrew text, and partly from the Samaritan Pentateuch.—6. The Persian translation of the Pentateuch, made by a Jew named Jacob, not earlier than the 9th c.—7. The Latin Vulgate (q. v.), from which a considerable number of fragmentary versions were made into that form of English commonly called Anglo-Saxon, the most noted translators being Adhelm, bishop of Sherborne, and Bede (8th c.); Alfred (9th c.); and Ælfric (10th c.).

Among ancient versions of the New Testament we may notice three in Syriac: the first is the *Peshito*, with a twofold secondary translation of the four gospels into Arabic and Persian. It does not, however, contain 2d Peter, 2d and 3d John, Jude, or the Apocalypse, which, at a later period, were classed among the *antilegomena*, or disputed books. The second, or *Philoxenian*, prepared, in 508, under the direction of Philoxenus, Bishop of Hierapolis. It no longer exists, but a counterpart of it does, in the translation made in the following century (616 A.D.) by Thomas of Harkel or Heraclia, the successor of Philoxenus. The best MS. of this version is one which belonged to Ridley, and is now in the archives of the New College, Oxford. It includes all the books of the New Testament excepting the Apocalypse. The style is slavishly literal. It was edited by White, Oxford, 1778. The third, or Jerusalem-Syriac version, preserved in a Vatican MS., and, according to the subscription annexed to it, executed at Antioch in 1031. With the above Syriac version we may class the *Ethiopic* translation; the Egyptian threefold version, made probably in the latter part of the 3d c., and of considerable critical value; the Armenian, Georgian, Persian, and Coptic-Arabic. Besides these may be mentioned the old Italic; the Vulgate by Jerome; the Gothic translation by Uphilas (about the middle of the 4th c.), of which the most famous MS. is preserved in the library of Upsal, in Sweden (this has only the four gospels, and not even these in perfect condition); the various Anglo-Saxon versions already mentioned in connection with versions of the Old Testament; and the Slavonic.

*Modern Translations.*—During the middle ages, when the laity were considered by the priesthood unfit to be intrusted with the B. as a whole, various poetical versions—such as the Gospel History, by Otfried von Weissenburg, and the version of Job and of the Psalms by Notker-Labeo (980 A.D.)—served a very important object, and stimulated the desire for more biblical information. As early as 1170, Petrus Waldis caused the New Testament to be translated into the Provencal dialect by Etienne d'Anse. This important work was followed by the translations made under Louis the Pious (1227) and Charles the Wise (1380), the B. Histories (*Bible historiale*) by Guyars of Mouline (1286), the Spanish version under Alfonso V. in the 13th c., the English by Wickliffe, and the Bohemian version of John Huss. After the invention of printing—especially after the latter part of the 15th c.—the harbingers of a new ecclesiastical era appeared in numerous republications of the translated B.—the Bohemian (Prague, 1448); the Italian, by the Benedictine Nic. Malherbi (1471); the French, by Des Mouline (1477—1546); the Dutch (Delf, 1477); the Spanish (1478—1515); but, above all, in the seventeen German translations before Luther, of which five were printed before 1477, and the remainder in the Low-German dialect during 1477—1518.

Luther's translation of the B. is universally esteemed by the best German scholars as a masterpiece of genial interpretation. It displays qualities far superior to those ordinarily expected in a translation—deep insight, true sympathy with the tone of the Hebrew Scriptures, and a perfect command of clear, popular language; indeed, every one who can thoroughly appreciate the merits of this great work, will be ready to excuse the boldness of the assertion, that 'it was rather a re-writing than a mere translation of the B.' a transfusion of the original spirit into a new language, rather than a mere version of the letter. The New Testament was finished by Luther at Wartburg, and appeared in September 1522. In the following year, the five books of Moses appeared; and, in 1534, the remaining part of the Old Testament canon was completed along with the Apocrypha. With wonderful rapidity, this translation was circulated throughout Germany. In the course of forty years, one bookseller, Hans Luft of Wittenberg, sold 100,000 copies; an astonishing number, when we consider the price of books in the 16th c. It was reprinted thirty-eight times in Germany before 1559, and meanwhile, the New Testament had been separately printed in seventy-two editions. Numerous other translations in Dutch, Swedish, &c., were based upon the work of Luther.

*English Translations.*—Wycliffe (q. v.) executed a noble version from the Vulgate, but it was long before our country began to print even portions. Long after Germany and other countries had issued vernacular versions of the B., that land continued to sit in darkness. The earliest attempt was a translation of the *seven penitential psalms* in 1505. No doubt, a very considerable number of MSS. circulated among the people; but still we may well ask: 'What were these among so many?' Such a question the noble martyr, William Tyndale (q. v.), seems to have put to himself, and bravely he answered it, voweding that 'if God would spare his life, ere many years he would cause the boy who driveth the plough to know more of the Scriptures than did all the priests.' To accomplish his purpose, he passed over to the continent. Before 1526, he had completed an English translation of the New Testament, which appeared both in quarto and duodecimo. In the beginning of 1526, the volumes were secretly conveyed into England, where they were bough up and burned, which, however, only stimulated Tyndale to greater exertions. Of the admirable character of his translation, we have a sufficient testimony in this fact, that in our present version a very large portion of the New Testament is taken almost *verbatim* from Tyndale's Testament. Tyndale next proceeded to prepare a version of the Old Testament out of the original Hebrew, and in 1530, he published the Pentateuch, and in the following year, the book of Jonah. The first English version of the whole B. was that published by Miles Coverdale, a friend of Tyndale. It is dated 1535, and dedicated to Henry VIII., but where printed, is unknown. It is much inferior to Tyndale's. The next English B. issued was called *Matthew's B.*, from the circumstance that the editor assumed the name of Thomas Matthew, but was simply Tyndale's version revised by his friend John Rogers, who also translated those books in the Old Testament which the martyr had not been able to overtake. It was finished in 1537, and Cranmer obtained for it the patronage of Henry, though that monarch had persecuted Tyndale some years before. Matthew's B. soon superseded Coverdale's. In April 1539 appeared the *Great B.*, usually called Cranmer's, because he wrote a preface to it. It was a large volume for use in churches. The text was Tyndale's revised. In the same year, Richard Taverner, a learned but eccentric

layman belonging to the Inner Temple, published an edition, the text of which is based on that of Matthew's Bible. In 1557 appeared the famous *Geneva B.*, so called because the translation was executed there by several English divines, who had fled from the persecutions of the bloody Mary. Among these may be mentioned Gilby and Whittingham. This edition—the first printed in Roman letter and divided into verses—was accompanied by notes, which shewed a strong leaning to the views of Calvin and Beza. It was, in consequence, long the favourite version of the English Puritans and the Scotch Presbyterians. It is, however, best known as the *Breeches B.*, on account of the rendering of Genesis iii. 7: 'Then the eyes of them both were opened, and they knew that they were naked, and they sewed fig-tree leaves together, and made themselves breeches.' In 1568, the *Bishop's B.* was published at London. The text of this was compared with the original by eight bishops, and seven other scholars of reputation, who appended their initials to their respective tasks; the whole being under the superintendence of Matthew Parker, Archbishop of Canterbury. In 1582 appeared at Rheims, in France, an English version of the New Testament, prepared by several Roman Catholic exiles; and in 1609—1610, a similar version of the Old Testament at Douay. Both were taken from the Vulgate, and form the standard English Scriptures of the Roman Catholics, being generally known as the *Douay Bible*.

We now come to the version which has been in common use for nearly 250 years, generally called *King James's Bible*. At the Hampton Court Conference in January 1604, Dr Rainolds, an eminent Puritan, suggested a new translation as a great national want; and this, though opposed by the Bishop of London, was sanctioned by the king. Arrangements were at once made for carrying out the project. In July, the king wrote a letter, intimating the appointment of 54 scholars for the preparation of the version, and instructing the bishops that whenever 'a living of twenty pounds' became vacant, they should inform his majesty of the circumstance, in order that he might recommend one of the translators to the patron. This was all that James did on behalf of the translation which bears his name. The expenses seem to have been borne by Barker, the printer and patentee, who paid the sum of £3500. Of the 54 scholars who had been nominated to the work, only 47 undertook it. These were divided into six companies, two of which were to meet at Westminster, two at Cambridge, and two at Oxford. The *first* company at Westminster translated the Pentateuch and the historical books to the end of 2d Kings; the *first* at Cambridge, from the beginning of Chronicles to the end of Canticles; and the *first* at Oxford undertook the remaining books of the Old Testament canon. The second company at Westminster translated the apostolic epistles; the second at Cambridge, the Apocrypha; and the second at Oxford, the gospels, the Acts of the Apostles, and the Apocalypse. According to Selden, 'they then met together, and one read the translation, the rest holding in their hands some B., either of the learned tongues, or French, Spanish, Italian, &c. If they found any fault, they spoke; if not, he read on.' When a portion was finished by one of the company, it was sent to all the others in succession for their deliberative examination; and whenever a difference of opinion was elicited, reference was made to a committee. The final revision of the whole was conducted in London by two delegates from each of the six companies. These twelve scholars, in the discharge of their critical functions, met daily

in the old hall of the Stationers' Company for nine months. The work of translation and revision occupied from 1607 to 1610. The superiority of the authorised version soon proved itself; for though there were several rivals in the field, and no steps were taken to secure for it a preference, it quickly gained the foremost place, and in the course of forty years from its publication, all others had quietly succumbed to it; it became, and has ever since remained the *English Bible*. Its ascendancy, and its exclusive use among all classes in Great Britain, and in her vast colonies, can only be traced to its intrinsic excellence. A new English version, however, has been in course of preparation for some years.

The exclusive right to print the present authorised version has been claimed by the Crown, ever since the date of its first publication, and under this royal prerogative, the B. is printed in different forms, and sold wholesale by certain patentees and licensees in England, Scotland, and Ireland. This claim, which does not practically affect Bibles with notes, has lately been much remonstrated against as a monopoly injurious to the free circulation of the Scriptures at a moderate price, and a modification is now looked for (see *BOOK TRADE*).

The more liberal Catholics—especially the Jansenists De Sacy, Arnauld, and Nicole; the enlightened Richard Simon and Quesnel—also shared in the common zeal for diffusing a knowledge of the Scriptures; but though many versions have been prepared by Catholics, the Romish Church has consistently maintained an opposition to the general circulation of Holy Scripture without ecclesiastical comments.

The numerous recent translations of the Scriptures into languages beyond the pale of Christendom, have been executed chiefly under the auspices of Missionary and Bible Societies (q. v.).

As to the *contents* of the B., its one grand object, under whatever form it may appear in the various books, is, to give an account of this world, both in its origin and government, as the work of an Almighty Creator, always and everywhere present; and especially to exhibit the relation of man to this Creator, and, in consequence of that relation, in what manner, and with what hopes he ought to live and die—subjects undeniably the most momentous that can occupy human thought. The sacred books of other religions have all an analogous aim; to account, namely, for the origin of all things, and to explain the nature and human relations of that something *divine*, which it is an instinct of the human mind to conceive as actuating and controlling all that moves. But so different—so immeasurably superior to all other sacred books is the B. in the conception it unfolds of the Divine nature as one personal God, exercising towards men the love and care of a parent to his offspring, and in the system of human duties springing therefrom, that on this consideration alone many rest its claim to being received as a direct revelation from heaven. The questions regarding the B., considered in this point of view, fall to be treated under the heads of *INSPIRATION* and *REVELATION*. To attempt to analyse or give any detailed account of the contents of the Scriptures, is beyond the scope of this article. The leading features of the doctrines and precepts, as a system, will be briefly sketched under the head of *CHRISTIANITY*; while the chief individual doctrines receive notice under their respective names, and in the accounts of the controversies to which they have given rise.

**BIBLE, PROHIBITION OF.** This is one of the main points of opposition between the Roman Catholic and the Protestant Church. In the earliest times, we find no evidence of any prohibition of

B.-reading by the laity. On the contrary, as the foundation on which the Church was built, and the sole source of religious knowledge, the reading of the B. formed an essential part of the instruction communicated by pastors to their congregations; and the greatest orators of the Church—especially Chrysostom and Augustine—continually reminded their hearers that private reading and study of the Scriptures should follow attendance on public services. This great fact is by no means contradicted by the warnings found, here and there, in the Fathers against abuse or mistake of the meaning of Scripture; these warnings rather imply that Scripture-reading was common among the laity. The gradual widening of the distinction, or rather the separation, between the clergy and the laity, was the work of the middle ages; and, among other means of preserving traditions inviolate and maintaining the exclusive character and sacred authority of the hierarchy, the B. was held in the background, even while there was no direct prohibition of its common use. In 1080, Gregory VII. ordained that Latin should be the universal language of Catholic worship, and consequently excluded all vernacular readings of Scripture in public assemblies. Again, with regard to the Waldenses, Innocent III., in 1199, prohibited the private possession and reading of Scripture (excepting the portions contained in the Breviary and the Psalter) without priestly permission and supervision. Similar prohibitions were repeated at Toulouse (1229), at Béziers (1233), and with regard to Wickliffe, at the synod of Oxford (1383). Ultimately, the recognised Latin version, or Vulgate, was more and more decidedly made the sole authorised Church version. Indeed, as early as 1234, the synod of Tarragona denounced as a heretic any one who, having a translation of the B., refused to surrender it to be burned within the space of eight days. As, however, it soon appeared plain that little could be effected by such prohibitions, milder measures were employed. The Tridentine Council, being required to pronounce on the question of B. translations, purposely employed a word of ambiguous meaning in styling the Vulgate simply ‘authentic’; but nothing was determined on B.-reading among the laity. This was first done in the publication of the first *Index Librorum Prohibitorum* soon after the Tridentine Council. Afterwards, the rules of the Church, placing the use of the Scriptures under the supervision of the bishops, were more and more strictly defined. The publication of the New Testament with practical annotations by Paschasius Quesnel (1637), gave occasion to the Roman Catholic Church to speak more definitely on the reading of the B. by the laity in the bull *Unigenitus Dei Filius*, 1713. New ordinances were issued by Pope Pius VII. in his Brief to the Archbishop of Gnesen and Mohilew (1816) against translations formerly authorised; again, by Leo XII., in his condemnation of B. societies (1824), and by Pius VIII. All these ordinances of the Roman Catholic Church imply that it is dangerous to give the B. freely to the laity, and that, therefore, no vernacular versions ought to be used without interpretations taken from the Fathers, and an especial papal sanction.

**BIBLE SOCIETY**, an association having exclusively for its object the diffusion of the sacred Scriptures. Such associations must be regarded as a natural form or expression of Christian benevolence, acting according to the principles of Protestantism, and seeking to take advantage of the facilities afforded by the art of printing: but a long period elapsed after the Reformation before a B. S. was formed; during which, however, an extensive diffusion of the Scriptures took place, and partly by the

agency of associations which included it among other means for the advancement of Christianity. It necessarily became, along with the translation of the Scriptures, one of the objects to which missionary societies directed their energy. But perhaps the first association ever formed for the sole and specific purpose of providing copies of the Scriptures for those who were destitute of them, was that founded by Baron Hildebrand von Canstein, an intimate friend of Spener, in conjunction with Francke at Halle, and which, down to 1834, when other Bible Societies had begun to be established in Germany, had distributed 2,754,350 copies of the Bible, and about 2,000,000 copies of the New Testament.—The impulse, however, to the formation of the Bible Societies now existing in all parts of Protestant Christendom proceeded from England, where, in 1780, an association was formed for the distribution of Bibles among soldiers and sailors. It was at first simply called *The B. S.*; it exists to the present day, is now known as the *Naval and Military B. S.*, and confining itself to its original specific object, has accomplished much good. It is not an uninteresting circumstance, that the first ship in which Bibles were distributed by this Society was the ill-fated *Royal George*.—In the beginning of 1792, a similar association was formed in London, under the name of the *French B. S.*, with a similar limited and specific object of distributing Bibles in the French tongue. It was probably the attitude assumed by infidelity in France which gave occasion to the formation of this Society, but the greater part of its funds having been remitted to Paris for the printing of the Bible there, were lost, and everything belonging to the Society destroyed in the tumult of the Revolution.—It was not till 1802 that the first steps were taken towards the formation of the **BRAITISH AND FOREIGN B. S.**, the parent of a multitude of similar institutions, and the establishment of which must be regarded as the great epoch in the history of this branch of Christian beneficence; nor was the Society fully organised and established till March 7, 1804. Its formation took place in consequence of the deep impression made upon the mind of the Rev. Thomas Charles of Bala, in Wales, by the destitution of the sacred Scriptures which he found to exist in the sphere of his labours, and particularly by a circumstance strikingly illustrative of that destitution. Meeting a little girl in one of the streets of the town, he inquired if she could repeat the text from which he had preached on the preceding Sunday. Instead of giving a prompt reply, as she had been accustomed to do, she remained silent, and then weeping told him that the weather had been so bad she could not get to read the Bible. She had been accustomed to travel every week seven miles over the hills to a place where she could obtain access to a Welsh Bible. Mr Charles, on his next visit to London, brought the subject of the want of Bibles in Wales under the notice of the committee of the *Religious Tract Society* (q. v.), when it was suggested by Mr Hughes, a member of the committee, that a Society might be formed for the purpose of supplying Bibles not only in Wales, but wherever destitution existed throughout the world. The Society was constituted on the widest possible basis, churchmen and dissenters being alike included in it; and soon attained a greatness corresponding with that of the other two religious societies, the *London Missionary Society* (see *Missions*), and the *Religious Tract Society* (q. v.), which had been formed on similar principles, a few years before. It was indeed able to expend only about £619 in the first year of its existence. Its annual income gradually increased to an

average of £70,000. But in 1872 it amounted to £99,284, derived from donations, legacies, collections, &c., and applicable to the general purposes of the Society, besides £252 for special objects (a 'Chinese N. T. Fund,' and a 'Roxburgh Fund'), and £84,660 derived from sales of Bibles and Testaments, Abstracts, Monthly Reporters, &c.: shewing the total net receipts for that year to be £184,196. Auxiliary and branch societies and dependent associations rapidly sprang up in all parts of Britain, and in the colonies, the number of which at present amounts to more than 8000. Much more than one-half of the expenditure of the British and Foreign B. S. has been devoted to the diffusion of the authorised English version of the Bible, the only English version with which its fundamental rules permit it to have anything to do; it has also spent large sums in printing and circulating the Scriptures in the different Celtic languages spoken in Great Britain and Ireland, and a very important branch of its operations has been the printing of translations of the Bible prepared by missionaries. The number of translations of the Scripture—in many cases complete, in others extending only to the New Testament, in some only to particular books—which have been printed at the expense of the Society, amounts to not less than 190, the greater part being translations never before printed, and many in languages possessing no previous literature.—The British and Foreign B. S. now issues annually more than two million copies of the Bible, the New Testament, or such portions of sacred Scripture as have been printed in languages not possessing complete translations. The whole number issued from the formation of the Society to 31st March 1872, was 65,884,095. This Society also employs agents of high education and Christian character, to visit different countries for the promotion of its great object. The names of Dr Henderson and Dr Pinkerton, former agents, must be familiar to many readers, and perhaps no instance could be mentioned more happily illustrative of the character of this branch of the Society's operations than the visit of Dr Henderson to Iceland, an account of which is given in his well-known volume of travels in that country.—A controversy concerning the circulation of the books of the Apocrypha along with the canonical Scriptures by the British and Foreign B. S. (see *APOCRYPHA*), led to a resolution in 1826—not, however, till after the withdrawal of some of its most zealous supporters—that its funds should be devoted, according to its original design, to the diffusion of the canonical books alone.—The **EDINBURGH B. S.** has from that time to the present subsisted as an entirely separate Society.

The **AMERICAN B. S.** is, in the magnitude and importance of its operations, next to the British and Foreign Bible Society. It was founded at New York in 1817, and still has its head-quarters in that city, in the '*Bible House*', a very large and magnificent building, erected by special subscription. It reckons fully 1200 auxiliary societies, in all parts of the United States. Its income now amounts to about 400,000 dollars (£82,000) a year, rather more than one-half being derived from sales of Bibles and Testaments, and the rest from donations, collections, &c. The American B. S. has for some time issued annually more than 250,000 Bibles, and nearly twice that number of New Testaments and other portions of Scripture. The funds of the Society have been chiefly expended in supplying the wants of the inhabitants of the United States, amongst whom the Indian tribes have not been neglected. 'The Bible Association of Friends in America,' founded at Philadelphia in 1829, has distributed the Bible extensively among the members of that society and others.

## BIBLIA PAUPERUM—BIBLIOGRAPHY.

Of the numerous Bible Societies of Germany, the most important and extensively ramified is the Prussian Central B. S. (*Hauptbibelgesellschaft*) in Berlin. It was founded in 1814, and has branches in all parts of the Prussian dominions. More Bibles, however, are annually supplied to the people of Germany by the agents of the British and Foreign B. S. than by all the German Bible societies together, and there still exists a great and acknowledged destitution.—Bible societies were prohibited by the Austrian government in 1817, and some which had already been established in Hungary were dissolved.—The RUSSIAN B. S., founded at St Petersburg in 1813, through the exertions of Dr Paterson, and under the patronage of the Emperor Alexander I., entered upon a career of great activity and usefulness, co-operating with the British and Foreign B. S. for the printing of the Scriptures in the numerous languages spoken within the Russian dominions; but its operations were suspended in 1826 on the accession of the Emperor Nicholas, its stock of Bibles, and the whole concern, being transferred to the *Holy Synod*, under the pretence that the sacred work of supplying the people with the Holy Scriptures belonged to the Church, and not to a secular society. The Bibles and Testaments in stock were indeed sold, and very large editions were thus disposed of, but the activity of a society which had no equal in continental Europe was at an end. A Protestant B. S. was then formed for the purpose of providing editions of the Scriptures, and circulating them among the Protestants of all parts of the empire, which now reckons about 300 auxiliary societies. But the action of this Society 'does not touch the members of the Greek Church, or, if at all, only slightly and incidentally, and it makes no provision of the Scriptures in the language spoken by the great mass of the people. It is merely designed to meet the wants of colonists and others, who do not use the Russian language.' Of the translations of the Scriptures published by the original Russian B. S., the greater number have never been reprinted since its suppression.

There can be no doubt that Bible societies have contributed very much to the progress of Christianity and civilisation since the beginning of the 19th c., and their influence is continually increasing and extending.

BIBLIA PAUPERUM, or Bible of the Poor, was a sort of picture-book of the middle ages, giving, on from forty to fifty leaves, the leading events of human salvation through Christ, each picture being accompanied by an illustrative text or sentence in Latin. A similar and contemporaneous work on a more extended scale, and with the legend or text in rhyme, was called *Speculum Humanae Salvationis*, i.e., the 'Mirror of Human Salvation.' Before the Reformation, these two books were the chief textbooks used, especially by monks, in preaching, and took the place of the Bible with the laity, and even clergy; and as the lower orders of the regular clergy, such as the Franciscans, Carthusians, &c., took the title of 'Pauperes Christi,' Christ's Poor, hence the name. Many manuscripts of the B. P., and of the *Mirror of Salvation*, several as old as the 13th c., are preserved in different languages. The pictures of this series were copied in sculptures, in wall and glass painting, altar-pieces, &c., and thus become of importance in the art of the middle ages. In the 16th c., the B. P. was perhaps the first book that was printed in the Netherlands and Germany, first with blocks, and then with type. The chief proof for the discovery of printing in Haarlem rests on the first impressions of the *Speculum Humanae Salvationis*. See COSTER.

88

BIBLICAL ANTIQUITIES, or BIBLICAL ARCHÆOLOGY, is a study which has for its objects the social and political constitution, the manners, customs, geography, &c., of the Jews and other peoples mentioned in the Scriptures. A knowledge of these is essential to a right understanding of many passages of Scripture. The antiquities of the ancient Jews themselves undoubtedly form the most important part of such a study; but an examination of the laws, customs, &c., of the neighbouring Semitic nations is likewise indispensable. The principal sources of such knowledge are the Old and the New Testament; the books of Josephus on *Jewish Antiquities* and the *Wars of the Jews*; the writings of Philo, the Talmud and Rabbinical works; and, lastly, Greek, Roman, and Arabian writers, with medals, monuments, and other works of art, the accounts of travellers, &c. The first work on Hebrew archaeology was Thomas Goodwin's *Moses et Aaron, seu Civiles et Ecclesiastici Ritus Antiquorum Hebr.* (Oxford, 1616). Among later treatises we may especially notice—Jahn's *Biblical Archaeology* (5 vols. Vienna, 1796—1805); Bauer's *Manual of Hebrew Antiquities* (Leip. 1797); De Wette's *Manual of Hebrew-Jewish Archaeology* (Leip. 1814); Rosenmüller's *Manual of Biblical Antiquities* (Leip. 1823); and Winer's *Biblical Dictionary* (3d ed. Leip. 1847). A convenient work of reference on this subject is Dr Kitto's *Cyclopaedia of Biblical Literature*, which numbers among its contributors many of the ablest British and continental scholars; or *The Pictorial Bible*, edited by the same writer, and containing original notes explanatory of passages connected with the History, Geography, Natural History, Literature, and Antiquities of the Sacred Scriptures (newest edition published by W. and R. Chambers, 1856).

BIBLIOGRAPHY, a term applied to the description and proper cataloguing of books. It is derived from *bibliographia*, which was employed by the Greeks to signify the transcription of books, while *bibliophilos* was merely a copyist. The introduction of the term in the meaning which we now attach to it may be dated from the appearance of the first volume of De Bure's *Bibliographic Instruction* in 1763.

The bare enumeration of the works that have been written on this branch of literature would more than fill an ordinary volume; we shall here confine ourselves to the more important of them.

A favourite dream of bibliographers has been the production of a general catalogue, embracing the whole range of printed literature; and one attempt at least has been made to realize it. In the year 1545, Conrad Gesner published at Zurich, in one folio volume, his *Bibliotheca Universalis*, in which are described, under the names of the authors, arranged alphabetically, all the books in the Hebrew, Greek, and Latin languages about which the compiler could obtain information. This restriction as to language, of course, does away to some extent with the idea of universality indicated by the title-page; still, as the three which are included were in Gesner's time almost the only ones employed by men of learning, his work may be regarded as a nearly complete account of the state of printed literature as it then existed. The only other effort in this direction which we have to record is the *Bibliotheca Britannica* of Dr Robert Watt, 4 vols. 4to (Edinburgh, 1824). Its object will be best described by the following extract from the preface to it: 'The account given of British writers and their works is universal, embracing every description of authors, and every branch of knowledge and literature. What has been admitted of foreign publications, though selective, forms a very considerable

## BIBLIOGRAPHY.

and valuable portion of the work, and as none of note have been purposely omitted, the *Bibliotheca Britannica* may be considered as a universal catalogue of all the authors with which this country is acquainted, whether of its own or of the continent. This great work was compiled under very adverse circumstances, and its author did not live to see it through the press. It thus labours under all the disadvantages of a posthumous publication; but with all its faults both of omission and commission, which are neither few nor small, it deservedly maintains a high character as a work of reference, and is indispensable to the library of every bibliographer.

The other labourers in this field of literature, whose works we are about to notice, have confined themselves within narrower limits. Some, proceeding upon a principle of selection, endeavour to furnish the inquirer with the information he seeks in regard to books which are rare, curious, or valuable; others, again, aiming at greater completeness within certain bounds, restrict themselves to the description of a special class of works—the literature, for example, of a particular country or language; the productions of a celebrated press; the books published within a given period; those of which the authors have withheld their names, or have veiled them under a pseudonyme; the treatises that have been written on a specific subject; and so on, together with a few which hardly admit of classification, but of which some examples will be given.

Bibliographical works on the selective principle form a numerous class; the following are amongst the more important: Vogt, *Catalogus Historico-criticus Librorum Rariorum*, 8vo (Francofurti, 1793). This is the fifth edition; the four preceding appeared successively at Hamburg in 1732, 1738, 1747, and 1753. David Clement, *Bibliothèque Curieuse, ou Catalogue raisonné de Livres difficiles à trouver*, 9 vols. 4to (Göttingen, 1750—1760). The expression *catalogue raisonné* is usually, but erroneously, applied in this country to classified catalogues; yet the work of Clement, who was the son of a Frenchman, and certainly understood the language in which he wrote, is arranged alphabetically. It is simply what it professes to be, a descriptive and methodised account of the books which it includes; but unfortunately it was never completed. It terminates with the article 'Hesiodus,' and the seven or eight volumes required to finish it have not been published. The *Bibliographie Instructive* of De Bure has already been mentioned; it extends to seven volumes 8vo, the last of which appeared in 1768. To these, however, should be added the *Catalogue des Livres de Gaignat*, 2 vols. 8vo (Paris, 1769), and the *Table destinée à faciliter la Recherche des Livres Anonymes*, 8vo (Paris, 1782). Ebert's *Bibliographisches Lexicon*, 2 Bde. 4to (Leip. 1821—1830), is an accurate and useful work. It has been translated into English, 4 vols. 8vo (Oxford, 1837). Lowndes's *Bibliographer's Manual* contains an account of rare, curious, and useful books, published in or relating to Great Britain, from the invention of printing, and may always be consulted with advantage. It appeared originally in 4 vols. 8vo (Lond. 1834); but a new edition, with many improvements, has since been published (1857—1864) in 11 parts or 6 vols., under the editorship of Mr H. G. Bohn. One of the most interesting and important works in this department of B. is the *Manuel du Libraire et de l'Amateur des Livres* of J. C. Brunet, of which it is hardly possible to speak in terms of too high commendation. It was first published in 1810, in 3 vols. 8vo; and the fifth edition, in 6 vols. 8vo (Paris, 1860—1865), is now out of print. The sixth vol. contains a valuable classed catalogue, the only

modern effort of this kind. Another work of a similar, but somewhat more extensive character, entitled *Trésor des Livres Rares et Précieux*, by J. G. T. Graesse, was published at Dresden, in 7 vols. 4to (1859—1869). In it more attention has been paid to the northern literatures than in Brunet. To these may be added the amusing and instructive bibliographical works of the Rev. Dr Dibdin.

Turning to special B., and taking the subjects of which it treats in the order given above, we have to notice first the works which confine themselves to the literature of a particular country or language. As regards Great Britain, we have besides Watt and Lowndes, already mentioned, the *Typographical Antiquities of Ames and Herbert*, 3 vols. 4to (Lond. 1785—1790). A new and improved edition was projected by Dibdin, but was not completed. Volumes 1 to 4 only have appeared, 4to (Lond. 1810—1819). The latest contribution to British B. is the *Critical Dictionary of English Literature and British and American Authors*, by S. A. Allibone, 3 vols. 8vo (Philadelphia, 1859—1871). Of this work we regret that we cannot speak favourably. It faithfully reproduces most of the errors of Watt, with the addition of not a few for which the compiler is himself responsible. Our French neighbours possess a treasure in *La France Littéraire* of J. M. Querard, but it embraces only the 18th and 19th centuries. The continuation, begun by Querard, and afterwards carried on by Louandre and Bourquelot, forms 6 vols. 8vo (Paris, 1846—1857). A further continuation by Lorenz (*Cat. Général de la Librairie Française pendant 25 ans* (1860—1865), 4 vols. 8vo, Paris, 1867—1871) brings the work down to a recent date. For the literature of Italy, we can only notice Gamba's *Serie de Testi*, 4th ed. (Venice, 1839); and for that of Spain, the *Bibliotheca Hispana Vetera*, and the *Bibliotheca Hispana Nova*, of Antonio, the latest and best editions of which appeared at Madrid (1783—1788) in folio. The authors of the Low Countries are enumerated in the *Bibliotheca Belgica* of Poppens, 2 vols. 4to (Brussels, 1739); and those of Scandinavia in the *Almindeligt Litteraturleksikon for Danmark, Norge, og Island*, of Nyerup and Kraft, 4to (Copenhagen, 1820). For Germany, we have Heinicus, *Allgemeines Bücherleksikon*, with supplements (10 vols. 4to, 1812—1849), and Ebert's *Handbuch der Deutschen Litteratur*, 4 vols. 8vo (Leip. 1822—1840). To this class also belong the *Bibliotheca Graeca*, *Bibliotheca Latina*, and *Bibliotheca Latina Media et Infirma Zetata* of Fabricius; Harwood's *View of the various Editions of the Greek and Roman Classics*; and Moss's *Manual of Classical Bibliography*. The Oriental student will find much to interest him in the *Lexicon Bibliographicum* of Haji Khalifa, edited in the original Arabic, with a Latin translation by Fluegel, 7 vols. 4to, 1835—1858.

Of works descriptive of the productions of particular presses, we can only notice Renouard's *Annales de l'Imprimerie des Aldé* (3d ed., 8vo, 1834); the *Annales de l'Imprimerie des Estiennes*, by the same author, 8vo (Paris, 1837—1838); and Bandini, *Juntarum Typographia Annales*, 2 vols. 8vo (Lucca, 1791). The student may also consult with advantage the *Notice de la Collection des Auteurs Latins, Français, et Italiens Imprimés en petits Formats par les Elseviers*, at the end of the 5th volume of Brunet's *Manuel*.

The bibliographers who have confined themselves to books printed within a given period are chiefly Panzer, *Annales Typographici ab Artis Invenita Origine ad Annum MD* (continued, however, to 1536), 11 vols. 4to (Norimberga, 1793—1803); and Hain, *Repertorium Bibliographicum*, 4 vols. 8vo,

1826—1838. The death of the author before the completion of this work, was the cause of the comparative inaccuracy observable in the 3d and 4th volumes. The article 'Virgil' for example, is omitted altogether.

One of the earliest attempts to reveal the authorship of anonymous works was the *Theatrum Anonymorum et Pseudonymorum* of Vincent Placcius, folio (Hamburg, 1708); to which Mylius added a supplement in 1740. So far as France is concerned, these have both been superseded by the admirable and well-known *Dictionnaire des Ouvrages Anonymes et Pseudonymes* of Barbier, 2d ed., 4 tom. 8vo (Paris, 1822—1827). Italy, too, has the *Dizionario di Opere Anonime e Pseudonime di Scrittori Italiani* of Melzi, 3 vols. 8vo (Milano, 1848—1859). Mr Ralph Thomas's (*Olphar Hamst*) *Handbook of Fictitious Names* (London, 1868, 8vo), a slight and tentative, though useful production, is the only work yet published on the anonymous and pseudonymous literature of Britain; but it is understood that the late keeper (Mr S. Halkett) of the Advocates' Library, Edinburgh, has left extensive collections on this subject, which, it is hoped, will soon be published. The most recent additions to this branch of B. are Weller's *Mastirte Literatur der älteren und neueren Sprachen*, 1ter Theil; *Index Pseudonymorum*, 8vo (Leip. 1856), 2ter Theil; *Die falschen und fingirten Druckorte*, 8vo (Leip. 1858).

Bibliographies which describe treatises on special subjects are very numerous; we have only space to notice the following: Lipenius, *Bibliotheca Realis Theologica*, 2 vols. folio (Francofurti, 1685); *Bibliotheca Philosophica*, 1682; *Bibliotheca Medica*, 1679; *Bibliotheca Juridica*, 1672—a new edition of the last of these was published at Leipzig in 1757, and supplements have been successively added by Scott, Senkenberg, and Madihn—Marvin's *Legal Bibliography*, 8vo (Philadelphia, 1847); Orme's *Bibliotheca Biblica*, 8vo (Edin. 1824); Fürst's *Bibliotheca Judaica*, 8vo (Leip. 1849—1851); Vater, *Litteratur der Grammatiken, Lexica und Wörtersammlungen aller Sprachen der Erde*, 2te Aug. von B. Jülg, 8vo (Berlin, 1847); Upcott's *Bibliographical Account of the Principal Works relating to English Topography*, 3 vols. 8vo (Lond. 1818); Oettinger's *Bibliographie Biographique Universelle*, 8vo (Bruxelles, 1854); *The Literature of Political Economy*, by J. R. McCulloch, 8vo (Lond. 1845); *Arithmetical Books from the Invention of Printing to the Present Time*, by Augustus de Morgan, 12mo (Lond. 1847); the *Biographia Dramatica* by Baker, Reed, and Jones, 3 vols. 8vo (Lond. 1812); and the *Bibliotheca Anglo-poetica*, 8vo (Lond. 1815).

As examples of other works not included in the above classification, we have only space to mention Van Praet's *Catalogue des Livres Imprimés sur Vélin*, 9 vols. 8vo (Paris, 1822—1828); Peignot's *Dictionnaire des Livres condamnés au Feu*, 2 vols. (Paris, 1806); and Martin's *Bibliographical Catalogue of privately printed Books*, 2d ed., 8vo (Lond. 1824).

Further information will be obtained from an excellent bibliography of bibliographies, Pietzholdt's *Bibliotheca Bibliographica* (Leipzig, 1864, 8vo).

**BIBLIO'MANCY** (Gr. *ta biblia*, the Bible, and *manteia*, divination), a mode of divination much practised during many ages, by opening the Bible, and observing the first passage which occurred, or by entering a place of worship and taking notice of the first words of the Bible heard after entering it. The application was often very fanciful, and depended rather upon the mere sound of the words than upon their proper signification, or the scope of the passage. Prayer and fasting were sometimes used as a preparation for a mode of consulting the divine oracles, than which nothing could be more

contrary to their purpose and spirit, and which was in harmony only with the notions and practices of heathenism. B. was prohibited, under pain of excommunication, by the Council of Vannes, 465 A.D., and by the Councils of Agde and Orleans in the next century. It continued, however, to prevail for many centuries thereafter, and is said to have been introduced into England at the Norman Conquest. It was essentially the same as the *Sortes Virgilianae*, the only difference being in the book employed.

**BIBLIOMANIA**, or book-madness, is a word recently formed from the Greek to express the passion for rare and curious books, which has manifested itself to such an extent during the last century. While the ordinary collector is satisfied with the possession of works which are valuable either on account of their established reputation, or as assisting him in his literary or professional pursuits, the bibliomania is actuated by other motives. With him utility is of secondary importance, rarity being the first and great requisite. Thus even a common book becomes valuable in his eyes, if it be one of a few copies thrown off on vellum or on large paper, or if it has been bound by Derome, Bozerian, Lewis, or Payne; and for the same reason, he sometimes prefers an inferior to a better article. The fac-simile reprint of the Giunta edition of Boccaccio's *Decameron* (Florence 1527) fetches hardly as many shillings as the original does pounds, yet the great distinguishing difference between them is, that the former is the handsomer and more correct of the two.

The formation of complete sets of such books as the *Elzevir Republica* (see ELZEVIR), or of the works of a single author, provided they be scarce, is a favourite pursuit with many. The editions of the classics most prized by collectors are those of the Elzevirs and of the Foulis (q. v.). The original editions of Defoe's numerous productions are eagerly sought for at present.

B. seems to have reached its climax at the sale of the library of the Duke of Roxburgh in 1812. Amongst the treasures which that library contained, was the only perfect copy, known to exist, of the first, or at least the first dated edition of Boccaccio's *Decameron* (Venice, Christ. Valdarfer, 1471). After a spirited competition with Lord Spencer, this volume was purchased by the Marquis of Blandford for the sum of £2260, the highest price perhaps ever paid for a single book. When the collection of the marquis came under the hammer in 1819, Lord Spencer secured this precious tome at the large yet more moderate cost of £918, 15s. It is now, we believe, in his lordship's library at Althorp.

One of the results of the Roxburgh sale was the establishment of the Roxburgh Club, the object of which was to reprint, for the use of the members only, works hitherto unedited, or of extreme rarity. The example thus set was speedily followed by the Bannatyne and Maitland Clubs in Scotland, and by many more in other parts of the kingdom. Some of these are defunct, and others are in a moribund state. It remains to be seen in what new form the B. of the present day will develop itself.

**BICANERE**, capital of the protected state of the same name in Rajpootana, India, is situated in a singularly desolate tract, 1175 miles to the north-west of Calcutta, in lat. 28° N., and long. 73° 22' E. Pop. about 60,000. It is surrounded by a battlemented wall of 3½ miles in circuit; and from a distance presents a magnificent appearance, but inside, the people are found to be extremely filthy. Immediately to the north-east is a detached citadel, of which the rajah's residence occupies the greater part.—The state of which B. is the capital, lies in

lat.  $27^{\circ} 30' - 29^{\circ} 55'$  N., and long.  $72^{\circ} 30' - 75^{\circ} 40'$  E., thus measuring, in its extremes, 160 miles by 200. It contains 17,676 square miles, with an estimated population of 639,250. The Rajpoots are the predominant race; but the Jauts form the great body of the inhabitants. Though the people find their principal resource in pasture, yet water appears to be remarkably scarce. In the whole territory, there is not one perennial stream; while wells, as precarious and scanty as they are brackish and unwholesome, average perhaps 250 feet in depth; even the lakes or *sirras*, which the periodical rains leave behind them, are generally saline, yielding, in fact, at the close of the dry season, a thick crust of salt. In 1863—1869, nearly the half of the population was destroyed by drought. The temperature varies greatly: in the beginning of February, ice is formed on the ponds; and in the beginning of May, the thermometer stands at  $123^{\circ}$  F. in the shade. Again, in the beginning of November, according to Elphinstone's experience, each period of 24 hours, according as the sun was above or below the horizon, presented such extremes of heat and cold as often to be fatal to life.

**BICE** (Ger. *Bris*, Ital. *Biadetto*), the name of two pigments of a blue and green colour respectively, known to artists from the earliest times—blue B. as *mountain blue*, *ongaro*, *azzuro di terra*, &c.; and green B. as *chrysocolla*, *Hungarian green*, *verde de Miniera*, *verde de Spagna*, *verdetto*, &c. Green B. is now usually called *malachite green* and *mountain green*. Both are native carbonates of copper, but are also prepared artificially. In its native state, however, B. is more durable, and in the case of mountain green especially, much more brilliant. Artificial blue B. is known as *Hambro*' blue, mineral blue, &c.; artificial green B., as mountain green, Paul Veronese green, and emerald green.

**BI'CEPS** (double-headed) is the muscle which gives a full appearance to the front of the arm. Above, it consists of two portions or heads—whence its name—one being attached to the coracoid process of the scapula, the other to the margin of the depression on that bone which lodges the head of the humerus. The former is the short, the latter, the long head of the biceps. They unite to form a fleshy belly, which terminates in a rounded tendon.

The B. tendon is inserted into the tubercle of the radius (see ARM). Before passing to this insertion, it gives off an expansion (see SPONEUROSIS), which separates the median basilic vein from the brachial artery in the situation generally selected for venesection. The action of the B. is rapidly to bend the forearm, and also to supinate the hand.

**BICETRE**, originally the name of a very old castle, situated on a little eminence in the neighbourhood of Paris, and commanding one of the finest views of the city, the Seine, and the environs. In 1632, it was destroyed, because it had become a hiding-place of thieves. Afterwards, it was rebuilt by Louis XIII., and made a hospital for old soldiers. When Louis XIV. had built the *Hôtel Royal des Invalides*, the B. was made a civil hospital for septuagenarians. It also serves as a prison for 2000 culprits, mostly condemned to the galleys, as well as a hospital for incurable lunatics. Wool-spinning and glass-polishing are carried on in the building. There is a well sunk in the rock to the depth of 183 feet.

**BICHAT, MARIE FRANC. XAVIER**, one of the most famous anatomists and physiologists, whose discoveries make an epoch in biology, was born at Thoiré-ette, in the department of Ain, France, November 11, 1771. He studied chiefly in Paris under Desault,

who adopted him as his son, and whose surgical works he edited. In 1797, he began giving lectures on anatomy, along with experimental physiology and surgery, and in 1800 was appointed physician in the Hôtel-dieu. Two years after, July 22, 1802, he fell a victim to intense and unremitting labour, before he had completed his thirty-first year. He was the first to simplify anatomy and physiology by reducing the complex structures of the organs to the simple or elementary Tissues (q. v.) that enter into them in common. This he has done in his *Anatomie Générale* (2 vols., Par. 1801, often reprinted). In his *Recherches Physiologiques sur la Vie et la Mort* (Par. 1800), he develops another luminous idea—the distinction between the organic and the animal life.

**BICKERSTAFF, ISAAC**, author of numerous comedies and light musical pieces produced under Garrick's management, which had at one time a great popularity, was born in Ireland about the year 1735, and became page to Lord Chesterfield, who was made Lord Lieutenant of Ireland in 1746. B. afterwards became an officer of marines, but was dismissed the service for some discreditable offence. Nothing is certainly known regarding his after-life, nor the time of his death, which would seem to have taken place on the continent. His best known pieces are, *The Maid of the Mill*; *The Padlock*; *He would if he could*; *Love in a Village*; *The Hypocrite*; and *The Captive*.

**BICKERSTETH, REV. EDWARD**, an influential clergyman of the Church of England, was born at Kirby Lonsdale, in Westmoreland, March 19, 1786. He commenced life as a post-office clerk; and afterwards, having served an apprenticeship to a London attorney, established a lucrative solicitor's business in Norwich. Here, he took great interest in all meetings of a religious nature, and soon became so deeply impressed with the importance of religious truth, that he resolved to devote himself to the ministry. Being admitted to orders, he was sent by the Church Missionary Society to re-organise their mission stations in Africa. Having most satisfactorily accomplished his mission, B. was, on his return, appointed secretary to the Church Missionary Society, and continued to discharge the duties of the office with an unwearied energy and devotion that won for himself a high reputation and extensive influence, as well as great prosperity for the institution he represented, until 1830, when he resigned on acceptance of the rectory of Watton, in Hertfordshire. Here, until his death, which took place February 24, 1850, he took an active part in promoting, both by tongue and pen, almost every work having for its object the spread of religious truth whether at home or abroad. B. belonged to what is known as the Evangelical section of the Church of England, and took a decided part against the endowment of Maynooth, and in opposition to the spread of Tractarianism in his own church. He was also one of the founders of the Evangelical Alliance. Of his religious writings—which were extensive, and which have been collected in 16 vols. (Lond. 1853)—the most popular are, *A Help to the Study of the Scriptures* (written before he was ordained), *The Christian Student*, and *A Treatise on the Lord's Supper*. B. also edited a work called *The Christian Family Library*, which extended to 40 or 50 vols.

**BIDASSOA'**, a river which, rising in Spain, forms the boundary between that country and France, and falls into the Bay of Biscay at Fuenterabia. The treaty of the Pyrenees was concluded on an island in its mouth in 1659. The B. was the scene of several conflicts during the Spanish campaign.

## BIDDING PRAYER—BIDPAL.

In April, May, and June 1793, the Spanish crossed the river, and defeated the French, who occupied a line extending from St Jean Pied-de-Port to the mouth of the B., in three successive encounters, capturing a considerable quantity of ammunition and several pieces of cannon. In July of the following year, however, the French captured the entrenched camp and all the fortified posts of the Spaniards—defended by 200 pieces of cannon—on the river. Napoleon, in June 1811, had a *tête-du-pont* constructed on the B. at Irun. In August 1813, the French under Soult were defeated at San Marcial on the B. by the allies; and in the October of the same year, Wellington surprised and drove the French from their strongly fortified positions on its northern side.

BIDDING PRAYER is a form of exhortation, always concluding with the Lord's Prayer, enjoined by the 55th canon of the Anglican Church, in 1603, to be used before all sermons and homilies. Except in cathedrals and the university churches, it is now but seldom used. The term 'B.' is from the Saxon 'Bede,' signifying a prayer. The form is of extreme antiquity, and we have a similar one in the Apostolical Constitutions (q. v.), the original of which was probably that used in the Church of Antioch. It was anciently used for the communicants or believers after the dismissal of the catechumens, and was pronounced by the deacon, each petition beginning with the words: 'Let us pray for —,' and the people responding at the end of each with 'Kyrie Eleison,' or some such words.

There is another very ancient example in the Ambrosian Liturgy; and St Chrysostom alludes to such a form in one of his sermons. It must have been, and even now in its abridged shape still is, very impressive, allowing each individual to supply from his own thoughts special cases of necessity under the different heads. There is some resemblance between these B. Prayers and the Litany, and prayer for the church militant, now used in the Anglican Church.

BIDDLE, JOHN, the founder of English Unitarianism, was born in 1615, at Wotton-under-Edge, in Gloucestershire, and, in 1632, entered Magdalen College, Oxford, where he took his degree of M.A. In 1641, he was elected master of the free school in the town of Gloucester, the duties of which function he discharged with such zeal, that the character of the institution was greatly improved; but having embraced certain opinions—which he printed for private circulation—in regard to the personality of the Holy Spirit, at variance with those held by the majority of Christians, he was thrown into jail, December 1645. Being at length summoned before the parliament at Westminster, on account of his heresy, he was formally tried, and condemned to imprisonment for five years. The famous Westminster Assembly of Divines undertook to 'settle' B.'s case, but unfortunately their arguments—as is usual in disputation—had only the effect of strengthening his previous convictions. In 1648, while still in prison, he published a *Confession of Faith concerning the Holy Trinity*, &c., which was followed by another tract containing the opinions of the Church Fathers on the same question. In consequence of this attempt to combat the orthodox doctrine, the Westminster Divines called upon the parliament to pass an act declaring the denial of the Trinity a crime punishable by death. The army, however, strange to say, proved on this occasion less cruel than the church, for it manifested such strong opposition that the act remained a dead-letter. Under the liberal rule of Cromwell, B. was released. He now commenced to gather a congregation of those

whom he had converted to his opinions—namely, that there was but one person, as there was but one nature, in the Godhead. The members were first called Bidellians, then Socinians, and finally assumed for themselves the name of Unitarians. Twice, however, after this, during the Commonwealth, B. suffered severely for his creed, and even the iron-willed Protector himself, in order to save his life, was compelled to banish him to one of the Scilly Isles. Three years of imprisonment having elapsed, he was permitted to return, and continued to preach in London till the death of Cromwell, and also after the restoration, until June 1662, when he was again apprehended and fined in £100, and being unable to pay, was committed to jail, where he died in September of the same year. His personal character was highly esteemed by those who knew him.

BIDDLE, NICHOLAS, an American financier, born at Philadelphia in 1786, graduated at Princeton College, and became an energetic member of the legislature of Pennsylvania. In 1823, he was appointed president of the United States' Bank, and held that post till 1839. He conducted its affairs at first with great skill, integrity, and prudence; but, in 1838, the bank became insolvent, and in October of that year suspended cash-payments. The commercial panic and distress which at that time prevailed in the United States, spread dismay far and wide, and involved multitudes in ruin. In December 1841, the grand-jury for the county of Philadelphia made a presentment against B. and some others for entering into a conspiracy to defraud the stockholders of the bank of 400,000 dollars in 1836, and endeavouring to conceal the same by a fraudulent and illegal entry in 1841; the presentment, however, was never followed up. B. had considerable literary taste, and for some time edited *The Philadelphia Portfolio*, contributing many articles to its pages. By request of the president of the United States, he compiled from the original papers a *History of Lewis and Clarke's Expedition to the Pacific Ocean*; also *The Commercial Digest*, a volume put forth by congress. A number of his essays, speeches, &c., were published. He died in January 1844.

BIDEFORD, a seaport town of Devonshire, on both sides of the Torridge, near its confluence with the estuary of the Taw, 30 miles north-west of Exeter. A bridge of 24 arches, and 677 feet long, unites the two divisions of B., which has manufactures of ropes, sails, earthenware, and leather. These it exports, together with oak-bark, corn, flour, linens, woollens, iron, and naval stores. Pop. (1871) 6969. In 1872, 116 vessels, of 8912 tons, belonged to the port; and 736 vessels, of 40,307 tons, entered, and 179 vessels, of 15,746 tons, cleared it. Vessels of 500 tons can get up to the quay in the centre of the town. Sir R. Granville, the discoverer of Virginia, was born in Bideford.

BIDPAI, or PILPAI, is the reputed author of a collection of fables and stories which have been widely current both in Asia and Europe for nearly 2000 years, passing as a compendium of practical wisdom. Scarcely any book except the Bible has been translated into so many languages; and its history deserves attention as part of the history of human development. The researches of Colebrooke, Wilson, Sylvestre de Sacy, and Loiseleur des Longchamps (*Recueil sur les Fables Indiennes*, 1838), have successfully traced the origin of the collection, its spread, and the alterations it has undergone among different nations. The ultimate source is the old Indian collection in Sanscrit, with the title *Pancha Tantra*, i. e., 'Five Sections' (edited by Kosegarten, Bonn, 1848). An analytical account of the Sanscrit

*Panicha Tantra*, by H. H. Wilson—who determines the date of its production to be subsequent to the 5th c. A. D.—is printed in the *Transactions* of the Royal Asiatic Society, vol. i.; but an abridgment of it, called the *Hītopadeśa*, is better known than the original. A critical edition of the *Hītopadeśa* has been published by A. W. von Schlegel and Lassen (Bonn, 1829), and translations have been made into English by Wilkins and Jones, and into German by M. Müller (Leip. 1844).

Under the Persian king, Nushirvan (531—579), the *Panicha Tantra* was translated into the Pehlvi tongue by his physician Barsuyeh, under the title of *Cālīlā and Dīnāh* (from two jacksons that take a prominent part in the first fable). This Pehlvi version has perished with all the profane literature of ancient Persia; but under the Calif Almansur (754—775), it was translated into Arabic by Abdallah-ibn-Almokaffa (published by De Sacy, Par. 1816). From Almokaffa's Arabic translation—in the introduction to which the author of the collection is called Bidpai, the chief of Indian philosophers—have flowed all the other translations and paraphrases of the East and West. Several Arabic poets wrote it up into complete poems; and in the new Persian literature a great variety of versions and paraphrases, some in verse, some in prose, were made. From the Persian of Vaez (about the end of the 15th c.), the work was translated into Turkish about 1540 by Ali Chalebi, under the title of *Homayun-nāmeh*, the Imperial Book. There are also translations into the Malay, Mongol, and Afghan languages.

Towards the end of the 11th c., a translation had appeared, from the Arabic of Almokaffa, into Greek, by Simeon Sethus; and later, a Hebrew translation by Rabbi Joel, which John of Capua, a converted Jew, in the last half of the 13th c., retranslated into Latin with the title of *Directorium Humanæ Vitæ* (published first at Augs. 1480, and repeatedly since). A version from this was made into German by Eberhard I., Duke of Württemberg (died 1325), which appeared with the title of *Examples of the Ancient Sages* (Ulm, 1483). Under Alfonso X. of Castile (1252—1284), Almokaffa's work was translated into Castilian, and afterwards from that into Latin by Raymond of Veziers, a learned physician. The other European translations follow, some the Latin of John of Capua, some that of Raymond of Veziers; Spanish (Burgos, 1498), Italian (Flor. 1648), English (Lond. 1570), Dutch (Amst. 1623), Danish (Cop. 1618), Swedish (Stock. 1743), German (most recent, Leip. 1802).

#### BIEL. See BIENNE.

BIELEFELD, a busy town of Westphalia, in Prussia, picturesquely situated on the Lutter or Lutterbach, at the foot of the Sparrenberg Mountain, and about 26 miles south-west of Minden. The broad ditch, which formerly surrounded B., is now converted into pleasant walks. The old walls of the town have been put to a similar use. The castle of Sparrenberg, erected in 1545 on the site of an old Guelphic fortress, and which now serves as a prison, is in the immediate neighbourhood. B., which is the centre of the Westphalian linen-trade, has extensive bleaching-grounds, manufactures of woollen thread, soap, leather, &c., and its meerschaum pipes are celebrated. Pop. (1871) 21,803.

BIELEV, an ancient town of European Russia, in the government of Tula, situated on the left bank of the Oka, in lat. 53° 45' N., and long. 36° 5' E. It has a large trade, and manufactures of soap, hardware, leather, &c. Pop. (1867) 8123.

BIELITZ, a town of Austrian Silesia, on the left bank of the river Bials, about 18 miles north-east of Teschen. A bridge over the river connects it with

the town of Bials, which is situated in Galicia. It has dye-works and print-fields, and carries on a large trade in woollens and kerseymeres with Russia, Poland, Hungary, and Italy. B. belongs to the Princes Sulkowsky, whose castle, now converted into public offices, is situated here. Pop. (1869) 10,721.

BIELLA, a town of North Italy, in the province of Novara, about 38 miles north-east of Turin, with which it is connected by railway. It is pleasantly situated on the Cervo, an affluent of the Sesia, and has manufactures of woollens, hats, paper, &c. Pop. 8362.

BIÉLO-OZÉRO (the White Lake), a lake in the government of Novgorod, Russia, lat. 60° 10' N., long. 37° 30' E. It is elliptical in shape, its length being about 25 miles, and its breadth 20. Its bottom is composed of white clay, which, during stormy weather, gives to the water a milky appearance; hence, doubtless, the name White Lake. B. is fed by numerous small streams, is pretty deep, and abounds with fish. Its surplus waters are conveyed by the Sheksna River into the Volga. Canals unite it with the Onega, Sukona, and Dwina.—B.-OZERSK, an old wooden town on the south shore of the lake, formerly capital of an ancient principality of the same name, has a trade in cattle, corn, and pitch, and manufactures of candles. Pop. (1867) 4467.

BIÉLO-POL, a town of Russia, in the government of Kharkov, and distant from the city of that name 106 miles north-west. It has a considerable trade and extensive distilleries. Pop. (1867) 12,173.

BIELSHÖHLE, a singular cavern in one of the Harz Mountains, called Bielstein, on the right bank of the Bode, in the duchy of Brunswick, Germany. It was discovered in 1768. The entrance to it is more than 100 feet above the bed of the stream. The cavern is divided into eleven main compartments, and contains a great deal of that curiously freakish work which nature delights to execute in stalactites, when she sometimes condescends to imitate the inventions of human art, as in the eighth division, where she has contrived to fashion the framework of an organ out of the slow drip of ages. In the ninth, there is also a picture of a sea, as it were, arrested in its motion, its waves silent, but in act to roll.

BIÉLSK, a town of Russia, in the government of Grodno. It is situated in a very fertile district, watered by the Narev and Nurzak, was formerly capital of a Polish palatinat, is well built, and has a fine custom-house. Pop. (1867) 3985.

BIEINNE, or BIEL, a town of Switzerland, in the canton of Bern, 17 miles north-west of the city of Bern, beautifully situated at the foot of the vine-clad Jura, at the mouth of the valley of the Suze, and at the northern extremity of the lake of Bienn. It is surrounded by old walls, and approached by shady avenues. Pop. (1870) 8113, engaged in the manufacture of watches, leather, cotton, &c. B. is a place of great antiquity. It belonged to the Bishop of Bâle, or Basel; but as early as 1352, it entered into an alliance with Bern, for the protection of its liberties, and for this display of independence was burned by its ecclesiastical ruler. The Reformation, however, so weakened the power of the clerical governors of B. that in the beginning of the 17th c. it had become merely nominal; and B. was essentially a free and independent city until 1798, when it was annexed to France. In 1815, it was united to Bern.—B., LAKE OF, extends from the town of B. along the foot of the Jura Mountains in a south-west direction, until within 3 miles of Lake Neuchâtel, its length being about 10 miles, and its greatest breadth 3. It is situated at an elevation of

1419 feet above the level of the sea, 8 feet lower than Lake Neuchâtel, whose surplus waters it receives at its south extremity by the Thiel, by which river it again discharges its own. Its greatest depth is 400 feet. Towards its southern extremity is situated the island of St Pierre, crowned with a grove of fine old oaks, to which Rousseau retired for two months after his proscription at Paris in 1765.

**BIENNIALS**, or **BIENNIAL PLANTS**, are plants which do not flower in the first season of their growth, but flower and bear fruit in the second season, and then die. Many of our cultivated plants are B., as the carrot, turnip, parsnip, parsley, celery, &c., and many of the most esteemed flowers of our gardens, as stock, wallflower, &c. But plants which in ordinary circumstances are B., often become annuals (q. v.), when early sowing, warm weather, or other causes promote the earlier development of a flowering stem, as is continually exemplified in all the kinds already named. If, on the other hand, the flowering of the plant is prevented—or, in many cases, if it is merely prevented from ripening its seed—it will continue to live for a much longer period: the same bed of parsley, if regularly cut over, will remain productive for a number of years.

**BIERVLIET**, a village of the Netherlands, province of Zeeland, 13 miles east-north-east of Sluis. It is deserving of mention as the birthplace of William Beukels (q. v.), who in 1336 invented the method of curing herrings. In 1377, B. was detached from the mainland by an inundation, and still remains insular.

**BIES-BO'SCH**, a marshy sheet of water of the Netherlands, between the provinces North Brabant and South Holland, formed in November 1421 by an inundation which destroyed 72 villages and 100,000 people, and forming that part of the estuary of the Maas called Holland's Diep. It is interspersed with several islands.

**BITTIN**. See **APPLE**.

**BIG HORN**, a navigable river of the United States, rises near Fremont's Peak in the Rocky Mountains, about 42° 20' N., and 110° W. It has a north-east course of about 400 miles, being the largest affluent of the Yellowstone, which, again, is the largest affluent of the Missouri.

**BIG SANDY RIVER**, a fine navigable affluent of the Ohio, flows through extensive beds of coal. It is formed by the junction of two branches—the east and west forks—which both rise in Virginia. The latter traverses several counties of Kentucky, and the former is, during the latter part of its course, the boundary between the two states. Their united waters lose themselves in the Ohio, nearly opposite to Burlington, in the state of Ohio.

**BI'GA**, a Roman term applied in ancient times to vehicles drawn by two horses abreast; and commonly to the Roman chariot used in processions or in the circus. In shape it resembled the Greek war-chariot—a short body on two wheels, low, and open behind, where the charioteer entered, but higher and closed in front.

**BI'GAMY**. This is an offence which, although perfectly intelligible in itself to the popular and unprofessional understanding, is yet, with a due regard to the strict meaning of the word, extremely difficult, legally, to define. Blackstone objects to the use of it as a term descriptive of the offence in view; for he says it is corruptly so called, because B. properly signifies being *twice married*, which a man or a woman may legally be; and he therefore prefers the term *polygamy*. B., however, even according to the literal meaning, was an offence, or

rather disqualification, according to the canonists, who explained it to consist in marrying two virgins successively, one after the death of the other, or in once marrying a widow; and persons so offending or disqualified were held to be incapable of holy orders, and therefore B. was anciently considered a good counterplea to the claim of *benefit of clergy* (q. v.), although the law in that respect was afterwards altered by a statute passed in the reign of Edward VI, when, bigamists or no bigamists, the clergy resumed their strange privilege. Different views prevailed in more modern times, and at a period, too, when the restraints of ecclesiastical dogmas had been thrown off. It is known that certain of the leaders of the German Reformation, including Luther, Melanchthon, Bucer, and Melander, did not withhold their consent from Philip, Landgrave of Hesse, champion of the Reformation, who, having lost conceit of his wife, had applied to the Protestant doctors for licence to have another, and which licence was not withheld, for the marriage took place, and was performed by Melander in presence of Melanchthon, Bucer, and others; and *privately*, as the marriage-contract bears, ‘to avoid scandal, seeing that, in modern times, it has not been usual to have two wives at once, although in this case it be Christian and lawful.’ Whether Luther and the other Protestant doctors actually held views favourable to polygamy has been the subject of warm controversy (see Sir William Hamilton’s *Discussions on Philosophy and Literature*, 1852, 2d ed., 1853; and Archdeacon Hare’s *Vindication of Luther*, 1855). Sir William Hamilton asserts that Luther believed in ‘the religious legality’ of polygamy, and wished it to be sanctioned by the civil authorities—an assertion, however, of which the promised proof never appeared. Archdeacon Hare, on the other hand, maintains that Luther and Melanchthon only held that in certain extraordinary emergencies dispensations from the usual law of marriage might be granted. Be that as it may, the conduct of the Reformation leaders in this matter has been universally condemned, even by Protestants. The ideas referred to never gained ground in Germany; while in Great Britain ‘monogamy’ not only continued an institution, but its violation was regarded as a serious offence, which continues to be treated in statutes, law-books, and in the practice of the criminal courts in the three kingdoms, under the name of *bigamy*. Nor, indeed, have the ideas referred to been followed by the Germans as a nation.

The first statute which distinctly treated this offence as a felony was the 1 James I. c. 11, which enacted that a person so convicted should suffer death. What now constitutes the English law regarding the crime of bigamy, is the 22d section of 9 Geo. IV. c. 31, passed in 1828. B. is there declared to be committed by ‘any person who, being married, shall marry any other person during the life of the former husband or wife, whether the second marriage shall have taken place in England or elsewhere’—a definition that appears to be adopted by the recent Divorce Act, the 20 and 21 Vict. c. 85, where, for the purpose of that act, B. is to be taken to mean ‘marriage of any person being married, to any other person during the life of the former husband or wife, whether the second marriage shall have taken place within the dominions of her Majesty, or elsewhere.’ More correctly, however, the offence of B. may be said to consist in going through the *form* or *appearance* of a second marriage, while a first subsists, with a man or woman, against whom the most odious deceit and fraud is thus practised, and upon whom, especially in case of a woman, the deepest injury is inflicted; for the second marriage is merely a marriage in form

BIGG—BIGNONIACEÆ.

—no real marriage at all, because a man cannot have two wives, or a woman two husbands, at one and the same time. In prosecutions under this act, the first wife is not admissible as a witness against her husband, because she is the true wife; but the second may, because she is not only no wife at all, but because she stands in the position of being the party peculiarly injured by the bigamy. The same is the procedure in the case of a second husband. The act following the 1 James I. makes B. a felony, and prescribes as the punishment, upon conviction, transportation for seven years; now changed (by the 16 and 17 Vict. c. 99, amended by the 20 and 21 Vict. c. 3) to penal servitude for the same period, or not less than three years; or to be imprisoned, with or without hard labour, in the common jail or house of correction for any term not exceeding two years.

The act, however, excepts from its provisions the following four cases: 1. That of a second marriage contracted out of England, by any other than a subject of the realm. 2. That of any person marrying a second time, whose husband or wife shall have been continually absent from such person for the space of seven years then last past; and shall not have been known by such person to be living within that time. 3. That of a person who, at the time of such second marriage, shall have been delivered from the bond of the first marriage. 4. That of a person whose former marriage shall have been declared void by the sentence of any court of competent jurisdiction. The third of these exceptions deserves notice, in consequence of its bearing on a curious question that arose before the passing of the act, and which shewed a serious conflict which then existed, if it does not still exist, between the laws of England and Scotland. The case referred to is known among lawyers as *Lolley's case*; it occurred in 1812, and may be shortly stated as follows: Lolley and his wife, two English persons, being tired of each other's conjugal society, and unable to bear the expense of the then English ordeal, went to Scotland, where, after acquiring a domicile, they applied to the Scotch Consistorial Court for a divorce, which was speedily (although it is said collusively) obtained, on the ground of the husband's adultery. Relying on such sentence of the Scotch court, Lolley returned to England, where he married again. He was immediately indicted for B., tried, convicted, and sentenced to seven years' transportation, and that in the face of the Scotch decree of divorce, which he reasonably pleaded by way of defence. The point, however, was reserved for further consideration before the full court (Court of Exchequer), who, however, shortly after gave a unanimous judgment, holding that Lolley had been rightly convicted; or, in other words, that the Scotch court had no authority to dissolve an English marriage, and that the decree of divorce which Lolley had obtained, although good in Scotland, was of no force whatever in England. Many distinguished English lawyers were of opinion that the judgment of the English court was wrong, and that the Scotch divorce afforded him a complete defence. But it is to be observed that the prosecution was founded on the 1 James I. c. 11, to which we have referred, the 3d section of which only excepts from its provision persons divorced by 'any sentence had in the Ecclesiastical Court,' meaning, of course, the English Ecclesiastical Court; and thus some colour at least is given to the view taken of Lolley's case by the Court of Exchequer. But it may well be doubted whether such a conviction could take place in the face of the above third exception in the 9 Geo. IV., which excepts persons who shall have been divorced, not by any particular court or

jurisdiction, but simply divorced from the bonds of the first marriage.

It remains to be added, that under the 9 Geo. IV., not only the actual bigamist, but every person counselling, aiding, or abetting the offender, is held equally guilty, and may be sentenced to the same punishment; and by section 31, accessories before and after the fact are also severely punishable.

The 9 Geo. IV. does not extend to Scotland, but the law there on the subject of this particular offence is very much the same in principle, although the punishment there is not so severe as in England. There is an old Scotch statute, passed in 1551, which declares the punishment of B. to be the same as that of perjury; but the offence is also indictable at common law in Scotland, and in modern practice, it is usual so to deal with it, and to limit the punishment to imprisonment. See MARRIAGE, DIVORCE, POLYGAMY.

BIGG. See BARLEY.

BIGHT (from the same root as the verb 'to bow') is a sailor's name for the bent or doubled part of a rope. Thus, one anchor may 'hook the B.' of the cable of another, and thereby cause entanglement. In Geography, B. has much the same sense as 'bay.'

BIGNONIA'CEÆ, a natural order of exogenous plants, containing trees, shrubs, and herbaceous plants, generally with compound leaves. The flowers are generally showy, and are among the most striking ornaments of tropical forests. The corolla is of one petal, generally more or less trumpet-shaped and irregular; the stamens are five in number, or four, with the rudiment of a fifth, and unequal. The ovary is free, seated on a disk, 1—2-celled; the fruit sometimes capular, sometimes drupaceous; with few or many seeds. There are about 500 known species; which, however, are often regarded as forming three distinct orders—*Bignoniaceæ*, *Crescentiaceæ*, and *Pedaliaceæ*. Of these the *Bignoniaceæ* are by far the most numerous,

*Bignonia picta.*

and are almost all tropical or subtropical, although a few are found in the United States of North America. See TRUMPET-FLOWER. They are in many cases noble trees, and some of them afford

valuable timber, among which are *Bignonia leucoxylon*, a tree of Jamaica, the green or yellow wood of which is sometimes brought into the market under the name of Ebony; and the Ipe-tobacco and Ipe-una of Brazil, species of the same genus, the former of which is used for ship-building, and the latter is accounted the hardest timber in Brazil. Not a few of them are climbing shrubs, and the tough shoots of *Bignonia Cherec* are used for wicker-work in Guiana. *Bignonia alliacea*, a native of the West Indies, is remarkable for its strong alliaceous smell; the leaves of *Bignonia Chica* afford the red colouring matter called Chica (q. v.).—The *Crescentiaceae* chiefly abound in Mauritius and Madagascar. The Calabash Tree (q. v.) is the best known example.—The *Pedaliaceae* are tropical or subtropical; many of them herbaceous plants. The most important is *SESAMUM* (q. v.). The fleshy sweet root of *Craniolaria annua* is preserved in sugar as a delicacy by the Creoles.

BIHA'CH, or BICHA'CZ, one of the strongest fortress-towns of Croatia, European Turkey, is situated on an island in the Una, in lat. 44° 43' N., and long. 15° 53' E., near the frontier of Dalmatia. It has been the scene of frequent contests during the Turkish wars. Formerly, it was possessed of a Christian church, but that has been completely destroyed by fanatic Mussulmans. Pop. 3000.

BIJANAGHU'R, meaning, it is said, *the City of Triumph*, is a ruined city within the presidency of Madras, being in lat. 15° 19' N., and long. 76° 32' E. It stands about 40 miles to the north-west of Bellary, in a plain encumbered with granite rocks, many of which have been rudely sculptured into a variety of forms. After having been for two centuries the metropolis of a powerful Hindu kingdom, B. was sacked and ruined by the Mohammedans of the Deccan in 1564. Even now it presents traces of its grandeur, being 8 miles in circuit, and containing many edifices, both temples and palaces, of granite.

BIJBAHA'R, the largest town of Caahmere, next to the capital Cashmere itself. It is situated on the banks of the Jailum, about 25 miles to the south-east of the metropolis, being in lat. 33° 47' N., and long. 75° 13' E. The only particular worthy of notice is a wooden bridge across the Jailum, which, notwithstanding its simplicity and fragility, has endured for centuries, in consequence of the tranquil and equable weather of the valley.

BIKH. See ACONITE.

BILANDER, or BI'LANDRE, is a small two-masted merchant-vessel, distinguished from others chiefly by a peculiar shape and arrangement of the main-sail. Of these vessels, which were probably French in origin, there are not many now remaining.

BILBA'O, a seaport town of Spain, capital of the province of Vizcaya (Biscay), is situated in a mountain gorge on the Nervion, about 6 miles from its mouth at Portugalete, in lat. 43° 14' N., long. 2° 56' W. B. is well built; the principal streets are straight, and the houses substantial. Four bridges, one of iron, opened in 1868, and a stone bridge of the 14th c. cross the river, which divides the old town from the new. There are several fine public walks, numerous fountains, but no public buildings of any note. The city is purely commercial. It has many extensive rope-walks and manufactures of hardware, leather, hats, tobacco, and earthenware. There are also docks for building merchant-vessels, and in the vicinity are iron and copper mines. Pop. 19,000. In 1864, a railway was opened to Tudela. Small vessels can navigate the river quite up to the town, but large vessels have to anchor at Portugalete. The number of ships enter-

ing B. in 1862 was 1744; clearing outwards, 1605. The imports consist chiefly of cotton and woollen manufactures, colonial produce, fish, jute, spirits, hardware, machinery, railway materials, &c.; and the exports consist of wool, iron, fruits, oil, flour and grains, wines, madder, minerals, liquorice, &c. There are more than 200 commercial houses in B. The women here do almost all of the heavy portage. B. was founded in the year 1300 by Diego Lopez de Haro, under the name of Belvao, i. e., 'the fine fort,' and being well situated, and little disturbed by the civil wars of Spain, it soon attained great prosperity. In the 15th c. it was the seat of the most authoritative commercial tribunal in Spain. It suffered severely in the wars with France, first in 1795, and again in 1808, when 1200 of its inhabitants were slaughtered in cold blood. During the first Carlist civil war, B. was exposed to two severe sieges.

BIT'LBERRY. See WHORTLEBERRY.

BIT'LILIS, an old Iberian city of Spain, about two miles east from the modern town of Calatayud, in the province of Saragossa, chiefly celebrated as the birthplace of the poet Martial, but also famed for its highly tempered steel blades. Quintus Metellus won a victory over Sertorius here; and B., under the Romans, was a municipal town with the surname of Augusta. Several of its coins, struck off during the reigns of Augustus, Tiberius, and Caligula, are still in existence—some in the British Museum.

BIT'LBOES are long bars or bolts of iron, with shackles sliding on them, and a lock at one end. When an offender on shipboard is 'put in irons,' it implies that B. are fastened to him, more or less ponderous according to the degree of his offence. The B. clasp the ankles in some such way as handcuffs clasp the wrist.

BIT'LCOCK. See RAIL.

BILDERDIJK, WILLEM, a Dutch poet and philologist, of much repute in his day, was born at Amsterdam, 7th September 1756. While studying law at Leyden, and afterwards, when practising at the Hague, he devoted himself assiduously to literature and poetry. On the invasion of Holland by the French, he repaired to Brunswick, and afterwards visited London, where he supported himself by lecturing and teaching. In the year 1806, he returned to Holland, where he was received as one who had done his country honour; and the newly elected king of Holland (Louis Bonaparte) appointed him president of the Institute at Amsterdam, just then organised after the fashion of the one at Paris, and also made him his own instructor in the Dutch language. B. afterwards resided at Leyden, and then at Haarlem, where he died 18th December 1831. His contributions to poetic literature were very numerous; but though they contain many beauties, yet, with one or two exceptions, none of his poems display any remarkable originality, or any great wealth of imagination. With his poetical pursuits he combined the theoretical study of his native language; and his writings on this subject are valuable contributions to the exposition of the older monuments of Dutch literature.

BILE is a fluid secreted from the blood by the liver. One part of it is destined to serve in the process of digestion; the other to be eliminated from the system. It is coloured yellow in man; that of graminivorous animals seems coloured by the leaves they feed upon. The primary cells of the liver (the hepatic cells) separate the B. from the blood of the portal vein, and discharge it into small ducts, which unite to form larger ones, and eventually the right and left hepatic ducts.

## BILEDULGERID—BILL.

The latter unite to form the common hepatic duct, which is soon joined by that of the gall-bladder (the cystic duct). This junction forms the common B. duct, which pierces the second part of the duodenum, and running obliquely in its wall for a short distance, opens on its mucous surface.

The secretion of B. is constantly going on, and if there is food in the intestine, the bile mingles with it, and dissolves the fatty portions, preparatory to their absorption, the excrementitious portion of the B. passing out of the body with the other indigestible materials. When the bowel is empty, the B. ascends the cystic duct, and is stored for future use in a small flask-like bag (the gall-bladder) situated under the liver.

Should, from any cause, the elements of the B. be in excess in the blood, or should the liver suspend the function of secreting it, not only is digestion imperfectly performed, but the general health suffers from the impure condition of the blood, and the patient is said to be *bilious*. On the other hand, the B. may be secreted, but its escape interfered with, and then its reabsorption will produce jaundice (q. v.). Its solid portions, again, especially the cholesterine, may be in excess, solidify, and produce biliary calculi or gall-stones (q. v.).

In *chemical composition*, B. is essentially a soap analogous to resin-soap, and as obtained from the ox, contains in 100 parts,

Water,	90.44
Biliary and fatty bodies, including resinoid acids,	8.00
Mucua,	0.30
Watery extract, chlorides, phos- phates, and lactates,	0.85
Soda,	0.41

The soap is formed from the union of the resinoid acids (*Glycocholic* and *Taurocholic Acids*) with the soda. Human B. has the specific gravity of about 1026 (water = 1000), is of aropy consistence, with a yellowish-green colour; does not readily mix with water, but sinks therein, and only after repeated agitation becomes diffused through the water, which then assumes a frothy appearance resembling soap-suds. B. has a bitter taste, and a very sickening musky odour. It is interesting to observe that the B. of salt-water fishes contains potash in place of soda; although, from their being surrounded by much common salt (chloride of sodium) in the sea-water, we should naturally expect to find soda in abundance; and the B. of land and fresh-water animals contains soda, while, considering diet and habitat, potash might more naturally be looked for in largest quantity. B. performs important functions in the animal economy, which will be considered under NUTRITION; see also LIVER.

**BILEDULGERID.** See BELED-EL-JERID.

**BILGE**, sometimes spelled **BULGE**, is the part of the bottom of a ship nearest to the keel, and always more nearly horizontal than vertical. A ship usually rests on the keel and one B. when aground. The name of *bilge-water* is given to any rain or sea water which trickles down to the B. or lowest part of a ship, and which, being difficult of access, becomes dirty and offensive.

**BILGEWAYS** are timbers which assist in the launching of a ship; for which, see LAUNCH.

**BILIARY CA'LCULL.** See CALCULUS.

**BILI'MBI.** See CARAMBOLA.

**BILIN**, a town of Bohemia, beautifully situated in the valley of the Bila, 17 miles west of Leitmeritz, and famous for its mineral springs, the waters of which it exports to the extent of 500,000 jars

annually. It has a manufactory of cotton yarn, and two castles, an old and a new one. In its vicinity, there is a remarkable isolated clinkstone rock, called Borzenberg, or Biliner Stein; and the Tripoli earth found at B. has been shewn by Professor Ehrenberg to be the remains of infusoria. Pop. about 3000.

**BILIUS FEVER.** See LIVER.

**BILL**, in Natural History, the hard, horny mouth of birds (q. v.). It consists of two *mandibles*, an upper and a lower, into which the upper and lower jaws are respectively produced, all appearance of lips being lost. It is not furnished with proper teeth, although rudiments of them have been observed in some of the parrot tribe in the fetal state, and the marginal laminae with which the bills of many water-fowl are furnished, partake of the same character, being secreted by distinct pulpa. The resemblance of these marginal laminae to teeth is particularly marked in the Goosander (q. v.). The bills of birds differ much, according to their different habits, and particularly according to the kind of food on which they are destined to live, and the manner in which they are to seek it. In birds of prey, the B. is strong; the upper mandible arched or hooked, and very sharp; the edges sharp, often notched, and the whole B., or *beak*, adapted for seizing animals, and tearing and cutting to pieces their flesh. A powerful, short, hooked beak, sharp edged and notched, indicates the greatest courage and adaptation to prey on living animals. The beak of the vulture is longer and weaker than that of the eagle or falcon. In birds which feed on insects and vegetable substances, the hooked form of the B. is not found, or it is in a very inferior degree; those birds which catch insects on the wing, such as the Goat-suckers, are remarkable for the deep division

Bill of Goat-sucker (Insect-eating bird).

of the B., and their consequently wide gape, and an analogous provision to facilitate the taking of prey is to be observed in herons, kingfishers, and other fishing-birds; but the object is attained in their case by the elongation of the B., whereas birds which catch insects on the wing have the B. very short. Birds which feed chiefly on seeds have the B. short and strong, for bruising them; whilst the B. of insectivorous birds is comparatively slender. Many aquatic birds have broad and comparatively soft and sensitive bills, with laminae on the inner margin for straining the mud from which much of their food is to be extracted; other birds, as snipes, avocets, &c., seeking their food also in mud, have slender bills of remarkable sensibility. The modifications of form are

Bill of Bunting (Seed-eating bird).

## BILL—BILL OF COMPLAINT IN CHANCERY.

very numerous, and the peculiarities of the bills of toucans, hornbills, spoonbills, crossbills, parrots, humming-birds, &c., are very interesting, and intimately connected with the habits of the different creatures. (See these articles.) At the base of the upper mandible, a portion of the B. is covered with a membrane, called the *cere* (Lat. *cera*, wax, from the waxy appearance which it presents in some falcons, &c.), which in many birds is naked, in others is feathered, and in many is covered with hairs or bristles. The nostrils are situated in the upper mandible, usually in the cere, but in some birds they are comparatively far forward, and in some, as puffins, they are very small, and placed so near the edge of the mandible, as not to be easily detected. They are more or less open, or covered with membrane, or protected by hairs or feathers. Besides their principal use for seizing and dividing or triturating food, the bills of birds are employed in a variety of functions, as dressing or preening the feathers, constructing nests, &c. They are also the principal instruments used by birds in their combats.

The mouths of some fishes and reptiles assume a character somewhat analogous to that of the B. of birds.

**BILL**, in its general acceptation, means a formal written paper or statement of any kind; originally, it was applied to any sealed document, being derived from Lat. *bulla*, a seal. It has a number of technical applications, for which see the articles that immediately follow.

**BILL OF ADVENTURE** is a writing by a merchant, stating that goods shipped by him, and in his name, are the property of another, whose *adventure* or chance the transaction is—the shipping merchant, on the other hand, undertaking to account to the adventurer for the produce. Generally, in commercial law, an adventure may be said to be a speculation in goods shipped under the care of a *supercargo*, to be disposed of by him to the best advantage, for the benefit of his employers.

**BILL OF ATTAINDER, and BILL OF PAINS AND PENALTIES**, are bills in parliament, introduced for penalty enacting the attaint and punishment of persons who have criminally offended against the state and public peace. Such a legislative proceeding was had recourse to generally in times of turbulence, when, either from the peculiar nature of the offence, or in consequence of difficulties in the application of the ordinary laws, it became necessary to resort to parliament. During the reign of Henry VIII., persons of the highest rank were frequently brought to the scaffold by such means; among whom may be mentioned the Earl of Surrey, the Earl of Essex, and others, who suffered for denying the king's supremacy; and during other reigns, both before and after that of Henry VIII., these bills were more or less had recourse to. There were greater facilities for conviction by this penal legislation than by the ordinary judicial procedure at law; because, while in the latter the strict rules of legal evidence must have been observed, the inquiry under a bill of attainder, or of pains and penalties, was entirely in the hands of parliament, who might dispense at their pleasure with such rules and forms of law as appeared inconvenient or unsuitable to the purpose in hand. Accordingly, in most of the cases to which we have referred, the bills were passed upon evidence which could never have been received as sufficient, or even admissible in a court of law; and there are even instances where parties were attainted, and punished, without there being any evidence against them at all, and even without

their being heard in their defence. Under the Stuarts, this extraordinary mode of proceeding in parliament was seldom had recourse to in England, and it has been still seldom used since the accession of the House of Hanover. The Jacobite movement in Scotland, after the union with that country, was productive of several instances of parliamentary attainder, which, however, resulted merely in the forfeiture of the estates of the attainted parties, and these attainers were likewise unattended with the harsh, and in too many instances, capital consequences, which were formerly the inevitable results of treason so discovered. In regard to bills of pains and penalties, perhaps the two most remarkable instances are those of Bishop Atterbury, in 1722 (see *ATTERBURY*), and of Queen Caroline, wife of George IV., in 1820.

The proceedings of parliament in passing bills of attainder, and of pains and penalties, do not vary from those adopted in regard to other bills. But the parties who are subjected to these proceedings are admitted to defend themselves by council and witnesses before both Houses. In the best of times, this summary power of parliament to punish criminals by statute, should be regarded with jealousy; but whenever a fitting occasion arises for its exercise, it is undoubtedly the highest form of parliamentary judicature. In impeachments, the Commons are but accusers and advocates; while the Lords alone are judges of the crime. On the other hand, in passing bills of attainder, the Commons commit themselves by no accusation, nor are their powers directed against the offender; but they are judges of equal jurisdiction, and with the same responsibilities as the Lords; and the accused can only be condemned by the unanimous judgment of the Crown, the Lords, and the Commons.—*May's Proceedings of Parliament*, 3d edition, p. 509. In passing bills of attainder, the bishops, contrary to the practice in capital impeachments, take part in the proceedings, and vote.

In such parliamentary attainers, the bill, sets out, by way of preamble, the facts and evidence on which it is founded, and concludes, by way of enactment, that the accused 'is hereby convicted and attainted of high treason, and shall suffer the pains of death, and incur all forfeitures as a person attainted of high treason.' In the case of pains and penalties, again, the preamble generally assumes the facts as proved, and proceeds to enact the pains and penalties; that is, the deprivations, indignities, and other punishment awarded. See *ATTAINER, PAINS AND PENALTIES, BILL IN PARLIAMENT*.

**BILL, or BILL OF COMPLAINT, IN CHANCERY**, is the formal statement in writing or pleading, by which a plaintiff in the Court of Chancery seeks its equitable redress or relief. It is in the style of a petition addressed to the Lord Chancellor, Lord Keeper, or Lords Commissioners for the Custody of the Great Seal, unless the seals are at the time in the Queen's hands, or the chancellor himself be the suitor, in which case, the bill is addressed to the Queen herself; for, according to the theory of the Court of Chancery, it is the conscience of the sovereign that is there addressed. The crown itself, however, may be the suitor, either on behalf of its own prerogatives, or of those rights which are under its particular protection, such as the objects of a public charity, and then the matter of complaint is submitted to the court, not by way of bill or petition, but of *information*, which the proceeding is accordingly technically called.

In stating the plaintiff's case, the bill was formerly exceedingly prolix and tedious, but it has been very much simplified, and now contains merely a full and distinct account of the case, the material

## BILL OF COSTS—BILL OF EXCHANGE.

facts and circumstances relied on; and it should pray specifically for the particular relief which the plaintiff conceives himself entitled to, and also for general relief, or, as the bill itself usually states, ‘for such further and other relief as the court may think proper;’ the object and advantage of which general prayer is, to decree equity and justice without regard to the particular equity sought for. It is indispensable that the bill be signed by counsel, in order to guard against irrelevant and improper matter. It is indeed usually not only signed but drawn by counsel, from instructions laid before him by the plaintiff’s solicitor.

Where the object is the administration of the estate of a deceased person, the procedure is by *summons*, and is of a simple and very summary nature. In cases of this description, without either formal pleading or any direct application to the court itself, a summons may at once be obtained, and the estate thereupon put in a course of administration. There are also cases where the chancellor’s aid is sought for in the form of a *petition*.

Generally speaking, the modern English bill in Chancery very much resembles the Scotch summons and *condeccendence*. See on the subject of this article, CHANCERY; CHANCELLOR, LORD; PLEADING; SUMMONS; CONDECCENDENCE.

**BILL OF COSTS** is an account stating articulately and in detail the charges and disbursements of an attorney or solicitor in the conduct of his client’s business; and which costs may be recovered under the regulations of the Attorneys’ and Solicitors’ Act, 6 and 7 Vict. c. 73. See COSTS.

**BILL IN CRIMINAL CASES** is the formal name of an indictment for a crime or misdemeanour, when preferred before a grand jury. If that body finds ‘a true bill,’ the prisoner or party accused is thereupon tried before a petty jury, whose verdict determines his guilt or his innocence; but if the grand jury ‘ignore the bill,’ the accused is at once set at liberty. In the latter event, however, other bills may be sent up against him, with or without the same result. See ARRRAIGNMENT, GRAND JURY, INDICTMENT, PROSECUTION, TRIAL.

**BILL OF EXCEPTIONS** is a statement of objections, by way of appeal, against the ruling or charge of a judge in a civil cause. See TRIAL.

**BILL OF EXCHANGE**, a document purporting to be an instrument of pecuniary obligation for value received, and which is employed for the purpose of settling a debt in a manner convenient to the parties concerned. The original and simple idea of a bill is this: Two parties residing at a distance from each other can settle their transactions without the trouble or risk of sending money direct from the debtor to the creditor. Thus, A and B are two parties in business in London; and C and D are merchants in Cadiz. A owes C £1000; and D owes B a like sum. Instead of A sending cash to C, and D to B, A pays B and receives B’s bill on D, which he sends to C, who receives the amount from D; so that the transaction throughout is settled, without a farthing in money being sent from Cadiz to London, or from London to Cadiz. Another simple idea of a bill is this: One person owes another £100 for goods, for which he is to have credit for three months. The creditor, however, not being able conveniently to be without the money for that length of time, gets from the debtor an obligation or bill bearing that the £100 is to be paid in three months. This bill, being a negotiable instrument, will be discounted by a banker, or other capitalist, who now stands in the position of the creditor, and receives payment when the bill is due. Thus, a bill of

exchange performs two kinds of offices in commerce—it saves the transmission of coined money, and it enables creditors not only to fix down debtors to a day of payment, but to get the use of a sum equivalent to the debt (less a small discount) before it is properly due.

The origin of this important mercantile instrument is attributed by Montesquieu and others to the Jews and Lombards, when banished from France and England in the 13th c., for their usury and other alleged vices, in order the more easily to recover the effects they had left behind in these countries; but Blackstone shews its earlier use in the Mogul Empire in China; and Depauw, in his *Philosophical Researches respecting the Greeks*, has attempted to prove that bills of exchange were in use among that people, and particularly among the Athenians. However this may be, it is certain that hitherto no trace of them has been discovered either in the Roman code, or in any other system of ancient jurisprudence. The first notice of them in modern times occurs about the middle of the 12th c., and by the end of the 14th they had got into general use in all the commercial states of Europe. In England, from about the middle of the 14th c. down to the time of James I, and for many years after, bills of exchange were restricted to the purposes of foreign commerce. What are called inland bills—that is, bills drawn by and upon persons resident in this country—were not employed much earlier than the reign of Charles II, and even then they were regarded with distrust and jealousy by the English judges. Another restriction upon bills of exchange was, that the privilege of their use was confined to parties that were merchants; and there is an old case tried by the Court of King’s Bench, in the days of William and Mary, where it was decided that an action on a foreign bill of exchange could not be maintained, because the defendant was a *gentleman*, and not a merchant! But all restraints on such instruments gradually yielded to the wants and conveniences of society, and now any one capable of making a contract can be a party to a bill transaction, without regard to position, calling, or occupation. In Scotland, inland bills were put on the same footing with foreign bills, by an act of the Scottish parliament passed in 1696.

A bill of exchange, as distinguished from a *pro-missory-note* (q. v.), is defined in law-books to be a written and open letter of request, addressed by a person who is called the drawer, to another person called the drawee, desiring him to pay a certain sum of money, either to the drawer himself, or to a third party called the payee, within a certain time after its date, or after it is presented for payment, or on demand. If the drawee signs the bill in token of his agreeing to this request, he is called the *acceptor*. For the constitution of the bill itself, no particular form of words is necessary, provided its characteristic qualities clearly appear on the face of it, as an essentially pecuniary instrument; a bill of exchange is only good for a certain sum in money: such an instrument for the delivery of *goods* or property other than money, would be invalid. But although no particular words are required in a bill or note, it is always advisable to adhere, as much as possible, to their customary form. To this general rule, however, there are exceptions: thus, by the 48 Geo. III. c. 88, negotiable bills or notes for less than 20s. are void; and by the 17 Geo. III. c. 30, s. 1—made perpetual by the 27 Geo. III. c. 16, and 7 Geo. IV. c. 6—such bills and notes under 20s. are illegal, and above this amount and less than £5, are also void, unless they specify the name and place of abode of the

## BILL OF EXCHANGE.

person to whom, or to whose order they are made payable, and are attested by one subscribed witness at the least, and bear date at or before the time when they are issued, and are made payable within twenty-one days after the date, and are in the form prescribed by the act. There are also certain forms prescribed with respect to cheques, and with respect to bills and notes issued and reissuable by bankers at certain distances.

In regard to foreign bills, the risk of miscarriage to which they are liable in their transmission to distant countries has given rise to the custom of drawing them in sets; that is, writing out two or three of the same form and tenor, and transmitting them to the payee by different channels, so that if one or two of the individuals of any set are lost, the other might reach its destination. The first of the set that is presented and accepted is alone entitled to payment, and payment of it discharges the acceptor; but foreign bills, of course, may also be drawn singly.

Besides the other requisites mentioned, bills of exchange must be duly stamped. The regulations on this subject are contained in the 17 and 18 Vict. c. 83, and are to be found in almanacs and other publications in common use. By sections 3 and 5 of the Act, it is provided that the duties on bills drawn out of the United Kingdom shall be denoted by adhesive stamps, to be affixed by the holder of the bill before negotiating it, under a penalty of £50.

The following are the usual forms of the bills of exchange.

### FORM OF A FOREIGN BILL.

£1000. JAMAICA, 1st January 1874.  
Fifty days after sight of this First of Exchange (second and third unpaid) pay to the order of A. B. One Thousand Pounds sterling, value received.

C. D.

To E. F., London.

### FORM OF AN INLAND BILL.

£100. LONDON, 1st January 1874.  
(Signed:) Two months after date [or 'at sight,' or 'on demand,' or 'at — days after sight'] pay to Mr —, or order, One Hundred Pounds, for value received.

C. D.

To Mr —, Merchant,  
Bristol, payable at — }

### FORM OF A BILL ABOVE ONE AND UNDER FIVE POUNDS.

As prescribed by Stat. 17 Geo. III. c. 30. [Insert the place, day, month, and year, when and where made.]  
Twenty-one days after date, pay to A. B. of —, or his order, the sum of —, value received.

E. D.

To E. F. of — }  
Witness, G. H. }

From the first form it will be seen that there are usually three parties to a Bill of Exchange, these three being: 1st, The *drawer* (C. D.); 2d, The *payee*, or party in whose favour the bill is drawn, and who is entitled to receive the contents (A. B.); and 3d, The *acceptor* or *drawee* (E. F.). The transaction, however, may be simply between the drawer and acceptor, without the interposition of a third party; and there are other modifications and changes of form, according to the circumstances of the case, and the mode in which it is desired to have the bill negotiated. The bill being thus in proper form, and duly authenticated, is then presented for acceptance, which may be defined to be the act by which the drawee evinces his consent to comply with, and be bound by, the request contained in the Bill of Exchange directed to him; or, in other words, it is an engagement to pay in money the bill when

94

due. While the bill is in the possession of A. B. he is the holder, but if he pass it to G. H., A. B. is the indorser and G. H. the indorsee or ultimate holder. Acceptance in the case both of inland and foreign Bills of Exchange must now be in writing on the bill, and signed by the acceptor, or some person duly authorised by him. In England, the mode of acceptance is by the acceptor simply signing his name across the bill, or with the word 'accepted' before his name; but in Scotland acceptance is usually made by the acceptor signing his name immediately under the drawer. There are certain precautions to be observed before accepting. The drawee should, upon presentation for acceptance, and before he accepts, assure himself that the signature of the drawer is genuine, and that there has not been a fraudulent substitution of a larger sum than that originally inserted in the bill by the drawer. And if the drawee accept a forged bill, or a bill for a larger amount than that originally named by the drawer, he will nevertheless be liable to pay a *bona-fide* holder; nor will he have any right to recover against the drawer for the larger amount. There is also acceptance *supra protest*, which takes place where, after a foreign bill has been protested for non-acceptance, but not before, the drawee or any other person may accept it *supra protest*, which acceptance is so called from the manner in which it is made. And where the drawee of a foreign bill cannot be found, or is not capable of making a contract, or refuses to accept, this description of acceptance is frequently made in order to save the credit of all or some of the parties to the bill, and prevent legal proceedings. In this country it is called an acceptance for the honour of the person or persons for whose use it is made, and in France an acceptance *par intervention*. It had been a question in England what amounted to a qualified acceptance, but that was set at rest by the 1 and 2 Geo. IV. c. 78 for England, and 9 Geo. IV. c. 24 for Ireland, which required an acceptance, in order to be a qualified acceptance, to express that the bill is 'payable at a banker's house or other place only, and not otherwise or elsewhere.' And now, as against the acceptor, the absence of these words from the acceptance leaves it at large, an unqualified acceptance, not requiring presentation at a particular place, notwithstanding that, in the body of the instrument, a particular place of payment is expressly specified by the drawer. There may likewise be conditional acceptance—that is, acceptance in such a form as will subject the acceptor to payment of the bill on a contingency only, of which there are numerous examples in the law reports; for instance, to pay 'as remitted for' or on account of the ship *Theseus*, when in cash, for the said 'vessel's cargo,' or on condition of getting a certain house by a given term, or when certain goods are sold, or when certain funds come to hand.

The bill as a negotiable instrument being thus complete in all its parts, may either be held by the drawer or other payee till due, when it may be presented for payment to the acceptor, or it may at once be transferred by *indorsement* (q. v.), the indorsee taking it for its value at maturity, and in the meantime cashing or discounting it to the holder. There may be a succession of indorsees, the last of whom is entitled to payment; and to him all the other indorsees, as well as the drawee and drawer, are bound.

When the bill comes to maturity—that is, when the period arrives for its presentation—it must either be at once paid, or the parties must arrange for its *renewal* (q. v.). If the latter course is not agreed on, and the necessary funds are not forthcoming, the holder can only then proceed to recover at law; and this is now done in a very speedy form under

## BILL—BILL OF SALE.

a recent act, the 18 and 19 Vict. c. 67. This act, however, does not extend to Ireland, where the old form of action still prevails. But in Scotland payment of bills may be enforced even more summarily without any action, under the severe provisions of two old Scotch acts passed in 1681 and 1696. See **INDORSEMENT**, **PROMISSORY-NOTE**, **RENEWAL**. Bills are sometimes drawn ‘at sight,’ ‘on demand,’ or at ‘one day’s date;’ and in these cases it is doubtful whether the three days of grace allowed for payment beyond the literal time specified in the document are applicable. Unless in special cases, bills, by the Statute of Limitations (q. v.) in England, and by Prescription (q. v.) in Scotland, do not cease to be valid documents for six years.

In the United States there has sprung up a method of dealing with bills of exchange which is not much known in England. This consists in selling bills without a concurrent obligation by indorsement to make them good. Instead of discounting his bills in the usual form through a banker, a merchant in New York will sell his bills to a broker or dealer in this kind of instrument, the price paid being according to the state of the money-market and the creditworthiness of the acceptor. In such cases, the purchaser stands in the place of the drawer, undertakes all risks, and as custodian of the bill, has the power of legally exacting payment. This method of transacting with bills is called discounting *without recourse*.

**ACCOMMODATION BILL.** A bill in its legitimate sense is a document constituting a debt, and as such is beneficial to all parties connected with its negotiation. A owes B £100. A cannot conveniently pay the amount, while B is in need of it; B draws on A, and C (a banker) discounts, i. e., for a consideration pays the amount to B. B thus gets his money at once, A obtains time, while C makes a profit for advancing. These facilities have had the effect of inducing bills to be resorted to for raising money where no value is given, and in which one party gives the use of his name for the *accommodation* of another. In the above case, for example, let us suppose that A does not owe B, but yet accepts B’s draft. If C discounts the bill, it is immaterial whether he knows that A has got value or not—as an onerous holder, he can compel payment from A if B cannot pay the bill. But if merely in B’s hands, the amount is not recoverable from A if the latter can prove that no value was received by him. Accommodation bills give rise to much fraud and rash speculation, and many attempts have been made to suppress the system; but it is difficult to do so without unduly interfering with the negotiation of *bona-fide* bills.

**BILL, EXCHEQUER.** See **EXCHEQUER BILLS**.

**BILL OF HEALTH**, a certificate or instrument, signed by consuls or other proper authorities, delivered to the masters of ships at the time of their clearing out from all ports or places suspected of being particularly subject to infectious disorders, certifying the state of health at the time that such ship sailed. A *clean* bill imports that at the time the ship sailed no infectious disorder was known to exist. A *suspected* bill, commonly called a *touched* patent or bill, imports that there were rumours of an infectious disorder, but it had not actually appeared. A *foul* bill, or the absence of a clean bill, imports that the place was infected when the vessel sailed. See McCulloch’s *Commercial Dictionary*.

**BILL OF INDEMNITY**, an act of parliament, passed every session, for the relief of those who have unwittingly or unavoidably neglected to take the necessary oaths, &c., required for the purpose of

qualifying them to hold their respective offices. See **ACT OF INDEMNITY**, and **ABJURATION**.

**BILL OF LADING** is a receipt from the captain of the vessel to the shipper (usually termed the *consignor*), undertaking to deliver the goods—on payment of freight—to some person whose name is therein expressed, or endorsed thereon by the consignor; and the delivery of this instrument—*independently* of the actual delivery of the goods—will suffice to pass and transfer to the party so named (usually termed the *consignee*), or to any other person whose name he may think fit to indorse thereon, the property in such goods; and by a recent statute, 18 and 19 Vict. c. 111, it is now expressly provided that every consignee and every indorsee of a B. of L. shall also have transferred to him all rights of suit, and be subject to the same liabilities in respect of the goods as if the contract in the B. of L. had been made with himself. It is also provided that every B. of L. shall be conclusive evidence of the shipment made. The act, however, declares that nothing contained in it shall prejudice or affect any right *in transitu*, or any right to claim freight against the original shipper or owner, or any liability of the consignee or indorsee, by reason or in consequence of his being such consignee or indorsee, or of his receipt of the goods, by reason or in consequence of such consignment or indorsement. See **STOPPAGE IN TRANSITU**.

**BILLS OF MORTALITY** are accounts of the births and deaths within a certain district; and they were an expedient, with the view of communicating to the inhabitants of London, to the court, and to the constituted authorities of the city, accurate information respecting the increase or decrease in the number of deaths. These bills were commenced in 1592, during a time when the plague was busy with its ravages; but they were not continued uninterruptedly until the occurrence of another plague in 1603, from which period, up to the present time, they have been continued from week to week, excepting during the great fire, when the deaths of two or three weeks were given in one bill. In 1605, the parishes comprised within the B. of M. included the 97 parishes within the walls, 16 parishes without the walls, and 6 contiguous out-parishes in Middlesex and Surrey. In 1662, the city of Westminster was included in the bills; in 1636, the parishes of Islington, Lambeth, Stepney, Newington, Hackney, and Redriff. Other additions were made from time to time. At present, the weekly B. of M. include the 97 parishes within the walls, 17 parishes without the walls, 24 out-parishes in Middlesex and Surrey, including the district churches, and 10 parishes in the city and liberties of Westminster. The parishes of Marylebone and St Pancras, with some others, which, at the beginning of last century, had only 9150 inhabitants, but now contain a rapidly increasing population, were never included in the bills.

But these bills are now, from want of proper machinery, of little or no value, and the only true bill is now that prepared at the Registrar-general’s office, under the new Registration Act. The first of these weekly bills was commenced January 11, 1840, and the series has been continued from that time without interruption. See Wharton’s *Law Dictionary*, 2d edition, 1860, and Knight’s *London*.

**BILL IN PARLIAMENT.** See **ACT OF PARLIAMENT** and **PARLIAMENT**.

**BILL OF RIGHTS.** See **RIGHTS, BILL OF**.

**BILL OF SALE** is a writing under seal, evidencing a grant or assignment of chattels personal. The occasions to which these instruments are commonly made applicable are sales of fixtures and furniture

## BILL OF SIGHT—BILLARDIERA.

in a house, of the stock of a shop, of the good-will of a business, of an office, or the like. But their most important use is in the transfer of property in ships, which being held in shares, cannot, in general, be delivered over on each change of part-ownership. Such B. of S. may be either absolute or conditional; in the former case, operating as a conveyance, and in the latter, as a security. By the 17 and 18 Vict. c. 36, passed to prevent frauds upon creditors by secret bills of S., it is provided that every B. of S. must be filed in the Court of Queen's Bench within 21 days after its execution, together with an affidavit of the time of such B. of S. being given, and a description of the residence and occupation of the deponent, and of every attesting witness of such B. of S., otherwise it will be void, as against assignees in bankruptcy and insolvency, and creditors. The residence and occupation of each attesting witness should appear in the B. of S., and also in the affidavit.

Notwithstanding these precautions, the practice of disposing of various kinds of movable property, more particularly household furniture and stocks of goods in trade by B. of S., leads to great and injurious deceptions; for as the seller, by an arrangement with the buyer, sometimes retains possession, and is in the eye of the world as much the proprietor as ever, he is enabled to carry on his affairs and get credit as usual. See REPUTED OWNERSHIP.

**BILL OF SIGHT.** The law on this subject is regulated by the Customs Regulation Act, 3 and 4 Will. IV. c. 52, s. 24 and 25, and is to the effect that when a merchant is ignorant of the real quantities or qualities of any goods assigned to him, so that he is unable to make a perfect entry of them, he must acquaint the collector or comptroller of the circumstance; and the collector is authorised, upon the importer or his agent making oath that he cannot, for want of full information, make a perfect entry, to receive an entry by B. of S. for the packages, by the best description which can be given, and to grant warrant that the same may be landed and examined by the importer, in presence of the officers; and within three days after any goods shall have been so landed, the importer shall make a perfect entry, and shall either pay down the duties, or shall duly warehouse the same. In default of perfect entry within three days, such goods are to be taken to the Queen's warehouse; and if the importer shall not within one month make perfect entry, and pay the duties thereon, or on such parts as can be entered for home-use, together with charges of moving and warehouse rents, such goods shall be sold for payment of the duties.

**BILL OF STORE,** a licence under the Customs Regulation Act, the 3 and 4 Will. IV. c. 52, granted by the Custom-house to merchants to carry such stores and provisions as are necessary for a voyage, custom-free.

**BILL OF VICTUALLING, or VICTUALLING BILL,** is a document relating to the stores put on board a ship when leaving a British port; it is a safeguard in reference to customs duties, and is regulated by a clause in an act passed in 1853. The master of a ship, on leaving a British port, for a voyage which (out and home) will not occupy less than 40 days, receives from the customs authorities an order or permission for the shipment of such stores and victuals as may be required—the data being the number of crew and passengers, and the probable duration of the voyage. When these are shipped, the master prepares a correct account of them, and of any other stores at that time in the vessel; and this account, when approved and countersigned by the customs officers, constitutes the victualling bill. No stores are allowed to be taken on board the ship,

96

nor any articles taken on board to be deemed as stores, unless they be specified in this document.

**BILL-BROKERS** are persons who, being skilled in the money-market, the state of mercantile and personal credit, and the rates of exchange, engage, either for their own profitable adventure, or that of their employers, in the purchase and sale of foreign and inland bills of exchange, and promissory-notes. They are to be distinguished from discount-brokers, or bill-discounters, whose business consists in discounting bills of exchange and notes which have some time to run before they come due, by means of the funds, or on the faith of the credit of capitalists or other persons having the command of money. See BROKER, BILL OF EXCHANGE, PROMISSORY-NOTE.

**BILL-CHAMBER** is a particular department of the Court of Session in Scotland (coeval with the establishment of that court itself in 1532), the business of which corresponds, in many respects, to the practice of the Judges' Chambers in England. It is called the B., because, formerly in Scotland, judicial proceedings were for the most part commenced by a writ called a bill, which was the skeleton or draft of the legal process which it was sought to have issued, and which bill was obtained in this particular department of the court. For such purpose, as well as for other matters which do not admit of delay, the B. accordingly sat, as it continues to sit, all the year round, and as in England, it is presided over by a single judge. This judge, to whom for the time are delegated the whole powers of the court, is called the Lord Ordinary on the bills, and during the sittings of the Court of Session, the duty is taken by the junior or last appointed judge of the court; but in vacation-time, the business of the B. is performed in rotation by the six judges of the court who are not justiciary or criminal judges. In case of the indisposition or absence of any of these six judges, any judge of the Court of Session may act for him. A recent act, the 20 and 21 Vict. c. 18, now regulates many of the details of the procedure.

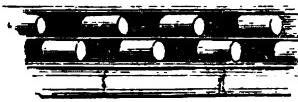

The business of the B. consists of all matters of a summary nature; and generally all cases requiring the immediate interposition of judicial authority are proceeded with, in the first instance, in the Bill-chamber. Applications for interdict or injunction, and for warrants necessary for the execution of process, are there at once made. The preliminary procedure by way of appeal from inferior courts, and in order to stay execution on the judgments of these tribunals, also takes place, in the first instance, in the Bill-chamber. Matters of bankruptcy or sequestration are also adjudicated on in this department. But the decision of the judge or lord ordinary officiating in the B., may, with some exceptions, be brought under review of the court; and the judgment of the court itself thus sitting on B. cases, may be brought before the House of Lords by appeal, as in ordinary cases. See COURT OF SESSION, JUDGE'S CHAMBERS.

**BILLARDIERA, or APPLEBERRY,** a genus of twining Australian shrubs of the natural order *Pittosporaceæ* (q.v.). They have simple alternate evergreen leaves, and axillary pendulous flowers. The flowers have a calyx of five sepals, and a bell-shaped corolla of five petals. The fruit is a soft, spongy pericarp, with inflated cells, and many seeds which lie loose in the cells, terminated by the style, and generally bluish when ripe. It is eatable, although not destitute of a resinous character, which prevails in the order. *B. longiflora* and *B. ovalis*, the former with nearly globose, the latter with oval fruit, are frequent ornaments of British greenhouses.

The fruit of *B. mutabilis* is larger, cylindrical, and of a pleasant subacid taste.

**BILLAUD-VARENNE, JEAN NICOLAS**, a leader in the Reign of Terror in the French Revolution; took an active part in the September massacres; entered the Convention, where he distinguished himself for his violence against the king and the royal family, and his general unfeeling cruelty. He was the author of the Revolutionary Tribunal, and it was on his proposal that the Duke of Orleans, the queen, and a host of others became its victims. He joined in the end in bringing about the fall of Robespierre, but could not ward off his own accusation as one of the Terrorists, and was transported to Cayenne, where he lived about 20 years, rejecting the pardon offered by the First Consul. In 1816, he came to New York, but was coldly received, and then sought an asylum in Hayti, where he died, 1819.

**BILLET**, in Architecture, an ornament belonging to the Norman style. It was formed by cutting a moulding—generally a round moulding—into notches, so that the parts left resembled billets of wood. When used in several rows, the billets and

Billet.

empty spaces are placed interchangeably, as in the accompanying illustration.

**BILLET**, in Heraldry. Billets are small oblong figures, sometimes taken to represent bricks, but more commonly *billet doux*. The latter interpretation, which is that of Guillim, is generally adopted by English heralds, and is supported by the authority of Colombiere. The former, again, which has the *Trésor Héraldique* and Sir George Mackenzie on its side, is further strengthened by the fact that in German they are called *Schindeln*, shingles.

**BILLETTING** is a mode of provisioning and lodging soldiers when not in camp or barrack. It is one of the many vexed questions connected with the organisation and administration of the British army. When in camp or barrack, the soldier is supplied with hot food daily by the commissariat officers; or rather, with undressed food, and the means for cooking it. But when it is necessary to keep soldiers for one or more days in a town unprovided with barracks, a difficulty occurs which has never yet been properly surmounted; a burden is sure to rest on some one who is unwilling to bear it. In the early times of our history, monarchs were often wont to quarter their troops on the monasteries. In later times, the soldiers often compelled the inhabitants of towns to receive and support them; and the authorities were either unable or unwilling to prevent this. The Mutiny Act, passed for the first time in 1689, put a stop to this pernicious practice, by declaring that no housekeepers should be compelled to accommodate soldiers except on some recognised and fairly administered system. The chief civil magistrate of a town, on requisition from the military authorities, quartered the soldiers on the inhabitants as fairly as he could. This continued in England until 1745, when all kinds of persons were exempted from this burden except certain traders; and the new system has been maintained with minor alterations ever since. The alteration was not made in Scotland until 1857.

At present, the persons liable to have soldiers billeted on them, are the keepers of public-houses, hotels, inns, ale-houses, beer-shops, wine-shops,

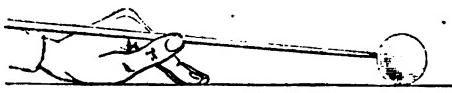

spirit-vaults, livery-stables, and such-like licensed houses. There are certain exceptional cases provided for; and in and near London there are special regulations concerning the B. of the Guards; but the general rule is as here stated. The persons liable are bound to accommodate soldiers, under a system that may be described in a few words. When troops are on the march from one barrack or station to another, and cannot cover the distance in one day's railway or foot travelling; or when they are to remain for a few days in a town unprovided with barrack accommodation, or where the barracks are already occupied—the commanding officer sends previously to the chief civil magistrate, and demands *billets* for a certain number of men for a certain time. The magistrate has a list of all the houses subjected to the B. system, and he quarters the men on those houses as fairly as he can. Rules are laid down to prevent the magistrate from B. too many soldiers on one house: any excess in this way is remediable at the hands of a justice of the peace. The billets are pieces of paper prepared under these rules. On the evening before the arrival of the troops, two or three non-commissioned officers enter the town, and present an order for the delivery of the billets to them, in order that no delay may arise when the main body enter. After the arrival, the soldiers go to the houses on which they are billeted: all those belonging to one company being quartered as near together as may be, for convenience of muster; and the sick are billeted near headquarters. The licensed victualler, or other person, is bound to provide each billet-holder with food, drink, bed, and accommodation, either in his own house or somewhere near at hand. A specified sum of 10d. per day is allowed for this; or, under other circumstances, a trifling sum per day is allowed for fire, candles, cooking-utensils, salt, and vinegar. The sum per day allowed for hay and straw for a horse varies with the price of forage. The officers visit the houses, to see that the men really have one hot meal per day, instead of taking the value of it in money. The soldier may demand facilities for cleaning his arms and accoutrements. The financial officer of the regiment makes the payments. There are often unpleasant disputes between the innkeeper or others, on the one side, and the officers of the regiment on the other, concerning the occupancy of the 'best room,' and on minor details. The militia are frequently billeted like the regulars.

There being many untoward circumstances connected with this system, a committee of the House of Commons, in 1858, sought how best to remove them. In their report, the committee could not recommend the cessation of the B. system altogether, but they pointed out certain possible ameliorations; and since that, by camping out the troops and other means, great efforts have been made to reduce B. to a minimum.

**BILLIARDS** (in Fr. *billard*, which meant originally the stick or staff with which the ball is struck, and is allied to Fr. *billot*, a block or billet of wood). It seems doubtful whether we are indebted for the discovery of this elegant game to France or Italy; but it is certain that it was imported hither from the former country. It must have been known, at all events by name, to Englishmen as early as the 16th c., since Shakespeare speaks of it; although, when he represents Cleopatra as amusing herself with B. in Egypt, it is probable that he commits an anachronism. It is certain that the rectangular slate-table, with its resilient sides, covered with green cloth, and furnished with the six brass-bound pockets, the three ivory balls, and that long array of cues with leathern tops, so familiar now-a-days to almost every eye, are

paraphernalia of quite modern production. For two centuries, B. was played with only two balls; and when the third or red ball was imported from France, the red winning hazard—that is to say, the holing of the red ball—was almost the sole object of the performers. The cushions also, now universally constructed of india-rubber, up to a recent date were lined with felt. In no game are knowledge and manual dexterity so combined as in B., nor can the spectacle of first-rate play be appreciated, or the difficulties which it overcomes be understood, except by those who have a scientific as well as practical acquaintance with the game.

A billiard-table varies in size, but it is generally about 12 feet long and 6 feet wide. It is covered with fine green cloth, and set round with cushions, to keep the balls upon the table and make them rebound. The six holes or pockets are placed at the four corners and in the middle, opposite to each other, to hold the balls, which, when played into them, are called ‘hazarda.’ The cues are long smooth sticks, with one end thick, and the other pointed; and the small end is covered with leather. The maces—slender sticks with a club at one end, adapted for pushing—are rarely taken in hand except by tyros and ladies, the but-end of the cue, when the point cannot conveniently be used, being commonly employed instead. The three balls are of ivory, ranging from an inch to an inch and a half in diameter, and two of them are white, and one is red. One of the former has a spot upon it; and when two persons are playing, he who uses the spot ball is called Spot, and he who uses the plain ball, Plain. The cue is held in the right

Bridge.

hand, and supported, in playing, by the forefinger and thumb of the left so placed as to form a ‘bridge;’ and the ball is struck with the point of the cue, which is chalked, to prevent its slipping. On a certain mark on the cloth, at the distance of about a foot from one end of the table, and exactly in its centre, the red ball is placed before commencing the game. At the other or lower end, and at the distance of about two feet from it, a line is drawn across the table; and from the centre of this line a semicircle is described between it and the lower end, of about 20 inches diameter. The space within this semicircle is called *bault*. The object of the player is, by striking his own ball against the red ball or his adversary’s, to drive either it or them into the pockets, or else to make ‘a cannon’—that is to say, to strike both balls with his own. The score is usually recorded by a third person, by means of a marking-board. The game of B. can be played by two, three, or four persons, and in a great many different fashions; but it is most commonly played by two, and the ordinary game is that called *Carambole*, which was introduced from France at the same time with the third or red ball. The technical term ‘cannoning’ may perhaps have arisen from ‘caramboling,’ which was the old word for striking both balls with your own. The method of play is as follows:

1. The limit of the game is properly 21, though it is sometimes made 24, 50, 63, and 100, as may be agreed upon before commencing. The shorter games were probably used when billiard-tables were rarer, so that persons waiting for the use of them might sooner have their turn; 50, or ‘50 up,’ as it is called, is now the most usual limit.

2. For the lead and choice of balls, the players *string*—that is to say, placing their balls within the semicircle, they strike them against the furthermost cushion, in order to see which will return nearest the cushion next to them: the owner of the ball so placed, provided it does not strike the other ball, has then the option; but after the first match, the winner of each game leads.

3. The red ball on the spot at the upper end is replaced there on being put into a pocket, knocked off the table, or when the balls are ‘broken’ (see 19) after a foul stroke; but should any ball be on the spot, or so near to it as to prevent the red being placed there without touching the ball, the red must be placed in the centre of the table.

4. The points of the game are these: 1 for a miss, 2 for a cannon, 2 for a white hazard, 3 for a red hazard, and 3 for ‘running a coo;’ but the miss and the coo count for the adversary.

5. A white winning hazard is made when you play at the white ball and pocket it; a white losing hazard, when you pocket your own ball off the white. These names of ‘winning’ and ‘losing,’ were used in the old game of B. with two balls, but their meaning is now reversed, it now being commonly a disadvantage to make a winning hazard; and vice versa.

6. A red winning hazard is when you pocket the red; a red losing hazard, when you pocket your own ball off the red.

7. A cannon is when your ball strikes the other two.

8. A miss is when your ball strikes no other.

9. A coo is when your ball goes into a pocket, or jumps off the table without striking another.

10. A four-stroke is made by playing at the white, making a cannon, and pocketing your own or adversary’s ball; or by pocketing his and your own without the cannon, or by playing at the red, making a cannon, and pocketing your opponent’s ball.

11. A five-stroke is made by playing at the red, making a cannon, and pocketing your own or the red; or by pocketing the red and your adversary’s ball without the cannon; or by pocketing your own and adversary’s ball off the red; or by playing at the white, making a cannon, and pocketing the red; or by playing at the white, and pocketing your own and the red.

12. A six-stroke is made by playing at the red, and pocketing it and your own; or by striking the white first, making a cannon, and pocketing your own and adversary’s ball.

13. A seven-stroke is made by playing at the red, making a cannon, and pocketing your own and adversary’s ball; or by playing at the white first, making a cannon, and pocketing your own or adversary’s and the red; or by striking the white, and pocketing all the balls without a cannon.

14. An eight-stroke is made by playing at the red ball, making a cannon, and pocketing your own and the red; or by striking the red, and pocketing all the balls without the cannon.

15. A nine-stroke is made when you cannon by striking the white first, and pocket all the balls.

16. A ten-stroke is made when you cannon by playing at the red first, and pocket all the balls. This is the greatest number that can be made.

17. If the striker, in making a cannon or hazard, should by accident touch either of the balls with his cue, hand, or otherwise, the adversary can, if he thinks proper, claim the stroke as foul, and have the balls broken; in which case, the points made by such stroke are not scored, and the person claiming the foul stroke leads off.

18. Foul strokes are made as follows—namely,

by the striker's ball touching either of the others; by touching any ball while rolling; by moving another ball in any way while taking aim or in the act of striking; by pushing the balls together when playing with the *butt* of the cue; by playing with both feet off the floor; by playing at a ball before it has done rolling; or by playing with the wrong ball: in this last case, should a hazard or cannon be made, the adversary can have the balls broken and lead off; or should no score be made by such stroke, he can take his choice of balls and play.

19. In 'breaking' the balls, you take them all off the table, place the red on the spot, and both parties play from the baulk as at commencing.

20. If the balls have been changed, and it cannot be ascertained by whom, the game must be played out with them as they then are; or even if two strokes have been made before the mistake is discovered, it must still be played out in the same way.

21. Should the striker, in making a cannon or hazard, knock his own or either of the balls off the table, he cannot score the points made by such stroke, and the opponent plays, but the balls are not broken.

22. If a ball stops on the edge of a pocket, and afterwards falls in, either through the shaking of the room, or table, or by any other accident, it must be replaced as near the original place as possible.

23. Should the striker, when in hand (i. a., when his ball is off the table), play at a ball in baulk, his adversary has the option of scoring a miss, or of having the balls replaced, and the stroke played again, or of breaking the balls.

24. If the striker's ball touch another, he must play, and should he make a cannon or hazard, the adversary can claim it as foul, or he can allow points to be scored and the person to play on; but should the striker not score, it is at the option of the opponent to break them or not.

25. Should the marker, whilst marking for the players, by accident touch either of the balls, while rolling or not, it must be put as near as possible to the place it would have otherwise occupied.

26. If the last player should alter the direction of the balls while rolling, with cue, hand, or otherwise, the striker may place it where he thinks proper.

27. A line-ball is when either the white or red is exactly on the line of the baulk, in which case it cannot be played at by a person whose ball is in hand, it being considered in baulk.

28. If the striker's ball is over the pocket, and he should, in the act of striking, miss it, but in drawing his cue back knock it into the pocket, he will lose three points, it being a *coo*.

29. If the red ball has been put into a pocket, it must not be placed on the spot till the other balls have done rolling, should there be a probability of either of them touching it again, as the stroke is not finished till the balls stop.

30. If the striker should touch his ball by accident when taking aim, it is not a stroke, and the ball is to be replaced; but should he touch it in the act of striking, then it is a stroke.

31. If either of the balls lodge on a cushion, it is off the table, and should a cannon or hazard be made, it does not score, and the ball must be placed on the spot, or played from the baulk, according to whether it is white or red.

32. Any person refusing to play the game out after he has played one stroke, loses it.

33. In a match of four, each person is at liberty to offer his partner advice.

34. All disputes in the game to be decided by the marker or majority of the company, but no person

has a right to interfere until appealed to by one or both players.

35. It is called a love-game when no hazard has been made by the loser.

As evidence of what may be done in the way of swift and sure performance by masters of this art, we may mention that two of them (one of whom was the celebrated Kentfield) actually played thirty games of '24 up'—that is to say, supposing they were well-contested matches, they scored about 720 each—within an hour. The greatest achievement of the player above mentioned, and perhaps of any player, was the making a hazard off the red ball from three different cushions.

The only other game played upon a billiard-table which it seems necessary for us to notice, is that called Pool. It is quite different from that above described, nor is it necessary that a good player at the one should greatly distinguish himself at the other. Pool is the game pursued at all the public billiard-rooms, and is the sole profession of many persons who might otherwise employ themselves to more advantage, if not to greater profit, since the requisites for forming a first-rate player are really high—namely, steadiness of hand and eye, imperceptible temper, and exact dynamical calculation. Pool is played by any number of persons—when between two only, it is called 'single pool,' and is nothing else than the old game at B. before the introduction of the red ball—and after various methods, such as playing at the last player, playing at the nearest ball, and playing at any ball whatever. The most common is that of playing at the last player, the rules of which game are to be found, by those whom they concern, upon the walls of every room where it is played. The best billiard-tables, furnished with slate bed and India-rubber cushions, cost from £70 to £80.

**BILLINGSGATE**, a gate, wharf, and fish-market, a little below London Bridge, to the west of the Custom-house. It was opened in 1558 as a landing-place for provisions; and in 1699 was made 'a free and open market for all sorts of fish.' It is the only wholesale fishmarket in London; and fish of every kind, fresh or cured, is admitted free of duty, if taken by British subjects and imported in British vessels. Lobsters and turbot, also, are admitted free, though in foreign vessels. All fish are sold by tale, except salmon and eels, which are sold by weight; and oysters and other small shell-fish, which are sold by measure. The influx of salmon about the beginning of autumn is sometimes above 1000 boxes per day. The market opens daily at 5 A.M.; no fish is sold on Sunday, except mackerel. The fishermen consign their cargoes to the dealers, or 'salesmen,' who occupy stalls in the market; and these supply the retail-dealers. An officer called the clerk has the general superintendence of the market, and the quality of all fish offered for sale is tested by inspectors. The unpolished phraseology native, though not peculiar, to this quarter of London, has given rise to the proverbial use of the name.

**BILLINGTON, ELIZABETH**, the most celebrated English female singer of her day, was the daughter of a German musician named Weichsel, and born in London, 1769. She early came forward as a performer on the piano and as a composer; and having married her music-master, Thomas B., appeared with brilliant success on the Opera stage in Dublin in 1786. Returning to London, she was engaged at Covent Garden at the then unheard-of salary of £1000 for the season. She perfected her musical education under Sacchini in Paris, who wrote for her his opera, *Inez de Castro*, while she was singing in Naples 1794. She appeared subsequently in Venice

and Rome with the greatest applause. In 1799, her first husband being dead, not without suspicion of poison, she married a Frenchman of the name of Florissant, and returned to London, 1801, where she received £4000 for six months, playing alternately at Covent Garden and Drury Lane. She retired from the stage in 1809, and died (1818) at her villa, near Venica. Her character as a wife was the reverse of exemplary; but as a singer she was unrivalled. To a voice of the largest compass and richest tone, trained in all the art of the Italian school, she added a fascinating personal beauty and grace. In illustration of her spirit, it is told that Catharine II. proposing, through her London ambassador, to engage Mrs B. for the theatre of St Petersburg, the vocalist demanded a sum that seemed to the ambassador exorbitant. ‘The Empress of all the Russias does not give more to her ministers.’ ‘Then let her make her ministers sing,’ was the reply.

BILLITO'N, an island in the Dutch East Indies, between the south-east of Banca and the south-west of Borneo. It is separated from the former by Clement's Strait, and from the latter by the Caremata or B. Passage. Its north-west point is in lat.  $3^{\circ} 13' S.$ , and long.  $108^{\circ} 7' E.$  It is said to contain 1150 square miles and 6000 inhabitants. It is rich in iron and timber, and imports rice, trepang, edible birds' nests, sea-weed, tortoise-shell, and wax. Its coasts are beset with rocks and islets.

BILLOM, a town of France, in the department of Puy-de-Dôme, situated on a hill 14 miles east-south-east of Clermont. It is one of the most ancient towns of Auvergne, and was formerly surrounded by walls, which have now disappeared; its commerce and manufactures have also declined. So early as 1455, a university was founded at B., which a century later passed into the hands of the Jesuits, and was governed by them until the suppression of their order. Pop. (1872) 3531, chiefly engaged in the manufacture of earthenware.

BILLION (see BULLION) is an alloy of copper and silver, in which the copper predominates, and which is used in some countries for the smaller denominations of money. The Groschen of North Germany—e.g., corresponding nearly to an English penny—is of B., and is about the size of an English fourpenny silver-piece. The object is to avoid the bulkiness of copper coin; but B., besides affording facilities for counterfeits, is dirty and inelegant.

BILMA, a town of the Sahara, Central Africa, situated in lat.  $18^{\circ} 40' N.$ , long.  $14^{\circ} E.$ , on an oasis called the Wady Kawas, on the route between Murzuk and Lake Teasd. It is the capital of the Tibu country, and important as a resting-place of caravans crossing the desert. Dates grow abundantly here; and large quantities of salt are collected from lakes in the vicinity for export to Bornu and Sudan.

BILSTON, a town in South Staffordshire, situated on a rising-ground about 3 miles south-east of Wolverhampton. Pop. (1871) 24,188. It forms a part of the parliamentary borough of Wolverhampton. It has extensive iron and coal mines, iron smelting-works, iron-foundries for making machinery, besides works for manufacturing tinplate goods, japanned and enamelled wares, nails, wire, screws, and coarse pottery. It is the centre, indeed, of the hardware trade, and consequently a very busy place. Fine sand, adapted for metal-casting, is found here. Upwards of 700 persons died of cholera here both in 1832 and 1849.

BIMA, a seaport in Sumbawa, one of the Sunda Isles, and capital of a state of the same name, in lat.  $8^{\circ} 30' S.$ , and long.  $119^{\circ} E.$  It is on a bay of

the north coast, being 100 miles to the east of Sumbawa, a town feudally dependent on its sultan. Its chief exports are horses and timber.

BIMANA (Lat. two-handed), in some zoological systems, the first order of *Mammalia* (q. v.), an order containing the human species alone. See MAN. Others reject this order altogether, reclaiming against this classification of man with brutes, and maintaining that the distance between him and them is too great to be represented as that between two orders in one class, or even between two classes of a zoological system. In assigning a place in this manner to man among animals, naturalists of course consider exclusively or chiefly his animal nature and bodily frame. The name B. has reference to the hands (q. v.) which terminate his anterior limbs; monkeys and lemurs, which, having opposable thumbs in all the four extremities, may be regarded as having four hands, although much less perfect than the human, are called *Quadrumania* (q. v.); but none of the inferior animals are two-handed, as man is.

BINA'B, a town of Persia, in the province of Azerbijan, charmingly situated on the banks of the Sofi Chai (a feeder of Lake Urumiyah), in the midst of orchards and vineyards, about 55 miles south-south-west of Tabriz. B. contains about 1500 houses; the streets are very clean, many of them having a stream of pure water, which is here very plentiful, flowing down the centre. B. forms a dependency of Maraghah, paying 4000 tómáns of revenue, and furnishing a quota of 400 men to the Azerbijan army.

BINARY COMPOUND. See BINARY THEORY.

BINARY THEORY, in Chemistry, takes cognizance of the mode of construction of salts. It assumes that all salts contain merely two substances, which either are both simple, or of which one is simple, and the other a compound playing the part of a simple body. The best and most familiar illustration of the B. T. is common salt or chloride of sodium ( $NaCl$ ), which is constructed of the metal sodium ( $Na$ ) and the non-metal chlorine ( $Cl$ ), and is at a glance seen to be a *binary compound* (a compound of two). In like manner, fluor-spar, or the fluoride of calcium ( $CaF$ ), consists of the metal calcium ( $Ca$ ) and the non-metal fluorine ( $F$ ); iodide of potassium ( $KI$ ), largely employed in photography, of potassium ( $K$ ) and iodine ( $I$ ); and bromide of silver ( $AgBr$ ), also useful in photography, of silver ( $Ag$ ) and bromine ( $Br$ ). Considerable difficulty is experienced in including all salts under the B. T., but in many cases the apparent difficulty may be got over. Thus, saltpetre, or the nitrate of potash ( $KO,NO_3$ ), according to the ordinary mode of representing its composition in symbols, naturally breaks up into potash ( $KO$ ) and nitric acid ( $NO_3$ ); but in this form it cannot be correctly included in the binary theory. If, however, the same elements be arranged differently, as when the nitrate of potash ( $KNO_3$ ) is represented as containing the metal potassium ( $K$ ) and the compound non-metal nitrationide ( $NO_3$ ), the latter playing the part of chlorine or other simple substance, the apparent barrier to the introduction of such salts into the list of those comprehended under the B. T. to a great extent disappears. The following table will represent this more clearly:

	SYMBOLS.	
	Ordinary Way.	Binary Theory.
Chloride of Sodium,	$Na,Cl$	$Na,Cl$
Nitrate of Potash,	$KO,NO_3$	$K,NO_3$
Sulphate of Soda,	$Na,O,SO_4$	$Na,SO_4$
Carbonate of Lime,	$Ca,O,CO_3$	$Ca,CO_3$

Much, however, remains to be cleared up, and in very many cases the B. T. does not answer the purpose of including all salts under one class. See SALTS; see also CHEMISTRY in SUPP., Vol. X.

BINASCO, a town of Lombardy, about 11 miles north-west of Pavia. It is defended by a castle, where, in September 1418, Beatrice di Tenda, wife of the Duke Filippo Maria, was beheaded by order of her husband, who unjustly suspected her of infidelity. Pop. 5000.

BIN-BIR-KILISA' (One Thousand and One Churches), the name of extensive ruins in the paahalic of Karamania, Asia Minor, and 20 miles north-north-west of the town of Karaman. The ruins consist chiefly of the remains of Byzantine churches, evidently of great antiquity, and some of very considerable size. B. is supposed to be the ancient Lystra, where the cripple was healed by St Paul.

BI'NCHE, a town of Belgium, province of Hainaut, on the Haine, about 10 miles east-south-east of Mons. It is well built and walled, with a fine square, ornamented with a fountain, and has manufactures of leather, cutlery, pottery, glass, &c., and a considerable trade in lace, paper, marble, and coal. Pop. (1870) about 7000.

BINDRABA'N, a town on the right bank of the Jumna, is situated in the district of Muttra and lieutenant-governorship of the North-west Provinces. It is in lat.  $27^{\circ} 34' N.$ , and long.  $77^{\circ} 45' E.$ , being 823 miles to the north-west of Calcutta, and 92 to the south of Delhi. The population of B., almost exclusively Hindu, was returned in 1871 at 21,500 inhabitants. Superstition appears to be the principal business of the place. Crowds of pilgrims come from all parts of India, more particularly in honour of Krishna; and, through the munificence of wealthy devotees, sacred edifices are constantly becoming more numerous and costly. Here, as at Benares, the immediate margin of the river is occupied by flights of steps, or ghauts, as they are called. These extend for about a mile along the bank, being constructed of red stone, which is brought from Jeypore, nearly 150 miles distant.

BI'NDWEED. See CONVOLVULUS.

BI'NGEN (the ancient *Vincum* or *Bingium*), a town in the grand-duchy of Hesse-Darmstadt, Germany, is situated in a charming country on the left bank of the Rhine, and on the right of the Nahe, here crossed by a bridge, generally supposed to have been built by the Romans, and called the Bridge of Drusus. Pop. (1871) 5936, who are chiefly engaged in the manufacture of fustian, leather, flannel, and tobacco. The vine is extensively cultivated in the surrounding country. The celebrated Scharlachberger wine is produced in the vineyard of the same name, near the village of Rüdesheim. In the vicinity of the town is the Rochusberg, with a chapel, to which annual pilgrimages are made. On the declivity of the hill are still to be seen the ruins of the old castle (blown up by the French in 1689), in which the Emperor Henry IV. was detained a prisoner by his son in the year 1105. On the other side of the Nahe is the Rupertenberg, with the ruins of a monastery, in which St Hildegard resided in the 12th c. Below the town is the celebrated *Bingerloch*, formerly a very dangerous point in the navigation of the Rhine, on account of the sunk rocks which, with the exception of a narrow passage through which the waters rushed loud and furious, stretched across the river; but in the year 1834, these rocks were partially blown up, so that there is no longer any great danger. In the middle of the river stands the tower, in which, according to the legend, Bishop Hatto

was devoured by rats in the year 969. History, however, fixes the date of the erection of the tower in the 13th c., as a toll-house for the collection of duties on goods passing this point in the river.

BI'NGLEY, a town in the West Riding, Yorkshire, 15 miles west-north-west of Leeds, situated on an eminence in a well-wooded district, on the west bank of the Aire, between that river and the Leeds and Liverpool Canal. It chiefly consists of one long street. It has considerable worsted manufactures. Pop. (1871) 6890.

BI'NNACLE, formerly called *Bittacle* (Fr. *habitude*), is a wooden box or case for containing a ship's compass, together with other apparatus (especially a lamp) essential to its use. In large ships, there are generally two binnacles, one for the steersman, and one for the officer or seaman who 'cons' or superintends the steering. Sometimes a lamp is so placed as to illuminate two compasses at night, sometimes only one. Many improvements have recently been made in binnacles. See COMPASS, MARINER'S.

BINNEY, REV. THOMAS, D.D., LL.D., one of the most distinguished modern preachers of the Independents in England, was a native of Newcastle. After officiating as a clergyman in Newport, Isle of Wight, he, in 1829, removed to London, where he soon acquired extensive popularity. The hall in which he preached becoming too small for his congregation, Weigh-house Chapel, near London Bridge, was erected for him by his hearers in 1833. Here he continued to labour with great success for nearly forty years, attracting around him a large number of the more intelligent class of young men in the metropolis. An address delivered at the inauguration of the new chapel, in which certain expressions rather derogatory of the influence of the English Church were used, brought B. into notoriety from the replies it called forth from many of the English clergy. He afterwards took the more liberal side in the *Rivulet* controversy, as it has been called, regarding the orthodoxy of certain hymns of a high order of poetic merit, written by the Rev. T. Lynch of London. In 1858–1859, he made a tour in Australia, preaching and lecturing with great success. He resigned in 1871 the pastorate of Weigh-house Chapel. As a preacher, B. was remarkable less as an orator than for breadth of view, originality of thought, and force of expression. He was author of many religious works, among the most popular being *Conscientious Clerical Nonconformity*, *The Practical Power of Faith*, *Service of Song in the House of the Lord*, and *Is it possible to make the Best of Both Worlds?* He died in 1874.

BINO'MIAL, in Algebra, is a quantity consisting of two terms or parts—e.g.,  $a + b$ , or  $9 - 5$ ; a trinomial consists of three terms, as  $a + b + c$ , or  $10 + 5 - 8$ . The BINOMIAL THEOREM is that remarkable series or analytical formula by which any power of a B. can be expressed and developed. Thus, the 8th or any other power of  $a + b$  can be at once written down without going through the actual multiplication of  $a + b$  by itself for the given number of times. The older mathematicians were acquainted with this theorem in the case of integral exponents, though the actual discoverer is unknown. Newton was the first to demonstrate its truth for all exponents—fractional and negative, as

Usual form of  
Binnacle.

well as integral. It is one of the finest of his discoveries, and is engraved on his tomb. Among its many applications, it affords the means of finding any root of any number much more conveniently than by the usual method of extraction.

BINTA'NG, an island of the Dutch East Indies, about 40 miles south-east of Singapore, and in lat. 1° 5' N., long. 104° 29' E. Area, 600 square miles. Pop., including that of small adjacent isles, 13,000. It is calculated that not less than 4000 tons of the astringent gum called gambir are obtained here annually. This, along with rice and pepper, forms its chief exports.

BITURONG (*Ictides*), a genus of quadrupeds nearly allied to Racoons (q. v.), from which the chief distinction is in the smaller and less tuberculated back molar (grinder) teeth. Only two species are known, natives of Malacca, Java, Sumatra, &c.

BO'OBIO, the largest river of Chili, has a west-north-west course from the Andes to Concepcion on the Pacific, being 2 miles wide at its mouth, and navigable for boats from the sea to the mountains. Its lower stream separates the province of Concepcion on the north from independent Araucania on the south.

BIOGRAPHY (from the Gr. *bios*, life, and *graphe*, writing) is the term applied to that department of literature which treats of the lives of individuals. The mode of treatment, especially in modern times, is far from uniform. In some cases, B. approaches the sphere of philosophy; in others, that of history; while in the majority it assumes, to a large extent, the character of analytic or descriptive criticism. To none of these modes, theoretically considered, can there be any valid objection; everything depends on the judiciousness of the biographer. The great points which he must keep perpetually in view are the personality and characteristics of his subject. If these are buried under a load of digressive dissertations, his book, however valuable or interesting, ceases to be a B., except in name. Anciently, B. was more of a mere *curriculum vitae* than it is now; that is to say, the leading incidents of a man's life were narrated in their historical sequence, without any elaborate attempt to analyse the character from which they emanated. Like ancient history, it was possessed of a simple greatness, a stately dignity of narrative, coloured here and there but sparingly with grave eulogy or censure. Modern B., on the other hand, like modern history, is full of elucidations, criticism, and disquisition; and if wanting in the severe grace of its classic predecessor, it is much more lively, acute, and expansive.

Biographical literature appears to have existed from a very early period. The oldest historical books of the Jews abound with beautiful examples of it, such as the lives of the patriarchs and the story of Ruth. But what, indeed, are the mythologies of all ancient nations, except a chaos of heroic or divine biographies written not on walls of stone or rolls of parchment, or leaves of papyrus, but on the tablets of the memory? Of purely biographical works, the most valuable that has come down to us from the Greeks is the *Parallel Lives* of Plutarch, a composition of the 2d c. after Christ. Roman literature also possesses an admirable specimen in the *Life of Agricola* by his son-in-law, Tacitus. Besides these may be mentioned the *Life of Alexander the Great* (in Latin) by Curtius, and of Apollonius of Tyana (in Greek) by Philostratus, *Lives of the Sophists* (in Greek) by Philostratus, and a *Life of Plato* (in Greek) by Olympiodorus of Alexandria.

Coming later down, we encounter St Jerome's

*Lives of the Fathers*; while biographies, more or less complete, of saints, martyrs, bishops, &c., are scattered profusely through primitive ecclesiastical literature. The monks of the middle ages also worked hard at the manufacture of absurd and superstitious legendary biographies, in which the hunger for the marvellous characteristic of that credulous time was hugely gratified. Modern biographical literature may be said to date from the 17th c., and has since developed itself to an unmanageable extent. Among the most valuable works belonging to this class, written since the Reformation, may be mentioned Vasari's *Lives of the Painters* (Florence, 1560); the *Acta Sanctorum* (q. v.); Tillenmont's *Mémoires pour servir à l'Histoire Ecclesiastique des six Premières Siècles de l'Eglise* in 16 vols. 4to (Paris, 1693); Thomas Stanley's *History of Philosophy, containing the Lives, Opinions, Actions, and Discourses of Philosophers of every Sect* (1655—1662); Bayle's *Dictionnaire Historique et Critique* (Rotterdam, 1697); Johnson's *Lives of the Poets* (completed in 1781); the *Biographie Universelle* (1810—1828); *Conversations-Lexicon* (10th edition, 1851—1855); Charles Knight's *English Cyclopædia*, Biographical Section (1856—1857). As for individual biographies in modern times, it would be endless to enumerate them. It having unhappily been discovered that these constitute the most attractive form of literature, the world is annually inundated with an intolerable flood of lives of nobodies. At present, the most insignificant literary, clerical, or philanthropical personages are not permitted to pass quietly away. Nevertheless, amid the desert of commonplace, the choicest cases may be found; works so rich in pleasant or profound thought, so copious in agreeable gossip, so valuable in unexpected glimpses and revelations of character, so abundant, in short, in everything that can stimulate, elevate, or enlighten, that it is not wonderful they should be read and re-read with avidity. Chief among such in our own country is Boswell's *Life of Johnson* (1790). During the present century also appeared the *Life of John Sterling*, by Thomas Carlyle, a work which is considered a model of its kind; and the *Life of Goethe* by G. H. Lewes, which has been universally accepted, both in Germany and England, as an adequate B. of the illustrious monarch of continental literature. In France, where B., at least in the shape of 'Memoirs,' has attained perfection, we may specify among others the *Life of Descartes* by Baillot, of *Charles XII.* by Voltaire, of *Voltaire* by Condorcet, of *Fénélon* and *Bosset* by Cardinal de Bawest, of *Molière* and *Corneille* by M. Taschereau, and of *Monk* by Guihot. In Germany, among others, we have the *Life of Heyne* by Heeren, of *Reinhard* by Poelitz, and of *Dorothea, Duchess of Courland*, by Tiedge; while America has contributed the valuable *Life of Christopher Columbus* by Washington Irving.

An *Autobiography* is the life of a person written by him or her self. This branch of literature, also, has become superabundant in this egotistic and self-conscious age. Unquestionably the highest work in this department of literature is Goethe's *Dichtung und Wahrheit*, a kind of idealised autobiography, in which the outward and inward truth, the fact and poetry of the author's life, are strangely but beautifully interwoven.

BIOLOGY (Gr.), or the science of life, embraces properly all knowledge regarding organised beings as distinguished from the inorganic world. But in a narrower sense it designates much the same as human physiology (q. v. and *Life*).

BIOT, JEAN BAPTISTE, a distinguished French

physicist and astronomer, was born at Paris 21st April 1774. He at first entered the artillery, but forsook the service for science; and in 1800 became Professor of Physics in the Collège de France. He was made a member of the Institute in 1803; and in 1804, it was solely through him that the Institute voted against making Napoleon emperor. Along with Arago, he was made a member of the Bureau of Longitude, and (1806) sent to Spain to carry out the measuring of a degree of the meridian, preparatory to the introduction of the present French system of weights and measures. On his return, he devoted himself to physical researches and to lecturing. In 1815, the Royal Society of London elected him one of their 50 foreign members. In 1817, he visited England, and went as far north as the Shetland Islands, in order to make observations along the line of the English arc of meridian, which had been extended by Colonel Mudge. His most valuable contributions to science are on the polarisation of light; and his researches connected with ancient astronomy are also very valuable. Of his numerous writings may be mentioned *Traité Elémentaire d'Astronomie Physique*, 3 vols. (Paris, 1805); 3d ed., considerably augmented (1850), 6 vols., with vol. of plates—translated into English. *Traité de Physique*, 4 vols. (1816); *Précise de Physique*, an abridgment of the former in 2 vols. (1817), often republished; *Recueil d'Observations Géodésiques*, &c. (1821). B. also contributed many excellent biographies of scientific men to the *Biographie Universelle*. Among the most important of his later works are *Recherches sur l'ancienne Astronomie Chinoise* (1840); *Mémoire sur la Constitution de l'Atmosphère Terrestre, in la Connaissance des Temps* (1841); and *Etudes sur l'Astronomie Indienne* (1862). In 1849, B. was made a commander of the Legion of Honour, and he was also a member of most of the learned societies in Europe. He died Feb. 3, 1862.

**BIOT, EDUARD CONSTANT**, son of the former, a distinguished Chinese scholar, was born at Paris 2d July 1803. He was one of the first to promote the introduction of railways in France; but his health failing, he retired from the public service, and devoted his leisure to the study of Chinese, and the history of the social organisation of the Celestial Empire. He died March 1850. He wrote a *Dictionnaire des Villes, &c., de l'Empire Chinois* (1842), and a multitude of *Mémoires* on Chinese subjects of scientific and social interest, printed in the *Journal Asiatique*, &c. His interesting work, *De l'Abolition de l'Esclavage Ancienne en Occident* (1840), was awarded a gold medal by the Institute.

**BIPOD** (Lat.), two-footed, a term sometimes applied, as descriptive, to man, more frequently to birds, and which scarcely admits of application to any other animal except a very few species of reptiles, some of which are batrachian (see BATRACHIA and SYREN), and some saurian (see SAURIA). The two-footed saurians may be regarded as forming a link between that order and serpents, the two-footed batrachians as connecting batrachians with fishes, other characters of resemblance being in both instances associated with this.

**BIPENNIS**, a double-headed axe, the weapon which, according to ancient historians and artists, particularly distinguished those fabulous female warriors, the Amazons.

**BIPQUADRATIC.** See EQUATIONS.

**BIR** (ancient *Birha*, Turkish *Bireh-jik*), a town of from 1800 to 2000 houses of Asiatic Turkey, in the pashalic of Diarbekir. It is situated on the east bank of the Euphrates, in lat. 37° 3' N., long. 38° E., on a steep hill above the river, the passage of which is here commanded by a castle. B. is

surrounded by a strong wall flanked with towers; its streets are narrow, but clean; it has several mosques with tall minarets, a caravansary, a bazaar, and a ruined citadel and castle. Travellers and caravans from Aleppo to Diarbekir, Bagdad, Persia, &c., cross the Euphrates at this point. From B. Colonel Chesney proposed to navigate the Euphrates by small steamers to its mouth in the Persian Gulf, a distance of 1143 miles. *B.*, which signifies 'well,' is also the prefix of several other small towns in Arabia.

**BIROH** (*Betula*), a genus of plants of the natural order *Amentaceæ* (q. v.), sub-order *Betulaceæ*, the natural order *Betulaceæ* of some botanists. In this order, or sub-order—which contains only the two genera, Birch and Alder (q. v.)—the flowers have merely small scales for their perianth; the ovary is two-celled, but the fruit—a small acheneum (q. v.)—is by abortion one-celled; the fruits and scales united form a sort of cone; and the leaves have stipules

Common Birch (*Betula alba*).

which soon fall off. They are all trees or shrubs, natives of temperate and cold regions.—The genus *Betula* is distinguished by 10—12 stamens, and winged achenes.—The COMMON B. (*Betula alba*) has small ova-to-triangular doubly serrated leaves. It is a very beautiful forest-tree, abounding in the North of Europe and of Asia, often forming large groves by itself. In the south of Europe, it is found only upon mountains of considerable elevation. It is a tree of rapid growth. In favourable situations, it attains the height of 60 or even 70 feet, with a diameter of 1½ or 2 feet; whilst on the northern, or utmost alpine limits of vegetation, it only appears as a stunted bush. The bark is smooth and silvery white, and its outermost layers are thrown off as the tree advances in age. The smaller branches are very slender and flexible, and in a particularly graceful variety called the WEEPING B. (*B. pendula* of some botanists), they are still more slender, elongated, and pendulous. Some of the finest Weeping Birches in Britain stand on the banks of the river Findhorn, near Forres, in Morayshire; they are 60 feet high, and exhibit pendent masses of spray 10 feet

## BIRCH.

in length. The bark and leaves of the B. are, in some northern countries, used medicinally in cases of fever and eruptions. They are also used for dyeing yellow. The bark is sometimes used for tanning, and is preferred to every other kind of bark for steeping nets, sails, and cordage. See BARK FOR TANNING. It is in some countries made into shoes, hats, drinking-cups, &c., and it is even twisted into a coarse kind of ropes. Portable boats made of it are used on the Volga. It is remarkable for durability. In many parts of the north of Europe, it is used instead of slates or shingles by the peasantry; and in Russia—the outer or white layers being subjected to distillation—there is obtained a reddish empyreumatic oil called B. OIL; it yields also the B. TAR, or *Degout*, which is employed in the preparation of Russia leather. Dried, ground, and mixed with meal, B. bark is used in Norway for feeding swine; and, in times of scarcity, has even served for human food. The wood is in universal use in northern countries for the most various purposes. It is white, firm, and tough, and is employed by wheel-wrights, coopers, turners, &c. It is very much employed in the manufacture of barrels for fish. It is much employed for smoking hams, herrings, &c., because of the flavour which it imparts. Much of it is made into charcoal for forgea. The twigs are in general use for besoms. In the Highlands of Scotland, and in many other countries, the sap is not only used as a beverage in a fresh state, but is converted by fermentation into a kind of wine. To obtain it, a hole is bored in the stem, in spring, in an oblique direction, one or two inches deep, and a small tube is introduced to carry the sap into a vessel. From a strong stem, there often flows as much as from four to six quarts in a day. If the hole is again

of the kidneys and in cases of urinary calculus. It contains more than 2 per cent. of sugar.—The WHITE B. of North America (*B. populinolia*) very nearly resembles the common B., but is of much less value. It is found as far south as Pennsylvania. The wood is scarcely used.—The BLACK B. of the same country (*B. nigra*), also sometimes called RED B., and very similar to the common B., produces very hard and valuable timber. It attains the height of 70 feet. It is not found further north than New Jersey. The bark is of a dark colour, the epidermis in the younger trees reddish.—But the name BLACK B. is also given to another species found in the more northern parts of North America, and sometimes called the SWEET B. or CHERRY B. (*B. lenta*), also a tree of 70 feet or upwards in height, and of which the timber is fine-grained, and valuable for making furniture, and for other purposes. Its leaves, when bruised, diffuse a sweet odour, and when carefully dried, make an agreeable tea. It is remarkable that this tree has been little planted in Britain.—The YELLOW B. of North America (*B. excelsa*) is a tree of 70–80 feet high, destitute of branches for 30–40 feet, remarkable for its large leaves, which are 3½ inches long, and for the brilliant golden yellow colour of the epidermis. It is found in Nova Scotia, New Brunswick, Maine, &c. Its timber is used in ship-building. The young saplings of all these American species are much employed for making hoops for casks.—The PAPER B. (*B. papyracea*) is found in the northern parts of North America. It attains the height of 70 feet. The bark of the young trees is of a brilliant whiteness. The bark is capable of division into very thin sheets, which have been used as a substitute for paper. It is used by the Indians for canoes, boxes, buckets, baskets, &c. Large plates of it are curiously stitched together with the fibrous roots of the White Spruce, and coated with the resin of the Balm of Gilead Fir. The wood is used for the same purposes with that of the common B.—The mountainous districts of India produce several species of this genus. Thin, delicate plates of the bark of *B. Bhojputra*, a native of the mountains of Kumaon, are used for lining the tubes of hookahs, and are carried in great quantities to the plains of India for this purpose. They were formerly used instead of paper for writing. *B. acuminata*, a native of the mountains of Nepaul, is a tree of 50–60 feet high, covered with branches from the base, and of an oval form. Its wood is strong and durable.—The DWARF B. (*B. nana*) is a mere bushy shrub, seldom more than two or three feet high, and generally much less. It has orbicular crenate leaves. It is a native of the whole of the most northern regions of the globe, and is found in some parts of the Highlands of Scotland. It is interesting because of its uses to the Laplanders and other inhabitants of very northern regions, to whom it supplies their chief fuel, and the material with which they stuff their beds. Its seeds are the food of the ptarmigan, on which the Laplanders in a considerable degree depend. A similar shrubby species (*B. antarctica*) occurs in Tierra del Fuego.

BIRCH, THOMAS, D.D., an industrious historical writer, son of a coffee-mill maker, a Quaker, born at Clerkenwell, November 23, 1705, was at first an usher in different schools. Having taken priests' orders in 1731, he was presented in 1732 to a living in Essex, and in 1734 became chaplain to the Earl of Kilmarnock, who was beheaded in 1746. Appointed in the latter year Rector of St Margaret Pattens with St Gabriel, Fenchurch Street, London, B. was elected in 1752 one of the secretaries of the Royal Society, a history of which he published in 4 vols., 4to, in 1756–1757. In 1761, he was preferred to the Rectory of Deepdene, Surrey. His first

Common Birch:  
Shewing catkin and leaves.

closed up each time with a wooden plug, covered over with clay or rosin, and the tapping is annually renewed in the same place, the tree sustains very little injury. B. sap is very beneficial in diseases

## BIRCH-PFEIFFER—BIRD-CATCHING SPIDER.

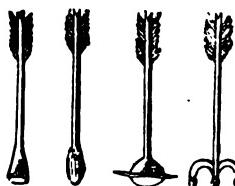

literary undertaking, in which he was assisted by others, was *The General Dictionary, Historical and Critical*, 10 vols., 1734–1741, founded on Bayle's celebrated work. He next edited the collection of state-papers of Thurloe, secretary to Oliver Cromwell, 7 vols., folio, 1742. His other works are *Life of the Hon. Robert Boyle*, 1744; *Lives and Characters of the Illustrious Persons of Great Britain*, the engravings by Houben, Gravelot, and Vertue (London, 1743–1752); *Inquiry into the Share which King Charles I. had in the Transactions of the Earl of Glamorgan*, 1747; *Historical View of the Negotiations between the Courts of England, France, and Brussels*, 1592 to 1617, 1749; *Life of Tillotson*, 1752; *Memoirs of the Reign of Queen Elizabeth*, 2 vols., 1754; *Life of Henry Prince of Wales*, 1760; &c. He likewise edited the works of Sir Walter Raleigh, Bacon's works, and various others. He was killed by a fall from his horse in the Hampstead Road, 9th January 1766. He left an extensive MS. collection, with his library, to the British Museum, of which he was a trustee. From these MSS. were compiled *The Courts and Times of James I. and Charles I.*, 4 vols. 8vo. (London, 1848).

**BIRCH-PFEIFFER, CHARLOTTE**, a German actress and writer of plays, was born at Stuttgart in the year 1800. Her passion for the stage displayed itself so strongly, that after encountering much opposition on the part of her parents, she made her débüt at Munich at the age of thirteen, and afterwards played with great success at Berlin, Vienna, and Hamburg. In 1825, she married Dr Christian Birch of Copenhagen, and afterwards performed at Petersburg, Pesth, Amsterdam, and other places. In 1837, she undertook the direction of the theatre at Zurich. At a later period, she acquired even greater renown as a writer for the stage than as an actress. Her principal theatrical pieces are *Pfeifferseel*; *Hinko*; *Die Günslinge*, perhaps her best piece; *Der Glöckner von Notre Dame*; &c. In 1843, Madame B. resigned the direction of the Zurich theatre, and after visiting professionally most of the cities in Germany, made an engagement with the theatre-royal at Berlin. The chief productions of what may be termed her later manner are—*Die Marquise von Vilette* (1845), *Dorf und Stadt* (1848), *Eine Familie* (1849), *Anna von Österreich* (1850), *Ein Billet* (1851). In 1862 was published a complete edition of her dramatic works, which are about 70 in number, and a collection of her novels and tales. She died at Berlin, August 25, 1868.

**BIRD, EDWARD**, an English 'genre' painter of considerable celebrity, was born at Wolverhampton in 1772. He having early displayed a strong inclination for drawing, his father thought he was consulting his son's taste when he apprenticed him to a Birmingham tea-board manufacturer, his duty there being to paint flowers, shepherds, &c., on the boards. On the expiration of his apprenticeship, B. established himself as a drawing-master in Bristol; and two of his pictures, the 'Choristers Rehearsing,' and 'The Will,' having been bought by the Duke of Clarence, afterwards William IV., and the Marquis of Hastings, his reputation was secure. He was elected a Royal Academician, and soon obtained some good commissions. The 'Field of Chevy Chase the Day after the Battle' is generally considered his master-piece. His 'Death of Eli' obtained the British Institution prize of 300 guineas. In 1813, B. was appointed painter to the Princess Charlotte. He now became ambitious to excel in Scripture subjects, and painted several, none of which, however, added to his fame. His

last picture, the 'Embarkation of Louis XVIII. for France,' which was never finished, was the least satisfactory of all his works. He died in 1819. His most popular works are—'The Blacksmith's Shop,' 'The Country Auction,' 'The Village Politicians,' 'The Young Recruit,' &c.

**BIRD-BOLT.** Stevens, in his note on *Much Ado about Nothing*, says the R. is 'a short, thick arrow, without point, spreading at the extremity so much as to leave a broad flat surface, about the

Bird-bolts.

breadth of a shilling. Such are to this day in use to kill rooks with, and are shot from a cross-bow.' The annexed illustration is copied from Douce's *Illustrations of Shakespeare*.

**BIRD-CATCHING SPIDER**, a name originally given to a large spider, *Mygale avicularia*, a native of Cayenne and Surinam; but which is now more extensively applied, being equally appropriate to a number of large species of *Mygale* (q. v.) and *Epeira* (q. v.), perhaps also of other genera. It has, indeed, been denied by some observers that the name is truly appropriate, but the positive evidence is too strong to be easily set aside by evidence merely negative. The *Mygale avicularia* is nearly two inches long, very hairy, and almost entirely black; its feet, when stretched out, occupy a surface of nearly a foot in diameter. The hooks of its mandibles are strong, conical, and very black. This great spider forms a tube-shaped cell, widening

Bird-catching Spider.

towards the mouth, of a fine white semi-transparent tissue, like muslin, in clefts of trees or hollows among rocks and stones. From this it issues only at night, to prey upon insects, and, it is said, upon humming-birds. It does not construct a net for the capture of its prey, but takes it by hunting, as do other large species of *Mygale*, natives of the warm parts of America, the East Indies, and Africa. It is probably a species of this genus that Dampier mentions as found in Campeachy, the fangs of which, 'black as jet, smooth as glass, and, at their small end as sharp as a thorn,' are said by him to be worn by some persons in their tobacco-pouches, to pick their pipes with; and to be by others used as tooth-picks, in the belief of their having power to expel the toothache. The bite of the large species of this genus is said to be dangerous.

It appears that spiders of the genus *Epeira* feed

## BIRD-CHERRY—BIRD OF PARADISE.

upon small birds caught in their webs, which have even been described as in some cases large enough to arrest the flight of a bird the size of a thrush, and to impede the traveller in tropical forests.

**BIRD-CHERRY** (*Padus*), a subdivision of the genus *Cerasus* (see **CHERRY**), itself very generally regarded as a sub-genus of *Prunus* (see **PLUM**). The Bird-cherries are distinguished by racemes of small flowers and deciduous leaves.—The **COMMON B.** (*Prunus* or *Cerasus Padus*), called in Scotland *Hagberry*, is a tall shrub or small tree, sometimes reaching the height of 40 feet, growing wild in moist woods in Britain, and in most parts of Europe and the north of Asia. Its younger branches are of a very dark or reddish-brown colour. The drupes are small, of a sweetish subacid taste, combined with a degree of what many regard as nauseous bitterness; but to some palates they are not disagreeable. A well-flavoured spirituous liquor is prepared from them in the north of Europe. In Siberia, the juice expressed from the ripe fruit is drunk either alone or mixed with milk, and the remaining mass is kneaded into cakes, and used as food.—Very nearly allied to this species is the **VIRGINIAN B.** (*P.* or *O. Virginiana*), a tree of 80—100 feet in height, found from Tennessee to Upper Canada, and now frequent in Britain as an ornamental tree, although never attaining the size which it does in the United States. The wood is compact, fine-grained, takes a fine polish, and is much used in America by cabinet-makers. The bark is used in the United States as a febrifuge. The fruit is not agreeable; but a cordial is made from it by infusion in spirits with sugar, and, when dried and bruised, it forms an esteemed addition to *pennoncias* (q. v.).

**BIRD ISLAND**, the north-west island of the Sandwich Archipelago, in lat. 22° 20' N., and long. 160° W. It is, as its name implies, a mere haunt of sea-fowl—the links of the chain increasing pretty regularly in size and elevation from B. I. on the north-west to Hawaii on the south-east.

**BIRD-LIME** is a viscid and adhesive substance, which is placed on twigs of trees or wire-netting, for the purpose of catching the birds which may alight thereon. A common practice is to place a decoy or tame bird in a cage near where the B. is spread; the wild birds, attracted to the spot by the song of the tame bird, get entangled with the bird-lime. The substance is generally prepared from the middle bark of the holly, mistletoe, or distaff-thistle, by chopping up the bark, treating it with water, boiling for several hours, then straining; and lastly, concentrating the liquid by evaporation, when the B. assumes a gelatinous consistence resembling that of moist putty. It mainly consists of a substance named by the chemist *viscin*. A second mode of preparing B., is to employ ordinary wheat-flour; place it in a piece of cotton cloth; tie up the ends, so as to form a bag; immerse the whole in a basin of water, or allow a stream of water to flow upon it; and repeatedly squeeze the bag and its contents. The result is, that the starch of the wheat-flour is pressed out of the cloth bag, and an adhesive substance named *gluten* is left on the cloth. This substance resembles that prepared by the previous process in its properties; but the former mode of preparing B. is a much cheaper plan, and is that generally followed.

**BIRD OF PARADISE**, the common name of a family of birds, *Paradisidae* of ornithologists, found chiefly in New Guinea and neighbouring islands, and remarkable for splendour of plumage. In all other respects, however, they are very closely allied to the crow-family, *Corvidae* (q. v.), to which

they exhibit a great similarity, not only in the characters of the bill, feet, &c., and in general form, but also in their habits, and even in their voice. They have been the subject of many fables. The state in which their skins are usually exported from their native islands, gave rise to the notion that they were destitute of feet; and free scope being allowed to fancy, it became the prevalent belief that they spent their whole lives floating in the air, except when perhaps they suspended themselves for a little by their long tail-filaments from the uppermost branches of trees. As for their food, it was supposed to be either mere dew and vapours, or nectar obtained from the flowers of trees, climbers, and plants growing on the branches of trees, in the high regions of bright sunshine above the shade of the tropical forests. Antony Pigafetta, indeed, who accompanied Magellan in his voyage round the world, described them as having legs, and stated that these were cut off as useless in the preparation of the skins; but his statement was not credited, and Aldrovandus went the length of accusing him of an audacious falsehood. It would seem that the fables concerning the Birds of P. are in part to be ascribed to the desire of the inhabitants of those islands in which they are found to increase the value of their skins as an article of merchandise; and a sort of sacred character being attached to them, they were employed not merely for ornament, but as a charm to secure the life of the wearer against the dangers of battle. The people of Ternate call them *Manuco-Devata*, or Birds of God; which name Buffon modified into *Manucode*. In different languages they are known by names signifying Birds of the Air, Birds of the Sun, &c.

The males alone are birds of splendid plumage, that of the females possessing neither brilliancy of colour nor remarkable development. The plumage of the males is not only characterised by great brightness of tint, but by a glosy velvety appearance, a metallic lustre, and a singularly beautiful play of colours. Tufts of feathers generally grow from the shoulders, and these, in some of the kinds, are prolonged so as to cover the wings; in the species sometimes called the Common B. of P., and sometimes the Great Emerald B. of P. (*Paradisea*

Bird of Paradise (*Paradisea apoda*)—male.

*apoda*), the prolongation of these shoulder tufts is so great, that they extend far beyond the body, and even far beyond the tail. They constitute the most magnificent part of the well-known B. of P. plumes. They are exquisitely light and delicate. It has

been supposed that they may be of use to the creature in enabling it, with less exertion of wing, to float in the air, but this notion is perhaps sufficiently confuted by the total absence of them in the female. —In other species, there are elongated feathers on the back of the neck, which the bird can erect, and even in some measure throw forward at pleasure; and these, in the genus *Lophotornis*, assume a form resembling that of a pair of outspread wings, and rise far above the head. The tail is, in general, not unlike that of a crow in its shape; but in many species there arise, from the rump, at the sides of the tail, two very long feathers, or rather filaments, covered with a sort of velvety down: of these, the Common B. of P. affords an example. In the King B. of P. (*Chacinarus regius*), these long tail-filaments terminate in a sort of disk, as the tail-feathers of the peacock do.

Birds of P. are, in general, more or less gregarious. They sometimes pass in flocks from one island to another, according to the change of seasons, from the dry to the wet monsoon. Owing to their plumage, they fly more easily against than with the wind, and by high winds they are sometimes thrown to the ground. They are lively and active, and in confinement pert and bold. They bestow great care upon their plumage, and sit always on the perches of the cage, so that no part of it may reach the floor, or get in the least degree soiled. It has seldom been found possible to bring them alive to Europe, and they seem very incapable of enduring any other than a tropical climate. In confinement, they are easily fed on rice, insects, &c. In a wild state, their food consists in great part of the fruit of the teak-tree, and of different species of fig, and also of the large butterflies which abound in their native islands.

The Papuans kill Birds of P. by shooting them with arrows, and employ various other means of taking them for the sake of their skins. The skins are dried in smoke, and fumigated with sulphur, to preserve them from insects; and in this way the brilliancy of the colour is impaired, so that the most gorgeous plumes which are ever seen in Europe are inferior, in this respect, to those of the living bird. The skin, to which great part of the flesh is allowed to remain attached, is always much contracted by this drying process, and a very erroneous notion is therefore often formed of the size of the bird. The common B. of P. is as large as a jay. It is of a cinnamon colour, the upper part of the head and neck yellow, the front and throat emerald green, the shoulder-tufts yellow. The whole length to the extremity of these is not less than two feet. Another nearly allied species (*Paradisea rubra*) has these long feathers of a brilliant carmine colour.

**BIRDE, WILLIAM**, a distinguished ecclesiastical composer, was born about the year 1540, and educated at Edward VI's Chapel. In 1563, he was appointed organist in Lincoln Cathedral, and twelve years afterwards organist to Queen Elizabeth. He published numerous compositions exhibiting great musical learning, and contributed many pieces to Queen Elizabeth's *Virginal Book*; but his fame rests on the canon, *Non Nobis Domine*, which, amid all changes in musical taste, has retained its popularity, and still continues to challenge admiration. B. died in 1623.

**BIRDS (Aves)**, the second class of Vertebrated (q. v.) Animals, and the first of oviparous vertebrated animals, including all the oviparous animals which have warm blood. B. exhibit great similarity in their general structure, and are sharply distinguished

from all other classes of animals. To this class belong all animals, except Bats (q. v.) alone, which have an internal skeleton, and are capable of true flight. The anterior extremities of B. serve them only as wings or organs of flight, and never in any degree as arms or legs; those few birds in which the wings are too small to raise the body in the air, generally employ them to aid their swift running upon land, as the ostrich, or for swimming under water, as the great albatross and the penguins. The body is covered with feathers (q. v.), and this is one of the characters in which all birds agree, and by which they are distinguished from all other animals. The general form is adapted to motion through the air, and the trunk is compact, and somewhat boat-shaped. The vertebral column possesses little flexibility; indeed, the vertebrae of the back generally become ankylosed or firmly united together by cementing bone, the solidity which is thus acquired being of evident use for the support of the ribs, and these also are proportionately stronger than is usual in quadrupeds; each of them is provided in the middle with a flattened bony process, directed obliquely backwards to the next rib, so that they support one another, whilst instead of being united to the sternum, or breast-bone, by cartilages, as in quadrupeds, they are continued to it in the form of bone; all these things combining to give strength to that part of the body in which it is particularly needed, both in order to the powerful action of the wings, and the perfect freedom of respiration during flight. In those birds, however, which do not fly, the vertebrae of the back retain some power of motion. The hinder part of the vertebral column exhibits a solidity even greater than the anterior part of it, the lumbar vertebrae (q. v.) being consolidated into one piece with the pelvis (q. v.), which furnishes attachment to strong muscles for the support of the trunk upon the legs, and for the motion of these organs. The vertebral column, however, terminates in a number of small movable (coccygeal) vertebrae, the flexibility of this part being necessary to the motion of the tail, which is itself supported by a short and generally much elevated bone, regarded as consisting of ankylosed vertebrae called the rump-bone, or, from its peculiar form, the ploughshare-bone.

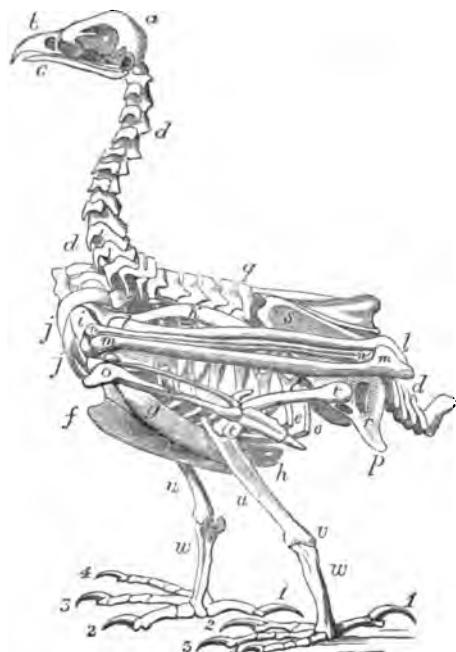

In contrast to the general stiffness of the vertebral column in the trunk, it is remarkable for great flexibility in the neck, enabling a bird to make ready use of its bill, or to bring its head into such positions as suit the adjustment of the centre of gravity in flying, standing, &c.

The number of vertebrae in the neck varies from ten to twenty-three, the smallest number being greater than is found in any quadruped. The head, also, is so articulated to the neck, by a single condyle, or pivot, that a bird can turn its head round in a manner impossible to the mammalia. The skull itself is formed of bones corresponding with those of man and quadrupeds; but they can only be distinguished when the bird is very young, soon becoming consolidated together. The jaws are much elongated, so as to form the bill, the organ chiefly employed in seizing food, as well as for fighting, nest-building, dressing or preening the feathers, and instead of a hand for every purpose which bird-life requires. The upper mandible of the bill is so connected, however, with the bone of the skull, by elastic plates, that it possesses some power of motion, and any shock which it may receive is much deadened before reaching the skull. The bill affords many of the most important distinctive characters of B., differing very much according to the mode of life of different orders and tribes. See BILL.

The following illustration will serve to indicate

the principal bones of a bird's skeleton; we borrow it from M'Gillivray's *British Birds*.

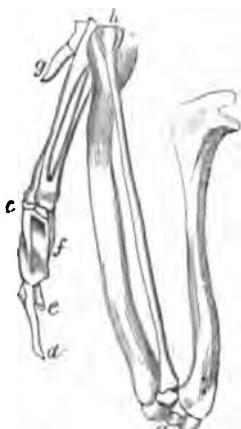

The sternum or breast-bone in B. is remarkably large and strong, serving for the attachment of the

Skeleton of Golden Eagle:

a, cranium; b, upper mandible; c, lower mandible; d, vertebrae; e, ribs; f, sternum; g, coracoid bone; h, furcula; i, scapula; l, humeral bone; m, ulna; n, radius; o, metacarpal bones; p, q, united sacrum and pelvis; r, ischium; s, illium; t, thigh-bone; u, tibia; v, ankle-joint; w, tarsus; 1, first or hind toe; 2, second or inner toe; 3, third or middle toe; 4, fourth or outer toe.

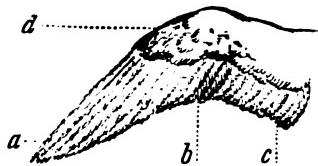

powerful muscles which depress the wings, and receives great attention from naturalists, because its variations correspond with the differences in some of the most important characters and habits of birds. It generally exhibits a projecting ridge along the middle, which is proportionately largest in birds of

Skeleton of Bird's Wing.

most powerful flight, and is wanting only in ostriches and a few other birds of allied genera which do not

fly. The clavicles or collar-bones, also, are generally united to form the fourchette (*furcula*) or merry-thought bone, serving, along with two bones called the coracoid bones, to keep the shoulders separated, and to resist the compressing tendency of the action of the wings. The bones of the wing itself are regarded as corresponding to those of the anterior extremities in man and quadrupeds; the bones of the hand, however, being much disguised, and some of them wanting or rudimentary. In the accompanying cut of the bones of a bird's wing, a is regarded as the elbow-joint, b as the wrist-joint, c as the knuckle-joint, d being the representative of a finger, e and f the rudimentary representatives of two others, whilst the *winglet*, g, formerly regarded as representing the thumb, is now rather supposed to be homologous to the forefinger. The wings, therefore, exhibit a structure entirely different from those of bats, in which the fingers are extremely elongated. The surface necessary for striking the air is provided by feathers larger and stronger than those of other parts of the body, called *wing-feathers*, *quill-feathers*, or *quills*. Of these, which exhibit an admirable combination of strength with lightness and elasticity, some spring from the part of the wing between b and d (in the figure of the bones of the wing); these are always the largest, and are called the *primary wing-feathers*, or simply *primaries*; those which spring from the part between a and b are called *secondaries*; and those which spring from the part between a and the shoulder-joint, are called *tertiaries*. At the base of the quills, on both sides of the wing, are feathers called *wing-coverts*, and these are likewise distinguished as primary, secondary, &c. The feathers which grow over the shoulder-blades are called *scapulars*. The feathers of the wings vary in length and strength, according to the mode of life

Bird's Wing, shewing Quills:  
a, primaries; b, secondaries; c, tertaries; d, winglet.

and power of flight in different B.; narrow, sharp, and stiff wings being indicative of swift and enduring flight. The tail-feathers serve the purpose of a rudder to guide the bird, and also that of balancing it in the air; they resemble in character the quills of the wings. They are also furnished with *coverts* above and below. Some B. have the tail rounded at the extremity; in some, it is square; in others, notched or forked. In many land B., the tail exhibits ornamental plumes, and remarkable developments of the plumage take place also in other parts of the body, in the form of crests, ruffs, shoulder-tufts, &c.

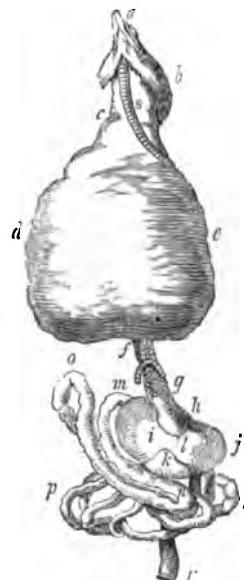

The legs of B. consist of parts corresponding to those found in man and quadrupeds; but the thigh is short, and so concealed within the body, that it is not apparent as an external portion of the limb; the next division, often mistaken for the thigh, being the leg strictly so called, or *tibia*, which ends at what is really the heel-joint, although popularly regarded as the knee; and beneath this is the shank, or *tarsus*, which in some B. is very long, serving as a part not of the foot but of the leg, and formed by a single bone which represents both the tarsus and metatarsus. The feet are divided into toes, which are generally four in number, three before and one behind, differing from each other in length and in the number of joints or phalanges of which they

are composed, the toe, which is directed backward, being in general comparatively short, and consisting only of two joints. A fifth toe or tarsal spur is found in some of the gallinaceous B.; and in some B., as Bustards, the hind-toe is wanting; the ostrich has only two toes, both directed forward, with the obscure rudiment of a third; and numerous B. classed together in the order of Climbers (q. v.) or Yoke-footed B., including Parrots, Cuckoos, Wood-peckers, &c., have two toes before, opposed by two toes behind, the foot being thus particularly adapted for grasping, so that parrots, as is well known, even use it as a hand.—The feet of B. vary considerably according to their mode of life; and naturalists therefore depend very much upon them in classification. In some the claws are strong and hooked; in others short, straight, and weak; in some the toes are all separate, in others more or less connected; in B. specially adapted for swimming, they are generally webbed or united by a membrane; in other swimming B., however, a membrane only extends along the sides of each toe. In most B. the tarsus is feathered to the heel-joint; in some, however, and particularly in *waders*, the lower part of it is bare; the shank and toes are generally, although not always, destitute of feathers, and are covered with a scaly skin. Almost the only other parts of a bird often destitute of feathers, are the cere at the base of the bill, and the combs and wattles of gallinaceous birds.

In order to flight, it is indispensable that the centre of gravity of a bird should be under the shoulders; and when a bird stands, the feet are brought forward, and the head thrown back, so that the claws project beyond a vertical line passing through the centre of gravity of the whole body. This is generally accomplished so that the trunk is in an almost horizontal position, the fore-part only a little elevated; but in some B., which have a short neck and short legs, an erect attitude is necessarily assumed, so that the penguins of the southern seas present to navigators a somewhat ludicrous resemblance to regiments of soldiers on the beach. B., when they sleep, very generally place their head under their wing, and some of them also stand upon one foot, their equilibrium being thus more easily maintained. A remarkable contrivance, particularly to be observed in storks and other long-legged B., renders this posture unfatiguing; a locking of the bone of one part of the limb into a sort of socket in the bone of the part above it, so that it retains its place without muscular exertion; whilst a similar purpose is served by the tendons of the muscles which bend the claws passing over the joints of the leg in such a manner as to be stretched by the mere pressure there when the weight of the bird rests upon the legs, so that without any effort the claws retain a firm hold of the branch upon which it is perched.—Flying is accomplished by the action of the wings upon the elastic and resisting air; the muscles by which the stroke of the wing is given are powerful, those by which it is retracted are comparatively weak. Owing to the manner in which the first strokes of the wing must be given, few B. rise with facility from a level surface; and some of them, as swallows, and particularly swifts, rise from a perfectly level surface with great difficulty, and comparatively seldom alight where they cannot find an elevation from which, as it were, to throw themselves.

The digestive apparatus of B. resembles that of mammalia; exhibiting, however, various modifications, according to the different kinds of food—some B. feeding on flesh, others on fish, others exclusively on insects, others on seeds, others more indiscriminately on a variety of animal and vegetable substances.

Few B. masticate their food in any degree, although parrots do; upon being swallowed, it enters the *crop* or *craw*, sometimes called the first stomach, an enlargement of the oesophagus or gullet, situated just before the breast-bone, and here it is moistened by a secretion, which is also by some B.—particularly by pigeons—employed as the first food for their young, the glands of the crop enlarging very much, so as to produce it in large quantity at the time when it is wanted for that purpose. The crop is wanting in the ostrich, and also generally in B. that feed on fish; and is of greatest size in those of which the food consists of seeds or grain. It is generally single, and on one side of the gullet; sometimes, as in pigeons, it is double. A second stomach, or dilatation of the oesophagus, called the *proventriculus* or *ventriculus succenturiatus*, is generally largest in those B. in which the crop is wanting or small; and in this the food is further softened and changed by a secretion which is mixed with it. The third and principal stomach is the *gizzard*, which in B. of prey, fish-eating B., &c., is a mere membranous sac; but in B. which feed on grain or seeds is very thick and muscular, so that it acts as a sort of mill, and with extraordinary power. In these B., also, a remarkable provision is made for the perfect grinding down of the contents of the gizzard, by the instinct which leads them to swallow small rough pebbles or grains of sand, an instinct well exemplified in the common domestic fowl.—The liver of B. is, in general, very large. The kidneys are large, but there is no urinary bladder, and the urine is at once poured into the *cloaca*, an enlargement of the intestine, at its termination, with which also the organs of generation communicate in both sexes. We are again indebted to M'Gillivray's excellent work for the following cut.

Digestive Organs of Domestic Pigeon:

a, bill; b, head; c, oesophagus; d, crop of extreme size; f, continuation of oesophagus; g, proventriculus; h, gizzard; i, upper muscle; j, lateral muscles; k, lower muscle; l, tendon; m, n, o, p, q, r, intestine; s, trachea.

The respiration of B. is very perfect, and their blood is from 12° to 16° warmer than that of mammalia; its circulation more rapid, and the energy of all the vital processes proportionally great. B., consequently, exhibit great liveliness; and upon the

admirable provision for the aeration of their blood they depend also for their powers of flight, which enable some of them to travel hundreds of miles with great rapidity and without exhaustion, whilst others soar to a prodigious height in the air. The heart resembles that of the mammalia in its form and structure; but the right ventricle, instead of a mere membranous valve, is furnished with a strong muscle, to impel the blood with greater force into the lungs. The lungs are small, and communicate with large air-cells (q. v.) in the cavities of the body, and even in the bones, so that the aeration of the blood takes place not only in the lungs but during its circulation through the body. An extraordinary proof of the use of these air-cells in respiration was afforded in a recorded instance of a large sea-fowl, which, when an attempt was made to strangle it, was kept alive by the air entering in a forcible current through a broken wing-bone. (Gosse, *The Ocean*, quoting Bennett's *Whaling Voyage*.) B. consume much more oxygen in proportion to their size than quadrupeds.

The organs of the senses are similar to those of mammalia. In the senses of touch and taste, it is generally supposed that there is an inferior development, although parrots appear to possess the sense of taste in considerable perfection; and the bills of some B., which search among the mud for their food, are certainly very delicate organs of touch. But the sight is remarkably keen, and the eye possesses great powers of accommodation to different distances. B. perceive even small objects distinctly, at distances at which they would be quite indistinguishable to the human eye, and thus are enabled to seek their food. B. of prey also appear to possess in great perfection the sense of smell. The nostrils of all B. open on the upper surface of the bill. Hearing is acute in B., and particularly in nocturnal B., although the organs of this sense are less complicated than in mammalia, and there is seldom any vestige of an external ear. Singing-B. are extremely sensitive to differences of pitch. The voice and musical powers depend upon the conformation of the windpipe and larynx, which differs very much in different birds.

Reproduction takes place by eggs (see REPRODUCTION and EGG), which are hatched after they have passed from the body of the mother. B. generally sit upon their eggs, their bodies supplying the warmth necessary to hatch them (see INCUBATION); and this office is usually undertaken by the female alone, but sometimes is shared by the male. In very warm climates, the ostrich leaves her eggs to be hatched by the heat of the sun, but in colder climates sits upon them. A very few B., as the cuckoo, deposit their eggs in the nests of other B., to be hatched by them. Some B. construct no nest, but lay their eggs on the bare rock, as many sea-fowl do, or in holes rudely scratched in the earth or sand; many, however, shew in the construction of their nests the most admirable instincts. See NESTS. The number of eggs varies, in a state of nature, from one to about twenty, being generally smallest in the larger B., and particularly in B. of prey. B. generally breed only once a year, but some B. twice. The care which B. take of their young is as admirable as the ingenuity which they display in nest-building, and more universal. Some B. are able to run about, and pick up food as soon as they leave the shell; others remain in the nest for days, or even weeks, and must be supplied with food by their parents. Many species are social, particularly at the breeding-season, and form large settlements, which they guard in common; and some even unite in the construction of large nests, which belong to a whole community.

The rapacious B., and particularly the larger ones, are very solitary in their manner of life.

B. change their feathers (*moult*), in general, once a year, and the colours of the plumage in many cases vary much in summer and winter. The change of colour, however, often takes place without change of feathers, and in B. which moult both in spring and autumn, the autumn moult is much more complete than that of spring. The gayest plumage of many B. is assumed at the breeding-season, with which, also, the song of B. is connected. See SONG OF BIRDS. The plumage of the male is, in general, more gay than that of the female, all the young at first resembling the female in plumage. The plumage usually characteristic of the male is occasionally assumed by the female, and most frequently by females which have become unfit for the ordinary functions of their sex.

The brain in B. differs in some important respects from that of mammalia (see BRAIN), presenting resemblances to the brain of reptiles and fishes; but it is of large size, often larger than even in quadrupeds. The manifestation of intelligence is not, however, usually so great in B. as in quadrupeds. Their nest-building, their migrations (see BIRDS OF PASSAGE), and many other things of greatest interest, must be ascribed to instinct.

In the geographical distribution of B., the limits of species are not so exactly circumscribed by mountains, seas, and rivers, as in other classes of animals, their power of flight enabling them to pass over these obstacles. Yet some species, and even groups, are found exclusively in certain regions: thus humming-birds are all American, penguins are found only in the southern seas, and B. of paradise are confined to New Guinea and the neighbouring islands. See SPECIES.

The free movements of B. through seemingly boundless space, the joyous song of many, and the characteristic tones of all—their brilliant colours, their lively manners, and their wonderful instincts—have from the earliest ages made a strong impression on men's minds, and in the infancy of intellect gave rise to many peculiar and mysterious associations with this class of creatures. Hence the flight of B. was made the foundation of a particular art of divination. See AUGURIES AND AURIPICES. Religion borrowed many of its symbols from them, and poetry many of its ornaments.

In an economical point of view, B. are very important. The flesh and eggs of almost all B. may be eaten, although those of B. of prey and of fish-eating B. are generally reckoned unpleasant. Their feathers are employed for various purposes of use and ornament; their dung is valuable for manure, and guano (q. v.) is nothing else than the accumulated dung of sea-fowls. Many B. are extremely useful in preventing the multiplication of insects and worms, and compensate in this way for the mischief which they occasionally do in fields and gardens. Domestic poultry are a source of considerable profit, upon account of their eggs, flesh, and feathers. See POULTRY. Some kinds of B. of prey have been tamed, and trained to the use of the sportsman. See FALCONERY.

About 5000 existing species of B. are known. As to their systematic arrangement, see ORNITHOLOGY.

The order of B. presents in the Dodo (q. v.) a remarkable and well-ascertained instance of the recent extinction of a species, and even of a genus. It is also a remarkable and interesting fact, that the greater part of the remains of extinct B. hitherto discovered are those of land-B. destitute of the power of flight, like the dodo, and the still existing ostrich, cassowary, emu, and apteryx. A particular interest

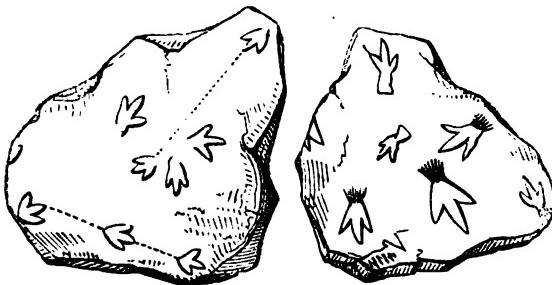

## BIRDS—BIRD'S FOOT.

is attached to those of the gigantic *Dinornis* (q. v.) of New Zealand. See next article.

**BIRDS, FOSSIL.** While the animal and vegetable kingdoms of the palaeontologist extend to as wide, or rather a wider, range than those of the historian of modern life, yet several divisions are scantily represented in the petrified remains preserved in the stony records of the earth's crust. This was to be expected from the conditions under which these fossiliferous strata were deposited. As these rocks are aqueous, chiefly marine, the relics of plants and animals whose natural habitats were in or near the water, must be common in a fossil state, whilst the remains of others with different habits will be comparatively rare, if present at all. Birds belong to this latter class. Their power of flight would save them from numerous casualties which would prove fatal to quadrupeds; and even if they did perish in water, the lightness of their bodies, produced by their internal cavities and the quantity of their feathers, would keep them floating until they decomposed, or became the food of predaceous animals.

The earliest traces of birds consist of footprints on red argillaceous sandstones in the valley of Connecticut river, North America. These sandstones, though long considered of a much older date, have

been, on the best evidence, referred by the brothers Rogers to the colitic period. The beds had formed an ancient sea-beach, and over it, during the recession of the tide, had marched the animals, which have left on them their footsteps. Before the return of the tide, the inequalities had been filled up with dry air-drifted sand and mud, and on this was deposited a new layer of silt. The beds often exhibit ripple-marks, and occasionally small circular depressions, which have been formed by drops of rain. The traces of thirty-three species of B. have been distinguished; with them are associated the impressions of various lizards, chelonians, and batrachians. The size of the *Ornithichnites* (Gr. *ornis*, a bird, and *ichnos*, a trace or footprint), as the bird-tracks are called, so far exceed those that would be made by the largest living birds, that it was doubted whether their origin had been satisfactorily explained, until the discovery, in New Zealand, of the remains of the *Dinornis*. In one species, the imprint of the foot measured fifteen inches in length, and ten inches in breadth, excluding the hind claw, which is two inches long. The distance of the impressions from each other varies from four to six feet. These measurements indicate a bird about four times the size of an ostrich, but probably not much larger than some species of *Dinornis*. The footprints are for the

Bird-tracks in New Red Sandstone.

most part trifid, and shew the same number of joints as exist in the living tridactylous birds.

No indications of the existence of birds have been discovered in the rocks of the cretaceous period. It does not follow, however, that the class *Aves* had no representatives during the ages when the chalk was being deposited. This is a deep-sea formation, and for the reasons already stated, it is not to be expected that the remains of this class should be found in these measures. And so also it would be rash to conclude, that the colitic footprints give the date of the first appearance of B. on the globe. The bone of *Cimiliornis Diomedeus*, found in the chalk, which was described by Professor Owen as part of the humerus of a bird, is now believed to belong to a Pterodactyle.

No true fossil remains of B. have been discovered in rocks older than the Eocene-gypseous deposits of Montmartre, where ten species have been found. Seven species have been described from strata of the Miocene period, the most important of which have been found in the Sewalik beds, associated with the remains of huge proboscidea. But the Pliocene deposits have supplied more than half of the known fossil birds. The most remarkable of these are the bones of huge struthious B. of the genera *Dinornis* (q. v.), *Palapteryx* (q. v.), and *Aptornis*. Dr Mantell mentions the fossil eggs and bones of a bird still larger, called the *Aepyornis*, from Madagascar.

**BIRD'S-EYE LIMESTONE** is a division of the Trenton group of the Lower Silurians of North America, apparently equivalent to the Llandeilo flags, and containing, besides the remains of brachiopods, many enormous orthoceratites.

**BIRD'S-EYE VIEW** is a term applied generally to modes of perspective in which the eye is supposed to look down upon the objects from a considerable height. If the eye is considered as looking perpendicularly down while it sweeps over each point of the scene in succession, we have an exact ground-plan; no object covers another, horizontal angles and distances are exactly represented; while, on the other hand, no vertical angles or side-views appear. In sketching or drawing a locality for military or economical purposes, this kind of perspective is always used. The great difficulty is to represent at the same time the relative heights of mountains and steepness of acclivities. But the more usual kind of bird's-eye views differ from common perspective only in the horizontal line being placed considerably above the picture. In the 16th c., the only kind of views known were of the nature of ground-plans, and the artists of the 17th c. tried to combine this method with side views.

**BIRD'S FOOT** (*Ornithopus*), a genus of plants of the natural order Leguminosæ, sub-order Papilionaceæ, deriving both its popular and its botanical name from the resemblance of the curved pods to

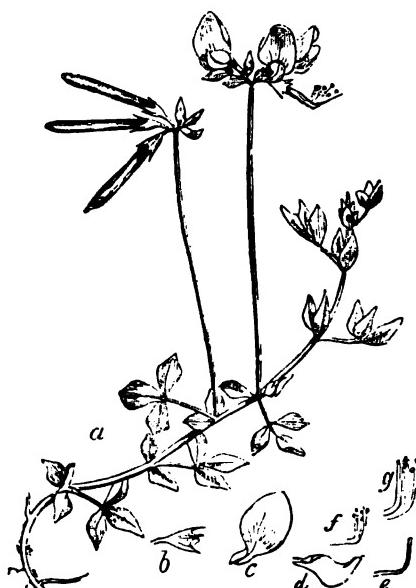

## BIRD'S FOOT TREFOIL—BIRDS OF PASSAGE

birds' claws; the leaves are pinnate, with a terminal leaflet. One species (*O. perpusillus*) is a native of Britain, growing on dry, sandy, or gravelly soils—a small plant of little importance, the flowers of which are white, striated with red. But *O. sativus*, an annual growing to the height of two or three feet, a native of Portugal, is cultivated in that country as green food for cattle, and is very succulent and nutritious. Like its British congener, it grows well on very poor soils. Its Portuguese name is Serradilla.

**BIRD'S FOOT TREFOIL** (*Lotus*), a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*. The pods are cylindrical, somewhat spongy within and imperfectly divided into many cells. The name B. F. T. is derived from the resemblance of the clusters of pods to a bird's foot. It has received the name *Lotus* from botanists, because a species of this genus is supposed to have been one of the plants so named by the Greeks. See *LORUS*. The species, which are pretty numerous, are natives of the temperate and colder regions of the old world. The COMMON B. F. T. (*L. corniculatus*) is very abundant everywhere in Britain in pastures. It has a stem 6-12 inches in length,

cultivation in every variety of soil and situation.—A species called the Winged Pea (*L. tetragonolobus*), remarkable for four membranous wings which run along its pods, a native of the south of Europe, is frequently cultivated in gardens in Britain amongst other annual flowers; but in some parts of Europe it is cultivated for its seeds, which are used as a substitute for coffee.

**BIRDS OF PASSAGE** are those birds which spend one part of the year in one country or climate and another part in another, migrating according to the season. No species of bird is known to hibernate (see *HIBERNATION*); and although many naturalists were at one time inclined to believe in the hibernation of swallows, this opinion has been entirely relinquished, and their annual migrations are fully ascertained. Birds avail themselves of their powers of wing to seek situations adapted for them in respect of temperature and supply of food, and even within the tropics there are birds which migrate as the seasons change from wet to dry, or from dry to wet. See *BIRD OF PARADISE*. The migration of birds, however, is more generally from north to south, or from south to north, in the temperate and colder regions of the globe, as winter passes into summer, or summer into winter; and B. of P. are commonly distinguished into Summer B. of P. and Winter B. of P., as they are summer or winter visitants; but, of course, those which are Summer B. of P. in one country are Winter B. of P. in another. They breed in the country in which they are Summer B. of P. The arrival of Summer B. of P. is always among the welcome signs of advancing spring, and is associated with all that is cheerful and delightful. In winter, flocks of swans, geese, and other waterfowl seek the British coasts and inland lakes and marshes from the frozen north; and at the same time, woodcocks, fieldfares, redwings, and many other birds which breed in more northern regions, regularly appear. Some birds come almost at the same date annually; others are more influenced by the character of the season, as mild or severe. Many sea-fowl are migratory, and the inhabitants of St Kilda and other isles, to whom they are of the greatest importance, depend with confidence upon their return almost at a particular day. The migrations of pigeons in North America are extraordinary, from the vast numbers of which the migrating flocks consist. See *PIGEON*. The whole subject of the migration of birds is one of great interest, particularly in reference to the instinct by which they appear to be guided. Birds of migratory species, which have been reared in confinement, become restless when the season for migration arrives, and in many species the migration seems to be little influenced by the state of the weather. It would seem that the youngest swallows are left behind, to follow the first migrating hosts of their species. The number of B. of P. is very considerable, nor are they all or mostly birds of long wing and powerful flight, but many short-winged birds are included among them. Some B. of P., as woodcocks, have, however, been found in a very exhausted state after their arrival; and it is to be considered that, both in the old and new world, distant migrations are possible without long flights. Some birds possess such powers of wing, that they may easily pass over wide seas; and the rapidity of the flight of birds—from 50 to 150 miles an hour—partly explains the possibility of their migrations between distant parts of the world. It is believed that B. of P. habitually return to the same localities which they have inhabited in former years, and this seems to have been sufficiently established by proof, at least in regard to swallows.

Bird's Foot Trefoil (*Lotus corniculatus*).

a, a stem with leaves, flowers, and pods; b, calyx; c, standard of flower; d, keel of flower; e, style; f, stamens.

decumbent, and bearing umbellate heads of 8-10 yellow flowers, which have a rich honey-like smell. The leaves have three obovate leaflets, like those of the true Trefoils or Clovers, but at the base of each leaf-stalk there are also two large leaf-like ovate stipules. The plant is by some regarded as the shamrock (q. v.) of Ireland. It is eaten with great avidity by cattle, and its deeply penetrating roots adapt it well for very dry situations.—A larger species, otherwise very similar, by many regarded as merely a more luxuriant variety of this, with stem nearly erect, more compact heads of smaller flowers, and much smaller seeds, is the GREATER or NARROW-LEAVED B. F. T. (*L. major*), which also is a common native of Britain, generally found in moist, bushy places. The characteristic differences remain under

## BIRDS OF PREY—BIRMINGHAM.

**BIRDS OF PREY**, a common English appellation of the order of birds called *Accipitres* (q. v.) by Linnaeus. Some birds, however, which do not belong to this order, frequently pursue and prey upon other birds. If those which make fishes, insects, and worms their food, were also reckoned, great part of the whole class of birds must be considered predaceous. B. of P. are very commonly divided into two sections—*Diurnal* and *Nocturnal*; the latter consisting exclusively of owls.

**BIRIOU'TCHÉ**, or **BIRIUTCH**, a town in the government of Voronej, Russia, on the left bank of the Sosna, a tributary of the Don. It is surrounded with earthen ramparts and a ditch, and has four annual fairs. Pop. (1867) 3062. A stream of the same name in its immediate vicinity is noted for its pearl-oysters; and the teeth of elephants are often found exposed on its banks.

**BIRKBECK**, GEORGE, M.D., distinguished for the leading part he took in founding mechanics' institutions, and in the education of the working-classes, was born at Settle, in Yorkshire, January 10, 1776. He commenced his medical studies at Leeds, and pursued them at Edinburgh, where he made the acquaintance, among others, of Sydney Smith, Brougham, Jeffrey, and Horner. Appointed to the chair of the Andersonian Institution in Glasgow, he delivered his first course of lectures on Natural and Experimental Philosophy in the winter of 1799. He took a leading part, along with Brougham and others, in the formation of the London Mechanics' Institution—the first of its kind in the kingdom—and was chosen its president for life. He died in London, December 1, 1841.

**BIRKENHEAD**, a market-town, sea-port, and parliamentary borough in the parish of Bidston, and hundred and union of Wirral, Cheshire, lies opposite Liverpool, on the left bank of the Mersey. The parliamentary borough, which was constituted in 1861, when one of the seats rendered vacant by the disfranchisement of Sudbury and St Albans was assigned to it, includes, besides the chapelry of B., the townships of Claughton, Oxton, Tranmere, and part of Higher Bebington. Pop. (1871) of the township, 42,981; of the parliamentary borough, 66,971. B. has within the last few years risen from comparative obscurity to its present important position. No later than 1818, only a few straggling houses existed, and the population numbered 50. In 1821 it amounted only to 236. The principal streets of B. are laid out with great regularity, crossing each other at right angles, and about 20 yards wide; but the back streets are narrow and the houses mean. Hamilton Square, a quadrangle of about 8 acres, is scarcely excelled by any buildings in the United Kingdom. The park is a splendid feature of B., consisting, as it does, of 180 acres. B. is so situated as to have communication with the entire railway system of the country. A railway bridge over the Mersey at Runcorn was opened for traffic in 1869, which shortened by ten miles the distance between the Liverpool and Birkenhead docks. It is to these docks chiefly that B. owes its rapid development and prosperity. The original idea is due to the late Mr Laird, who in 1824 purchased, at a very low price, a large piece of ground on the borders of the Wallasey Pool, on which he meant to start a ship-building yard. Discovering the capabilities of the site, he began to project plans for extensive docks; and the corporation of Liverpool, dreading the rivalry, purchased the Pool and the lands about it; and in 1847, two docks, the Morpeth and the Egerton, were opened by Lord Morpeth, the chief commissioner of woods and forests. Other docks, and a great floating harbour, were subsequently added,

and now they have a reputation wide as the world, as splendid specimens of engineering skill.

B. has for some years been celebrated for its ship-building yards, some of the largest iron ships afloat having been built there by extensive firms. The too historical *Alabama* was built by the Messrs Laird, to whose enterprise, more than that of any other company, the town owes its present eminence. In the neighbourhood of the docks are the Canada Works for the construction of gigantic bridges, the Britannia Machinery Works, and others.

B. owes its origin to a Benedictine Priory founded there in the 12th c., of which some remains still exist. Edward II. granted the entire monopoly of the ferries to its monks. The remains of the monastery are still in a tolerable state of preservation, exhibiting some fine specimens of the English architecture of the period of its foundation.

**BIRMAH**. See **BURMAH**.

**BIRMINGHAM**, the chief town in Britain for metallic manufactures, and supplying much of the world with hardware, stands near the centre of England, in the north-west of Warwickshire, with suburbs extending into Staffordshire and Worcestershire, 112 miles north-west of London. Built on the east slope of three undulating hills, on the Rea and the Tame, on a gravelly foundation overlying clay and new red sandstone, and supplied with plenty of water, it is one of the best drained towns in England, while the means which have been adopted for the prevention of smoke-contamination of the atmosphere are so far effectual that the air is unusually clear and salubrious. The older part of B. is crowded with workshops and warehouses; but the modern is well built, and possesses some architectural beauty. A new Post-office was built recently and new Corporation Buildings are in course of erection; handsome buildings are being constructed in some of the older quarters of the town. B. began very early to be the seat of iron manufactures, from its vicinity to a forest and extensive iron mines; but its industry and trade were long small. Its high commercial importance dates from the 17th c., when the restoration of Charles II. brought from France a fashionable rage for metal ornaments, and B. supplied the demand with unexampled vigour. From being the 'toyshop of Europe' of Burke's time, B. now constructs steam-engines, hydraulic presses, and Crystal Palaces; and its hardware are unequalled in the world for quantity, variety, and value. Pop. (1690) 4000; (1801) 60,822; (1851) 232,841; (1861) 296,076; (1871) 343,787. B. returns three members to parliament. It produces upwards of £5,000,000 worth of goods yearly, chiefly articles made of gold, silver, iron, brass, steel, mixed metal, plated metal, glass, papier-mâché, japanned and electrotyped articles; including firearms, ammunition, swords, metal ornaments, toys, jewellery, buttons, buckles, lamps, pins, steel-pens, tools, locks, bedsteads, saddlery, steam-engines, and all sorts of machinery. In B. 1000 ounces of gold are made into chains weekly; at least 70 ounces of gold-leaf are used weekly; 30,000 gold rings are made yearly; 150,000 ounces of silver are used yearly; a billion of steel pens are made yearly, 90 tons of iron being used; above 80,000 copper coins are struck daily; 20,000,000 nails are made weekly at one work; 5,000,000 fire-arms were made between 1804 and 1818; and during the Crimean war the government were supplied with 3000 muskets weekly. The button manufacture of B. is very large. The steam-engines employed in B. in 1872 were equal to 10,000 horse-power, and they consumed 600 tons of coal daily. In B. above 20,000 families are engaged in trade, manufactures, and

handicraft. B. has 173 places of worship, 53 belonging to the Establishment; a grammar-school, founded in 1552, with a yearly revenue of £12,000; a Queen's College connected with the London University; a well-conducted literary and scientific institute (the Midland Institute); a free reference and central public library, also 5 free branch libraries; a Roman Catholic college and cathedral; a botanic garden; an art gallery; and four public parks. It is famed for its charitable institutions, and in B. was originated the system of annual collections for local charities. The town-hall can hold 6000 persons, and has a magnificent organ, and a musical festival is held in it once every three years. Of the many ways of spelling the name of this city, the oldest is that given in *Domesday Book*—namely, Birmingham. This was corrupted into Brummagem, a name which has become synonymous with worthless wares with a glittering outside. B. took the Parliament side in 1643, supplying swords, and using them well against Prince Rupert and his lancers. In 1791, a B. mob denounced the distinguished Dr Priestley as an atheist and Jacobin, destroyed his house, library, and apparatus, besides much other property; a statue has recently been erected to his memory. Near Handsworth, a little to the south of B., were the famous Soho Works, founded by Watt and Boulton, where steam-engines were first made. Handsworth church has a statue of Watt by Chantrey, and a bust of Boulton by Flaxman. Darwin, author of *Zoologia*, and Withering the botanist, lived in Birmingham. Thomas Attwood originated the Political Union here, which greatly hastened the passing of the Reform Act of 1832, and the enfranchisement of Birmingham.

**BIRNAM**, a hill 1530 feet high, in the east of Perthshire, near Dunkeld, 12 miles north-west of Perth, and 12 miles west-north-west of Dunsinhan hill, one of the Sidlaws. It commands a fine view of the valley of the Tay. It was formerly covered by part of an ancient royal forest. Shakespeare has immortalised B. wood in his tragedy of *Macbeth*.

**BIRNEE, OLD and NEW**, the name of two towns of Bornu, central Africa. Old B., which was formerly the chief city of the empire, walled and of vast extent, is situated on the banks of the Yeu, about 70 miles north-west of the modern capital Kuka, or Kukawa, and about 75 miles west of Lake Tsad, in lat. 13° N., and long. 13° 15' E. It is now greatly deserted and decayed, but it has still a population estimated at 10,000, and considerable markets. New B. is about 20 miles south of Kuka, is walled, and has a large mud palace. Pop. about the same as that of Old Birnee.

**BIRON, or BIREN, ERNEST JOHN DE**, Duke of Courland, born 1687, was the son of a landed proprietor in Courland, of the name of Bihren. He studied at Königsberg, and in 1714 visited St Petersburg, where his handsome person and cultivated mind soon gained him the favour of Anna Ivanovna, niece of Peter the Great. When Anna ascended the throne of Russia in 1730, Biron repaired to court, and was loaded with honour. He assumed the name and arms of the French duke De Biron, and soon swayed all Russia through his royal mistress. Proud and despotic by nature, he hated every one who stood in the way of his ambition. The princes Dolgorouki and their friends were his first victims. More than a thousand persons were executed by his orders, and a still greater number sent into banishment. The empress is said to have often thrown herself at his feet to induce him to relent, but her prayers and tears were of no avail. It is, however, undeniable, that by the strength of his character he

introduced vigour and power into every branch of the public administration throughout Russia. In the year 1722, he married a Courland lady, and in 1737, the Courlanders were compelled to choose him as their ducal ruler. By his desire the empress, on her death-bed, appointed him guardian and regent during the minority of her presumptive heir, Prince Ivan. On the death of the empress (28th October 1740), Biron assumed the regency, and acted with great prudence and moderation. A secret conspiracy was, however, soon formed against him, and on the night of the 19th November he was arrested, by the orders of Field-marshal Münnich, and conveyed to the fortress of Schlisselburg, where he was tried and sentenced to death. His sentence was afterwards commuted to imprisonment for life, and confiscation of his property. He was now, along with his family, conveyed to Peлим, in Siberia. When, in the following year, Elizabeth ascended the throne of Russia, B. was recalled, and Münnich sent to occupy his prison in Siberia. The sledges met at Kassan; the two enemies looked at each other, but continued their journeys without exchanging a word. During the remainder of Elizabeth's reign, B. continued to reside with his family at Jaroslaw. The Empress Catharine II. restored to him the Duchy of Courland, and he died 28th September 1772.

**BIRR.** See PARSONSTOWN.

**BIRS**, a small but famous affluent of the Rhine. It rises in the canton of Bern, Switzerland, near the pass of the Jura called Pierre Pertuis, flows in a north-easterly direction through the Münsterthal, and enters the Rhine near Basel. In a narrow gorge through which the stream breaks, at a little distance from that city, 500 confederate Swiss died heroically, on the 26th August 1444, in battle against the French army under the Dauphin Louis. On the same river, near the village of Dornbach, about a mile and a half south of Basel, 6000 confederate Swiss gained a splendid victory over 15,000 Austrians, under Fürstenberg, on the 22d of July 1499; in consequence of which, the Emperor Maximilian signed a peace at Basel on the 21st of September following.

**BIRTH.** The act of coming into life has an important legal bearing in regard to the evidence of its legitimacy or illegitimacy. These qualities are variously determined by the regulations of different systems of jurisprudence. The ancient Roman law, as well as the modern Prussian and French Codes, in particular, contain anxious provisions on the subject. In England, no precise time appears to be prescribed for fixing legitimacy or illegitimacy of birth. Forty weeks is considered, in practice, the more usual time for legitimate births; but a discretion to allow a longer time is exercised, when, in the opinion of medical men, or under the peculiar circumstances of the case, protracted gestation may be anticipated, or is likely to occur. In Scotland, the law is more distinct. There, in order to fix bastardy on a child, the husband's absence must continue till within six lunar months of the birth, and a child born after the tenth month is accounted a bastard. The fact of legitimacy or illegitimacy may be judicially determined by an Action of Declarator in the Court of Session, which concludes, according to the nature of the case, for the legitimacy or illegitimacy of the party whose birth is the subject of the legal inquiry. In England, legitimacy may be ascertained by proceedings in the Court for Divorce and Matrimonial Causes, under the 21 and 22 Vict. c. 93, called the 'Legitimacy Declaration Act, 1858'; but there the remedy is not so complete as that afforded by the Scotch declarator, which may decree not only legitimacy, but also illegitimacy. See **BASTARDY**, **HIRE**, **INHERITANCE**.

**BIRTH, CONCEALMENT OF**, is an offence against the public economy, and punishable as a misdemeanour. By the 9 Geo. IV. c. 31, s. 14, it is enacted, that any woman endeavouring to conceal the birth of a child, shall be liable to be imprisoned, with or without hard labour, for any term not more than two years: and it shall not be necessary to prove whether the child died before, at, or after its birth. It is also provided, that if any woman tried for the murder of her child shall be acquitted thereof, it shall be lawful for the jury, so acquitting her, to find her guilty (if the case be so) of concealing the birth: upon which the court may pass the same sentence as if she had been committed upon an indictment for the concealment.

In Scotland, the law on this subject appears to be regulated by the 49 Geo. III. c. 14, by which it is enacted, that if a woman shall conceal her being with child during the whole period of her pregnancy, and shall not call for, or make use of help or assistance in the birth; and if the child shall be found dead, or be amissive, she shall be imprisoned for a period not exceeding two years. It has, however, been decided, that disclosure by the mother to the putative father is a sufficient defence. The punishment usually awarded for this offence in Scotland, is imprisonment from three to six, and in aggravated cases, from nine to eighteen months. See PRE-NANCY, CONCEALMENT OF.

**BIRTHRIGHT.** See INHERITANCE, and PRIMOCEDURE.

**BIRTHS, REGISTRATION OF**, as also that of Burials and Marriages (q. v.), is regulated by the 6 and 7 Will. IV. c. 86, amended by the 7 Will. IV. and 1 Vict. c. 82, by which a general register-office for the whole of England is established. The registrar-general shall, under the act, furnish a sufficient number of strong iron-boxes to hold the register-books, and every such box shall be furnished with a lock and two keys, one of which shall be kept by the registrar, and the other by the superintendent-registrar; and while the register-books are not in use, they are to be kept in the register-box, which shall always be left locked. The form for general registration of births, comprises the time of birth, name, and sex of the child; the name, surname, maiden surname, and profession of the parents; the signature, description, and residence of the informant (who must be the father or mother, or in case of their inability, the occupier of the house, s. 20); the date of registration and signature of the registrar; and also the child's baptismal name (if any be given after registration, within six months). Searches may be made, and certified copies obtained, at the general registrar-office, or at the office of the superintendent-registrar of the district, or from the clergyman, or registrar, or any other person who shall for the time being have the keeping of the register-books. By 3 and 4 Vict. c. 92, provision is made for depositing with the registrar-general a number of non-parochial registers and records of births, baptisms, deaths, burials, and marriages, which had been collected by a commission appointed for that purpose, and for rendering such registers and records available as evidence. For other regulations on the subject of this article, see 21 Vict. c. 25.

The Scotch law relating to the registration of births commenced with 17 and 18 Vict. c. 80, by which a registrar-general, parochial registrars, and other officers are appointed with suitable machinery for carrying out the provisions of the act. It is the duty of the local registrar to ascertain and register all births within his parish or district, without fee or reward, save as provided by the act; but parents,

or persons in charge of children after their birth, are required to give information of such births, and to sign the register; and after the expiration of three months following the day of birth, it shall not be lawful for the registrar to register the same, except as provided by the act. The act declares that the sheriff of the county shall have the care and superintendence of the parochial registrars; and, as in England, the registrar-general is directed to furnish strong iron-boxes to hold the registers and other documents, such box to have a lock with two keys, one of which shall be kept by the registrar, and the other by the sheriff. The 36th section contains the noticeable provision, that in the case of children legitimated by subsequent marriage of the parents, but who were originally registered as illegitimate, such registration shall be corrected by an entry of the marriage on the margin. The act contains other provisions, more or less corresponding to the enactments of the above English statutes, and has been amended by the acts 18 and 19 Vict. c. 29; 19 and 20 Vict. c. 96; and 23 and 24 Vict. c. 85.

**BIRTHS, DEATHS, AND MARRIAGES.** See VITAL STATISTICS.

**BIRTHWORT.** See ARISTOLOCHIA.

**BIBU', BEEROO', or BEROO'**, a kingdom of Sudan, Western Africa, in lat. 15°—16° N., long. 5° 30'—7° 15' W. It is bounded on the N. by the Sahara, on the E. by the Niger, and has Bambara on the S. Its western limits are not clearly defined. The capital town, Walet, is about 260 miles south-west from Timbuctu.

**BIS**, in Music, denotes that the passage over which it is placed is to be played twice, or repeated. Such passages generally have a slur or bow over them, and the word 'bis' written below it, thus bis

**BISACCIA**, a town of the Italian province of Avellino, situated on a hill about 30 miles east-north-east of Avellino, with a population of about 6000. Numerous ancient remains discovered here appear to fix B. as the site of the old *Romulea*, captured by the Romans in the third Samnite war.

**BISACQUI'NO, or BUSACCHI'NO**, a town of Sicily, about 27 miles south of Palermo, with a population of 8690, who carry on an extensive trade in grain and oil.

**BI'SCAY, or VIZCAY'A**, the most northerly of the Basque Provinces (q. v.), is bounded N. by the Bay of Biscay; E. and S. by its sister-provinces, Guipuzcoa and Alava; and W. by Santander. It has an area of about 1300 square miles, and a population, in 1870, of 187,926.

**BI'SCAY, BAY OF**, that portion of the Atlantic Ocean which sweeps in along the northern shores of the Spanish peninsula in an almost straight line from Cape Ortegal to St Jean de Luz, at the western foot of the Pyrenees, and thence curves northward along the west shores of France to the island of Ouessant. Its extreme width is about 400 miles, and its length much about the same. The depth of water varies from 20 to 200 fathoms, being greatest along the north shores of Spain. The whole of the south coast is bold and rocky, in some places rising to a height of several hundred feet, and interspersed with short inlets, some of which form safe and commodious harbours. From the mouth of the Adour to the Gironde, the shore presents a totally different aspect, being low and sandy, with numerous lagoons, the embouchures of these two rivers forming the only harbours. For 200 miles north, the coast is still low, but marshy instead of sandy; and from the peninsula of Quiberon northward to Ouessant, it is moderately

elevated and rocky in some places, with several good harbours. The rivers falling into the Bay of B. on the Spanish shores are unimportant, none of them having a course of more than 30 or 40 miles. On the coast of France, it receives, through the rivers Loire, Charente, Gironde, and Adour, the waters of half the surface of the whole country. Its chief ports are Gijon, Santander, Bilbao, San Sebastian, and Passages, in Spain; and Bayonne, Bordeaux, Rochefort, La Rochelle, and Nantes, in France. Its chief islands—which are all situated north of the Gironde—are Belleiale, Ré, and Oléron. Navigation is rendered difficult and dangerous by the prevalence of north-west winds (which drive in through the wide mouth of the bay large volumes of water from the Atlantic, to be again thrown back from the long regular line of coast towards the centre, thus causing great commotion, and high, short, broken waves), and by the existence of a current—called Rennel's Current—which sweeps in from the ocean round the north coast of Spain, along the west and north-west coasts of France, then shooting across the British Channel, brushes the Scilly Isles, and after approaching the coast of Ireland, turns west and south, till it joins the north African current.

BISCHOF, KARL GUSTAV, a distinguished chemist and geologist, was born at Nürnberg (1792), and became professor of chemistry in Bonn in 1822. Having obtained the prize of the Scientific Society of Holland for his treatise on Internal Terrestrial Heat, he published in England, in connection with it, *Researches on the Internal Heat of the Globe* (Lond. 1841), which was followed by a number of papers on connected geological subjects. The results of his researches (1837—1840) on inflammable gases in coal-mines, and on safety-lamps, appeared in the *Edinburgh New Philosophical Journal* and other periodicals. His chief work is his *Manual of Chemical and Physical Geology*. He died at Bonn in 1870.

BISCHOFF, THEOD. LUDW. WILH., anatomist and physiologist, was born in Hanover, 1807, became professor of anatomy in Heidelberg in 1836. From Heidelberg he removed, in 1843, to the university of Giessen, and in 1854, to that of Munich. He has devoted himself specially to embryology, to which he has made many contributions. His *Entwickelungsgeschichte des Kaninchencieles* (Bruna. 1843) received the prize from the Berlin Academy. Of his numerous writings in Müller's *Archiv*, and published separately, may be singled out the *Beweis der von der Begattung unabhängigen periodischen Reifung und Lösung der Eier der Säugetiere und der Menschen* (Giess. 1844), in which he establishes the important doctrine of the periodic ripening and detachment of the ova in mammalia and man, independently of generation. Being called upon, in 1850, along with Liebig, to give his opinion in the famous Görlich process (q. v.), which involved the question of the possibility of spontaneous combustion, he took occasion to give a dissertation *Über die Selbstverbrennung* (on Spontaneous Combustion), demonstrating its impossibility, which is published in Henke's *Annals of Legal Medicine* (1850).

BISCHWEILER, a German town situated on the Moder, about 14 miles north of Strasburg. B. was formerly fortified, but was dismantled in 1706. It has manufactures of earthenwares, coarse woollens, linens, and gloves, and a trade in beer, leather, and the agricultural produce of the district. Pop. (1871) 9231.

BISCUIT, in Pottery, is the term applied to porcelain and other earthenware after the first firing, and before it has received the glaze and embellishments. See PORCELAIN and POTTERY. In this condition, the ware is very porous, adheres to

the tongue when placed upon it, and allows water very slowly to percolate through its pores. The unglazed bottles employed in cooling water are examples of Biscuit-ware.

BISCUIT, MEAT, a preparation of the substance of meat combined with a certain quantity of flour, made into the form of biscuits, by which process the nutritive qualities of the meat are preserved for any length of time. One way of preparing these biscuits is as follows: Large pieces of beef are placed in a quantity of water sufficient to cover them, and are subjected to slow ebullition. The fat being skimmed off, evaporation is allowed to take place, until the liquid is about the consistency of sirup, when it is mixed with fine wheaten flour, rolled out to the thickness of ordinary ship-biscuit, cut into any shape required, baked, and dried in the ordinary manner. One pound of biscuit usually contains the soluble part of 5 lbs. of meat, and half a pound of flour. The meat-biscuits can be eaten like ordinary biscuits; but boiled in about twenty times their own weight of water for half an hour, with the usual condiments, they make excellent soup, and for this they were chiefly intended. Meat-biscuits were first introduced into Britain from America by Mr Borden, in the year 1851. They have been spoken highly of by medical men as food, and are still made to a limited extent; but one purpose they were at first intended to serve—that of preserving the animal food of South America and Australia—has since been more effectually done by other means. See PRESERVED PROVISIONS in SUPP., Vol. X.

BISCUITS (Fr. twice-baked), small, flat bread, rendered dry and hard by baking, in order to their long preservation. They are divided into two classes—the unfermented and the fermented. Unfermented or unleavened B., generally known as common sea-biscuits or ship-bread, are made of wheaten-flour (retaining some of the bran), water, and common salt. The materials are kneaded together, either by manual labour—that is, by the hands and feet of the workmen—or by introducing the materials into a long trough or box, with a central shaft, to which a series of knives is attached, and which is made to revolve rapidly by machinery. The mass of dough so obtained is then kneaded and thinned out into a sheet the proper thickness of the B., by being passed and repassed between heavy rollers. This sheet being placed below a roller with knife-edge shapes, is readily cut into hexagonal (six-sided) or round pieces of dough of the required size of the biscuits. The indentation of the slabs of dough, in the case of the hexagonal B., is not complete, so that all the B. cut out of each slab remain slightly adhering together. These slabs of B. are then introduced into an oven for about 15 minutes, and are placed in a warm room for 2 or 3 days, to become thoroughly dry. The more modern oven is open at both ends, and the B. being placed in a framework, are drawn by chains through the oven. So rapidly is this operation conducted, that about 2000 lbs. weight of B. are passed through one of these ovens every day of ten hours.

Captains' B. are prepared from wheaten-flour, water, with common salt, and butter, with an occasional small dose of yeast to cause partial fermentation. Milk is also sometimes employed. Water or hard B. are made of flour, water, with variable quantities of butter, eggs, spices, and sugar. Soft B. contain increased quantities of butter and sugar. Yeast B. are those the dough of which is mixed with a small quantity of yeast, yielding more porous biscuits. Buttered B. are made with much butter and a little yeast. Other varieties of B. are named in

the following table, which gives the materials added to the sack of flour, 280 lbs. in weight:

	Water or Milk. quarts.	Butter. lbs.	Sugar. lbs.	Flavouring. Caraway seeds in ounces.	Eggs. 17½
Captains,	10	15			
Abernethy,	8½	17½	17½		17½
Machine,	5½	58	14		
American,	10	40			
Jamaica,	8½	17½	17½		
Coffee,	8½	17½			140

Great care must be taken in the manipulative part of the process to incorporate the ingredients in a systematic manner. Thus, the butter is mixed with the flour in a dry condition, and then the water or milk added; and when eggs are used, they are thoroughly beaten up with water, and the sugar (if the latter is required) and the egg-paste added to the dough, which has been previously prepared with butter, or without butter. The various kinds of B. in the preparation of which yeast is employed, present a more spongy aspect than the unyeasted biscuits. Occasionally a little sesquicarbonate of ammonia (volatile salt) is added, to assist in raising the dough, and make a lighter biscuit. There are three principal varieties of the yeast or fermented B., and the following table gives the ingredients used in their manufacture from a sack of flour, or 280 lbs.:

	Water or Milk. galls.	Dried Yeast. lbs.	Butter. lbs.	Sugar. lbs.
Oliver,	.	10½	4½	35
Reading,	.	...	4½ to 5	25 to 30
Cheltenham,	10½	...	...	5

Soft or spiced B. are prepared from flour, with much sugar, a great many eggs, some butter, and a small quantity of spices and essences. The eggs tend to give a nice yellow cream-colour to the B., which is occasionally imitated by the admixture of a chromate of lead (*chrome yellow*); but this is dangerous, and has given rise to several cases of poisoning. Several of the soft or spiced B. are referred to in the following table, a sack, or 280 lbs., being the amount of flour employed in each instance:

	Eggs.	Sugar.	Butter.	Flavour.
	lbs.	lbs.	lbs.	
Tunbridge Cakes,	{ 930	140	23	Orange flower, Water-currants, Citrons and Cara- ways.
Shrewsbury,	93	93	93	Volatile salt, Cinnamon, Nutmeg or Mace.
Ginger Wafers,	600	112	112	Ginger.
Victoria,	. 750	70	80	Essence of lemon.

The extent to which B. are now consumed may be learned from the fact, that several of the largest biscuit-manufactories each prepare and throw into market every week from 30,000 to 50,000 lbs. weight of B. of various kinds. One of the largest and most complete biscuit-manufactories in England is that of Carr at Carlisle, whose biscuits, sold in tin-boxes, are well known. Another bakery of this kind is that of Harrison of Liverpool.

BISEGLIE, a fortified town of Italy, in the province of Bari. It is built on a promontory in the Adriatic, about 21 miles west-north-west of Bari, the district around being studded with handsome villas and country-houses, and famous for its production of currants, which are considered equal to those of the Ionian Islands. The vine and olive are also cultivated in the neighbourhood. B. has a cathedral, numerous churches, two monasteries, a hospital, an ecclesiastical college, &c., with the ruins

of a hospital founded by Bohemond for pilgrims from the Holy Land, and celebrated during the Crusades. Pop. (1872) 21,371.

BISHOP, the title of the highest order of clergy in the Christian Church. The name is in the Saxon, *biscep*, and is from the Greek *episcopos*, an overseer. The Athenians used to send officers called *episcopoi* to their subject states. The word was adopted by the Romans; and Cicero speaks of himself as an *episcopus* in Campania; it was also applied by them to the officers who inspected the provision-markets. There are two theories as to the functions of a B. in the primitive church, which may be described as the Episcopalian and the Presbyterian theories.

According to the former, the first bishops in the Church of Christ were his apostles; 'for the office whereunto Matthias was chosen is termed (Acts i. 20) *episcope*—i. e., an episcopal office, which being spoken expressly of one, agreeth no less unto them all; and therefore St Cyprian, speaking generally of them all, calls them *bishops*.' The form of government at first established by the apostles was, that the laity or people should be subject to a college of ecclesiastical persons appointed for that purpose in every city. These, in their writings, they term sometimes 'presbyters,' sometimes 'bishops.' Thus St Paul to the elders at Ephesus says: 'Take heed to the flock over which the Holy Ghost hath made you *overseers*'—i. e., bishops. This explains the Presbyterian view of the office. But as the apostles could not themselves be present in all churches, and as in a short time strifes and contentions arose, they appointed, after the order began at Jerusalem, some one president or governor over the rest, who had his authority established a long time before that settled difference of name took place whereby such alone were called bishops; and therefore, in the book of Revelation, we find that they are entitled 'angels.' St Irenaeus, martyred in the 2d c., says: 'We are able to number up them who by the apostles were made bishops.' In Rome, he tells us, they appointed Linus; and in Smyrna, Polycarp. St Ignatius witnesses that they made Evodius B. of Antioch. St Jerome says: 'All bishops are the apostles' successors'; and St Cyprian terms bishops '*propositos qui apostolis vicaria ordinatione succedunt*' (presidents who succeed to the apostles by vicarious ordination). Hooker says, in his usual judicious manner: 'Such as deny apostles to have any successors at all in the office of their apostleship, may hold that opinion without contradiction to this of ours, if they will explain themselves in declaring what truly and properly apostleship is. In some things, every presbyter, in some things only bishops, in some things neither the one nor the other are the apostles' successors.' And he adds, what fairly states the Episcopal theory on this subject: 'The apostles have now their true successors, if not in the largeness, surely in the kind of that episcopal function whereby they had power to sit as spiritual ordinary judges, both over laity and over clergy, where churches Christian were established.' We find, also, that throughout those cities where the apostles did plant Christianity, history has noted a succession of pastores in the seat of *one*, not of many; and the first one in every rank we find to have been, if not some apostle, yet some apostle's disciple. By Epiphanius, the bishops of Jerusalem are reckoned down from St James to his own time; and Tertullian, writing in the 2d c., has the following: 'Let them shew the beginnings of their churches, let them recite their bishops one by one, each in such sort succeeding other that the first B. of them have had for his author and predecessor some

apostle, or at least some apostolical person who persevered with the apostles; for so apostolical churches are wont to bring forth the evidence of their estates.' The judgment of the Church of England as to the primitive existence of bishops is to be found in the preface to the ordination service, drawn up in the reign of Edward V., where it is said: 'It is evident unto all men diligently reading the Holy Scripture and ancient authors, that from the apostles' time there have been these orders of ministers in Christ's church—bishops, priests, and deacons.'

According to the other or Presbyterian theory of bishops, the origin and general history of the institution are thus sketched. In the earliest churches, no traces of a hierarchy, it is affirmed, are to be found. The superintendents or directors appointed over the first churches by the apostles, or chosen by the members of the congregations, were unquestionably styled indifferently presbyters or bishops—the former title being borrowed from the Jewish synagogue, the superintendent or director of which was called the Elder (Gr. *presbyter*); the latter (*episcopos*) being familiar to the heathen converts as the title of a civil office corresponding in function to that of a Christian pastor. But this original equality did not last long. As new churches multiplied, those formed round the original church, though each having its own bishop or presbyter, remained in confederacy; and in the meetings of the pastors to regulate the common affairs, one must of necessity preside, most likely determined by age, superior piety, or other qualification. From this simple circumstance, as is indicated by Clemens Alexandrinus in the beginning of the 3d c., sprang the habit of looking upon one of the bishops as superior to the others; and this superiority, at first personal and accidental, soon came naturally to be regarded as attached to the B. of a particular congregation. In his case the word B. came to signify an overseer of pastors rather than an overseer of people. The monarchical form of state government favoured this tendency, and converted the president of a presbytery into the privileged superintendent of his brother-pastors. The assumption was resisted by the presbyters at first, but from the middle of the 5th c. Episcopacy, or the domination of bishops, continued to gain the upper hand over Presbyterianism, or equality of all pastors.

In the 3d c. bishops appear still dependent on the advice of their presbyters, and the consent of the people, and shared with the former the office of teaching and the cure of souls. As yet their exclusive privileges or functions were limited to confirmation, ordination of ministers, consecration of sacred things, settlement of secular differences among Christians, and management of the revenues of the church. But the tendency to subordination and unity did not rest here. Among the bishops, at first all equal, those of the larger and more important cities began gradually to acquire a superiority over those of inferior cities. When Christianity was made the religion of the Roman empire, the bishops became more and more monarchical, and put themselves on the footing of ecclesiastical princes. The chief cities of the larger civil provinces rose to be seats of extensive dioceses, the bishops of these assuming the distinctive titles of *patriarch*, *metropolitan*, *papa*—titles of courtesy that had long been applied to all bishops; while the less important provinces, with their capitals and bishops, became subordinate. Among these provincial bishops, again, three, from obvious causes, acquired a prominence that cast all the rest into the background—namely, Alexandria, Constantinople, and Rome. The beginnings of the ascendancy of the Roman B. are discernible as

early as the end of the 2d century. While ancient Rome sought her secular dominion more in the south and east, modern ecclesiastical Rome turned herself chiefly to the nations of the west and north; and round the B. of Rome has grown a power—the Roman Catholic Church—not less important than that of imperial Rome.

In the Roman Catholic Church the episcopal office is the foundation of the whole system. Christ's apostles are held to have transferred their functions to the episcopacy as a body. Every B., therefore, exercises within his own diocese, first, the *jus magisterii*—i. e., the right of maintaining and propagating the orthodox faith; and second, the *jus ordinis*, or regulation of the sacred and mysterious rites of the priestly office, some of which are transferred to the inferior clergy, as *jura communia*, while others remain the privilege of the bishop (*jura propria*). Among episcopal prerogatives, in addition to those already mentioned as assigned to them in the 3d and 4th c., are anointing of kings, consecration of abbots, preparation of the chrisma, &c. They have also the management of the church-property in their respective dioceses, and the oversight of all ecclesiastical institutions. Election to the office of B. rests generally with the presbyters of the diocese assembled in chapter, with the sanction of the secular power and of the pope. This is the case in Prussia. Where the sovereign is a Catholic, the appointment is mostly made by him, but subject to papal approbation. At consecration, which requires the presence of three bishops, the new B. takes an oath to the sovereign and to the pope, and signs the articles of belief, on which he receives the episcopal insignia—the mitre (q. v.); crozier (q. v.), or staff; a gold ring, emblematic of his marriage to the church; the cross upon the breast; the dalmatica (q. v.), tunic, pallium (q. v.), and peculiar gloves and chausses; and being enthroned, as formal installation into office, he then pronounces the blessing on the assembled people. In the discharge of his office, the B. has a number of subordinate assistants; sometimes, in case of age or weakness, a coadjutor, but ordinarily deans, archdeacons, &c. (q. v.)

In the Greek church, the office of B. is essentially the same, though less influential. Greek bishops, however, are always chosen from the monkish orders, and generally from the archimandrites—i. e., abbots or priors.

As Protestantism met with its chief resistance from the bishops, and, besides, laid the chief stress on doctrine rather than on church order, the episcopal order, in most of the reformed churches, either disappeared or sank into comparative insignificance. Of the continental Protestant churches, episcopacy has kept the foremost hold in Sweden and Norway. The Scandinavian bishops acceded to the reformation in 1531 only on compulsion from Gustavus Vasa, who confirmed them in their revenues and prerogatives. The B. of Upsala is primate, and has the prerogative of crowning the king, consecrating the other bishops, &c. The bishops are named by the king out of three proposed by the chapters. They preside in consistories, hold synods, visit the churches, examine and ordain ministers, consecrate churches, and watch over purity of doctrine and the property of the church. They have seats in parliament, and wear the pallium, mitre, crozier, and cross. There are only six bishops in Sweden and Norway, with an additional B. of the order of the Seraphim.

In Denmark, the Catholic bishops opposed the reformation, and were (1536) deposed by Christian III., and their extensive possessions confiscated. The king appointed in their stead a general superintendent and 9 Protestant bishops, with a fixed stipend. They are under the secular government,

and have very limited authority over the clergy under their charge. The first in rank is the B. of Seeland.

In Protestant Germany, the episcopal dignity and rights passed into the hands of the secular sovereigns, who, down to quite recent times, assumed the title of supreme bishops, and exercised the prerogatives of such. Where the sovereign, as in Saxony, was of a different confession from the majority of his subjects, the episcopal authority was delegated to a minister. The bishoprics, however, were gradually secularised, and with the nominal or titular bishops of Osnabrück and Lübeck (1803) the old episcopal dignities became almost extinct on the Protestant soil of Germany. The Lutheran Church, however, never formally abolished the office of B., and Melanchthon endeavoured to get it expressly recognised. In Prussia, accordingly, the title of B. has had a fluctuating fate. The bishops in office at the time having acceded to the reformation in 1525, were continued; but in 1554 the revenues were confiscated, and the duties assigned to superintendents. In 1587 this last remnant of the episcopal office also disappeared; till Frederick I conferred the title of B. on two of his court-preachers on occasion of his coronation. At their death it again ceased, and was not revived until at the peace-festival in 1816 Frederick-William III raised two clergymen to the dignity of bishops. One of them, the B. of Königsberg, received in 1829 the title of Evangelical Archbishop. Several have since received the title of B., along with that of superintendent-general, entitling them to the first place in the consistories, a certain civil rank, insignia, and salary. Of the other German states, only Nassau followed the example of Prussia, by naming in 1818 a B. for the united evangelical churches of the duchy. Elsewhere, the episcopal authority, mostly in very limited form, is exercised by consistories, ministries of worship, superintendents-general, inspectors, &c.

In the Church of Scotland, and other Presbyterian churches on the Geneva model, the episcopal office is not recognised. Roman Catholic Scotland was divided into eleven dioceses or bishoprics.

In none of the Protestant countries have the prerogatives and revenues of bishops remained so little impaired as in England, where the reformation was taken into his own hands by the king, and being propagated from above downwards, was effected in a very conservative spirit. Episcopacy was abolished about the time of the Commonwealth, but at the restoration the bishops were restored, and have since retained their position in church and state.

The practice and history of the Church of England in the matter of bishops may be given somewhat more in detail. The B. is the head of the clergy in his diocese; he ordains them, whereby he calls them into existence as ecclesiastical persons; he institutes them to benefices, and licenses them to cures, and to preach; visits them, and superintends their morals; and enforces discipline, for which purpose he has several courts under him, and can suspend or deprive them for due cause.

Over the laity he exercises a general pastoral authority, but they are more particularly brought under his notice at the time of their confirmation. The style, title, and privileges of the B. are inferior to those of the archbishop (q. v.). He is said to be *installed* in his bishopric; he writes himself, By Divine Permission; and has the title of Lord, and Right Rev. Father in God; and he may retain six chaplains. A bishop must be at least 30 years of age; the reason for which is that Christ began his ministry at that age. For many centuries after the Christian era, the B. received all the profits of his diocese, and paid salaries to such as officiated under

him. The mode of election, confirmation, and consecration is the same in the case of bishops and archbishops, for each archbishop is also B., and has his own diocese. The B. is elected by the chapter of his Cathedral church by virtue of licence from the crown. The laity used to take part in the election, but from the tumults that arose, the different sovereigns of Europe took the appointment, in some degree, into their own hands by reserving to themselves the right of confirming these elections, and of granting investiture to the temporalities which now began to be annexed to these dignities. This right was acknowledged in the Emperor Charlemagne by Pope Hadrian I., 773 A.D., and the Council of Lateran. The right of appointing to bishoprics is said to have been in the crown of England even in Saxon times. But when, by length of time, the custom of electing by the clergy only was fully established, the popes began to object to the usual method of granting these investitures, which was *per anulum et baculum*—i.e., by the prince delivering to the prelate a ring and pastoral staff or crozier. In the 11th c., Pope Gregory VII. published a bull of excommunication against all princes who should dare to confer investitures. There were long and eager contests occasioned by this papal claim, but at length the matter was compromised, the Emperor Henry V. agreeing to confer investiture for the future, *per sceptrum*; and the kings of France and England consented to receive only the homage for the temporalities, instead of investing them by the ring and crozier, the pope keeping in his hands the power of confirmation and consecration. This concession was obtained from Henry I.; but King John, in order to obtain the pope's protection against his barons, gave up, by a charter to all monasteries and cathedrals, the free right of electing their prelates. This grant was confirmed in Magna Charta, and was again confirmed, by statute 25 Edward III. But by statute 25 Henry VIII., the ancient right of nomination was in effect restored to the crown. The sovereign, on the vacancy being notified, sends to the dean and chapter a letter missive, or *conge d'élire*, containing the name of the person to be elected; and if they do not elect in the manner appointed by the act, or if the archbishop or B. appointed for the purpose refuse to confirm, invest, and consecrate the B. elect, the recusants incur the penalty of a *proemissio* (q. v.). A bishop is not consecrated more than once, and he cannot be deposed, as it is supposed that the order itself cannot absolutely be taken from him; he may, however, be *deprived*, as was done to the B. of Clogher in 1822; he may also resign his see; and he may be removed from one see to another, which is called *translation*; but this practice is now less frequent than it used to be. The Dean and Chapter of Canterbury claim it as an ancient right of that church, that every B. of the province is to be consecrated in it, or the archbishop to receive from them a licence to consecrate elsewhere; and it is said that a long succession of licences to that purpose are regularly entered in the registry of that church. When elected and confirmed, a B. may exercise all spiritual jurisdiction, but he is not completely B. until consecration. Bishops, upon their election, become peers of the realm, and are summoned to the parliament as well as the other nobles; but the right under which they sit there, whether in respect of their baronies, or by usage and custom, is a matter of uncertainty. It appears, however, that the bishops sat in the Wittenagemote, under the Saxon monarchs, as spiritual persons; for they were not barons until William the Conqueror turned their possessions into baronies, and subjected them to the tenure of knights' service. The bishops created by

## BISHOP—BISHOP'S STORTFORD.

Henry VIII.—viz., Bristol, Gloucester, Chester, Oxford, and Peterborough, as also the lately created bishops of Ripon and Manchester—sit in parliament, though they do not hold their lands by baronial tenure. The bishops withdraw from the House (under protest, however) when any capital charge is to be decided. The bishops sit in parliament next to the Archbishop of York; first, London; second, Durham; third, Winchester; and then the rest according to their ancientities. In respect of their persons, bishops are not peers with the nobility; and in cases of alleged crimes, they are tried by a jury in the same manner as commoners, as was the case with Cranmer and Fisher. When a see is vacant, the archbishop of the province is guardian of the spiritualities; but he cannot as such consecrate or ordain or present to vacant benefices. The sovereign has custody of the lay-revenues during a vacancy. Queen Elizabeth kept the see of Ely vacant nineteen years.

All the bishops of a province, with respect to their archbishop, are called his suffragans; but originally this term denoted the bishops who were consecrated to assist and help the other bishops, and to supply their places when absent. They were also called *clereici opus*, or bishops of the country.

The B. of Durham had formerly a *palatine* jurisdiction, as it was called, in the county of Durham; and the B. of Ely had a similar secular authority in certain places; but these powers were transferred to the crown in 1836. The houses of bishops are called their palaces. In old times their palaces in London were extra-diocesan; and while residing there, they exercised jurisdiction in the same manner as in their own dioceses. This personal privilege is now extinct in the bishops; but Lambeth House, Croydon, Winchester Place, and Ely House retain the privilege. A bishop makes a triennial visitation of his diocese.

The conferring of orders rests, in a great measure, with the discretion of the bishop. He can refuse to ordain without giving any reason, but he can ordain no person who does not subscribe to the Queen's supremacy, the Book of Common Prayer, and the Thirty-nine Articles. A candidate for orders must be first examined and approved; and the person to whom the right of performing this duty belongs, is by the Canon Law the archdeacon of the diocese. A B. may give letters dimissory to another B., licensing the latter to ordain a candidate. No person under 23 can be ordained deacon, and none can be ordained priest under 24 years of age. See ORDINATION.

In England, there are 28 bishops, including the two metropolitans—viz., Canterbury; York; London; Durham; Winchester; Bangor; Rochester; Exeter; Peterborough; St David's; Worcester; Chichester; Lichfield; Ely; Oxford; St Asaph; Manchester; Hereford; Chester; Llandaff; Lincoln; Salisbury; Bath and Wells; Carlisle; Gloucester and Bristol; Ripon; Norwich; Sodor and Man. Two of these, the B. of Sodor and Man, and the junior of the rest (provided he be not either of the archbishops, or London, Durham, or Winchester), have no seat in parliament.

In Ireland, there are twelve, including the two metropolitans, whose sees stand first—viz., Armagh and Clogher; Dublin and Kildare; Meath; Killaloe, Kilfenora, Clonfert and Kilmacduagh; Tuam, Killala, and Achonry; Ossory, Ferns, and Leighlin; Cashel, Emly, Waterford, and Lismore; Down, Connor, and Dromore; Derry and Raphoe; Limerick, Ardfert, and Aghadoe; Kilmore, Elphin, and Ardagh; Cork, Cloyne, and Ross.

In British North America, there are ten sees; in the West Indies, four; in South America, one; in

Africa, six; in Asia, six; in Australasia, twelve; and in Europe, one—that of Gibraltar. There is also a B. of the United Church of England and Ireland at Jerusalem. There are seven bishops of the Episcopal Church in Scotland (q.v.)—viz., of Edinburgh; Argyle and the Isles; Brechin, Glasgow, and Galloway; Moray and Ross; St Andrews and Aberdeen. In the United States, there are thirty-nine bishops of the Protestant Episcopal Church.

There are fourteen Roman Catholic bishops in England, four in Scotland, and four Roman Catholic archbishops in Ireland. The assumption of territorial titles by Roman Catholic bishops in England and Scotland is illegal, but they are, nevertheless, commonly ascribed to them by members of that communion. See Hooker's *Ecclesiastical Polity*, Burn's *Ecclesiastical Law*, Cripe's *Law of the Church*, and Blackstone. See also ARCHBISHOP.

BISHOP, BOY. See BOY BISHOP.

BISHOP, a favourite beverage composed of red wine (claret, Burgundy, &c.) poured warm or cold upon ripe bitter oranges, sugared and spiced to taste, and drunk either hot or cold. The quality of the B. depends upon the excellence of the wine employed in its preparation. The oranges must be carefully selected, and the white part between the peel and pulp must be thrown away. If white wine be used, the beverage is called *cardinal*; and with Tokay it becomes *pope*. Taken in moderation, B. is a wholesome drink; but if partaken of too freely, the aetherial oil contained in the orange-peel is apt to occasion headache. The beverage was known under other names in Germany during the middle ages, having been imported into that country from France and Italy; its present name seems to have been bestowed during the 17th c.

BISHOP, SIR HENRY ROWLEY, an eminent English composer of music, was born in London in 1780. His principal musical instructor was Signor Francesco Bianchi, an opera composer settled in London. In 1806 B. was appointed composer of ballet music at the Opera. His most popular operatic entertainments were *Guy Mannering*; *The Slave*; *The Miller and his Men*; *Maid Marian*; *Native Land*; *The Virgin of the Sun*; &c.—all remarkable for their long flowing melodies, animated style, and true musical power. From 1810 to 1824, he was director of the music at Covent Garden Theatre. One of the first directors of the Philharmonic Society, he for many years conducted the concerts of Ancient Music. He arranged several volumes of the *National Melodies*, and succeeded Sir John Stevenson as arranger of the airs selected by Moore for his *Melodies*. In June 1839 he received the degree of Bachelor of Music from the university of Oxford, and in November 1841, was elected Reid Professor of Music in the university of Edinburgh. In 1842 he was knighted. In December 1843 he resigned his Edinburgh chair, and in February 1848 was elected professor of music in the university of Oxford. In his later years he was in very necessitous circumstances. He died April 30, 1855.

BISHOP'S CASTLE, a town in the south-west of Shropshire, 19 miles south-west of Shrewsbury. It is irregularly built on a hill slope. Pop. (1871) 2091. The bishops of Hereford had formerly a castle here, now destroyed. During the civil wars of the 17th c., the inhabitants took shelter in the church, which was demolished over their heads.

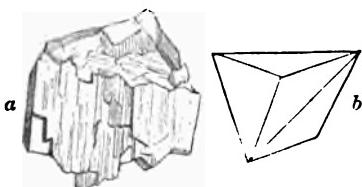

BISHOP'S STORTFORD, a town of Hertfordshire, on the Stort, 10 miles E.N.E. of Hertford. It chiefly consists of two streets in the form of a cross. It carries on a trade in grain and malt, and has several tan-yards. B. S. was in Saxon times the property of the bishops of London. Pop. (1871) 6250.

**BI'SHOP'S WALTHAM**, a town of Hampshire, about 10 miles east-north-east of Southampton. Pop. of parish (1871), 1939. Corn, leather, and malt form the chief trade of the town. It has been immemorially the property of the see of Winchester. There are the remains of a bishop's castle, built in 1135 by Henry de Blois King, Stephen's brother, and which was reduced to ruins during the civil wars of the 17th c. A gang of 'Waltham Blacks,' or deer-stealers, infested the forest in this vicinity in the early part of the 18th c. The *Black Act* (q. v.) was passed in 1723, to put them down.

**BISIGNA'NO**, a town of Italy, in the province of Cosenza, is situated on a hill near the junction of the Mucone with the Crati, about 15 miles north of the town of Cosenza. It has a cathedral, a castle, and a trade in silk, and gives the title of prince to the existing branch of the Sanseverino family. Pop. 4096.

**BISLEY**, a town of Gloucestershire, 11 miles south-east of Gloucester. Pop. of parish (1871), 4985. The chief manufacture is coarse clothing. The church contains some interesting monuments, a cross-legged knight in armour, and an ancient stone font. There is also an ancient octagonal stone-cross in the churchyard. The canal uniting the Severn and the Thames passes through the parish, the highest part being 370 feet above the sea level.

**BISMUTH** is a brittle metal of a crystalline texture, and of a white colour tinged with a faint red hue. It is found native in Cornwall, Germany, France, and Sweden, where it occurs in veins or fissures passing through other rocks. The principal natural source is an impure metal; but it is likewise found in combination with oxygen, sulphur, and arsenic. The pure metal is generally obtained by heating the impure native B. in iron tubes in a furnace, when the metal volatilises, and the vapour, condensing into a liquid in a somewhat cool part of the tube, runs into a receiving-vessel, and is ultimately transferred to moulds, where it solidifies with a crystalline texture. B. is represented by the chemist by the symbol Bi; has the atomic weight or equivalent of 213, and has the specific gravity of 9783 to 9833 (water = 1000). The metal B. is seldom employed by itself in the arts. The

Bismuth :

a, example of native bismuth from Redruth, in Cornwall ;  
b, crystal of bismuth.

alloys of B. are of considerable commercial importance. In combination with tin, B. forms an alloy possessing great sonorousness, and therefore suitable for bells. The alloy of 8 of B., 5 of lead, and 3 of tin, readily fuses at 202° F., and therefore melts in boiling water; and the alloy of 2 of B., 1 of lead, and 1 of tin, at 200-75° F. Either of the latter alloys is entitled to the term *fusible alloy*, and when mixed with some mercury, becomes still more fusible, and may then be used in forming moulds for toilet-soaps, and in taking casts.

B. forms several compounds of service in the arts and in medicine; it combines with oxygen to form

several oxides, of which the teroxide ( $\text{BiO}_3$ ) is the most important. It may be prepared by evaporating the solution of the tannitrate of B. ( $\text{BiO}_3 \cdot 3\text{NO}_3$ ) to dryness, and then heating, when the nitric acid ( $3\text{NO}_3$ ) escapes, and leaves the teroxide of B. ( $\text{BiO}_3$ ) as a yellowish powder. It is employed in the porcelain manufacture as an agent for fixing the gilding, and for increasing the fusibility of fluxes, at the same time neutralising the colours which are often communicated by them. The tannitrate of B. is prepared by acting upon the metal B. with a mixture of one part of commercial nitric acid and one part of water, and applying heat. The subnitrate or basic nitrate of B. receives the names of *Pearl White*, *Pearl Powder*, *Blanc de Fard*, *Blanc d'Espagne*, *Majestery of B.*, and *Peruvices* and *Schminke-weiss* (German). It is used as a cosmetic, but is apt to become gray in tint, and even brown or black, when sulphuretted hydrogen, often evolved from sewers, cesspools, and drains, comes in contact with it.

The subnitrate of B., the only medicinal preparation formed from this metal, acts as a local irritant and caustic poison on animals. On man, when given in small doses, it acts locally as an astringent, diminishing secretion. On account of the frequent relief given by it in painful affections of the stomach, where there is no organic disease, but where sickness and vomiting take place, accompanied by cramp or nervous disorder, it is supposed to act on the nerves of this viscera as a sedative. It has also been denominated tonic and antispasmodic. Vogt says, that when used as a cosmetic, it has been known to produce a spasmotic trembling of the face, ending in paralysis.

**BI'SON**, a name given by the ancients to an animal of the same genus with the ox (q. v.), still called the B., or the European B. (*Bos Bison* of some naturalists, *Bos Ursus* of others); also known as the Aurochs (Germ., wild animal, or wild ox). This animal at one time abounded in most parts of Europe, but is now found only in the forests of Moldavia, Walachia, Lithuania, and Caucasus. Herds of bisons, carefully protected by the emperor of Russia, and believed to amount to about 800 in all, roam through the great forest of Bialowieza, in Lithuania. The B. differs from all varieties of the common ox, in the arched line of the back, which rises in a sudden elevation behind the neck; the hump which is formed not consisting, however, of mere fat, but in great part of the very thick and strong muscles which support the large head. It is remarkable for strength in the fore-parts, and trees of five or six inches in diameter cannot withstand the thrusts of old bulls. It is capable of repelling all the attacks of the wolf or bear, rushing upon, overthrowing, and then trampling an adversary. Its horns are short, tapering, very distant, spreading, a little curved inwards at the point. They are affixed not at the extremities of the most elevated salient line of the head, as in the ox, but considerably in front of it. The figure of the forehead differs also from that of the ox in its greater breadth, and in its convex profile. Another important anatomical difference is in the number of ribs, of which the B. has fourteen pair, whilst the ox has only thirteen; and the vertebrae of the tail are fewer, being only nineteen instead of twenty-one. The hair of the forehead is long and shaggy; that under the chin and on the breast forms a sort of beard; and in winter the neck, hump, and shoulders are covered with long woolly hair, of a dusky brown colour, intermingled with a short, soft, fawn-coloured fur. This long hair is gradually cast in summer. The legs, back, and hinder-parts are covered with short dark-brown hair. The tail

terminates in a large tuft. The females are not so large as the males, nor do they exhibit the same shagginess of the fore-parts. The B. is the largest quadruped now existing in Europe, although within the historic period there appears to have existed along with it an ox exceeding it in size; and it appears to have been this ox, and not the B., which was called *Urus* (q. v.) by the ancients, although their *Bonusus* (or *Bonassus*) was probably the same with the bison.—The food of the B. consists of grass and brushwood, and the leaves and bark of young trees. Its cry is peculiar, ‘resembling a groan or a grunt, more than the lowing of an ox.’ It does not attain its full stature till after its sixth year, and lives for about thirty or forty years. The period of gestation appears to be the same with that of the ox. The B. has never been reduced to subjection by man, and the domestication even of individuals taken young, has been very partial. It generally shews a great aversion to the domestic ox. The common statement, however, that the B. calf invariably refuses to be suckled by the domestic cow, is contradicted on the excellent authority of the master of the imperial forests in the Russian government of Grodno.—The B. is generally very shy, and can only be approached from the leeward, its smell being very acute. It is easily provoked, and is not approached without danger. It runs very swiftly, although it cannot long continue its flight, galloping with its head very low, so that the hoofs are raised higher than the head.

There is no historical evidence that the B. ever existed in Britain; but remains of this, or of a very closely allied species, are found in pliocene freshwater beds in several parts of England, as well as on the continent of Europe. The size of these B. bones is, however, so great as of itself to cause a doubt of the identity of the species, and the horns are longer in proportion. The fossil B. has been called *Bison priscus*; *Bison* being by some naturalists separated as a genus from *Bos*, upon the ground chiefly of the osteological differences in the head.

The American B. (*Bos americanus* of some naturalists, *B. Bison* of others) is interesting as the only species of the ox family indigenous to America, except the Musk Ox (q. v.) of the subarctic regions. It is commonly called *Buffalo* by the Anglo-Americans, although it is very different from the Buffaloes (q. v.) of the old world. It is found in vast numbers in the great prairies between the Mississippi and the Rocky Mountains; it occurs as far north as the vicinity of Great Marten Lake, in lat. 63° or 64°; extensive level and marshy tracts there affording it suitable food, although it is nowhere else to be met with in so high a latitude. Its southern limit appears to be in New Mexico. It is comparatively rare to the west of the Rocky Mountains, and appears to have been rare to the east of the Appalachians, even on the first settlement of Europeans. Within the present century, however, it was found in the western parts of the State of New York, and in large numbers in that of Ohio; but it has now disappeared from the whole region east of the Mississippi, and it is necessary to advance about one hundred miles to the westward of that river before considerable numbers are anywhere to be found. In the western prairies, enormous herds still congregate; great plains are sometimes spotted and darkened with them as far as the eye can reach; ‘countless thousands’ are described as coming to refresh themselves in stagnant pools; and their paths are said to be, in some parts of the wilderness, as frequent and almost as conspicuous as the roads in the most populous parts of the United States.

About 300,000 Indians are supposed to subsist almost entirely on the flesh of the B. The spear and the bow and arrow are still much employed by them in hunting it, although many of them also use firearms. They frequently pursue it on horseback; but the hunter, whether on horseback or on foot, has often much difficulty in getting within shot, upon account of its keenness of scent, and the speed with which it runs. The chase of the B. is also very dangerous, as it is apt to turn upon an adversary, and even a fleet horse cannot always escape it. Great numbers, however, are sometimes killed when the hunters can succeed in throwing the herds that are scattered over the plains into confusion, so that they run wildly, without heeding whither. Another expedient of the Indians is to set fire to the grass of the prairies around them, when they retire in great consternation to the centre, and are easily killed. A sort of pound or enclosure is sometimes made, with a long avenue leading to it, and an embankment of snow, such that when the animals have descended over it they cannot return, and by this means great numbers are often captured and killed. Livingstone describes a similar expedient as in use for killing wild animals in South Africa. Sometimes, also, the Indians contrive to throw them into consternation, and to make them run towards a precipice, over which many of the foremost are driven by the crowds which throng up behind.

The American B. is very similar to the European. In general, it is of rather smaller size, but this does not appear to be always the case, and it is said sometimes to attain a weight of 2000 lbs. Its limbs and tail are shorter, and the tail consists of fewer vertebrae. The horns are shorter and more blunt. The fore-parts are still more shaggy, and retain more of their shagginess in summer. The ground upon which many naturalists have rested their chief confidence of specific difference has been, however, the presence of an additional pair of ribs, the

American Bison.

American B. being said to have fifteen pair; but Mr Vasey has recently ascertained that, like the European B., it has only fourteen. The more gregarious habit may perhaps be accounted for, like that of the American beaver, by difference of circumstances.

The wolf is quite unable to contend with the B., but many wolves often hang around the herds, to devour calves which may stray, or aged animals which have become too weak to keep up with the rest. These have sometimes been seen assailed by whole packs of wolves, and dealing death to many of their assailants, before they were compelled to yield to numbers and hungry pertinacity. The only American animal that is singly capable of overcoming the B. is the grizzly bear. See BEAR.

The flesh of the B. is very good, and differs from

that of the ox in having a sort of venison flavour. The hump, in particular, is esteemed a delicacy.—*Peweecon* (q. v.), so much the food of fur-hunters and northern *voyageurs*, is made of the flesh and fat of the bison.—The tallow forms an important article of trade. One bull sometimes yields 150 lbs. The skins are much used by the Indians for blankets, and when tanned, as coverings for their lodges and beds. A blanket of B.'s skin is not unfrequently sold for three or four pounds sterling in Canada, to be used as a travelling cloak or wrapper. The Mandan Indians make canoes of B. skins spread upon wicker-work frames. These canoes have the round form of the Welsh *coracle* (q. v.). The long hair or fleece is spun and woven into cloth; and some of it which has been brought to England has been made into very fine cloth: stockings, gloves, &c., are also knitted of it. A male B. yields from six to eight pounds of this long hair.

The few attempts which have been made to domesticate the American B., have been so far successful, that they afford encouragement to further experiments. The size and strength of the animal make it probable that, if domesticated, it would be of great use.

BISSA'GOS or BIJU'GA ISLANDS, a group of small volcanic islands, about 20 in all, off the west coast of Africa, in lat.  $10^{\circ} 2'$ — $11^{\circ} 42'$  N., and long.  $15^{\circ} - 17^{\circ}$  W., opposite the mouth of the Rio Grande. The islands are enclosed by a reef, and, with a few exceptions, are thickly wooded. Many of them appear to be densely peopled by a savage, thievish, negro race, who cultivate maize, bananas, and palms, and feed cattle and goats, which constitute their chief wealth. There are several fine ports. On one of the islands, Bulama, the British formed a settlement in 1792, but were obliged to abandon it the following year, on account of its unhealthiness. Bissao, one of the group, on which there is a Portuguese settlement, has a population of 8000. It carries on a large trade in slaves, nearly all its European inhabitants being engaged in the traffic. It has also a trade in rice, wax, hides, &c., and imports annually about £20,000 worth of British manufactured goods.

BISSEN, WILHEM, a distinguished Danish sculptor of the present century, was born near Slesvig in 1798, and studied his art for ten years in Rome, under the guidance of his countryman, Thorwaldsen. Returning home, he executed a number of excellent works (a bust of Oersted, Atalante hunting, &c.). In 1841, he returned to Rome, being commissioned by the government to make 18 statues larger than life. Along with these he produced a Venus, and a charming piece, 'Cupid sharpening his Arrow.' Being recalled to Copenhagen, he was commissioned to execute a frieze of several hundred feet long for the great hall of the palace, representing the development of the human race according to the Greek mythology. Thorwaldsen, in his will, appointed B. to complete his unfinished works and have charge of his museum. In 1850 he was made director of the Academy of Arts, Copenhagen. At the Paris Exhibition in 1855, he was the only sculptor who represented Danish art. He died in 1868.

BI'STORT (*Polygonum Bistorta*), a perennial plant, 1— $1\frac{1}{2}$  ft. high, with a simple stem, ovate subcordate and wavy leaves, the radical leaves tapering into a long footstalk, and one dense terminal cylindrical spiked raceme of flesh-coloured flowers. The root is about the thickness of the little-finger, blackish brown externally, reddish within, and tortuous (whence the name *bistort*). The whole plant is astringent, containing much tannin; the root is one of the strongest vegetable astringents, and is

much employed in medicine, both internally and externally, in hemorrhages and many other complaints. B. is a native of meadows in Europe, and

Bistort (*Polygonum Bistorta*).

is found in Britain, but is by no means common. See POLYGONUM.

BI'STRE, or BI'STER, is a pigment of a warm brown colour, prepared from the soot of wood, especially beech. It is used in water-colours after the manner of Indian ink.

BI'STRITZ, a fortified town of Transylvania, beautifully situated on the Bistriza River, in a fine valley about 50 miles north-east of Klausenburg. In its vicinity are the remains of an ancient castle, once the residence of the illustrious Hunyadas. It has several large cattle-fairs, but the extensive general trade it once carried on is now entirely gone. Forming, as it does, the last strong position in the N.E. of Transylvania, it was repeatedly during 1848—1849 the scene of hot strife between the Hungarian and Austrian generals. Pop. (1869) 7212.—B. is also the name of a river which, rising in East Hungary, flows south-east through Bukowina and Moldavia, and joins the Sereeth near Baku, after a course of 110 miles, and is called the Golden B., on account of the auriferous character of its sands.

BIT, or BITT, in ship-building, is a frame composed chiefly of two short but strong vertical timbers, fixed into or upon the deck in the fore-part of the vessel. Its main purpose is for fastening the cable when the ship rides at anchor, and for 'leading' the principal ropes of the rigging. To 'bit the cable,' is to fasten it round the bit. Various kinds are called 'riding-bits,' 'Elliott's bits,' 'Carrick-bits,' 'paul-bits,' 'jeer-bits,' 'topsail-sheet-bits,' &c. Having to resist great strains, the bits are strongly bolted to the beams that support the deck.

BITCHE, a German town of Alsace-Lorraine, in a wild and wooded pass of the Vosges, about 16

miles east-south-east of Sarreguemines. Its citadel, which is built on a precipitous and isolated rock, in the middle of the town, is well supplied with water, defended by 80 cannon, has accommodation for a garrison of 1000 men, and is considered all but impregnable. The Prussians under the Duke of Brunswick attempted to surprise it in 1793, but failed. Pop. of town, 2456, who are engaged in the manufacture of paper, glass, and porcelain.

BITHOO'R, a town in India in the district of Cawnpore, and lieutenant-governorship of North-west Provinces, stands on the right bank of the Ganges, about 12 miles north-west of Cawnpore itself. B., particularly devoted to the worship of Brahma, has numerous pagodas. It is, of course, a favourite resort for pilgrims, who here, as at Benares and Bindraban, have access to the sacred stream for purposes of ablution, by means of elaborately constructed ghauts. During the mutiny of 1857, B. acquired an unenviable notoriety as the stronghold of Nana Sahib. Here also Havelock more than once exacted retribution, however inadequate, defeating the Nana in the field, and burning his fort. B. in 1871 contained 8322 inhabitants.

BITHY'NIA, an ancient division of Asia Minor, was separated from Europe by the Propontis (Sea of Marmora) and the Thracian Bosporus (Strait of Constantinople), and was bounded N. by the Euxine, and S. by Galatia, Phrygia, and Mysia. Its eastern limits were not very clearly defined, but they at least extended as far as Paphlagonia. It contained the famous Greek cities or colonies of Chalcedon, Heraclea, &c.; and at later periods, Nicomedia, Nicæa, and Prusa, were flourishing cities of Bithynia. The inhabitants of B. were supposed to be of Thracian origin. The country was subdued (560 B.C.) by Croesus of Lydia, and five years later, fell under the Persian dominion. But about 440 or 430 B.C., it became an independent kingdom under a dynasty of native princes, who made Nicomedia their capital. The last king, Nicomedes III., made the Romans his heirs, and with a large addition from the Pontic kingdom, B. became a province of the empire (74 B.C.). Under Trajan, B. was governed by Pliny the Younger, whose letters to the emperor, on the administration and condition of the province contain the well-known passage respecting the Christians. The Emperor Diocletian made Nicomedia his habitual residence. In 1298, Osman the Turk broke into the country; and in 1328, Prusa, or Brusa, then the chief town of B., became the capital of the kingdom of the Osmanli.

BITLIS, a town of Asiatic Turkey, in the pashalic of West Van, in lat. 38° 24' N., and long. 42° 5' E., about 120 miles south-east from Erzrum. It is situated at an elevation of 5156 feet above the level of the sea, in a deep ravine traversed by the river Bitlis, one of the head streams of the Tigris. B. is a straggling, irregular place, covering a large surface of ground, and surrounded by bare limestone mountains, rising to a height of about 2000 feet above the valley, which is filled with orchards and gardens, and watered by numerous streams and springs. It has 3 mosques, about 12 convents belonging to the howling dervishes, who appear to have made B. their head-quarters, several well-stocked bazaars, and extensive manufactures of cotton cloths, which are celebrated for their bright red dye. It has also a very extensive trade. The import of British goods is small. The population consists of about 2000 Mohammedan, and 1000 Armenian families. The Persians defeated Solyman the Magnificent near B. in 1554.

BITO'NTO (ancient *Butuntum*), a town of Italy, in the province of Bari, and 10 miles west-south-west of the city of Bari. It is situated in a fruitful plain about 5 miles from the sea, is well built, is, conjointly with Ruvo, the see of a bishop, and has a fine cathedral, monasteries, and a nunnery. Pop. 16,000, who carry on an extensive trade in a wine called *Zagarello*, which is largely cultivated in the environs. B. is the birthplace of Giordani, the mathematician. In its vicinity, the Spaniards, under Count de Montemar, gained a splendid victory over the Austrians on the 25th of May 1734, the result of which was that Spain re-obtained possession of the kingdom of Naples.

BITTER CRESS. See CRESS.

BITTER KING (*Soulaurea amara*), a shrub or small tree of the natural order *Polygalaceæ* (q. v.), a native of the Indian Archipelago, which has received its name from its intense bitterness. The genus differs from the usual structure of the order in its regular flowers. The B. K. has large oval leaves and axillary racemes of flowers. It is used medicinally in fevers and other diseases.

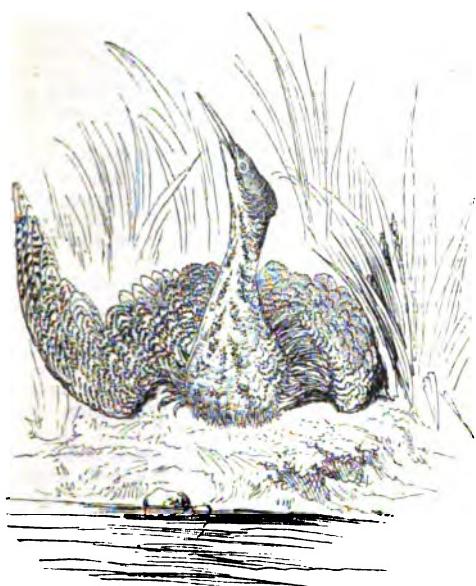

BITTER SPAR, a name given to Dolomite (q. v.), from the magnesia contained in it, which the Germans call *Bitter Salt*.

BITTER VETCH. See OROBIA.

BITTERN (*Botaurus*), according to some modern ornithologists, a genus of the Heron (q. v.) family (*Ardeidae*); but regarded by others as a mere sub-genus of Heron (*Ardea*), and not a very well defined one. Bitterns are indeed chiefly distinguished from herons by the long, loose plumage of the neck, which they have the power of erecting at pleasure, along with the rest of their clothing feathers, so as greatly to increase their apparent size. The back of the neck, however, is merely downy, or almost bare, the long feathers being on the front and sides. Bitterns also differ from herons in the greater length of their toes, the middle toe being as long as the shank. They are almost all solitary birds, inhabiting reedy and marshy places, where they lie hid during the day, and will almost allow themselves to be trodden upon ere they take wing; they feed during the night, and then, also, often rise spirally to a great height into the air, and emit loud resounding cries. Their food consists chiefly of frogs, and partly, also, of fish, lizards, water-insects, &c., and even of small birds and quadrupeds. The claw of the middle toe is serrated on the inner edge, probably to aid in securing slippery prey.—The COMMON B. (*B. stellaris*, or *Ardea stellaris*) is a bird very widely diffused over the old world, being found in almost all, at least of the temperate, parts of Europe, Asia, and Africa, which are sufficiently marshy for its manner of life. It is now rare in Britain, owing to drainage; but was formerly more common, and in the days of falconry, was carefully protected by law in England, on account of the sport which it afforded. Its flesh also was in high esteem, and is not rank and fishy, like that of the herons generally. In size, it is rather less than the common heron; the bill is about four inches long, the feathers on the crown of the head are greenish black, and the plumage in general of a dull yellow colour, beautifully and irregularly marked and mottled with black. The B. makes a rude nest of sticks, reeds, &c., in its marshy haunts, and lays four or five greenish-brown eggs. It has a peculiar bellowing cry, which has obtained for it such English provincial names as Mire-drum, Bull of the Bog, &c., and many of its appellations in other languages, perhaps even its name B. (*Bitour*, *Botur*, *Botaurus*). Some naturalists used to assert that the booming cry of the B. was produced by the bird inserting its bill into a

BITTERN—BITTERSWEET.

reed; that notion, however, has long since been exploded. When assailed, it fights desperately with bill and claws; and it is dangerous to approach it inadvertently when wounded, as it strikes with

Common Bittern (*Botaurus stellaris*).

its long sharp bill, if possible, at the eye.—The LITTLE B. (*B. minutus*, or *Ardea minuta*) is common in some parts of Europe, but rare in Britain. Its whole length is only about thirteen inches.—The AMERICAN B. (*B. lentiginosus*, or *A. lentiginosa*), a species almost equal in size to the common B., and very similar to it in habits and voice, has occasionally been shot in Britain. It is common in many parts of North America, migrating northward and southward, according to the season. The crown of the head is reddish brown, and the colours and markings of the plumage differ considerably from those of the common B.—The LEAST B. (*B.* or *A. exilis*) is another North American species, of very small size, which is also migratory, and somewhat social in its habits. The AUSTRALIAN B. (*B.* or *A. australis*) is generally diffused throughout Australia, wherever marshes or sedgy rivers occur. In habits it closely resembles the B. of Europe. The head and upper parts generally are purplish brown, except the wings, which are buff, conspicuously freckled with brown; the throat, breast, and belly mottled brown and buff.

BITTERN, BITTER LIQUID, or SALT OIL, is an oily liquid obtained during the preparation of common salt (q. v.). When the mother-liquor of the evaporating pan ceases to deposit crystals of common salt, there is left behind in the boiler the material called bittern. It consists principally of a strong solution of common salt, along with Epsom salts, and other compounds of magnesia.

The B. at our salt-works is generally run into tanks, and during winter, it is employed as a source of Epsom salts. The B. is treated with a little sulphuric acid, which converts the chloride of magnesium ( $MgCl$ ) into sulphate of magnesia ( $MgSO_4$ ), and on the liquid being allowed to cool, the crystals of Epsom salts (or sulphate of magnesia) separate.

BITTERS are prepared from an infusion of herbs containing bitter principles. The plant generally used for the purpose is *Archangelica officinalis*, or the Garden Angelica. See ANGELICA. The roots or seeds, or both, are placed in water, and the whole is left to simmer for several days, when the infusion will be strong enough. The B. from Angelica are not much used by physicians, having been superseded very much by infusions of gentian, &c.; but they are still used as a household medicine in town and country by elderly people. The chemical composition of the root is:

Bitter extractive,	27·06
Volatile oil,	0·70
Arid soft resin,	6·02
Gum and common salt,	31·75
Starch,	5·40
Woody fibre,	8·60
Albumen,	0·97
Water and loss,	19·50
	100·00

The medicinal properties of B. are mainly those of a mild tonic and pungent aromatic stimulant, and hence they are serviceable as a stomachic in cases of weakness of the digestive organs. The taste is at first sweetish, rapidly becoming hot, aromatic, and bitter, and the odour is rather pleasant. The Angelica root yields a larger amount of the bitter principle than Angelica seeds. Camomile flowers, coriander-seeds, and other vegetable tonics and stimulants, are occasionally employed in the preparation of bitters.

BITTERSWEET, or WOODY NIGHTSHADE (*Solanum Dulcamara*), a plant found in hedges and thickets in Britain, and in most parts of Europe, also in Asia and in North America. The root is perennial; the annual stems climbing and shrubby,

Bittersweet (*Solanum Dulcamara*):  
a, branchlet with flowers and fruit, reduced; b, a flower, reduced.

many feet in length; the leaves ovate-heart-shaped, the upper ones spear-shaped; the flowers purple, in drooping corymbs, much resembling those of its congener, the potato, but much smaller, followed by ovate red berries of tempting appearance, which, being poisonous, are not unfrequently the cause of serious accidents, particularly to children.

## BITTERWOOD—BIVALVE SHELLS.

twigs, collected in autumn after the leaves are fallen, are used in medicine as a diaphoretic and diuretic, and as a remedy for leprosy and other cutaneous disorders. See SOLANUM.

**BITTERWOOD**, a name given to certain species of the genus *Xylopia*, trees and shrubs remarkable for the bitterness of their wood, particularly the West Indian *X. glabra*. Furniture made of this wood is safe from the attacks of insects.—The genus *Xylopia* belongs to the natural order *Annonaceæ* (q. v.). The fruit of some of the species, particularly *X. sericea*, is highly aromatic and pungent like pepper. *X. sericea* is a large tree, a native of Brazil; its bark is used for making cordage, which is excellent.

B. is also the name of *Pierrea excelsa* (formerly *Quassia excelsa*), a tree of the natural order *Simarubaceæ* (q. v.), a native of Jamaica, the wood of which is used in medicine for the same purposes as Quassia (q. v.), and often under that name; indeed, it is probable that all the present quassia of the shops is really this wood. It is, botanically, very nearly allied to the true quassia, and possesses very similar properties, containing the crystallisable bitter principle called Quassite or Quassin. The wood, which is intensely bitter, is a very useful stomachic and tonic; an infusion of it is a well-known and useful fly-poison; and it appears to act as a powerful narcotic on many quadrupeds.

**BITU'MEN**, a mineral substance, remarkable for its inflammability and its strong peculiar odour; generally, however, supposed to be of vegetable origin. The name, which was in use among the ancient Romans, is variously employed, sometimes to include a number of the substances called *Mineral Resins* (see RESINS), particularly the liquid mineral substances called *Naphtha* (q. v.) and *Petroleum* (q. v.) or *Mineral Oil*, and the solid ones called *Mineral Pitch*, *Asphalt* (q. v.), *Mineral Caoutchouc*, &c.—sometimes in a more restricted sense it is applied by mineralogists only to some of these, and by some mineralogists to the solid, by others to the liquid ones. All these substances are, however, closely allied to each other. Naphtha and petroleum consist essentially of carbon and hydrogen alone, 84—88 per cent. being carbon; the others contain also a little oxygen, which is particularly the case in asphalt, the degree of their solidity appearing to depend upon the proportion of oxygen which they contain, which amounts in some specimens of asphalt to 10 per cent. Asphalt also contains a little nitrogen. Bituminous substances are generally found in connection with carboniferous rocks, in districts where there is, or evidently has been, volcanic agency. See the articles already referred to. Indeed, most kinds of coal contain B., and a substance essentially the same is produced from all kinds of coal by distillation; and whether before existing actually formed in the coal, or produced at the time by the action of heat, B. may often be seen bubbling from pieces of coal after they have begun to burn on an ordinary fire. Some of the shales of the coal-measures are very bituminous, as is also a kind of marl-slate abundant in some parts of the continent of Europe. See **SHALE** and **MARL**.—One of the most interesting of the bituminous minerals is that called *Mineral Caoutchouc* or *Elastic B.*, and for which the new name of *Elaterite* has been devised, as if to support the dignity of its exaltation to the rank of a distinct mineral species. It is a very rare mineral, only three localities being known for it in the world—the Odin lead-mine in Derbyshire; a coal-mine at Montrelais, near Angers, in France; and a coal-mine near South Bury, in Massachusetts. It is elastic and flexible like caoutchouc, and may be used, like it, for effacing pencil-marks. It is easily cut with a

knife. Its colour is blackish, reddish, or yellowish-brown; and its specific gravity is sometimes a little less, and sometimes a little more than that of water. It has a strong bituminous odour, and burns with a sooty flame.

**BITU'MINOUS COAL** is a term applied to the varieties of coal which contain a large percentage of volatile matter. They yield, on their destructive distillation, a considerable quantity of gas, remarkably pure, and with good illuminating qualities, and are consequently largely used for that purpose. See COAL.

**BITU'MINOUS LIMESTONES** are limestones impregnated and sometimes deeply coloured with bituminous matter, obtained from decaying vegetables, or, more probably, from the decomposed remains of those animals, the hard parts of which form so large an amount of the rock.

**BITU'MINOUS SHALES** are indurated beds of clay occurring in the coal-measures, and containing such an amount of carbon and volatile matter that they are able to keep up combustion when mixed with but a little coal. They are indeed impure coal, with a large percentage of ash or earthy matter, which after burning retains the original form. See COAL.

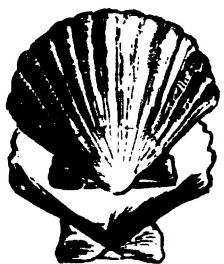

**BITZIUS, ALBERT**, better known under the *nom de plume* of Jeremias Gotthelf, a Swiss author, was born at Morat, in the canton of Freiburg, 4th October 1797. He was educated for the church; and after holding several cures, was appointed, in 1832, pastor of Litzelstühli, in Emmenthal, canton of Bern, which office he retained till his death. His first work was entitled *The Mirror of Peasants* (Burgdorf, 1836). It is the touching history of a poor villager, Jeremias Gotthelf, which pseudonym B. ever after retained. In 1838 appeared his *Sorrows and Joys of a Schoolmaster*; in 1839, *Dursli, the Brandy-drinker, and How Five Maidens miserably perish in Brandy*; in 1842—1846, *Scenes and Traditions of the Swiss*, in six vols., in which B. narrates, with great art, the old national legends, among which the most remarkable is the *Reconciliation*. The best and most popular of his stories, however, are *Grandmother Katy* (Berlin, 1848); *Uli, the Farmer* (Berlin, 2d edition, 1850); its continuation, *Uli, the Farmer* (2d edition, Berlin, 1850); and *Stories and Pictures of Popular Life in Switzerland* (Berlin, 1851). Subsequently, he wrote several pamphlets against the German democrats, without, however, violating those popular sympathies and liberal convictions which pervade his writings, and which at an earlier period led him vehemently to oppose the family government of the Bernese aristocracy. His last work was *The Clergyman's Wife*, which appeared in 1854. Its author died on the 22d October of the same year. B.'s writings are greatly relished in Switzerland. They are characterised by simplicity, inventiveness, a wonderful fidelity in the delineation of manners and habits, great vigour of description, and raciness of humour, while their tone is strictly moral and Christian.

**BIVALEV SHELLS**, or **BIVALVES**, are those testaceous coverings of mollusks which consist of two concave plates or valves, united by a hinge. So long as molluscan animals, provided with shells, were considered by naturalists almost exclusively with respect to these, the order of B. S., originally established by Aristotle, retained its place (see CONCHOLOGY); and indeed the external character upon which it is founded is closely connected with some of the important structural characters according to which mollusks are now classified. See MOLLUSCA. A vast majority of recent B. S. belong to Cuvier's Testaceous order of *Acephalous Mollusca*, the *Lamel-*

*Brachiate* (q. v.) *Mollusca* of Owen, although with them are classed some which were placed among *Multivalves* (q. v.) by conchologists, on account of accessory valves which they possess, and some which have a calcareous tube superadded to the true valves, or even taking their place as the chief covering of the animal. There are also mollusks of the class *Brachiopoda* (q. v.), or *Pallibranchiata*, which possess B. S., as the *Terebratula*, or Lamp-shells (q. v.), &c. The structure of the shell, however, when closely examined, is found to be different in these two classes (see *SHELL*), although its general appearance is much the same. A very large proportion of the B. S. of the older fossiliferous rocks belong to the class *Brachiopoda*.

In the *Brachiopoda*, one valve is ventral, and the other dorsal; in the *Lamellibranchiata*, the one is applied to the right side, and the other to the left side of the animal. The valves of ordinary B. S. consist of layers, of which the outermost is always the smallest; and each inner one extends a little beyond it, so that the shell becomes thicker and stronger as it increases in length and breadth. The valves are connected at the hinge by an elastic ligament; and in general this consists of two parts, more or less distinct—one on the outside, to which the name *ligament* is sometimes restricted, and which is stretched by the closing of the valves; another, sometimes called the *spring*, more internal, which is compressed by the closing of the valves, and tends to open them when the compressing force of the *adductor* muscle or muscles is removed,

the effect of which is to be seen in the gaping of the shell when the animal is dead. The hinge is often furnished with teeth which lock into each other; sometimes it is quite destitute of them; sometimes the hinge-line is curved, sometimes straight. Conchological classification has been much founded upon characters taken from this part. The valves of some B. S. are equal and symmetrical, in others they

Peeten.  
A bivalve shell.

are different from one another, particularly in those mollusks which, like the oyster, attach themselves permanently by one valve to some fixed substance, as a rock. Sometimes the valves of B. S. close completely at the pleasure of the animal; those of others always gape somewhere.

The point at the hinge, from which the formation of each valve has proceeded, is called the *umbo*. On the side of the *umbo* opposite to the ligament there is usually a small depression called the *antrum*. The marks, familiar to every one, upon the inside of a bivalve shell, are the impressions of the *mantle* of the (*Lamellibranchiata*) mollusk, and of the adductor muscle or muscles.

BIVOUAC (from the German *bewacht*, or *besuchen*, to watch over) is the encampment of soldiers in the open air, without tents, where every one remains dressed, and with his weapons by him. Even during the Seven Years' War it was no uncommon thing for the whole army, when in the vicinity of the enemy, to pass the night in their ranks, each lying down in his place, in order to be ready to stand to their arms at a moment's notice. But the French revolutionary armies introduced the practice of dispensing with tents altogether, and regularly passing the night en bivouac. Hence in a great measure that rapidity in their motions which long made them uniformly successful; and the practice

was afterwards imitated by the other armies of Europe, though less by the English. Soldiers in B. light fires, and improvise, where it is possible, huts of straw, branches, &c. But this mode of encampment, though favourable to celerity of movement, is purchased at the expense of the soldiers' health, besides being destructive of discipline, by leading to plundering and destroying of houses, fruit-trees, &c., in the vicinity. Accordingly, the tent is again coming into use, and for permanent encampments, regularly constructed wooden huts have been introduced. There are still, however, many cases where the B. is the only resource.

#### BIXA. See ARNOTTO.

BIZERTA, or BENZERTA (ancient *Hippo Diarrhytus*, or *Zaritus*), a seaport town of Tunis, at the bottom of a deep gulf or bay of the Mediterranean, and at the mouth of a lagoon, united to the gulf by a narrow channel. It is the most northerly town in Africa, being about 38 miles north-west of Tunis, in lat.  $37^{\circ} 17' N.$ , and long.  $9^{\circ} 51' E.$  It is surrounded by walls, and defended by two castles; which, however, as they are commanded by the neighbouring heights, are quite useless against a land-attack. Its port, formerly one of the best in the Mediterranean, has been suffered to fill up, until now only small vessels can be admitted, though very little labour is required to give a uniform depth of 5 or 6 fathoms to the channel leading to the inner harbour or lagoon, which has a depth varying from 10 to 50 fathoms, and is extensive enough to afford accommodation to the largest navies. The adjacent country is remarkably fertile, but its cultivation is neglected. Pop. variously estimated at from 8000 to 14,000. Agathocles, between the years 310 and 307 B.C., fortified and provided B. with a new harbour; and under the Romans, it was a free city.

#### BIZIURA. See MUSK DUCK.

BJÖRNSTJERNA, MAGNUS FRIEDRICH FERDINAND, Count, a Swedish statesman and author, was born 10th October 1779 at Dresden, where his father then resided as secretary to the Swedish legation. He received his education in Germany, and entered Sweden for the first time in 1793 to join the army. In 1813 he was appointed lieutenant in the Swedish army that went to aid the allies in Germany; took part in the conflicts at Grossbeeren and Dennewitz; was present at Leipzig, and concluded the formularies of capitulation with the French at Lübeck and Maastricht. Subsequently, he fought in Holstein, and in Norway, where he concluded the treaty that united that country with Sweden. In 1826, he received the title of count; and in 1828 was appointed ambassador to the court of Great Britain, which office he held till 1846, when he returned to Stockholm, where he died, 6th October 1847. As a politician, B.'s opinions were liberal. In addition to some political writings, he published a work on the Theogony, Philosophy, and Cosmogony of the Hindus in 1843.

BLACK may be considered as the negation of colour, resulting from the absorption of the rays of light by certain substances. Painters produce it by an unequal combination of the three primary colours. In medieval art, B. was symbolical of evil, error, and woe; thus we find Christ, when the old illuminators wished to represent him as wrestling against the Spirit of Evil, arrayed in black drapery; and Byzantine painters, to express the sorrow of the Virgin Mary, gave her a black complexion. 'All faces shall gather blackness,' is the expression of Joel, when he wishes to convey the idea of the trouble of the people when the calamities which, with prophetic eye, he sees brooding over Jerusalem, should come to pass. B. clothing

BLACK—BLACK-BAND IRONSTONE

among some oriental nations was regarded as a badge of servitude, slavery, or low birth; among the Moors, it has several significations—obscurity, grief, despair, constancy. B. in blazonry, under the name of sable, denotes constancy, wisdom, and prudence. For B. as a funereal colour, see FUNERALS, and MOURNING.

**BLACK PIGMENTS**, used in painting, are derived principally from animal and vegetable substances. They are very numerous, and of different hues and degrees of transparency; but the most important are vegetable blue-black—obtained from beech-wood burned in close vessels—ivory-black, cork-black, and lamp-black, the principal constituent of all being charcoal or carbon. A fine-toned B. pigment is obtained by burning German or French Prussian blue. Combined with white, B. P., which are slow driers, yield grays of several tinta.

**BLACK, JOHN**, an eminent newspaper editor, and classical scholar of some reputation, was a native of Berwickshire, his father being a shepherd, or farm-labourer, in the Lammermoors, near Dunse. Born in 1783, and left an orphan at twelve years of age, B. commenced life in the office of a Dunse writer, but he soon left that place for Edinburgh, where he was engaged for several years as a writer's clerk. While in this capacity, B. was assiduous in the work of self-education; and besides considerable progress made in classical studies at this time, he acquired German from a German musician in an Edinburgh band, and Italian from a refugee. Finding Edinburgh too limited a sphere for his energies, he went to London about the year 1810, and was immediately engaged as a parliamentary reporter for the *Morning Chronicle*, of which paper he afterwards became editor. Under his management the *Morning Chronicle* was celebrated for its independence and fearless advocacy of progress, and that at a time when subserviency was so common that it was regarded as little or no disgrace. He retired from the editorship in 1843, and continued to reside, until his death, which took place June 25, 1855, in a pleasant cottage on the Kentish estate of one of his friends. Among those who acted on the *Morning Chronicle* under Mr Black was Mr Charles Dickens, the eminent novelist. B. was author of a *Life of Tasso, with a Historical and Critical Account of his Writings*, 2 vols. (Edin. 1810), and the translator of the lectures of the brothers Schlegel on *Dramatic Art and Literature* (since republished by Bohn), and on the *History of Literature Ancient and Modern*, as well as of one or two works from the French and Italian.

**BLACK, JOSEPH**, an eminent chemist, was born in 1728, at Bordeaux, where his father was engaged in the wine-trade. Both his parents were of Scotch descent, but natives of Belfast, to which their son was sent for his education in 1740. In 1746 he entered the university of Glasgow, and studied chemistry under Dr Cullen. In 1751 he went to Edinburgh to complete his medical course, and in 1754 took his degree. His thesis, on the nature of the causticity of lime and the alkalis, which he shewed to be owing to the absence of the carbonic acid (called by him fixed air) present in limestone and in what are now called the carbonates of the alkalis, contained his first contribution to chemical science, and excited considerable attention. In 1756, on the removal of Cullen to Edinburgh, B. succeeded him as professor of anatomy (which branch he afterwards exchanged for medicine) and lecturer on chemistry in Glasgow. Between 1759 and 1763, he evolved that theory of 'latent heat' on which his scientific fame chiefly rests, and which formed the immediate preliminary to the next great stride in discovery by his pupil and assistant James

Watt. In 1766, Cullen was appointed to the chair of theoretical medicine in Edinburgh, and B. succeeded him in the chair of chemistry. Thenceforth he devoted himself chiefly to the elaboration of his lectures, in which he aimed at the utmost degree of perspicuity, and with perfect success. His class became one of the most popular in the university; it occasioned, however, some disappointment that one so capable of enlarging its territory made no further contributions to chemistry. Though of an extremely delicate constitution, he prolonged his life, by care and temperance, to the age of 71. He died on the 26th November 1799. His lectures were published in 1803 (Edin. 2 vols. 4to), edited, with a biographical and critical preface, by Professor Robison.

**BLACK ACTS** are the acts of the Scottish parliament of the first five Jameses, those of Queen Mary's reign, and of James VI., down to 1586 or 1587. They were called the B. A. because they were all printed in the black or Saxon characters. Several of these acts were afterwards left out in the later additions, most of them because they were private acts, and a few from reasons of state.

In English law-books, the expression 'black act' is applied to the 9 Geo. I c. 22, because it was occasioned by the outrages committed by persons with their faces blackened or otherwise disguised, and associated, as we are told in the preamble of the act, under the name of Blacks, who appeared in Epping Forest, near Waltham in Essex, and destroyed the deer there, and committed other enormities. This act was, however, along with numerous other statutes, repealed in 1827, by the 7 and 8 Geo. IV. c. 27.

**BLACK ART.** See MAGIC.

**BLACK ASSIZE**, the popular name commemorative of an extraordinary and fatal pestilence which broke out at Oxford at the close of the assizes, July 6, 1577. The contemporary accounts describe it as having broken out in the court-house, immediately after the passing of sentence on Richard Jencks, a bookbinder, condemned for alleged sedition to lose his ears. It was popularly interpreted as a divine judgment on the cruelty of the sentence, but the phenomenon is satisfactorily explained by the pestilential atmosphere of the adjoining jail, then, as it was until long after, a seat of misery, filth, and disease. From the 6th of July to the 12th of August, 510 persons are said to have died in Oxford and the neighbourhood of this terrible malady, among whom were the chief officials who sat on the assize, most of the jury, and many members of the university. Women, poor people, physicians, visitors, and children are said to have escaped the infection. A similar event is recorded as having taken place at Cambridge at the Lent Assizes in 1521 (Holinshed's *Chron.*, Stow's *Annals*, Wood's *Athen. Oxon.* &c.).

**BLACK-BAND IRONSTONE** is an ore of iron found very extensively in Scotland and elsewhere. It occurs in the carboniferous system of geologists, in regular bands, layers, or strata, and generally associated with coal and limestone. It is mainly a carbonate of iron accompanied by much coaly matter. The following is the composition of several samples:

	A.	B.	C.	D.	E.	F.

## BLACK BEETLE—BLACKCAP TITMOUSE.

The B. L. is easily reduced. It does not, however, yield a first-class iron when smelted by itself, and is therefore generally mixed with a small quantity of hematite (red iron ore), which communicates strength and hardness to the iron obtained.

**BLACK BEETLE.** See BLAPS and COCKROACH.

**BLA'CKBERRY.** See BRAMBLE.

**BLA'CKBIRD,** or **MERLE** (*Turdus Merula* of some naturalists, *Merula vulgaris* of others), a well-known species of Thrush (q. v.), common in all parts of Britain, and throughout Europe generally; found also in the north of Africa and in the Azores. In Asia, it gives place to a closely allied species, *Turdus pectoropterus*. In size, the B. is intermediate between the missel-thrush and the song-thrush or mavis. The plumage of the adult male is wholly of a deep black colour, the bill and orbits of the eyes yellow; the female and the young are of a dark rusty brown, with dusky bill and eyelids. The B. frequents hedges, thickets, and woods; is shy, restless, and vigilant, keeping much under cover of evergreens or shrubs; and when disturbed, takes wing with a vociferous chattering of alarm, seeking refuge in some neighbouring thicket. Its food consists of worms, snails, insects, berries, &c. Its fondness for fruit makes it often annoying to the gardener; but probably it would in general be better to protect cherries and pears by nets than to shoot the B., which is of great use as a destroyer of insect larva. Like some of the other thrushes, it also devours great numbers of small snails, dexterously breaking the shell against a stone. It is not usually a gregarious bird, although great flocks sometimes appear upon the British coasts in winter, on their passage from more northerly to more southerly countries (*Selby*, quoted by *Yarrell*). Otherwise, the B. is not in Britain a bird of passage. It pairs very early in spring; the male and female are indeed very often seen together during winter; it builds its nest early, and generally has two broods in the year. The nest is generally placed in some thick bush; it is of ruder workmanship than that of the song-thrush, which, however, it resembles, and is usually formed of strong stems of grass, with a finer lining of dry grass inside, and a massive plastering of clay outside. The eggs are four or five in number, of a pale blue colour, generally speckled with brown. The voice of the B. is very powerful, and its song more mellow than that of the thrush, but with 'much less variety, compass, or execution.' The B. is often kept as a cage-bird, and would be much more frequently so, but for the too great loudness of its song: it is very susceptible of being trained, exhibits considerable powers of imitation, and has even been taught to speak.—The RING OUZEL (q. v.), a bird very nearly allied to the B., is sometimes called the Ring Blackbird.—The CROW BLACKBIRDS (q. v.) of America are entirely different.—The SAVANNA B. of the West Indies is also of a different family. See CROTOPHAGA.

**BLA'CKBURN**, a manufacturing town in the middle of Lancashire, on the B. stream now called simply 'the Brook,' 21 miles north-north-west from Manchester. It is much improved of late years, and has a very beautiful Gothic parish church. Coal and lime abound in the vicinity. The great business of the town is the manufacture of cotton stuffs. There are also woollen factories, and large establishments for the manufacture of weaving machinery. Above 200 years ago, a kind of linsey-woolsey was well known as the 'B. Checks,' afterwards superseded by the 'B. Grays,' so called from their being printed unbleached. Here James Hargreaves (q. v.), a native of the town, invented the

spinning-jenny in 1767. He was driven out of the country, and it was more than forty years before B. followed in the general track of improvement introduced by his invention. Pop. in 1871, 82,926. B. returns two members to parliament. B. has a grammar-school founded by Queen Elizabeth in 1567, as well as a number of other educational establishments and religious and benevolent institutions. There is a public park of 50 acres open to the public. The finest building in the town is the new Exchange.

**BLA'CKCAP,** **BLA'CKCAP WA'RBLER,** or **BLA'CKCAP FAUVETTE** (*Currucia atricapilla*), a bird of the great family of the *Sylviidae*, or Warblers, and of the same genus to which the nightingale is commonly referred. See FAUVETTE, WARBLER, and SYLVIADE. It is regarded as the sweetest song-bird in Britain, or indeed in Europe, except the nightingale, to which it is said to be even superior in 'its shake or trilling note.' Very often, however, the strain is desultory, and of short continuance; but it is loud, rich in tone, and has a 'great variety of sweet and gentle modulations.' White says, in his *Natural History of Selborne*, that

Blackcap (*Curruca atricapilla*).

while the B. warbles, its throat is wonderfully distended. It is a rather smaller bird than the nightingale; the female is larger than the male. The back, wings, and tail are of an ash-brown colour; the chin, throat, and breast are gray; the belly, white. The upper part of the head in the male is jet-black; in the female, of a dull rust colour. The feathers of the head, both in the male and female, are somewhat erected, giving the bird a hooded appearance, on account of which it is called, in Germany, *the monk*. In Britain, the B. is a bird of passage, arriving early in spring, and retiring in September. The males, as in the case of the nightingale, arrive a few days before the females. The B. is not a common bird in Britain: it is most frequent in the southern counties of England, but is found even in Scotland; on the continent, it extends its migrations as far north as Lapland. In the south of Europe, it is found both in summer and winter. As a cage-bird, it is pleasing not only on account of its song—which, however, is sometimes partly spoiled by its too successful imitation of other birds—but also on account of its manners, the intelligence which it displays, and its strong attachment to those who are accustomed to feed and caress it.

**BLA'CKCAP TITMOUSE,** or **CHICKADEE**, a North American bird. See TITMOUSE. The Marsh Titmouse, a British bird, is sometimes called Blackcap, or Blackcap Titmouse.

## BLACK CHALK—BLACK DEATH.

**BLACK CHALK** is a variety of Clay-slate (q. v.), containing a considerable proportion of carbon. It is used for drawing, and is also ground down to form a black paint. It is found as a rock of a silty texture and bluish-black colour in the island of Islay and in Caernarvonshire, also in Spain, and other parts of the world.

**BLA'CKCOOCK, HEATH-FOWL, or BLACK GROUSE** (*Tetrao Tetrix*), a species of Grouse (q. v.), abundant in Britain wherever there are moors of considerable extent, and more particularly where there are bogs and morasses with rank herbage, or, adjacent to the moors, natural woods or young plantations of pine and fir. Comparatively rare in the south of England, the B. becomes more common towards the north, and is very plentiful in the mountainous parts of Scotland. It is found in some of the Hebrides, but not in the Orkney or Shetland Isles. On the continent of Europe, it occurs both in mountainous and marshy countries, as on the Alps and in Holland; it is found as far south as the Apennines, and as far north as the forests of Lapland; it abounds in most parts of Scandinavia, where it is carefully protected, the males only being killed, great numbers of which are sent to the London market; it is diffused over almost all parts of Russia, and is found in Siberia. The male is much larger than the female, sometimes weighing as much as four pounds, whilst the female weighs only about two pounds; they also differ very much in plumage. The male is of a shining bluish-black colour, with a conspicuous white bar on the wings below the ends of the great wing-coverts, and a mixture of black and white on the legs; there is a piece of bare scarlet skin over the eye; the outer feathers on each side of the tail are elongated and curve outwards, giving it a very peculiar appearance. The female, called the *Gray Hen*, is of a rust colour,

Blackcock (*Tetrao Tetrix*).

darkest on the upper parts, everywhere barred and mottled with a darker colour; the tail is straight and even at the end. The young males resemble the females in plumage. The shank in this species is feathered, but not the toes. It is a gregarious bird, the different sexes, however, in winter, generally keeping in flocks by themselves. In spring, the males resort to elevated and open spots, where they crow, and also make a sound which has been likened to the whetting of a scythe, thus inviting the females to repair to them; they strut and trail their wings like turkey-cocks, and fierce contests often take place among them. They are polygamous, and pay no attention to the females during incubation, nor do they take any part in rearing the young.—The nest is of the simplest construction, a few straws or

the like, placed together among tall heath, or under the shelter of a low thick bush. The eggs, six to eight in number, are yellowish-white, speckled with orange-brown, and about two inches long. The food of the B. consists of the seeds of rushes and other plants, berries, insects, the tender shoots of heath, stubbles to feed on corn; is frequently to be found in turnip-fields in the neighbourhood of plantations in hilly districts; and, at least in winter, eats the young shoots of pines, firs, birches, and alders. It is highly esteemed for the table.

It seems to be well established that hybrids are occasionally produced between the B. and other species of grouse; and also between the B. and the pheasant; but this subject, although regarded with much interest by some of the greatest naturalists, has not yet received the investigation which it deserves, and nothing appears to be known concerning any offspring of such hybrids. See Yarrell's *British Birds*, ii. 289—314. It can only be deemed probable, not certain, that the bird called *Tetrao hybridus*, sometimes found in the Scandinavian peninsula and other parts of Europe, is a hybrid between the B. and the Capercaillie (q. v.).

**BLACK DEATH** was one of the names given to an oriental plague marked by inflammatory boils and tumours, which in the 14th c. desolated the world. It took this name from the black spots, symptomatic of a putrid decomposition, which, at one of its stages, appeared upon the skin.

Our information as to the symptoms and course of this terrible malady is far from perfect. So much is clear, that they varied somewhat from case to case, and in different countries, and greatly changed towards the close of the period of its ravages in Europe (1348—1351). Among them may be noticed great imposthumous on the thighs and arms—what are called buboes—and smaller boils on the arms and face; in many cases, black spots all over the body; and in some, affection of the head, stupor, and palsies of the tongue, which became black as if suffused with blood; burning and unspeakable thirst; putrid inflammation of the lungs, attended by acute pains in the chest, the expectoration of blood, and a fetid pestiferous breath. On the first appearance of the plague in Europe, fever, the evacuation of blood, and carbuncular affection of the lungs, brought death before the other symptoms could be developed; afterwards, boils and buboes characterised its fatal course in Europe as in the East. In almost all cases its victims perished in two or three days after being attacked. Its spots and tumours were the seals of a doom which medicine had no power to avert, and which in despair many anticipated by self-slaughter.

If the symptoms of the B. D. have been only imperfectly handed down to us, the history of its rise and progress is still more obscure. But while fable enters largely into its history, it would seem to be safe to assign its birthplace to China; and there is a strong concurrence of testimony, that the causes which co-operated to produce it are to be sought for as far back as 1333—15 years before its outbreak in Europe—in a series of great convulsions of the earth's structure, which commenced in that year, and which, for 26 years thereafter, continued powerfully to affect the conditions of animal and vegetable life. The precise date of the appearance of the plague in China is unknown, but from 1333 till 1348, that great country suffered a terrible mortality from droughts, famines, floods, earthquakes which swallowed mountains, and swarms of innumerable locusts; and in the last few years of that period, from the plague. During the same time, Europe manifested sympathy with the changes

## BLACK DEATH.

which affected the East. The order of the seasons seemed at various times to be inverted; storms of thunder and lightning were frequent in the dead of winter, and there occurred great earthquakes and eruptions of volcanoes conceived to have become extinct. The theory is, that this great tellurian activity, accompanied by the decomposition of vast organic masses, myriads of bodies of men, brutes, and locusts, produced some change in the atmosphere unfavourable to life; and some writers, speaking of the established progress of the plague from East to West, say that the impure air was actually visible, as it approached with its burden of death. 'A dense and awful fog was seen in the heavens, rising in the East, and descending upon Italy' (*Mansfeld Chronicle in Cyriac Spangenberg*, chap. 287, fol. 336). With this view of the plague is to be conjoined another regarding the causes which produced a predisposition of the inhabitants of Europe to become its victims, and which are referred to the effects on the popular health partly of scarcity, and partly of the prevalent bad habits of living. There is much probability in the theory, that the plague was owing to an atmospheric poison acting on the organs of respiration, which, it will be recollectcd, were always those first attacked. But while impurity of the air and the state of the public health may have largely contributed to the mortality, it may be doubted whether the disease did not owe its extension almost wholly to infection and contagion, whatever causes may have originally produced it. It appears that the pestilence had in a milder form appeared in Europe in 1342, but it had passed away, and there is little reason for holding that, in the interval, it remained merely latent. The invasion of 1348 may actually be tracked from China in its advance by the various caravan routes towards the West. The northern coast of the Black Sea sent the plague by contagion to Constantinople. By contagion it reached the seaports of Italy, and thence, as from so many foci of contagion, it soon established itself over Europe. Its advance may be traced through Germany and France to England, from which it was transmitted to Sweden. It was three years from its appearance at Constantinople, before it crept, by a great circle, to the Russian territories. This fact of its spread by contagion has led to speculations as to whether, by rigid rules of quarantine, it might not have been excluded from Europe. Such rules are now at many points in force as securities against oriental plagues.

There are no proper materials for estimating the mortality which this plague produced, for it occurred before the value of statistics was appreciated. But in China, 13,000,000 are said to have died, and in the rest of the East nearly 24,000,000. These numbers appal the imagination. Coming to Europe, the horror is increased by the greater exactness of the details. London alone lost over 100,000 souls; 15 European cities lost among them about 300,000; Germany is calculated to have lost 1,244,434; Italy, one half of its population. On a moderate calculation, it may be assumed that there perished in Europe 25,000,000 human beings. Africa suffered with the rest of the known world. Everywhere was death. All animal life was threatened. Rivers were consecrated to receive corpses, for which none dared perform the rites of burial, and which in other places were cast in thousands into huge pits made for their reception. Death was on the sea, too, as well as on the land, and the imagination is quickened to the realisation of the terrible mortality by accounts of ships without crews—the crews dead and putrefying on the decks of the aimless hulls—drifting through the Mediterranean, the Black and the North Seas, and cursing with the contagion the

shores on which winds or the tide chanced to cast them.

The mortality caused by the plague was, however, only one of the evils to which it gave rise. Its moral effects on the survivors and the frame of society were no less momentous. Many died of fear, which among the living dissolved the ties of kindred; mothers forsook their plague-stricken children; the worldly became quickened to a mad-dening sense of sin; the religious fixed their eyes more steadily on futurity; all rushed to sacrifice their means to the church, while the ecclesiastics drew back from the gold showered over their walls, as being tainted with death. Superstition finally banded multitudes together by common means to work out the common safety. In Hungary, and afterwards in Germany, rose the brotherhood of the Flagellants, who undertook to expiate the sins of the people, and avert the pestilence by self-imposed sufferings. Originally of the lower classes, they gathered to their order, as it extended, crowds of the highest, both men and women, and marched from city to city, robed in sombre garments, with red crosses on the breast, back, and cap, and with their heads covered as far as the eyes; they went chanting in solemn processions with banners, with down-turned faces, and bearing triple scourges with points of iron, with which, at stated times, they lacerated their bodies. They at last pervaded nearly all Europe; Germany, Hungary, Poland, Bohemia, Silesia, and Flanders did them homage. This, however, is not the place to give their history, for which the reader will refer to the article under the head FLAGELLANTS. Suffice it that the order was not suppressed till the pope, at the instigation of several crowned heads, prohibited throughout Christendom their pilgrimages, on pain of excommunication. While the wanderings of the Flagellants threw society into confusion, and helped to spread the plague, the horrors of the time were further heightened by the fearful persecutions to which the Jews were subjected, from a popular belief that the pestilence was owing to their poisoning the public wells. The people rose to exterminate the Hebrew race, of whom, in Mayence alone, 12,000 were cruelly murdered. They were killed by fire and by torture wherever they could be found, and for them, to the terrors of the plague were added those of a populace everywhere infuriated against them. In some places, the Jewish people immolated themselves in masses; in others, not a soul of them survived the assaults of their enemies. No adequate notion can be conveyed of these horrors. To aggravate the pestilence, the poison-panic made the people shut up their wells. With terror of poison and of plagues in a state of society rude at the best, but now disorganised, what means were available to mitigate or prevent the sufferings of the people were rendered altogether nugatory.

It would be useless to attempt to give any notion of the effects on society of this plague; how during it some, like people in sieges, came to be callous, and some, like thieves under the gallows, to regard the desolation only as it afforded opportunities for plunder and indulgence. The whole phenomena would form a fine study for the social philosopher and psychologist. We must content ourselves here with referring the reader to the *Decameron* of Boccaccio for a description of the plague at Florence, which, for vividness and particularity of observation, almost equals Thucydides's account of the plague at Athens. In Bulwer's *Rienzi*, also, an account of the plague will be found. The reader should also consult Hecker's *Epidemics of the Middle Ages*, translated for the Sydenham

Society. Accounts of the plague have been left us by the physicians Guy de Chauliac and Chalin de Vinario. But perhaps Boccaccio's is the best of the whole. The B. D. afterwards more than once appeared in Europe, but never with the same virulence or duration.

**BLA'CKFISH** (*Centrolophus Moris*), a fish of the family of the *Scomberidae* (q. v.), very nearly allied to the beautiful *Coryphenea* (q. v.), so frequently called *dolphins*. It is found both in the Mediterranean Sea and on the western coasts of Europe, occasionally on the southern coasts of Britain, but is everywhere rare, perhaps because it is an inhabitant chiefly of deep waters. It is known to attain a length of more than thirty inches, and a weight of fourteen pounds. The general form is not unlike that of a perch; there is a single elongated dorsal fin with short rays, rising from a thin elevated ridge; the body is covered with minute scales, the skin is tough and can be stripped off like that of an eel; there is no air-bladder. The colour is black, that of the fins intensely so. The B. is remarkable for great strength and velocity. As an article of food, it is described as delicious.

**BLACK FLUX** is prepared by heating in a covered crucible ordinary or crude cream of tartar, or the bitartrate of potash ( $KO_2HO_2C_4H_4O_1_0$ ), when the tartaric acid ( $C_4H_4O_1_0$ ) is decomposed, and charred, forming carbonic acid ( $CO_2$ ), which remains in combination with the potash ( $KO$ ) as carbonate of potash ( $KO.CO_3$ ), accompanied by much free carbon. This very intimate mixture of carbonate of potash and carbon, otherwise called B. F., is a fine black powder of great service in the fluxing of metallic ores, as of lead (q. v.), and the separation of the metal therefrom. The B. F. is likewise employed as the raw material from which, on the application of heat in iron vessels, the metal potassium can be obtained.

**BLACK FOREST** (Ger. *Schwarzwald*), a wooded mountain-chain in Baden and Würtemberg, running from south to north along the western side of Swabia, parallel with the course of the Rhine after its great bend near Basel, and often only a few miles distant from it. The Rhine also bounds it on the south, and the level country between the Enz and the confluence of the Neckar with the Rhine borders it on the north; lat.  $47^{\circ} 30'$ — $49^{\circ} 30'$  N., long.  $7^{\circ} 40'$ — $9^{\circ} E$ . The chief rivers rising in the B. F. are the Danube, Neckar, Murg, Kinzig, Elz, Enz, and Wiessen. The B. F. attains its greatest elevation in the Feldberg (variously stated at from 4600 to 4892 feet high), which rises near the source of the Wiessen and the celebrated Höllé (Hell) Pass, a narrow valley shut in by mountains in the vicinity of Neustadt. The great mass called the Kaiserstuhl (Emperor's Chair), situated near Breisach, is quite isolated. As to the geological character of the B. F., primitive granite and gneiss form its core, porphyry is found on its sides, and sandstone along its highest ridges, as well as at its base. Silver, copper, cobalt, lead, and iron are found in greater or less quantity in its principal chain, which is luxuriantly wooded, its name Schwarzwald being derived from the dark-tinted foliage and immense number of its fir-trees. The B. F. is also rich in mineral waters, as, e.g., the baths of Baden-Baden and Wildbad (q. v.). On the Rhine side, the descent is precipitous, but towards the Danube and the Neckar it is gradual. Among its numerous valleys, the Murghthal is the most famous for its natural beauties. The western slopes are studded with vineyards. Summer rye, oats, and potatoes are cultivated in some parts of the B. F.; but it is with difficulty, and the rearing of cattle is

prosecuted with much greater success. This, and the manufacture of articles of wood, forms the chief industry of the inhabitants. The making of wooden clocks and other kinds of time-pieces employs about 40,000 persons; and not less than 600,000 articles of this kind, including music boxes, are exported annually to all parts of the world, 1000 dealers being engaged in the traffic.

Two of the passes of the B. F., the Kniebis and the Hölle, acquired considerable celebrity during the wars of the French Revolution. The first, situated on the borders between Baden and Würtemberg, at the source of the Murg, was taken by the French in 1796 and in 1797; the Hölle is known in connection with Moreau's retreat in 1796.

**BLA'CKHEATH**, a high-lying open common, in the county of Kent, five miles south-east of London, near Greenwich Park. It commands a fine view of great extent, and being a healthy tract, many villas have been built on its margin. It is a favourite holiday resort for Londoners. The Roman road to Dover crossed it. B. is one of the few places in England where the ancient Scottish game of golf is practised. On it stands Morden College, founded in 1695 by Sir J. Morden for decayed merchants, and with a revenue of £5000. B. was formerly the scene of several insurrections, including those of Wat Tyler, 1381, and Jack Cade, 1450. Here the Danes encamped in 1011; the Londoners welcomed Henry V. from Agincourt; and Charles II., on his way from Dover, met the army of the Restoration. B. was also a noted place for highwaymen.

**BLACK HOLE**, an appellation familiarly given to a dungeon or dark cell in a prison, and which is associated in the public mind with a horrible catastrophe in the history of British India—namely, the cruel confinement of a party of English in an apartment called the 'Black Hole of Calcutta,' on the night of the 18th of June 1756. The garrison of the fort connected with the English factory at Calcutta, having been captured by the nabob Suraja Dowlah, this barbarian caused the whole of the prisoners taken, 146 in number, to be confined in an apartment 20 feet square. This cell had only two small windows, and these were obstructed by a veranda. The crush of the unhappy sufferers was dreadful; and after a night of excruciating agony from pressure, heat, thirst, and want of air, there were in the morning only 23 survivors, the ghastliest forms ever seen on earth. See **HINDUSTAN**.

**BLACKIE, JOHN STUART**, Professor of Greek in the university of Edinburgh, was born in Glasgow in 1809, but received his early education in Aberdeen, where his father was agent for a bank. After going through the usual course of a Scotch university education—partly at Marischal College, Aberdeen, partly at Edinburgh—with a view to the church, he went in 1829 to Germany, and studied for some time both at Göttingen and Berlin. He thus acquired a mastery of German, and an acquaintance more extensive than ordinary with the literature of that language. On his return, having abandoned the thought of entering the church, he began the study of law, and passed as advocate at the Edinburgh bar in 1834. But he soon found the practice of the profession uncongenial, and devoted himself henceforth to literary pursuits. Among his earliest productions was his translation, in English verse, of Goethe's *Faust*, which is preferred by G. H. Lewes to any other of the metrical translations. He wrote also about this period numerous articles in the *Foreign Quarterly Review*, the *Westminster*, *Blackwood*, and *Tait*, chiefly on German subjects. In 1841, he was appointed by the crown to the

chair of Humanity in Marischal College, which he held until, in 1852, he was elected to the Greek chair in the university of Edinburgh. Ever since he became professor, he has been incessant in advocating educational reform in Scotland. He took an active part in the movement that led in 1859 to the remodelling of the Scottish universities. Of works of a professional and philological kind may be mentioned two lectures *On the Studying and Teaching of Languages; On the Rhythematic Declamation of the Ancients*; *The Pronunciation of Greek; Accent and Quantity*, 1852. Among the most matured and scholarly of B.'s productions is his metrical translation, with notes, of the dramas of *Æschylus*, published in 1850. In 1853, he spent above three months in Athens, acquiring a complete mastery of the language as now spoken; and as fruits of the visit, there appeared articles on the subject in the *North British* and *Westminster Reviews*. In 1866, Professor B. gave to the world *The Iliad of Homer, translated into English Verse, with Commentary and Introductory Dissertations* (Edin.), in which he endeavours to present Homer to the English reader in his distinctive character as a popular singer. In the Homer controversy raised by Wolf, B. takes a medium position between the extreme German Wolfians and the extreme unitarians of the old English school. More recently, B. has published *Colloquies*, English and Greek, besides various philological essays in the *Transactions* of the Royal Society of Edinburgh.

Not content with educational and philological subjects, the versatile activity of Professor B. has led him to make incursions into the fields both of abstract speculation and of poetry. He published in 1858 a treatise on *Beauty*, in refutation of Lord Jeffrey's association theory. In 1857 appeared *Lays and Legends of Ancient Greece, with other Poems*; and in 1860, *Lyrical Poems*. More recently, *Musa Burachicosa* (Edin. 1869); *War Songs of the Germans* (translated with historical commentary, Edin. 1870); *Four Phases of Morals* (Edin. 1871), directed mainly against the utilitarian school of ethics; *Songs of the Highlands and Islands* (Lond. 1872).

**BLACKING** is the material employed for producing a black glazed shining surface on leather. The main ingredient in the various kinds of B. is bone-black (q. v.), which is mixed with an oil, some sugar, and a little sulphuric acid. The materials in Day and Martin's B. are finely powdered bone-black ground with sperm-oil, raw sugar or molasses, a little vinegar, and some concentrated sulphuric acid (specific gravity 1850). The substances are incorporated together one by one in the order in which they are stated, and the action of the sulphuric acid is to convert much of the lime in the bone-black into sulphate of lime, which causes a thickening of the mixture, and a tenacious paste results. This paste, diluted with weak vinegar, is put, while warm, in stoneware bottles, and is then ready for the market.

**BLACK JACK**, the name given by miners to Blende (q. v.). It was also the name applied in former times to a kind of drinking flagon.—B. J. (tree), see OAK.—B. J. or NIGGEE CATERPILLAR, see TURNIP SAWFLY.

**BLACK LEAD**, **GRAPHITE**, or **PLUMBA'GO**, a mineral consisting chiefly of carbon, but containing also more or less of alumina, silica, lime, iron, &c., to the extent of 1 to 47 per cent, apparently mixed rather than chemically combined. B. L. is the popular name, and that by which it is generally known in the arts; Graphite is that generally preferred by mineralogists.—The name B. L.

however, ought, perhaps, to be regarded as an unfortunate one, as no lead enters into the composition of the mineral. It sometimes occurs crystallised in short imbedded hexagonal prisms; but generally massive, and more or less radiated, foliated, scaly, or compact. It is of a grayish-black colour, with a somewhat metallic lustre, and is perfectly opaque. It is greasy to the touch, and is a perfect conductor of electricity. It is found in primary and transition rocks, as in gneiss, mica-schist, quartz-rock, greenstone, and clay-slate, and pretty abundantly in various parts of the world. It is much more incombustible than even anthracite (or *blindsight*), burning with much difficulty even before the blow-pipe, on which account it is much used for the manufacture of crucibles or 'melting-pots,' which withstand a great heat. These are not, however, made of mere B. L., but of B. L. in powder, mixed with half its weight of clay. B. L. is employed for making pencils (q. v.). It is also extensively employed to give a black gloss to iron grates, stoves, railings, &c., and to diminish the friction of the belts and other parts of machinery. Lately it has been suggested as a lubricating agent in the cartridges of rifles, instead of lard or tallow.—Much B. L. is obtained at Borrowdale, in Cumberland; there are also great deposits in Siberia, and in Missouri, U.S.

**BLACK LETTER** (*Black Letter*), the name commonly given in this country to the types which on the continent are most generally known as Gothic. The first printed books imitated every peculiarity of the contemporary manuscripts; and as printing was first practised in Germany and the Netherlands, the first types were copies of the letters in use in those countries in the middle of the 15th c. Two sorts of letters have been employed in the writings of Western Christendom. What have been called Roman letters prevailed from the 5th to about the close of the 12th c., when they gradually began to pass into what have been called Gothic letters, which continued till the 16th c., when, in most European countries, they were superseded by Roman letters. The first types, as has been said, were Gothic, and they spread with the art of printing into various European states. In France and Italy, they were slightly modified by cutting off some of their rougher points; and when thus trimmed, they came to be known in the former country as *lettres de somme*, being so called, it is said, from their use in an edition of the *Summa* of St Thomas Aquinas. The classic taste of Italy could not long tolerate the Gothic character even of the *lettres de somme*; and they were still further modified, until they assumed the shape to which the name of Roman letters has since been given. The first works printed with these new types were two beautiful editions of Pliny's *Natural History*: the one by John of Spira at Venice in 1489; and the other by his disciple, Nicholas Jenson, also at Venice, in 1472. Another Venetian printer—the first Aldus Manutius—attempted in 1501 to supersede the Roman letters by what have been called Aldine (q. v.), or Venetian, but are best known as Italic characters. These can scarcely be said to have come into much more than temporary or exceptional use; but the Roman letters in no long time spread from Venice all over the west of Europe. Although thus supplanted in general use, the Gothic or B. L. was long retained for special purposes, such as, in this country, the printing of Bibles, prayer-books, proclamations, and acts of parliament. Books in B. L. being the earliest, are highly prized by antiquaries and bibliomaniacs, who are hence sometimes spoken of as 'black-letter' devotees. Thus, Matthias, in his *Pursuits of*

BLACK LIST—BLACK PRINCE.

*Literature* (published in 1796), alluding to the commentators on Shakespeare, writes:

On Avon's banks I heard Acteon mourn,  
By fell black-letter dogs in pieces torn;  
Dogs that from Gothic kennels eager start, &c.

The Gothic or B. L. still continues in general use in Germany, but of late has begun to give way in some quarters to the Roman.

**BLACK LIST.** Such is the name familiarly applied to printed lists connected with insolvency, bankruptcy, and other matters affecting the credit of firms and individuals, and which are circulated for the private guidance of the mercantile community. These lists, which serve an important purpose, are well known by commercial men in the United Kingdom. For the most part they are published in London weekly; but some are bi-weekly. In their contents are embraced the English bankruptcies and liquidations by arrangement under the act of 1870; the bankruptcies of Scotland and Ireland; Scottish registers of protested bills; decrees in absence; judgments for debt in the Irish courts; offers of composition; dissolutions of partnership; warrants of attorney and cognovits; judges' orders; bills of sale, &c. The legality of issuing information of this kind has been challenged, but it has been determined that it is quite lawful. In point of fact, the lists are only extracts from public registers, as are the ordinary lists of bankruptcies in the newspapers. Private lists of a more searching kind are furnished to subscribers by Mr Thomas Perry of Cornhill, the proprietor of the 'Original Bankrupt and Insolvent Registry Office, for Protection against Fraud, Swindlers,' &c.; and also by the Scottish Trade Protection Society, Edinburgh. See TRADE PROTECTION SOCIETY. In the United States, printed lists of forgeries of bank-notes are similarly issued. In one of these *Counterfeit Detectors*—which is certainly black enough—may be reckoned up some thousands of varieties of forged bank-notes in circulation; the whole revealing a frightful state of commercial and moral depravity.

**BLACKLOCK, THOMAS, D.D.**, a remarkable example of the power of the mind to overcome the most oppressive disadvantages, was born at Annan in 1721, and died at Edinburgh in 1791. The child of humble parents, and deprived before he was six months old of the power of sight, he won for himself before he reached middle age the designation of an accomplished scholar, a cultivated thinker, and, for those times, a respectable poet. After going through the necessary course of academic study in Edinburgh, he was licensed as a preacher of the Established Church in 1759, and in 1762 was ordained minister of Kirkcudbright. The determined resistance of the congregation to the appointment, based apparently on his too philosophical and 'moderate' style of preaching (joined perhaps to the fact that he was the intimate friend of David Hume), led to a litigation, to his sensitive mind extremely distressing, and he resigned the charge in consideration of a small annuity. After this, he resided in Edinburgh till his death, occupied chiefly in superintending the education of a limited number of boarders, a charge for which his varied accomplishments and benign manners peculiarly qualified him. He will, however, be best remembered in connection with that famous letter of his which happily arrested Robert Burns on the eve of his departure for the West Indies, and thus, to all human appearance, saved from oblivion the greatest lyrist that the world has seen. A collected edition of his poems was published in 1798, with a biographical sketch by Henry Mackenzie.

184

**BLACK-MAIL**, a scarcely voluntary impost submitted to, in the earlier half of the 18th c., by the people of the Highlands, and of parts of the Lowlands bordering on the Highlands, as a kind of compromise with robbers. The districts in question, being then in an extremely barbarous state, enjoyed but an imperfect protection from the law. Owing, moreover, in part, to political and social circumstances, theft and robbery were not then regarded in the Highlands as they are now: to carry off the cattle of a neighbour was perhaps only wreaking out an old family quarrel or clan dispute, or making reprisals for some severity of persons in power. Certain it is that men of good standing gave a certain degree of protection to notorious cattle-lifters. In these circumstances, a class of men rose up who professed to take upon themselves the duty of protecting the property of individuals, on the payment by them of a percentage on their rents, generally 4 per cent. They were not low men who did so; nearly all of them had good Highland pedigrees, and passed externally as honourable persons, though there was only too great reason to suspect that they encouraged and profited by robberies, in order to make the B. a necessity. The celebrated Rob Roy was, about 1730, a notable levier of B. in the southern Highlands and adjacent Lowland districts. A little later, Coll M'Donell of Barrisdale, a cadet of the Glengarry family, was equally noted further north. When one of the payers of the B. suffered what was called a *herseip*, the levier of the impost, being quickly informed of what had happened, busied himself to recover the lost cattle, and if he failed, he held himself bound to pay an equivalent. We are informed by Mr Lapalie, the minister of Campsie, Stirlingshire, in his Statistical Account of the parish, 1795, that his father, John Lapalie, was a farmer who paid B. in 1744 to M'Gregor of Glengyle, the nephew of Rob Roy. The engagement was that he should make good losses, if the number of sheep stolen exceeded seven, for anything less was held as not a *herseip* or *lifting*, but merely a *picking*. Early in 1745, fifteen were stolen, and M'Gregor was honourably preparing to replace them, when the breaking out of the rebellion, in which he became involved, deprived him of the power of fulfilling his engagement, and likewise put an end to his self-created wardenship of the Highland borders. After that period, law was vigorously enforced in the Highlands, and B. ceased to be heard of.

**BLACKMORE, SIR RICHARD**, one of the court physicians in the reigns of William III and Anne, is remembered as the most heavy and voluminous poetaster of his own or any other age. He appears to have been a good and well-meaning man, and the merciless ridicule of contemporary wits was due, in some part at least, to the moral and religious tone of his works, and to his free censures of the libertinism of the time. But the worthlessness of the poems has been amply confirmed by the judgment of posterity. *The Creation*, considered his best, Addison pronounces 'one of the most useful and noble productions in our English verse'; but few modern readers are likely to examine the grounds of this judgment, still less to agree with it. B. wrote six epics (choosing always the loftiest themes)—viz., *Prince Arthur*, in 10 books; *King Arthur*, in 12; *Eliza*, in 10; *Creation*, in 7; *Redemption*, in 6; *Alfred*, in 12; besides *The Nature of Man*, 3 books; a new version of the Psalms, paraphrases of Job, and other parts of the Bible, and a long list of theological, medical, and miscellaneous treatises.

**BLACK PRINCE**, the name usually given in

## BLACK QUARTER—BLACK ROD OF SCOTLAND.

history to Edward Prince of Wales, son of Edward III. (q. v.).

**BLACK QUARTER**, syn. *Black Spald, Black Leg, Quarter Evil, Blood Striking*; incorrectly termed by some English writers *Inflammatory Fever*—termed by others *Hæmatosepsis* (Simonds) *Hæmatoxysia*.

**Definition.**—An apoplectic disease peculiar to cattle; a form of carbuncular disease, or anthrax—an-zootic, i.e., limited to districts; not spread by contagion, but attended, especially in warm climates, and in Great Britain in hot weather, with the development of a blood-poison destructive to man and the lower animals. See **MALIGNANT PUSTULE**.

**Causes.**—Rich pasture on stiff, retentive, and undrained soil; sudden changes from poor to rich keep, particularly with animals in good health, predisposed to make blood or fatten fast. Youth predisposes to the disease, from the greater activity of the nutritive functions in early life. It is a disease confined almost entirely to yearling and two-year old animals; the writer has, however, seen it in aged cows &c. A young animal, thriving fast, may suddenly be seized with B. Q., if exposed to cold, showers, or a storm. A check thus induced to the organs of secretion, and particularly to the action of the skin, at once produces the blood-charge and apoplectic effusion peculiar to the disease. In various countries where calves are reared by the hand, and not allowed to suckle their mothers, there are many cases of quarter ill when the young animals are transferred from the stable or bare fields to rich grass-lands. The malady is chiefly witnessed in spring and autumn, particularly when animals are fed on strong autumn grass.

**Symptoms.**—The premonitory signs are often very insignificant, and usually overlooked. The healthy thriving aspect of a young steer, in a district where the disease prevails, excites the suspicion of the farmer. The animal may be observed with a sleek coat, voracious appetite, quick staring look, suddenly to stop feeding; the eyes become bloodshot; there is slight salivation or foaming at the mouth; and in the space of an hour or less, it will fall helpless, having manifested slight lameness in one of the limbs before dropping. In other cases, the animal suffers from swelling and pain, suddenly developed in one of the joints, whether the fetlocks, knees, or hocks, elbow, shoulder, or stifle. The swelling extends, and the animal falls. In both cases, the limb or *quarter* of the animal affected swells, the skin is bluish, the veins of the part are distended by black blood, and the creature is perfectly helpless. The suffering is unusually acute; but in many instances the respiration is tranquil, the pulse, however, oppressed and frequent. Animals in this state are costive at first, but occasionally violent diarrhoea supervenes, and the excrement is tinged by black extravasated blood. Death almost invariably supervenes in from 4 to 48 hours. Some cases prove lingering, especially if active and proper treatment be employed early; but recovery is rare. The symptoms of approaching death are convulsive twitchings of the muscles, fixed haggard look, grinding with the teeth, and spasmodic breathing. In some cases, the animal appears quite paralytic, and quietly breathes its last.

**Post-mortem Appearances.**—The quarter affected is found, when cut into, soaked in black semi-coagulated blood. Similar blood is found in all the vessels of the body, and all the tissues have consequently a black congested appearance, particularly the lungs. The heart, as in all blood-diseases, is stained both externally and internally by black blood, effused beneath its serous covering or lining; and this appearance has led some veterinarians to

believe the immediate cause of death to be inflammation of the heart. Such is not the case. The blood extravasations indicate the peculiar condition of the circulating fluid. In some cases in which a joint has been affected some hours before severe constitutional symptoms have appeared, the tissues around the joints are infiltrated by a yellow semi-solid exudation or lymph, which is capable of producing malignant pustule if inoculated in man or animals. Abscesses and sloughs are occasionally met with in and around the diseased joints.

**Treatment.**—In the earliest stage, blood-letting to the extent of 5 or 6 quarts. Administer half-ounce doses of nitre in solution every half-hour for 4 or 5 hours. Give the animal much water to drink, and if chances of recovery are observed, 4-ounce doses of Mindererus's spirit, or solution of the acetate of ammonia, must be given every 4 hours. As the animal rallies, it may be desirable to administer a mild purge of Epsom or Glauber salts. The local treatment consists in incisions into the swollen parts, care being taken that the joints are not penetrated. The incisions must be washed with the following lotion: Chloride of zinc, 1 drachm; water, 12 ounces; dissolve and apply with linen rag or lint, confining the moisture by gutta-percha or oil-silk. Treatment is not often successful, but we have the greatest facilities for

**Prevention** by deep draining, whereby many pasture-lands have been rendered perfectly safe—after having repeatedly ruined tenant-farmers—from destruction by black quarter. In some hill-lands, where drainage does not appear the cause, the malady may be prevented by giving to all the cattle on the farm a weekly dose of an ounce of nitre. The animals that thrive most rapidly should have the medicine rather more frequently, though not to such an extent as to reduce their condition.

The flesh of animals dying from this disease should not be used for human food. It has destroyed whole families, and though in this cold climate accidents are rare, nevertheless they have occurred. Butchers have lost their arms, and persons have lost their lives from being inoculated in cutting up meat from oxen that have died of quarter ill.

**BLACK ROD, USHER OF THE**, an officer of the House of Lords, appointed by letters-patent. He is chief gentleman-usher to the sovereign, and belongs to the order of the Garter. His principal duty is to summon (himself, or by his deputy the yeoman-usher) the House of Commons to the Peers when the royal assent is given to bills, or when royal speeches are read; and to take into custody any peer guilty of breach of privilege. His income is derived from certain fees under the regulation of the House; and the appointment of messengers, door-keepers, servants, &c., rests with him. This patronage was at one time very lucrative, but new arrangements have made it much less so.

**BLACK ROD OF SCOTLAND.** When the Anglo-Saxon princess who became the wife of King Malcolm Ceannmohr landed in Scotland, about the year 1070, she brought with her what was regarded as a priceless relic—a cross of gold, elaborately wrought, in the form of a casket, about a span long, containing what was believed to be a piece of the true cross, set in an ebony figure of the Saviour, richly decorated with gold. Of its earlier history, nothing is known; but St Margaret bequeathed it as an inheritance to her children, and as she herself was at the point of death, we are told by her confessor, that she had it brought to her bedside, when she pressed it to her eyes and lips, and expired clasping it with both her hands. The contemporary biographer of

her son, King David I., relates that 'the Black Rood of Scotland,' as it was called, received the dying adoration of that saintly prince, and that it had then (in the middle of the 12th c.) come to be regarded by the whole nation of the Scots with mingled feelings of love and awe. It was kept as an heirloom of the kingdom, in the royal treasury in the castle of Edinburgh, and along with the other regalia and muniments of Scotland, was delivered up to King Edward I. in 1291. The irreverent scrutiny of the officers of the English king discovered that the outer case, which to the eyes of St Aelred, in the previous century, seemed to be of the purest gold, was only silver gilt. But the relic itself was not the less venerable on that account; and it was used by King Edward to give increased solemnity to the oaths of fealty which he exacted from the magnates of Scotland. Thus, when the bishops of St Andrews and of Glasgow sided with Bruce, it was urged as a heinous aggravation of their guilt, that they had sworn 'upon the body of Christ (i. e., the sacrament of the eucharist), and upon the holy gospels, and upon the cross of St Neot, and upon the B. R. of S.,' to be true and faithful to the English king and his heirs for ever. When the long struggle between England and Scotland was at last ended by the peace of Northampton in 1328, the B. R. was restored to Scotland as one of the national treasures. But it was not destined to remain long in the north. When the hapless King David II. invaded England in 1346, he carried the B. R. with him, in the belief (common in that age) that such a holy relic would insure safety to his person or victory to his arms. On his defeat and capture under the walls of Durham, the B. R. of S. became the prize of his conqueror, Sir Ralph de Neville, Lord of Raby, by whom, along with other spoils of the battle, it was offered up at the shrine of St Cuthbert, in the cathedral of Durham. There it hung till the Reformation, when all trace of it disappears.

**BLACK or EUXINE SEA** (*the Pontus Euxinus*, or 'hospitable sea,' of the ancients, the Kara Deniz of the Turks, the Mauri Thalassa of the modern Greeks, and the Tschernoje More of the Russians) is an inland sea lying between Europe and Asia, extending from lat.  $40^{\circ} 45'$  to  $46^{\circ} 45'$  N., and from long.  $27^{\circ} 30'$  to  $41^{\circ} 50'$  E. In shape it bears a certain resemblance to the human foot. Its greatest length from east to west, on the 42d parallel, is about 700 miles, and its greatest breadth, near the west end, about 380 miles. Area, 172,000 square miles. On the south-western extremity it communicates by the Bosphorus, the Sea of Marmora, and the Dardanelles, with the Mediterranean, and on the north-east by the Straits of Yenikale with the Sea of Azof. The B. S. drains nearly one-fourth of the surface of Europe, and also about 100,000 square miles of Asia. Throughout its whole extent it has but one island, and that a small one, lying opposite the mouths of the Danube, called *Adassi*, or Isle of Serpents, on which is a light-house. The continued occupation of this island by the Russians, in defiance of the stipulations of the treaty signed at Paris after the termination of the Crimean war, occasioned considerable uneasiness in Turkey, and detained a British fleet in the B. S. for several months. In the centre of the B. S. there are no soundings at 150 fathoms, nor are there shoals along the shores, except at the entrance of the Bosphorus; the navigation of the B. S. ought, therefore, to be particularly easy and safe. It is so in summer; but in winter, being enclosed on every side, it becomes the scene of conflicting winds, and of storms which, though of

short duration, are terrible while they last. Such a storm it was on the 14th of November 1854, in which about forty vessels of the allies were either totally wrecked or very seriously injured, nearly 1000 lives were lost, and property worth some millions destroyed.

All the coasts are high, with good harbours, except between the mouths of the Danube and the Crimea; there the land is low, and the danger of navigation greatly increased in winter by the presence of floating ice; for, from the many large rivers which flow into the B. S. and Sea of Azof (Danube, Dniester, Bug, Dnieper, Don, and Kuban, in Europe; and the Kizil-Irmak and Sakara in Asia), the waters are fresher, and consequently more easily frozen than those of the Mediterranean. The specific gravity of the water of the B. S. is 1014 (water being = 1000), while that of the Mediterranean is 1028. The shores from Odessa to the Crimea are ice-bound during January and February; and although the harbour of Odessa is never frozen up, yet the drift-ice frequently renders the entrance to it dangerous.

There is no tide in the B. S., but the large rivers flowing into it give rise to currents, which are particularly strong in spring when the snows melt, and the accumulated moisture of the whole winter is drained off the land. The great current which, passing out of the Sea of Azof round the Crimea, flows first in a south-westerly, then in a north-westerly direction, and again due west, is turned southwards by a current from the Dnieper and Dniester; the two currents are afterwards met by another from the Danube, and then, all united, rush towards the Bosphorus. The Bosphorus, however, is not wide enough to admit the entire volume of water pressing into it; and a portion of the main current is consequently diverted to the coast of Asia, where it is strengthened by new accessions. This, which is the normal course of the currents in the B. S., is modified by the winds, and by local circumstances. In some bays of Roumelia and Bulgaria counter-currents have been observed.

The most important ports on the B. S. are those of Odessa, Kherson, Eupatoria, Sebastopol, Batum, Trebizond, Samsun, Sinope, Varna, &c.

The depth of the water is unfavourable to the extensive establishment of fisheries, but several kinds of sturgeon are caught in considerable quantities in the straits of Yenikale. Other fish of various kinds are said to be abundant.

The ancients believed that the B. S. was at one time much more extensive, and that it had no connection with the Mediterranean. They accounted for its decrease and communication with the larger sea by the supposition that the Thracian Bosphorus had been burst through by an earthquake, or by the great deluge known as the Deucalion deluge, which inundated Greece. The B. S. being higher than the Mediterranean, the latter, of course, through the newly created channel, became the basin for much of its waters. Certain geological and other appearances have led some modern geographers to entertain an opinion similar to that of the old Greeks, which, however, is not shared in by others.

The B. S. has been navigated from a very early period. Its original name (supposed to have arisen from the dangers such an expanse of sea offered to early navigation, as well as from the fact that savage tribes dwelt upon its coasts) was *Axine*, or 'inhospitable' sea, afterwards changed by the Greeks to *Euzinus*. In the time of Xerxes large quantities of corn were exported from its ports to Athens and the Peloponnesus. The Romans and Byzantine emperors, and also the Genoese, had large traffic on the Black Sea. When the Turks captured

## BLACK SNAKE—BLACK WATCH.

Constantinople, all but their own ships were excluded from its waters until the treaty of Kinarji, 1774, when the Russians obtained the right to trade in it. Ten years after, Austrian ships were privileged to trade here; and by the Peace of Amiens, in 1802, British and French ships were admitted. The undue preponderance of Russia in the B. S. was the main cause of the Crimean war.

**BLACK SNAKE** (*Crotalus constrictor*, see COBRA), a species of snake common in the United States of America from Louisiana to Connecticut. It is of an almost uniform leaden colour, is one of the largest serpents in North America, and is remarkable for its great agility. It moves along the ground with a swiftness equal to that of a horse, glides over bushes, and climbs trees. It feeds on small quadrupeds, birds, frogs, &c.; frequently plunders poultry-yards of eggs; and enters dairies to drink milk or cream, of which it is very fond, but compensates for these depredations by killing rats and mice. It has no poison-fangs, but is not slow to bite. It is very capable of domestication.

**BLACKSTONE**, Sir WILLIAM, a commentator on English law, was the posthumous son of a silk-mercer in London, and was born there on the 10th of July 1723. At the age of 15, having obtained a scholarship from the Charterhouse school, where he was educated, he was sent to Pembroke Hall, Oxford. There he was fortunate enough to obtain a second scholarship, and remained till, in 1744, he was admitted a fellow of All Soul's College, when he removed to London, to attend the courts of law with the view of qualifying himself for his future profession. In 1746, at the age of 23, he was called to the bar, but failed to attract either notice or practice. Upon the death of an uncle in 1749, he was appointed recorder of Wallingford, in Berkshire; but in 1753 he went to Oxford, where he delivered a course of academic lectures upon the law of England. A few years later, a Mr Viner having left a sum of money to endow a chair of English law in the university of Oxford, B. was, in 1758, appointed first Vinerian professor. The following year, B. returned to Westminster; and as the doctrines which he had taught as a lecturer had been such as to command him to the notice of the Tory government of that day, he obtained its patronage, and in 1761 was made a king's counsel. Shortly after, he was appointed principal of New Inn Hall, Oxford. Other honours followed fast, and he became successively member of parliament, bencher of the Middle Temple, and solicitor-general to the Queen. In 1765, B. published the first volume of his lectures, and the remaining three volumes between that date and 1769. These lectures form his celebrated *Commentaries on the Laws of England*. His practice continuing to increase, he resigned, in 1766, his Oxford appointments. Four years later, he was offered the solicitor-generalship, and after declining it, was knighted, and made a justice of the Court of Common Pleas. The remaining years of his life were spent in the discharge of his duties as a judge. He died on the 14th of February 1780, at the age of fifty-seven.

The fame of B. rests entirely upon his *Commentaries*. His other literary works were incon siderable, and his merits as a pleader or judge were not such as, of themselves, to have made his reputation outlive himself. As a commentator, he had many excellences. His style was in general clear and gracefully ornate, and his illustrations pleasing and felicitous. While he confined himself to exposition—to the accurate statement in scholarlike English of what had heretofore lain buried in the cumbrous language of lawyers like

Littleton—B. was unsurpassed, and rendered an important service to the country. But he was ambitious of combining with this exposition the higher task of explaining the reasons for the law, as well as its merits and defects. For this survey of the law, from the legislator's point of view, he had not the requisite qualifications. His knowledge of English history was, as Hallam tells us, superficial, and his study of the philosophy of law had been imperfect. With the works, indeed, of Montesquieu and Beccaria he was acquainted; but the mode in which he quotes them shews that he had imbibed nothing of their spirit. The method followed in the *Commentaries* was as unscientific as could be imagined, and had not even the merit of originality. It was taken, with little alteration and no improvement, from Sir Matthew Hale's *Analysis of the English Law*. Possibly the haste with which the *Commentaries* must have been composed, being originally in the form of lectures, may have led to some of their imperfections. Since B.'s death, the *Commentaries* have been very frequently reprinted, perhaps the best editions being those of Christian. As a century has elapsed since they were composed, so many alterations are requisite to adapt them to the existing state of the law, that it may be said that their purpose has been served, and that they are now valuable chiefly as materials for history.

**BLACK STONE EXAMINATION.** See GLASGOW UNIVERSITY.

**BLACK WAD** is a name given by miners to the native black oxide of manganese, and principally to an impure and earthy variety of the ore. See MANGANESE.

**BLACKWALL**, a suburb of London, in Middlesex, at the junction of the Lee with the Thames, four miles east-south-east of the metropolis. It has foundries, ship-building yards, and the East and West India Docks. A railway, four miles long, mostly on a brick viaduct above the streets, connects B. with the city of London. To avoid the dangers and delay of the 'Pool,' many passengers proceed by this railway to embark in steamers at B., instead of going on board at London Bridge.

**BLACK WARRIOR**, a river formed, in the north of Alabama, by the junction of the Mulberry and the Locust. Almost from the very point of confluence it is navigable for steam-boats, till, after a course of more than 150 miles, it enters the Tombigbee, which, again, is navigable for large vessels all the way to Mobile on the Gulf of Mexico, a stretch of nearly 200 miles more. Its banks yield coal, iron, and other valuable minerals.

**BLACK WATCH**, the appellation given to certain armed companies employed to watch the Highlands of Scotland. The term *black* arose from the dress of this species of militia, which was composed of tartans of dark colours. Some Highlanders had been armed by government as early as 1725, when General Wade was appointed commander-in-chief in Scotland; but it was not till about 1729 or 1730 that the companies assumed a regular form. The companies were six in number—three comprising 100 men each, commanded by a captain; and three of 70 men each, commanded by captain-lieutenants. Stationed in different parts of the Highlands, and acting independently of each other, they were styled the Independent Companies of the Black Watch. The body was raised chiefly from the Whig or loyal clans—Campbells, Grants, Muhrs, &c.—and many men of good station in society joined it, not only for the sake of good pay, but the valued privilege of bearing arms. The

duties of the B. W. were to enforce the disarming act, to overawe the disaffected, to prevent political meetings of a seditious kind, and to check depredations among the clans, or on the Lowland frontier. After being of considerable use for these local purposes, the whole of the companies were formed into the 42d Regiment, under the command of the Earl of Crawford, in 1739—their removal giving facility, no doubt, for the outbreak of the rebellion in 1745. Retaining its original Highland character, the 42d Regiment became one of the most distinguished corps in the British army; the whole of its history, for which we would refer to the work of Colonel Stewart on Highland Regiments, being a series of brilliant achievements. Embodied under the Earl of Crawford, the regiment would have adopted the tartan of that nobleman, if he had possessed such a cognizance; the earl, however, being a Lowlander, it was necessary to adopt an arbitrary pattern of tartan, which has ever since been known as the 42d or B. W. tartan. See TARTAN.

**BLA'CK-WATER**, a disease in cattle. See DARN.

**BLA'CKWATER**, the name of five Irish rivers, two of which deserve notice.—1. The B. of Cork county rises in the west of Kerry county; runs east across Cork county and the west part of Waterford county, in a carboniferous limestone basin, past Mill-street, Mallow, Fermoy, Lismore, and Cappoquin, and enters the sea at Youghal harbour. High mountains bound it on the south, and its chief feeders come from the north. It has a course of 100 miles, and is the seventh in size of the Irish rivers. The scenery along its banks is highly beautiful and picturesque, with ruins, mansions, and woods. It is navigable for barges for the last 15 miles of its course. It abounds in salmon.—2. The B. of Ulster rises on the confines of Tyrone and Fermanagh counties; runs first south-east, and then north-west through Tyrone; and then between Tyrone, Monaghan, and Armagh, past Caledon and Charlemont, and falls into the south-west corner of Lough Neagh.

**BLACKWELL**, ELIZABETH, M.D., a medical practitioner in New York, U.S.—the first woman that ever obtained a medical diploma—was born at Bristol, where her father carried on an extensive business as a sugar-refiner, in the year 1821. Circumstances afterwards induced the family to emigrate to New York, and then to push west to Cincinnati, where in 1838 the father died, leaving a widow and family of nine children but scantily provided for. Miss B., who was at this time in her 18th year, and who had already been distinguished by unusual decision of character, immediately, along with two elder sisters, opened a boarding-school, which soon gained a reputation, and had a large attendance. But the spirit of Miss B. chafed at the limitations which society had imposed on the energies of women, and she often took counsel with her sisters as to the practicability of storming the learned professions, and thus enlarging woman's sphere. At length, in 1844, the school was given up, Miss B. determining to become the medical apostle of her sex. After three years' further work as a salaried teacher, which she undertook in order that she might have the pecuniary means wherewith to prosecute her medical studies, and during which time she devoted the whole of her leisure to the study of medical and anatomical books, she went to Philadelphia, where she applied in vain for admission into the medical schools. Failing this, she entered on a course of private anatomical study and dissection and of midwifery with Professor Allen and Dr Warrington of Philadelphia. After strenuous efforts, she at last obtained admission to a university—that of Geneva, in New

York State—and thither she accordingly repaired in the November of 1847. Here she remained until January 1849, when she graduated with the highest honour. During the two years of her study, she conducted herself with a propriety and discretion that gained for her the esteem and respect of all her fellow-students. Only once was an insult offered to her. It was in the class-room, and she repelled it with so quiet a dignity as to bring down the applause of the students on herself, and their hisses on her despicable assailant. Her presence had a beneficial effect upon the students; her 'brilliant example,' as the president called it, had stimulated them to greater effort, and their general conduct and attainments during the sessions she was at college were better than usual. Shortly after her graduation, Miss B. visited Europe, in order to the further prosecution of her medical studies. At Paris she was told that it would be impossible for her to gain entrance to the schools or hospitals there, unless she adopted male attire; a suggestion which she refused to act on, as it was alike repugnant to her taste, and to the great object she had in view—viz., the recognition of female doctors. After much perseverance, she was at length admitted into the extensive lying-in hospital of the *Maternité*, and was permitted to visit other hospitals. After studying at St Bartholomew's Hospital, and the Woman's Hospital, London, she returned to New York in 1851, and there established herself in practice. At first difficulties were thrown in her way by physicians of the opposite sex refusing to meet her in consultation; but these were soon overcome, and Miss B. is now established in excellent practice. In 1852, she delivered a series of lectures to ladies on health and physical development; in the following year she published a work, entitled *The Laws of Life, considered with Reference to the Physical Education of Girls*, and also established a dispensary for women and children, which proved so successful that she was induced, in 1857, to open a small hospital for women. Miss B.'s sister, now Dr Emily B., has followed in the footsteps of Elizabeth.

**BLACKWELL**, ALEXANDER, a physician of great natural genius, son of the Rev. Thomas B., one of the ministers of Aberdeen and Principal of Marischal College, was born in that city in the beginning of the 18th c. He studied physic under Boerhaave at Leyden, where he took the degree of M.D. He was afterwards a printer in London, but becoming bankrupt in 1734, was supported in prison by his wife, who prepared and published a *Herbal* (2 vols. folio, 1737—1739) with 500 cuts of plants, drawn, engraved, and coloured by herself, her husband adding their Latin names, with a brief description of each. The work, patronised by the College of Physicians, met with great success, and B. obtained his release. A work on Agriculture, published by him, falling under the notice of the king of Sweden, B. was invited to Stockholm in 1740, and received apartments in the house of the prime minister, with a pension. Having cured the king of a dangerous illness, he was appointed one of the royal physicians; but while in the full enjoyment of court favour, he was charged with being concerned in a plot with Count Tessin against the king and government, and after being subjected to the torture, was broken on the wheel, August 9, 1748, protesting his innocence to the last. A genus of plants, *Blackwellia*, is named in honour of Mrs Blackwell.

**BLACKWELL**, THOMAS, a scholar of some eminence, brother of Alexander B. (q. v.), born at Aberdeen, August 4, 1701, studied Greek and philosophy in Marischal College, and took the degree of M.A.

in 1718. In December 1723, he was appointed professor of Greek in Marischal College, and in 1737 published anonymously at London an *Inquiry into the Life and Writings of Homer*, 8vo, 2d edition, 1746, and shortly afterwards, *Proofs of the Inquiry into Homer's Life and Writings*. In 1748 he published, also anonymously, *Letters concerning Mythology*, 8vo. The same year he was made principal of Marischal College; and at the commencement of the session 1752, on his recommendation, a new order in teaching the sciences was introduced into the college. In 1753 he published the first volume of his *Memoirs of the Court of Augustus*, 4to. The second volume appeared in 1755; and the third, left unfinished by him, was completed by John Mills in 1764. He died March 8, 1757. A chemical professorship was founded by his widow in Marischal College in 1793, and also a biennial award of £20 (the 'Blackwell Prize'), open to any one, for the best essay on a subject proposed by the principal and professors of Marischal College.

**BLACKWOOD, WILLIAM**, a distinguished Edinburgh publisher, the originator of *Blackwood's Magazine*, was born in Edinburgh, November 20, 1778. After serving his apprenticeship to the book-selling business in his native city, and prosecuting his calling in Glasgow and London, he settled in Edinburgh as a bookseller—principally of old books—in 1804. In 1817, at which time he had become a publisher on his own account, he issued the first number of *Blackwood's Magazine*. The literary ability displayed in this periodical was so much in advance of the monthly magazines then existing, that from the first it was a great success. Its remarkable popularity was sustained by the papers of John Wilson (q. v.) and J. G. Lockhart (q. v.), also of James Hogg (q. v.), and other spirits, whom B. had the liberality and tact to attract to his standard. Overwhelming its political and literary opponents, now with the most farcical humour, and now with the bitterest sarcasm—sometimes with reckless injustice—the Magazine secured for itself a prodigious reputation, more particularly among the Tories, of whose political creed it has always been a resolute adherent. We believe it can hardly be said that *Blackwood's Magazine* has ever had any distinct editor. William Blackwood himself, who added literary tastes and acquirements to his profession of a bookseller, was the chief manager of his Magazine, and conducted the whole of the correspondence connected with it until his death, which took place September 16, 1834. Under his sons, the Messrs B., who succeeded him in the business, *Magaz* has not only sustained but increased its reputation; the places of its old contributors are supplied by many of the most distinguished men of letters in the country. In the conduct of the Magazine, the late Professor W. E. Aytoun was understood to occupy a position in relation to the publishers somewhat analogous to that which Wilson held under their father. The publishing business, which includes that of printing the works issued, has been greatly extended by the Messrs B., who have now a name second to none in the kingdom.

**BLA'CKWOOD RIVER**, in West Australia, enters the Hardy Inlet, 6 miles to the north-east of Augusta, in lat. 34° 14' S., and long. 115° 12' E. It flows through the counties Durham and Nelson, first to the west, and then to the south, traversing a district of wood and pasture. It is navigable for boats to a distance of 20 miles from the sea.

**BLADDER (urinary)** is a bag formed of fibrous membrane externally, muscular fibres in the middle, and mucous membrane for an internal lining. The peritoneum (see ABDOMEN) covers its back. The

shape of the B. is somewhat conical, the apex being upwards, and the anterior part of the base constricted at the commencement of the urethra, called the neck of the bladder. On each side, rather below its middle, open the two ducts from the kidneys (the ureters); an imaginary line drawn between them, and from each end of this line others drawn to the neck of the bladder include an equilateral triangle. In this space, which is called the trigone, the mucous membrane is not thrown into folds, but is smooth and very sensitive, the slightest touch upon it giving rise to a desire for micturition. The habit of some children to empty their bladders when sleeping on their backs, is supposed to be due to the urine accumulating in this part, as is also the distressing pain of stone.

The B. is situated in the pelvis in adults, but much higher in the young. It is kept in position by four true or membranous ligaments, and false ligaments formed of folds of the peritoneum. The neck of the B. is surrounded by the prostate gland, and here the urethra (q. v.) begins. Like all cavities lined by mucous membrane, the B. is subject to catarrhal inflammations, which are accompanied by an increased secretion of mucus, rendering the urine turbid, frequent and painful desire to micturate, and very great constitutional disturbance. The symptoms may be acute, and must be relieved by local bleeding, and hot fomentations along with opiates; or they may be chronic, when some medicines, as the *Uva-ursi* (see ARBUTUS), bucku (q. v.), the preparations of iron, and the mineral acids, are found useful. If there is much mucus, or decomposed urine in the B., it may be washed out with warm water, in which a minute quantity of nitric acid has been dropped. Of course, if there is any known cause for this inflammation, as a stone, it must be removed.

Irritable B. resembles the former disease, but is produced by various causes unaccompanied by inflammation. Some persons, from mere nervousness, are frequently troubled with a desire to pass water; and strange as it may seem, many in this condition never effectually empty their bladders, always leaving a portion, which keeps up the irritation. This condition frequently arises from the habit of retaining the urine so long as to over-distend and weaken the muscular walls of the B.; but it may be induced by general debility, the irritation of worms, cold, or an irritating state of the urine itself. The best treatment is tonics, and soothing the irritability with sedatives. When this irritability is nocturnal, it may be from the patient lying on the back, as explained above; it generally occurs in delicate children, and is more a habit than a disease.

*Paralysis* of the B. may be the result of accident, or disease of the nervous centres, or over-distension; in this condition the urine accumulates and dribbles away, and must be drawn off by the catheter (q. v.). This dribbling, or *incontinence*, must be carefully distinguished from irritable B., as it is in nearly every case the sign of a distended bladder. *Retention* of the urine may be caused by mechanical obstacles to its exit, by paralysis, or by an absence of voluntary power over the muscles. This last is termed *Hysterical* retention, and is common in young girls, in persons suffering from sea-sickness, from being in a strange place, an accident, such as a broken leg, &c. If the affection is not encouraged by an officious use of the catheter, the power generally soon returns. Any long continued difficulty in passing water is generally followed by a thickening of the walls of the B. itself, or *Hypertrophy*. The mucous membrane may form pouches in these thickened walls, which is called *Sacculated* B., and

## BLADDER CAMPION—BLAINVILLE.

cancerous diseases, and tubercle, may also attack this organ.

The B. is liable to be ruptured by accident from without, as, for instance, by a blow or hurt from a saddle; and as this accident is usually fatal, it cannot be too carefully guarded against. If the B. is ruptured posteriorly, the accident is always fatal.

**BLADDER CAMPION.** See *SILENE*.

**BLADDER GREEN.** See *BUCKTHORN*.

**BLADDER-NUT (*Staphylea*)**, a genus of plants which, according to some botanists, is the type of a small natural order, *Staphyleaceae*, by others, united with *Celastraceae*. See *SPINDLE TREE*. The *Staphyleaceae* have usually opposite pinnate leaves, the leaflets of which, as well as the leaves themselves, have deciduous stipules. The sepals, petals, and stamens are equal (five) in number. Only about fourteen species are known, which are found in very different climates, and scattered over the world. They are mostly small trees of rather elegant appearance. The seeds contain a considerable quantity of a fixed oil, which is slightly purgative. The common B. (*Staphylea pinnata*) is a native of the east of Europe, and of temperate parts of Asia, which has been admitted into the British flora, but has in all probability been introduced as an ornamental tree. It is frequently planted in shrubberies, as is also *S. trifolia*, a North American species with ternate

Bladder-nut (*Staphylea pinnata*):  
a, a branch with leaves and raceme; b, fruit.

leaves. The wood of both is firm and white, well suited for the purposes of the turner. The seeds may be eaten, but act as a mild aperient. The flower-buds are pickled as capers. The name B. has reference to the curious inflated membranous capsule, and the hard bony *testa* of the seed. The name *Staphylea* is from the Greek *staphyle*, a bunch of grapes, and has reference to the racemed flowers.

**BLADDERWORT (*Utricularia*)**, a genus of plants of the natural order *Lentibulariaceae* (q. v.), containing a large number of species, the bright blossoms of which, along with those of water-lilies, &c., adorn the surface of lakes, ditches, and marshes in almost all parts of the world. They are particularly abundant within the tropics, and many are natives of Australia. Britain produces only three species, all of which have yellow flowers. These plants are very interesting from the provision made

140

for the expansion of their flowers above water, although the whole plant is ordinarily submerged. The roots, stems, and even leaves, are furnished with numerous little bladders or vesicles, which are filled with water till it is necessary that the plant should rise for the expansion of the flowers, when they become filled with air; and this again gives place to water after flowering is over, so that the seeds are ripened at the bottom. The bladders, at least of *U. vulgaris*, have an orifice closed by a very thin elastic valve opening inwards. Aquatic insects sometimes enter them, and are imprisoned.

**BLADDENSBURG**, a post-town of Maryland, on the east branch of the Potomac, and on the Washington and Baltimore Railway. It is six miles to the north-east of Washington; and it was here that the battle which decided the fate of that city was won by the British on the 24th August 1814.

**BLAEBERRY.** See *WHORTLEBERRY*.

**BLAES**, a Scottish colliers' name for the shale of the coal-measures, originating apparently from the 'blae' or bluish colour sometimes noticed in the shale. The term is occasionally used by geologists.

**BLAEU**, also **BLAEUW** and **BLAUW** (*Lat. Cœsius*), the name of a family of learned Dutch publishers who have rendered as important services to literature and art as Aldus, Giunti, Stephanus, or Elzevir, and whose activity spread itself over Europe for a century.

**BLAEU, WILH.**, a mathematician, map-drawer, and publisher, was born at Alkmaar, in Holland, in 1571. He belonged to the school of Tycho Brahe, and secured a considerable reputation by publishing a Terrestrial and a Celestial Globe, excelling in beauty and accuracy everything that had preceded them; and also several maps, which indicated a comparatively precise knowledge of geography. As a printer, he did not attain the elegance and completeness of Elzevir, but nevertheless his chief publications are marked by a fine external finish, and a praiseworthy correctness. He died 21st October 1638, and left two sons, John and Cornelius, who carried on the business together until the death of the latter in 1650.

**BLAEU, JOH.**, the son of the preceding, was born at Amsterdam about the beginning of the 17th c. He commenced business on his own account at Amsterdam, but afterwards entered into company with his father. His *Atlas Major*, in eleven volumes of the size in which atlases are published at the present day, is a splendid work. It is full of archaeological and geographical information, supplied for each country by men of eminence connected with it. There are many curious plates—among them a representation of Tycho in his observatory—and the maps are extremely valuable from the light they throw on local history. Besides this, he published a series of singularly rich topographical plates and views of towns, which are consulted even to the present day. He died about 1690, leaving three sons, Joh., Wilh., and Peter, the second of whom became a member of the Amsterdam council, while the other two carried on with distinction and success the paternal business. Some of their classical publications, especially Cicero's *Orationes* (1699), are still highly prized.

**BLAINVILLE, HENRI MARIE DUCROTAY DE**, a distinguished French zoologist and anatomist, was born 12th September 1778, at Arques, near Dieppe. At an early period, he went to Paris, where he devoted himself to the study of medicine and the physical sciences, and took the degree of doctor in 1808. Through Cuvier chiefly, he was induced to study natural history and comparative anatomy. In 1812, he was appointed assistant-professor of

Comparative Zoology, Anatomy, and Physiology, in the university of Paris, as well as Professor of Natural History at the Athenaeum; in 1825, a member of the Institute; and in 1832, successor of Cuvier in the chair of Comparative Anatomy in the Museum of Natural History. He died May 1, 1850. B. achieved great success, not only as a teacher, but as an author. Besides various small treatises which appeared in scientific journals, he published many large and valuable works, all of which have greatly advanced our knowledge of the various sciences they treat of; such as *Faune Française* (1821—1830), *De l'Organisation des Animaux* (1822), *Cours de Physiologie Générale et Comparée* (1833), *Ostéographie* (1839—1849), *Manuel de Malacologie et de Conchyliologie* (1825—1827), *Manuel d'Actinologie et de Zoophytologie* (1834—1837).

BLAIR, HUGH, an eminent Scotch divine and man of letters, was born at Edinburgh, April 7, 1718. He entered the university of his native city in 1730, where he soon became noted for his diligence; and an *Essay on the Beautiful*, which he wrote when a student, gave his preceptors a high idea of his ability and taste. In October 1741, B. was licensed as a preacher of the Established Church; and after occupying successively the churches of Colesie in Fifeshire, Canongate Church in Edinburgh, and Lady Yester's, he was promoted in 1758 to the highest position attainable by a Scotch clergyman—one of the charges of the High Church, Edinburgh. His discourses, which display little power or originality of thought, and which derived nothing from the delivery of their author, were greatly admired by ‘persons of the most distinguished character and eminent rank’ in Scotland on account of their polished style. In 1759, B. commenced a series of lectures on *Composition* to classes in the university; and three years afterwards, a new chair of Rhetoric and Belles-lettres, with a salary of £70 a year, being created by the crown, B. was made professor. He held this appointment until 1783, when he resigned; and in the same year published his *Lectures*, which obtained a reputation far beyond their merits, and one that time has by no means sanctioned. His first volume of *Sermons* appeared in 1777, with the approval of Dr Johnson, who had read them, and proved a great success. George III. shewed his appreciation of them by bestowing on B., in 1780, a pension of £200 a year. B. also published three other volumes of *Sermons*, and prepared a fourth, which was printed after his death, which took place December 27, 1799. They were all as successful as the first one. Opinion about their merits has much changed since the date of their publication; they are now considered as moral essays rather than sermons. B.'s critical acumen was not great; he believed in the authenticity of Ossian's poems, which he strenuously defended.

BLAIR, ROBERT, author of *The Grave*, was born at Edinburgh, where his father was a clergyman, in 1699. After completing his education for the church, and travelling on the continent, he received licence, and in 1731 was ordained minister of Athelstaneford, Haddingtonshire, where he lived in easy circumstances till his death, in 1746. He was an accomplished and thoughtful man, devoted considerable attention to natural science, particularly botany, and corresponded on friendly terms with several eminent contemporaries, among others, Watts and Doddridge. To them he submitted the MS. of his poem, which he had written before his ordination. Watts offered it to two publishers, who thought it too heavy for the times, and it remained several years unprinted. It afterwards attained an honourable

place in the esteem of those capable of appreciating a masculine, though somewhat gloomy force of thought and imagery, applied to a profoundly suggestive and serious theme. It found a congenial illustrator in William Blake (q. v.). B. was succeeded in his ministerial charge by the author of *Douglas*. His son, Robert Blair, of Avontoun, became Lord President of the Court of Session.

BLAIR-A'THOL, a village in the county of Perth, Scotland, situated at the confluence of the Tilt and Garry, about 30 miles north-north-west of the city of Perth. Blair Castle, the seat of the Duke of Athol, is situated here. The larch-trees surrounding it are remarkable alike for their enormous size, and for the fact of their being among the first planted in Scotland.

BLAIR-GOW'RIE, a village in Perthshire, very picturesquely situated on the east side of a range of hills, on the right bank of the Ericht, 16 miles north-north-east of Perth. It consists chiefly of one winding street. Pop. in 1871, 4832. It has flax-spinning and weaving factories, driven by the Ericht. Pure white marble is found in the vicinity. There is a branch railway from Cupar-Angus.

BLAKE, ROBERT, a celebrated English admiral, who, more than any other, contributed to render England mistress of the sea, was born at Bridgewater, in Somersetshire, where his father was a merchant, in 1598. An ardent republican, and a man of blunt, straightforward manners, singularly devoid of fear, and of inflexible character, he was much respected by Cromwell, with whom, however, he had no very intimate intercourse. When the civil war broke out, he raised a troop in Somersetshire, and took part in all important actions fought against the royalists in the western counties. In 1644, he surprised Taunton, of which place he was made governor, and in that capacity gave proof of no mean military skill. In 1649, in conjunction with two other officers of equal rank, he was appointed General of the Sea, the two services at that time not being distinct, as they are now. This was B.'s true sphere, and in it he soon exhibited transcendent ability. After destroying, with the exception of two vessels, the squadron of Prince Rupert, which had sought safety in the Tagus in 1651, B. forced the royalists to surrender Guernsey, Jersey, and the Scilly Isles. In March 1652, he was made sole admiral of the fleet for nine months, and during this year he fought four engagements with Dutch fleets under Tromp, Ruyter, and De Witt. In the first, on the 19th May, the Dutch retreated under cover of darkness, with the loss of one man-of-war captured, and another sunk. In the next engagement, a squadron of 12 ships, sent to protect the herring-vessels from the attacks of B., were captured; and in the third, on the 28th September, 3 Dutch vessels were destroyed, and the rear-admiral taken. On the 29th November, a fleet of 80 vessels, under the command of Van Tromp, encountered B. with only 40 off the Goodwin Sands. The courageous Englishman scorned to fly even from odds so overwhelming, and the result of the action was the loss of 6 of his ships—2 captured, and 4 destroyed; the rest, in a shattered condition, sought safety in the Thames. Van Tromp now had recourse to that foolish act of bravado with which his name is associated: he tied a broom to the mast-head of his vessel, and sailed through the Channel, thus intimating that he had swept English vessels clean out of it. Tromp little knew the indomitable character of B., or of the nation of which he was the worthy representative on the seas. By February 1653, B. was at sea again with 80 ships, and falling in with Van Tromp with about an

## BLAKE—BLANC.

equal force, he at once attacked him, and after a three days' running-fight, the Dutchman was fain to seek shelter in the shallow waters of Calais—where the greater draught of the English ships did not admit of their following—with a loss of 11 men-of-war, and 30 of a fleet of merchantmen he had in convoy. The English lost only one ship. On the 3d and 4th of June, B. and his coadjutors, Deane and Monk, won another victory over Van Tromp; but ill-health prevented B. from taking part in the engagement of the 29th July, which finally shattered the naval supremacy of Holland. In 1654, B. was appointed by Cromwell to command an English fleet in the Mediterranean, where he soon made the British flag respected by Dutch, Spanish, and French alike. The Dey of Tunis refused to do it reverence. B. attacked his capital, burned the Turkish fleet of nine ships which lay before it, accomplished a landing, and with a body of about 1000 men, annihilated an army of 3000 Turks. He next sailed to Algiers and Tripoli, landed, and set free all the English who were detained as slaves. He concluded alliances highly favourable to England with Venice and Tuscany. In 1657, he defeated the Spaniards at Santa Cruz. This was perhaps one of the most daring actions in B.'s memorable career. With a wind blowing right into the bay—which was very strongly defended—B. dashed in, attacked and destroyed the Spanish galleons and shipping in the harbour, and, the wind fortunately changing, sailed out again with a loss of only one ship and 200 men. The Spanish loss in men and property was immense, and the terror the action inspired insured increased respect to the English flag. His health now failed; he returned to England, and died, as his ship entered the harbour of Plymouth, in the year 1657. Cromwell honoured his memory by a solemn funeral procession, and caused him to be interred in Westminster Abbey. His skill and courage were equalled only by his disinterested patriotism, sterling honesty, and love of justice; he not only gained a decided superiority over England's mightiest naval opponent, but, by the bold tactics he introduced, infused that intrepidity and spirit of enterprise by which the British navy has ever since been distinguished.

BLAKE, WILLIAM, a celebrated engraver and poet, was born in London, 1757. In 1789, he published *Songs of Innocence and of Experience, shewing the Two Contrary States of the Human Soul*, with about 60 etchings, remarkable for their peculiar and original manner. The poems were equally singular, but many of them exhibited true pathos. Some marginal designs for Young's *Night Thoughts*, executed by B., were greatly admired by Flaxman. B. lived in the full belief that he held converse with the spirits of the departed great—among others, with those of Moses, Homer, Virgil, Dante, and Milton, and that some of these spirits came to him to have their portraits taken! He published numerous etchings, chiefly of religious and cognate subjects, among the best of which are his *Illustrations of the Book of Job*, and the illustrations of Blair's *Grave*. He died (August 12, 1828) in poverty and obscurity, with the conviction that he was a martyr to poetic art. Charles Lamb regarded him as 'one of the most extraordinary persons of the age,' and Mrs Jameson, in her *Sacred and Legendary Art*, speaks of his conception of angels in the highest terms of praise.

BLANC, Lé, a town of France, in the department of the Indre, with a beautiful situation on the Creuse, which divides the town into two parts, about 32 miles west-south-west of Châteauroux. Above B., the river expands so as to form a lake, but at

the town it contracts, and breaks into cascades with sufficient fall to turn the machinery of several manufactories. B. is a thriving place, with cloth and linen yarn mills, potteries, tanneries, vinegar-works, forges, &c. It is very ancient, having been frequented by the Romans. Pop. (1872) 4332.

## BLANC, MONT. See MONT BLANC.

BLANC, JEAN JOSEPH LOUIS, a celebrated French Socialist and historian, was born at Madrid, 28th October 1813. In 1820, he was placed in the college at Rhodes; in 1830, he went to Paris, and became a clerk in an attorney's office for a short time; but in 1832 he was intrusted with the education of the son of M. Hallette, mechanist of Arras. Here he resided for two years, contributing largely, on literary and political subjects, to the *Progrès du Pas-de-Calais*. He afterwards went to Paris, where he contributed to various political papers, and where in 1838 he founded the *Revue du Progrès Politique, Social et Littéraire*, in which he laid down in a more quiet and leisurely way his Socialistic theory. In this he brought out his chief work on Socialism, the *Organisation du Travail*, which, in 1840, appeared in a separate form. The book obtained for its author a wide, enthusiastic popularity among the French *ouvriers*, who were captivated by the brilliancy of the writing, the symmetrical simplicity of the scheme, and the freshness of the views advocated. The book denounces the doctrine of individualism—i.e., individual and competitive efforts in labour—and advocates the absorption of the individual in a vast 'solidarity,' where 'each would receive according to his needs, and contribute according to his abilities.' B. next published (in 1841—1844) a historical work, entitled *Révolution Française: Histoire de Dix Ans*, 1830—1840, which produced a deadly effect on the Orleans dynasty. Louis Philippe afterwards declared that 'it acted like a battering-ram against the bulwarks of loyalty in France.' It owed its success partly to the exposure it gave of the scandalous jobbery and immorality of the crown and its advisers, partly to that passionate ardour which changed the tranquillity of history into the vehemence of a pamphlet, and partly to its academic pomp of style. This was followed by the first volume of a *Histoire de la Révolution Française*, in which the author's aim was not only to describe, from his own point of view, the incidents of the first revolution, but the social history of the 18th c. On the breaking out of the February revolution of 1848, B. seemed likely to play an important part. His connection with the party of the *Réforme* journal, and his popularity with the working-classes, led to his being appointed a member of the Provisional Government. He was placed by government at the head of the great commission for discussing the problem of labour. At the same time, Marie, Minister of Public Works, began—but without B.'s co-operation—to establish the so-called national workshops, which were to bring about the realisation of the Socialistic principle, but which only proved the hazardous and impracticable character of B.'s doctrines. The national workshops led to the arrest of the 15th May 1848, when B. nominally, if not actually, again played a prominent part. A proposal was made to prosecute him, but it was negatived by the National Assembly. After the June insurrection, he was again accused, and prosecuted for conspiracy, but contrived to escape to London, where he spent many years. During his exile, he devoted himself to political and historical literature. In 1849 appeared his *Appel aux Honnêtes Gens*, and *Catéchisme des Socialistes*; in 1850, *Pages d'Histoire de la Révolution de Février*; and in 1851, *Plus de Girondins; la République Une*.

*et Indivisible.* The work which has secured him the most enduring reputation is his *History of the French Revolution*, written during his residence in England. It is characterised by extensive and original research, which has frequently enabled the author to reverse the common verdicts on historical personages, and to explode many of the extravagant stories of the stormy period of which it treats. In style, it is eloquent, bold, and dignified; and if its sentiments do not always command themselves to the sober judgment of English readers, there can be but one opinion in regard to its candour, impartiality, and power. It consists of 12 vols. On the fall of the Empire in 1870, B. returned to France. In occasional letters in the *Times*, B. displays a mastery of the English language that few Frenchmen attain.

BLANCH or BLENCHE HOLDING is one of the ancient feudal tenures in the law of Scotland relating to land, the duty payable to the superior or lord being in general a trifling sum, as a penny Scots, or merely illusory, as a peppercorn, 'if asked only,' although it may happen that the duty is of greater value. Anciently, many estates in Scotland were held, both of the crown and other superiors, by this tenure; but it is now seldom adopted in the constitution of an original right of property. See CHARTER, TENURE.

BLANCHE-LYON, the title of one of the English pursuivants-at-arms. See PURSUIVANT.

BLANCHING is a process resorted to by gardeners, to prevent certain secretions which in ordinary circumstances take place in the leaves of plants, and to render them more pleasant and wholesome for food. The action of light is indispensable to the decomposition of carbonic acid by the leaves of plants, and, consequently, to the elaboration of many of the substances from which they derive their peculiar qualities: the exclusion of light, therefore, renders them white, or nearly so, and deprives them of much of their natural coarseness and bitterness—as in the familiar examples of lettuce, celery, sea-kale, &c. B. is accomplished in various ways, as by drawing up earth to the plants, when the lower part

of the leaf or leaf-stalk alone is to be blanched; tying the whole leaves together, by which the inner ones are blanched in a somewhat imperfect way, as is commonly done with lettuce; covering with boxes, pots, or

Blanching-pot.

like, as the practice is with sea-kale; causing the leaves to grow up through litter, &c. The figure represents a very convenient B.-pot, of French invention; it is made of earthenware, and perforated with many holes. B., although so simple and easy, is of great importance in the art of gardening, and the usefulness of many plants very much depends upon it. In cabbage, and some other cultivated plants whose leaves form themselves into compact heads, there is a natural B. or etiolation.

BLANC-MANGE, so called from its white appearance, is a jelly made of isinglass and milk. The following is the ordinary recipe for making it. Take a quart of sweet milk or cream, and put in it two ounces of the best isinglass, with the rind of a lemon, a blade of mace, and white sugar to taste. Put the whole in a saucepan, and let it boil a quarter of an hour; then mix with 6 bitter almonds and 24 sweet ones, beaten into a paste with a little water; strain through a piece of muslin; and having let the composition settle a little, pour into a mould, and turn it out when cold. Soyer gives one ounce of isinglass to a quart of milk, a

quarter of a pound of sugar, a quarter of an ounce of cinnamon, a little grated nutmeg, half of the peel of a lemon, and a bay-leaf, prepared as above. B. is also made of calf's-foot jelly and eggs, of arrow-root and milk, &c.; and the flavour is modified to taste.

BLA'NCO, CAPE, a remarkable headland on the west coast of Africa, in lat. 20° 47' N., and long. 16° 58' W., the extremity of a rocky ridge (called Jebel-el-Bied, or White Mountain) which projects from the Sahara in a westerly direction, and then bending southward, forms a commodious harbour called the Great Bay. The bay and town of Arguin, which is supposed to have been the limit of ancient navigation in this direction, lie some miles to the southward. Southward to the mouth of the Rio Grande the shores are of a low sandy character, with a current tending south-west, and prevalent north-east trade-wind; northward from Cape B. to Cape Geer, the coast is rocky, with a moderate elevation. On account of the deficiency of good harbours, the prevalence of west winds, and other causes, the casualties to shipping are very numerous. The constancy of west wind on a coast almost wholly within the sphere of the trade-winds, is very remarkable, and is accounted for by the rarefaction of the air by the heat of the sands of the Sahara. The natives of the Canary Islands carry on a pretty lucrative fishery in the bay in boats of from 100 to 150 tons burden. Cape B., which is composed of mixed calcareous and silicious sandstone, was first discovered by the Portuguese in 1441.—Cape B. is also the name of several less important headlands in Spain, Greece, America, and the Philippines.

BLAND, a beverage which is—or formerly was—a common drink among the inhabitants of the Shetland Islands during the summer months. It is prepared from the whey or serum of churned milk, and is said to be an agreeable beverage. Dr Edmondston, in his *View of the Zetland Islands*, describes B. as being, when twelve months old, perfectly good and transparent; its flavour then bearing a strong resemblance to lemon-juice.

BLA'ND FORD-FO'RUM, or MARKET BLANDFORD, a town in Dorsetshire, on the right bank of the Stour, 16 miles north-east of Dorchester. It lies in a fine tract of pasture-land, famed for its multitude of cows. It suffered much in 1579, 1677, 1713, and 1731, from fire. It is built of brick, and is neat and regular. It was formerly famed for its manufacture of bandstrings and lace, the point-lace bringing £30 a yard. Shirt-buttons are made here. Pop. in 1871, 4011.

BLANDRATA, Gronio, the founder of Unitarianism in Poland and Transylvania, was a native of Saluzzo, in Italy. He had established himself as a physician at Pavia, when he was compelled, on account of his heretical opinions, to fly to Geneva in 1556, where at first, and to avoid further molestation, he feigned to agree with Calvin. In 1558, he went to Poland, hoping to find there greater freedom of thought and speech; and in 1563 he betook himself to the court of John Sigismund, Prince of Transylvania, whose favourite physician he became. Here he exerted himself prudently but assiduously to spread his doctrines, and succeeded in forming a considerable party. In his old age, however, the heat of his proselytizing zeal died out; and it is asserted that, to preserve his worldly interests, he even forsook the cause of the Unitarians, and favoured that of the Jesuits, who were in high esteem with the prince. He was murdered in 1590 by his nephew, whom he had threatened to disinherit on account of his attachment to the Catholic Church. B.'s religious treatises are entirely destitute of importance.

**BLANE, SIR GILBERT**, a distinguished physician, was born at Blanefield, Ayrshire, August 29, 1749. He studied at Edinburgh University, and afterwards became private physician to Lord Rodney, whom in that capacity he accompanied in 1780, when Rodney assumed the command of the West Indian squadron. On one occasion, when all the officers were wounded, B.'s bravery was so conspicuous, that Lord Rodney immediately obtained for him the appointment of physician to the fleet. In 1785, he was elected physician to St Thomas's Hospital, London, having previously been appointed physician-extraordinary to the Prince of Wales. In 1795, he was chosen head of the Navy Medical Board, and was greatly instrumental in introducing the use of lemon-juice, so effective in preventing scurvy, into every vessel in the navy; and in many other ways he was active in promoting measures for the prevention or remedy of diseases on board ship. In 1809, he was employed to report on the cause of the unhealthiness of the Walcheren army, and the following year he was sent to inquire into the expediency of establishing a naval arsenal and dockyard at Northfleet. In 1812, he had a baronetcy conferred upon him, and in the same year the Prince Regent made him his physician in ordinary. When the Duke of Clarence ascended the throne as William IV. in 1830, he made B., then 81 years old, his first physician. B. died June 28, 1834. He published several valuable works, characterised by varied knowledge and originality of thought, the most popular and useful of which are, *Observations on the Diseases of Seamen*, a lecture on *Muscular Motion*, and *Elements of Medical Logic*.

**BLA'NES**, a town of Spain, in the province of Gerona, and 22 miles south of the city of that name, with a port on the Mediterranean. Pop. 5000.

**BLANK BONDS** were Scotch securities, in which the creditor's name was left blank, and which passed by mere delivery, the bearer or holder being at liberty to insert his name in the blank space, and sue for payment. The intention originally was to save the expense of conveyances, and to facilitate the transmission of the obligation; but experience having proved that they were capable of being used for fraudulent purposes, these bonds were, by a Scottish act, passed in 1696, declared void. The act, however, excepts from its provisions the notes of trading companies, and indorsements of bills of exchange. See BOND, SECURITY.

**BLANK CARTRIDGES**. The distinction between *blank* and *ball* cartridges will be found noticed under CARTRIDGE.

**BLA'NKENBURG**, a town in the duchy of Brunswick, 37 miles south-south-east of the capital, is situated on the Harz Mountains, at an elevation of 732 feet above the sea. It is walled, has a gymnasium, and several charitable and educational institutions. Pop. 3500, who are chiefly engaged in mining; iron, marble, and dye-earths being plentiful in the surrounding districts. On the Blankenstein, a rocky height immediately adjoining the town, there is a palace belonging to the Duke of Brunswick; and on the lofty summit of the Regenstein, about half a mile distant, there are the remains of a large castle, with many chambers, hewn out of the rock by Henry the Fowler in 919. Louis XVIII. resided at B. as Comte de Lille, 1796—1798.

**BLANK VERSE** is verse without rhyme (q. v.), and depending upon metre (q. v.) alone. The classical productions of the Greek and Roman poets—at least such of them as have come down to us—are composed on this principle; and accordingly, when the passion for imitating classical models set in, rhyme came to be looked upon as an invention of Gothic barbarism, and attempts were made in

most countries to shake it off. The first specimen of blank verse in English is a translation of the Second and Fourth Books of Virgil's *Aeneid*, by the Earl of Surrey, who was executed in 1547; but it had been used by Italian and Spanish writers as early as about the beginning of that century. In England, its adaptation to the drama was at once felt, and in that department of poetry it soon became and has continued dominant—if we except the effort made by Dryden and others, after the Restoration, to return to rhymed plays; but in other kinds of poetry, it was not till the appearance of *Paradise Lost* (1667) that it could be said to have taken root; and even then the want of rhymes was felt, as the poet expected it would. Many poets have since followed Milton's example; and English narrative, didactic, and descriptive poetry, is partly in B. V., partly in rhymed couplets. It is chiefly in 'heroic' metre, as it is called—that is, in verses or lines of ten syllables—that blank verse has found a firm footing. Some, in fact, would restrict the name blank verse to lines of ten syllables, not considering it applicable to such metres as those of Southey's *Thalaba* and Longfellow's *Hiawatha*.—Dramatic B. V. is characterised by the frequent occurrence of a supernumerary syllable at the end of the line:

To be | or not | to be, | that is | the question :  
Whether | 'tis nobler in | the mind | to suffer.

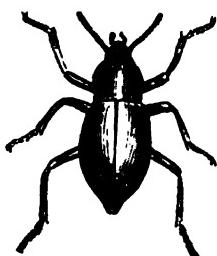

In Italian and Spanish, B. V. never became popular, and still less in French. The German language seems to admit every variety of blank metre.

**BLANQUI, JÉRÔME ADOLPHE**, one of the first French economists, was born at Nice, 28th November 1798, and educated at the Lyceum of that city. In 1814, his family quitted Nice, and young B. went to complete his studies at Paris, where he became acquainted with J. B. Say, who induced him to turn his attention to the study of political economy. In 1825, by Say's recommendation, he was appointed Professor of History and of Industrial Economy in the Commercial School at Paris. On the death of Say, he was appointed Professor of Industrial Economy in the Conservatoire des Arts et Métiers, and was one of the editors of the *Dictionnaire de l'Industrie Manufacturière, Commerciale, et Agricole*. In June 1838, he became a member of the Academy of Moral and Political Science. The Academy sent him to Corsica, to study the condition of that country, and in 1839, to Algiers for the same purpose. In 1841, he visited Turkey. In 1851, the Academy, which highly valued his abilities, requested him to furnish a complete account of London in its financial and other aspects. This task he executed to the satisfaction of the savans who employed him. He died at Paris on the 28th January 1854. B., as a national economist, was somewhat inclined to Socialism. Like his master, Say, he was in favour of free-trade. In method, he is ingenious; in style, transparent; and even the driest discussions become interesting, from his lively mode of treating them. His principal works are—*Voyage d'un Jeune Français en Angleterre et en Ecosse* (Paris, 1824); *Résumé de l'Histoire du Commerce et de l'Industrie* (Paris, 1826); *Précis Élémentaire d'Economie Politique, précédé d'une Introduction Historique, et suivi d'une Biographie des Economistes, &c.* (Paris, 1826); and, most important of all, the *Histoire de l'Economie Politique en Europe, depuis les Anciens jusqu'à nos jours, suivie d'une Bibliographie raisonnée des Principaux Ouvrages d'Economie Politique*.

**BLANQUI, LOUIS AUGUSTE**, the brother of the economist, was born at Nice in 1805. He has made himself conspicuous chiefly by his rabid advocacy of the most extreme political opinions.

From an early age, he dabbled in conspiracy, and submitted to its penalties with the pride of a martyr. After the revolution of February, he formed the Central Republican Society, which menaced the very existence of the Provisional Government. He it was also who organised the revolutionary *attentat* of the 15th May, the aim of which was to overthrow the Constituent Assembly, although it has been alleged that he was driven to this step by the impatience and violence of his party, or, more properly, his club. At the head of an excited mass, he made his appearance before the national representatives, and with that melodramatic love of liberty which makes a French patriot fancy it to be his first and most sacred function to emancipate the world, demanded the *resuscitation of the Polish nationality!* His coadjutor, M. Huber, went a step further, and theatrically imitating the desperate promptitude of the great Revolution, pronounced the dissolution of the assembly. The latter fortunately proved itself strong enough to crush this insolence. B. was arrested, tried, and condemned to ten years' imprisonment in Belle Isle.

**BLAPS**, a genus of insects, of the order *Coleoptera*, the type of a tribe called *Blapsides*, the species of which are numerous, all of a dark colour, destitute of wings, and having the elytra or wing-cases united together. They run slowly, however, in comparison with many kinds of beetles, and inhabit dark and damp situations, feeding chiefly on dead vegetable matter. They have the power of secreting and emitting a brownish, acrid, irritating fluid, of a peculiar and penetrating odour, with which they appear to be furnished for the purpose of self-defence, and which some of them are capable of throwing to a distance of six or eight inches. *Blapse mortisaga*

*Blapse mortisaga.*

ish women in Egypt, under the notion that it will make them fat, this being, in their estimation, one of the chief points of beauty.

**BLA'SIUS**, a saint and martyr, was Bishop of Sebastia, in Cappadocia, when Licinius began a bloody persecution of the Christians. B. left the town, and concealed himself in an unknown chasm in the rocks, but his abode was discovered by Agricola, while out hunting. The saint was conveyed to Sebastia, and as he steadfastly refused to deny Christ, and worship the heathen gods, he was put to death (316 A.D.) with circumstances of the most horrid cruelty. At one period, his worship must have been widely diffused, judging from the extent of territory over which his relics were scattered. The wool-combers claim him as their patron, for the singular reason that he was tortured, among other instruments, with a wool-comb. At Bradford, in Yorkshire, there is a septennial procession of that craft on his day. The practice of invoking St B. in cases of sore throats, is said to have originated in the circumstance that, when young, he saved the only son of a rich widow from being choked by a fish-bone. It has been conjectured, however, that the wool-

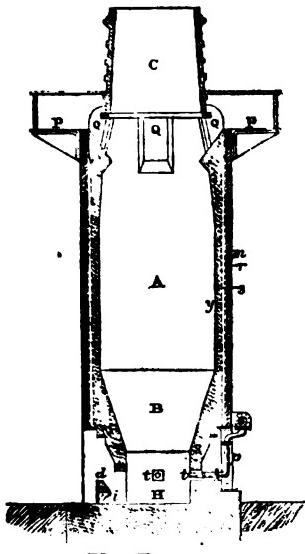

comb has probably been mistaken for a fish-bone, and that the story of the rich widow's only son is simply a myth elaborated in explanation of the circumstance. St B.'s day is the 3d February.

**BLASPHEMY** is an offence against God and religion, by denying to the Almighty his being and providence; or by contumelious reproaches of our Lord and Saviour Jesus Christ; also all profane scoffing at the Holy Scriptures, or exposing them to ridicule and contempt. Seditious words, moreover, in derogation of the established religion may be proved under a charge of blasphemy. These all are offences punishable at common law by fine and imprisonment, or other infamous corporal punishment; for Christianity is held to be part of the laws of England; and a blasphemous libel may be prosecuted as an offence at common law, and punished with fine and imprisonment. In Gathercole's case, tried at York in 1838, where the defendant, a clergyman of the Church of England, was prosecuted for a libel on a Roman Catholic nunnery, and in which he also made a violent attack on the tenets and the morality of the Roman Catholic Church, it was laid down by the judge who tried the case (the late Baron Alderson), that a person may, without being liable to prosecution for it, attack Judaism, or Mohammedanism, or even any sect of the Christian religion, save the established religion of the country; and the only reason why the latter is in a different situation from the others is, because it is *the form established by law*, and is therefore a part of the constitution of the country. But any general attack on Christianity is also the subject of criminal prosecution, because Christianity is the public religion of the country. Thus, as an offence against religion, B. may assume one of two forms: first, either as against the articles and creeds of the Established Church; or secondly, as against a dissenting community, in the libel against whom, a general attack on the Christian religion is involved. The B. must in some manner have been overtly and publicly declared, either by a speech on some public occasion, or by the act of publication in print.

The Scotch law regarding this offence is now very much the same. The old severe Scotch acts, one passed in 1661, and another in 1695, which provided capital punishment for offences of this description, were repealed by the 53 Geo. III. c. 160. The punishment is now arbitrary at common law; and by the 6 Geo. IV. c. 47, the punishment of B. is further restricted, and made the same as in England. It is also enacted by the second section of that act, that a person convicted of a second offence may be adjudged, at the discretion of the court, either to suffer the punishment of fine or imprisonment, or both, or to be banished the country; but the provision as to the punishment of banishment is repealed by the 7 Will. IV. c. 5. The latest and most remarkable illustration of the Scotch law regarding this offence, is a case that was tried before the High Court of Justiciary in 1843. The prisoner, who defended himself, was accused, convicted, and sentenced to imprisonment for fifteen months, for publishing profane, impious, and blasphemous books, containing a denial of the truth and authority of the Holy Scriptures and of the Christian religion; and devised, contrived, and intended to ridicule and bring into contempt the same. In the course of the trial, the prisoner endeavoured to justify his conduct by quotations from the Bible, which, he maintained, warranted the language of the blasphemous works in question. But the court would not allow such a line of defence, and the Lord Justice-clerk (the late Right Honourable John Hope), in charging the jury, pointed out that the indictment charged, that the wicked and felonious publication of such

works is a crime, and that therefore the jury were not to consider themselves engaged in any theological discussion, but simply in trying whether a known and recognised offence against the law had been committed." His lordship proceeded further to expound the law as follows: "Now, the law of Scotland, apart from all questions of church establishment or church government, has declared that the Holy Scriptures are of supreme authority. It gives every man the right of regulating his faith or not by the standard of the Holy Scriptures, and gives full scope to private judgment, regarding the doctrines contained therein; but it expressly provides, that all "blasphemies shall be suppressed," and that they who publish opinions "contrary to the known principles of Christianity," may be lawfully called to account, and proceeded against by the civil magistrate. This law does not impose upon individuals any obligations as to their belief. It leaves free and independent the right of private belief, but it carefully protects that which was established as part of the law, from being brought into contempt." The learned judge also observed: "I think it also my duty to add—as a part of the [prisoner's] address was directed against the policy and expediency of this prosecution—that I think it was a most proper and fit prosecution. I have no doubt of the effect that will result from this prosecution; because, though, in his advertisement and address, this individual declares that he addresses himself chiefly to the working-classes of Scotland, yet I am sure that he deceives himself if he imagines that that is a class which would easily part with their belief in those truths, which are perhaps more valuable to them in this life than to any other class in the community. There may, indeed, be a class of persons, like the prisoner at the bar, in situations above that of the working-classes, young men whose education is imperfect, and their reading misdirected; and it is to save them from the mischief of these opinions that it is necessary the law should take its course." See RELIGION, OFFENCES AGAINST.

**BLAST FU'RNACE.** Many costly experiments have been tried of late years in order to determine,

Elast Furnace.

along with other related questions, the best form of the blast furnace in which iron is smelted. Which is the most serviceable form is as yet a

146

very much disputed point; but, according to the published accounts, furnaces of the unusual height of 80 or 90 feet give, as a rule, the best results. There are two types of blast furnaces, irrespective of differences in their forms, as regards the way in which they are constructed. Some are built with thick walls, either entirely of brick or of brick and stone, hooped with iron, forming massive towers. Others, again, are formed of comparatively thin brick walls, and depend for their strength on an outer malleable iron casing, in which case they are called *cupola* furnaces. The furnace A, in fig. 1, article IRON, is an example of the former, and the annexed figure represents one of the latter kind.

The various parts of the furnace are distinguished as follow: A is the *shaft* or *body*, generally either in the form of a cone or cylinder, or somewhat barrel-shaped, in which case, the portion marked B is not distinguishable from the shaft. B is called the *boshes*, and is the part of the furnace which, from the high heat to which it is exposed, usually gives way first. H is the *hearth*, and C is the *tunnel-head*, which, however, is usually wanting when the mouth is closed by a bell and cone to save the gases generated in the furnace. P is the charging platform, and Q, Q, the openings through which the ore, fuel, &c., are fed. These materials are brought to the platform by hoists, inclines, or level gangways, according to the situation of the furnace. Just below the boshes there are four or five openings in the circumference for the *tegrees*, and another for the arrangements required for tapping the furnace. As respects the latter, a is called the *tymp-arch*, immediately below which is placed the *tymp* itself, consisting of a rectangular iron box containing water in a coiled pipe. The hearth is prolonged in the direction of the *dam-plate*, and the space between it and the *tymp* is filled up with sand or clay, in which there is a channel for the escape of slag, when it overflows the dam-plate. In the latter is placed the *tapping-hole*, through which the molten iron is run off twice or thrice a day. The pipe at p conveys the blast, produced by a powerful blowing-engine, and heated to between 600° and 1000° F. See IRON.

**BLASTING.** Before gunpowder was invented, the separation of masses of stone from their native rock could only be effected by means of the hammer and wedge, or by the still slower method of fire and water. In soft and stratified rock, wedges are still used for quarrying stones for building purposes; but in hard rock, or where regularity of fracture is no object, gunpowder is universally employed. There are two kinds of B.—first, the small-shot system; and second, that of large blasts or 'mines.'

The small-shot system consists of boring holes into the rock, of from one to six inches in diameter, and of various depths, according to circumstances. In hard rock, this is done by a steel-pointed drill, struck by a hammer, and turned partly round after each blow, to make the hole cylindrical. The addition of a little water serves to preserve the temper of the boring tool, and makes the rock more easy to cut. In soft rock, whenever the hole is to be vertical, a 'jumper' is used; this is a weighted drill, which acts merely by its own weight, when let fall from about a foot in height. The powdered stone is removed at intervals by a 'scraper.' The rate of progress varies, of course, with the hardness of the rock. At Holyhead, the average work done by three men in hard quartz rock, with 1½ inch drills, is 14 inches in depth per hour; one man holding the drill, and two striking. After the hole is bored, it is cleaned out, and the powder poured down. A wad of dry turf or hay is put over the charge, and the rest of the hole 'tamped,'

or filled with broken stone, clay, or sand. The shot is fired by a length of Bickford's patent fuse. When it is desirable to prevent the stones from flying about, when the shot is fired, a shield of boiler-plate, or of brushwood weighted, may be laid over the hole.

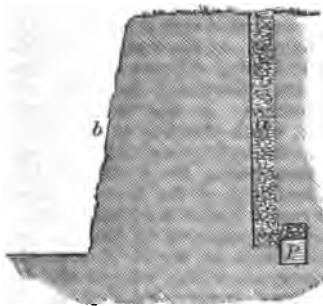

Small shots may be fired, even under water, by enclosing the charge in a tin case, with a tube of powder reaching to the surface; or in a canvas bag, well tarred, tied at the neck round a length of Bickford's fuse, which burns under water. The charge is inserted in the drill-hole; and the weight of the superincumbent water acts as tamping.

In removing the wall between the old and new Shadwell basins of the London Docks, shots were fired under water within a few yards of vessels lying in the basin, by using moderate charges, and by keeping a raft of timber floating over the hole, as a shield to prevent anything flying upwards.

The voltaic battery has been used for firing shots, chiefly under water, since 1839, in which year it was employed at the wreck of the Royal George and at the Skerryvore Light-house.

When a large mass of rock has to be removed at once, or where a steady supply has to be daily furnished of irregularly broken stone, for breakwater or other purposes, recourse must be had to large blasts, or 'mines.' The greatest isolated example of this kind of blasting was the overthrow, in 1843, of the Rounddown cliff at Dover, by 18,500 lbs. of powder, in three separate charges, fired simultaneously by voltaic electricity. But by far the grandest system of B. by mines is to be seen at the quarries for supplying stone to the breakwater at Holyhead, where small shots having been found inadequate, large mines were introduced in 1850. These large blasts are of two kinds—'shafts' sunk from the top of the rock; and 'headings,' or galleries driven in from the face.

The shaft-holes are 6 feet long by 4 feet wide, of various depths, according to the height of the rock, but seldom much exceeding 60 feet. The deal-box, with the charge of powder, p, is placed in a chamber

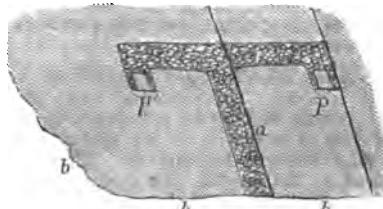

Vertical Section of Shaft:  
a, tamping; b, face of the rock; p, box for charge.

cut at one side of the shaft, so that the tamping may not be in the direct upward line of fire. The tamping consists of the stone and débris which have come out of the shaft; and the wires from the battery are protected from injury by being laid in a groove cut in a batten placed up one angle of the shaft.

It is evident that the same point, p, in the rock may be reached as well by a heading or gallery driven in from the face of the rock, as by a shaft from the top, and often by a shorter route. Headings are made 5 feet high by 3 feet 6 inches wide, and are driven, if possible, along a natural joint in the rock. The direction of the

gallery is changed and sunk at parts, to prevent the tamping from being blown out. Four men can, on the average, drive 5 feet run of heading per week; but cannot sink above 3 or 4 feet of shaft, which has a greater sectional area, and is more inconvenient to work in.

The charge of powder may be divided and placed in two or more separate chambers, as p and p'; and

Sectional Plan of a Double Heading.

it is better thus to spread a heavy charge over a length of face, than to have it in one spot, at a greater distance from the face than about 30 feet.

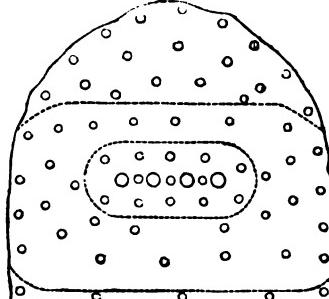

The charges for these mines vary from 600 lbs. to 13,000, and even more, pounds of powder; and the produce is from 2 to 6 tons of stone to the pound of powder, according to the density of the rock and the position of the mine.

Besides the quarrying of stone, B. is used for military objects, or where total destruction is aimed at, and an excess of powder is little or no objection.

Of late years great improvements have been effected in the production and application of explosive agents other than gunpowder, which latter, until lately, may be said to have been exclusively used for the purpose of blasting. Nitroglycerine (q. v.) and gun cotton (q. v.) were discovered within two years of each other; but while gun cotton was immediately applied to industrial purposes, nitroglycerine was destined to remain a chemical curiosity for about 16 years.

Dynamite is a preparation of nitroglycerine and porous earth, in the form of a pasty mass, which, without materially impairing its explosive properties, has the effect of rendering it perfectly safe to handle.

One of the most celebrated applications of boring

Section of Mont Cenis Tunnel.

and blasting to modern engineering was the driving of the Mont Cenis tunnel. See TUNNEL.

BLA'TTA. See COCKROACH.

BLAYE (ancient *Blavia*), a fortified seaport of France, in the department of the Gironde, 20 miles north-north-west of Bordeaux. It is built on the right bank of the river Gironde, which at this point is about 2½ miles in breadth, at the base of a

rocky eminence crowned with a strong citadel. The town is further defended by the two forts of Paté and Médoc, which command the passage of the river. The port of B. is a very busy one, all inward vessels being required to anchor and deliver the manifests of their cargoes; and many outward-bound vessels lay in their provisions here. B. has manufactures of linen and woollen, glass and earthenware; a considerable export-trade in corn, wine, brandy, oil, fruits, soap, &c., and tribunals of jurisdiction and of commerce. Pop. (1872), exclusive of garrison, 3274.

**BLA'ZON, BLA'ZONRY** (Ger. *Blasen*, to blow, as with a horn). These heraldic terms originated in the custom of blowing a trumpet to announce the arrival of a knight, or his entrance into the lists at a joust or tournament. The blast was answered by the heralds, who described aloud and explained the arms borne by the knight. B. and B. thus came to signify the art of describing, in technical terms, the objects (or charges, as they are called) borne in arms—their positions, gestures, tinctures, &c., and the manner of arranging them on the shield.

**Rules of Blazoning.**—As heraldry, though an entirely arbitrary, is a very accurate science, the rules of blazoning are observed on all occasions with the most rigid precision. The following are the most important: 1. In blazoning or describing a coat of arms, it is necessary to begin with the field, mentioning the lines by which it is divided—*per pale*, *per fess*, &c., if such there be—and noticing if they are *indented*, *engrailed*, or the like, it being taken for granted that they are straight, unless the contrary be mentioned. 2. There must be no unnecessary repetition in blazoning; thus, where the field is blue, and the charges yellow, we should say, *azure, a crescent between three stars, or*, thereby implying that both the crescent and the stars are *or*. 3. For the same reason, where a colour has been already mentioned, and it is necessary, in order to avoid ambiguity, to repeat it in describing a subsequent charge, we say, *of the first, or of the second*, as the case may be. Thus, we should say, *azure, on a saltire argent, three water bougets of the first*, thus avoiding the repetition of the word *azure*. 4. Again, recurring to our first example, it would be an error to say, *three stars with a crescent between them*, because we must always begin with the charge which lies nearest the centre of the shield. 5. Where the charges are of the natural colour of the objects or animals represented, in place of describing the colour, you simply say *proper*—i.e., of the proper or natural colour. 6. Another general rule in blazoning, or rather in marshalling coat-armour, is, that *metal shall never be placed upon metal, nor colour upon colour*.

The rules for blazoning separate charges, whether animate or inanimate, are indicated in the descriptions which will be found of them under their respective heads. See ORDINARIES; also BAR, BEND, &c.

**BLEACHING** (Ang.-Sax. *blæcan*, from *blæc*, pale, bleak) is generally understood to mean the process of whitening or decolorising cloth; but the term is also applied to the decolorising of such substances as the fixed oils, Irish moss, &c. Until about the close of the 18th c., B. depended upon the natural bleaching agencies present in the atmosphere and in the sun's rays. The usual plan was to spread out the cloth on a grass field, called a bleaching-green, and to continue sprinkling it with water several times a day. After being thus exposed for several months to the action of air, light, and moisture, the cloth was rendered white. The process

was necessarily tedious and occupied much valuable land, and for this reason a large quantity of the cloth required to be bleached was sent to Holland for that purpose. A particular kind of linen, which was regularly sent to Holland, received on that account the name of *Hollands*; and another variety of linen, which, from its fineness, was generally spread on the better grass-fields or lawns, received the title of *lawn*. An improvement in the preceding process was to dip the cloth occasionally in a weak *alkaline lye*, or solution of an alkali, such as soda in water, which step was called *bucking*; after which, the cloth was spread out on the grass for some weeks, and regularly moistened with water, this stage being styled *crofting*; the cloth was then soaked in sour milk and water, which was called *souring*, and again exposed on grass to the action of air and sun-light. By repeating the bucking, crofting, and souring operations several times, the bleaching was very much hastened, and the amount of land occupied in bleaching-greens lessened. The next improvement was the introduction of dilute sulphuric acid instead of sour milk, as the souring agent; and this was so effectual, that it lessened the time required for B. from about eight months, which was the original time, to about four months.

Till very recently, it was thought that the agent in this natural mode of B. was entirely resident in the sun's rays, but the discovery of the substance called *Ozone* (q. v.), which possesses very powerful B. properties, and which in greater or less quantity exists in the air of country districts at all times, has led to the opinion, now held by chemists, that the B. which takes place when cloth is moistened and exposed to the air is mainly due to the ozone present therein; though the chemical rays which accompany the luminous rays of the sun may assist in the B., and also aid in the formation of the ozone. That the ozone has very much to do in open-air B., is observable from the fact that in town districts, where little or no ozone exists in the air, cloth is never bleached white.

In the year 1785, Berthollet, a distinguished French chemist, discovered the powerful B. properties of *Chlorine* (q. v.), and immediately thereafter it was suggested that chlorine would be useful in the B. of cloth. At the first, the gas chlorine was employed, and being diffused in the atmosphere of a vessel or small apartment, cloth hung therein was speedily bleached. It was found, however, that the chlorine, which bleaches, or destroys colour by uniting with the hydrogen of the colouring principle and thus decomposing the colour, could also unite with the hydrogen of the fibre (see *LIGNIN*) and destroy or render tender the textile fabric. So long as chlorine was employed in the gaseous state, it was very difficult to use it of such strength as only to destroy the colour, without also rotting the cloth. It was then suggested, that as chlorine was soluble in water, to the extent of two volumes of chlorine gas in one volume of cold water, the solution of chlorine might be employed. But although chlorine water was found to act efficiently and safely when the solution was of the proper strength, it was very difficult always to make it of the same strength, and more so to preserve it when made; as the least exposure to light causes more or less of the chlorine to unite with the hydrogen of the water, forming hydrochloric acid, which does not possess B. properties. After attempts to fix the chlorine in alkaline solutions, it was found that dry slaked lime was an admirable absorber of chlorine gas. The material produced from the union of chlorine with dry slaked lime is known as the *chloride of lime*, or *Bleaching powder* (q. v.), and this is the substance which has continued from 1799 up

## BLEACHING.

to the present time to be the great artificial bleacher of cotton and linen fabrics. It is not serviceable in the destruction of the colour of wool, silk, or the oils and fats; such materials being bleached by the employment of other agents, as will be afterwards noticed.

**BLEACHING OF COTTON AND LINEN FABRICS.**—The substances requiring to be got rid of in the purification of cotton and linen cloth, are (1) the organic colouring matter naturally present in the fibre; (2) resinous and fatty bodies, also inherent in the fibre; (3) weavers' dressing and perspiration taken up during the process of spinning; and (4) certain saline or earthy substances. The *first stage* in the B. is the singeing of the cloth, which is accomplished by drawing the cloth rapidly over a red-hot iron cylinder, or a numerous series of gas jets, which burn off the minute particles of fibre, resembling in appearance short hairs or down, and leave the cloth perfectly smooth. The *second stage* is the washing or scouring of the cloth, which consists in rolling up the pieces of calico or linen into bundles like coils of rope, and throwing a number of pieces into a large vat among lukewarm water, and allowing them to lie till fermentation begins, and proceeds some length, when the cloth is taken out, and thoroughly washed in the dash-wheels; which are large horizontal cylinders divided into several compartments, into each of which a stream of water keeps running while the wheel is turning. The *third stage* is boiling with lime-water, or *bucking*. The apparatus employed is called the *Bouking* or *Bucking Kier*, and consists of two compartments. The lower part is a boiler containing the lime-water, and the upper part is a capacious circular tank, into which the cloth in bundles, as it comes from the dash-wheels, is placed. By an ingenious arrangement, the lime-water is alternately forced up, by the compression of the steam, through a pipe into the upper compartment, and falls in a shower upon the cloth, through which it percolates and sinks again through perforations into the boiler, to be again propelled into the upper compartment. Instead of using lime alone, a mixture of lime and carbonate of soda ( $\text{NaOOCO}_3$ ) is occasionally employed, which acts by forming the inert carbonate of lime or chalk ( $\text{CaOOCO}_3$ ) and caustic soda ( $\text{NaO}$ ), which possesses high detergent properties. The chemical action which the boiling lye exerts on the cloth is in the formation of a soap with the resinous and fatty substances naturally inherent in the cotton or linen fibre, or communicated to it in the process of weaving, the greater portion of which is detached by the lye in the *bucking kier* and ultimately removed by a subsequent washing with water. This takes place either in the dash-wheels, or in a more effectual washing arrangement, consisting of a series of boxes or vats of different depths, placed side by side, into which the cloth is made to dip successively by passing over and under two sets of rollers. As the cloth moves on from the lower vats to the higher, it is passing from the soiled water to the more pure, as a stream of pure water is kept constantly running through the vats from the higher to the lower. The *fourth stage* in B. is the *souring* or *chemicking* in dilute sulphuric acid, of the strength of one gallon of the acid to from 25 to 30 gallons of water. The weak acid liquid is put into a large stone vat, and the goods are steeped in it. The acid acts beneficially in removing the remaining traces of the lime-soap which have adhered to the cloth, and a second washing in water, followed by bucking or scouring in soda lye, and a third washing in water are generally found necessary to obtain the cloth in

the condition best suited for the subsequent operations. The *fifth stage* is *chemicking with B. liquor*, obtained by dissolving *B. powder* (q. v.) in water, and allowing the impurities or insoluble matter to subside. The B. liquor is much diluted with water, and the cloth is steeped in it for about six hours, then taken out, and allowed to soak for other six hours in a second vat containing water, after which it is drawn out and exposed to the atmosphere, when the carbonic acid of the air sets free a portion of the chlorine from the B. powder, imbibed by the cloth. The *sixth stage* is another *souring* process, during which the cloth is immersed for about four hours in a steeping vat, containing dilute sulphuric acid of the strength ranging from 1 to 8 gallons of acid in 200 gallons of water. This acid liquid, as it soaks the cloth, encounters the B. liquid which previously saturated the fibre of the cloth, and the acid combining with the lime of the B. liquid, liberates the chlorine, which attacks the remaining traces of colour and removes them from the cloth.

The cloth, on being removed from the souring-vat, is boiled with soda lye, washed, and again treated with dilute sulphuric acid, which more effectually removes the decomposed colouring matter. It is thereafter thoroughly washed, passed through rollers to remove some of the water; then introduced into the *Hydro-extractor*, to get rid of the water more effectually; and lastly, the cloth is dried by being suspended in the air, or by being passed over a series of heated tin rollers, called *Steam Cans*. In the ordinary course of B., cotton loses about one-twentieth of its weight, and linen about one-third.

After the B. operations have been successfully performed, it is customary to proceed to the *finishing* of the cloth, which consists in, firstly, passing it through a large mangle, where the crumpled piece of cloth becomes smooth; secondly, drawing the cloth over rollers, which cause it to dip in a trough containing starch; thirdly, drying the starched cloth; and, fourthly, passing it through a large mangle or calender, consisting of a series of rollers, alternately of polished cast iron and solid paper, and which not only smooth out the cloth, but communicate a fine glazed surface, such as is generally exhibited in bleached cloth when purchased. The cloth intended to be printed upon or to be dyed is not starched or calendered.—The operations connected with the B. of cloth by chlorine exert no injurious effect on the health of men and women engaged in them. Some of the bleach-works near Glasgow are of long standing, and give regular employment to several hundred women. The rapidity with which the B. by chlorine can be carried on, may be understood from the fact, that when pressed for time, it is no uncommon thing to bleach, finish, and return to town 1000 pieces of cloth within 48 hours. Valuable in many respects, however, as is the rapidity of B. by means of chemical agents, it must be admitted that the process exerts a certain weakening effect on the cloth, and that, after all, B. according to the old method on the grass is preferable. Grass-B. is therefore still in use where time admits, as also for clearing linen and cotton apparel in domestic washing. See *WASHING*.

**BLEACHING OF WOOL** is never accomplished by B. powder, but recourse is had to sulphurous acid, which disguises the colour of the wool by combining with it to form a colourless compound. Originally the wool is contaminated with a greasy substance called the *yolk*, which naturally exudes from the skin of the sheep, and this unctuous matter mainly consists of a kind of soap soluble in water. The *first stage* in the B. of W. is to get rid of the yolk, which can be done by long-continued washing

## BLEACHING—BLEACHING POWDER.

in water; but as this is tedious, the general plan is to steep the wool in a vat containing one part of stale urine and five parts of water, then boil for some time, and ultimately strain the wool and wash well. The agent in the stale urine which acts upon the yolk is carbonate of ammonia, and thus acting upon the oily matters forms a soap which can be readily washed away. When woollen cloth is to be bleached, it is customary to substitute carbonate of soda (washing soda) for the stale urine, and this forms an alkaline lye, which performs the same part as the carbonate of ammonia. Soap is sometimes used as an auxiliary. The second stage of bleaching wool is the *sulphuring*, which takes place in a small wooden apartment, in which the damp cloth is suspended in regular folds from the roof to the floor, and a small pan of ignited sulphur being introduced, the doors, &c., are firmly closed. There are little openings round the sides of the chamber, for the admission of air, which can be closed at pleasure. The sulphur (S) in burning takes up two atoms of oxygen from the air, forming sulphurous acid ( $\text{SO}_2$ ), which is the bleaching agent; and in about 24 hours the operation is finished, and the woollen material only requires to be thoroughly washed with water, which may contain a little potash or soda. Where the wool is naturally high-coloured, it is necessary to repeat the various stages of the process several times before the bleaching is complete. Instead of applying sulphurous acid in the gaseous form, a solution of it in water is sometimes used. An economical method of preparing the solution of sulphurous acid is to introduce a mixture of sulphate of iron and sublimed sulphur into an earthenware retort, and apply a low red heat, when sulphurous acid is disengaged, which is passed through a vessel containing some porous matter, such as moss, to retain mechanical impurities, and then transmitted through a series of bottles containing water, where it is dissolved to the extent of forty volumes of the gas for every one volume of the water. The bleaching of wool by sulphurous acid is not so complete as the bleaching of cotton or linen by chlorine. In the latter case, the colour is destroyed, but in the former, the sulphurous acid merely combines with the colouring matter to produce a colourless compound, from which the colour can again be revived, either by soaking the wool in a dilute acid, such as sulphuric acid, or a dilute alkali, such as soda. Hence it is that new woollen cloth or garments, such as flannel, blankets, and underclothing, though almost colourless when purchased, yet after being washed several times, return to their natural yellow; for the soda used, as well as the soap which contains potash or soda, destroys the colourless compound formed in the texture of the wool during the sulphuring, and resuscitates the original colour.

BLEACHING OF SILK is carried on in a manner very similar to that pursued in the bleaching of wool. The silk has naturally a good deal of wax, accompanied by oil and colouring matter, enveloping the fibre, and the silk stuffs are repeatedly boiled in water containing a little soap or carbonate of soda, the alkaline nature of the solution being occasionally tempered by the admixture of some bran, which contains an acid. When well scoured and washed, the silk is obtained white enough for many kinds of printing; but where it is desirable that a pure white be obtained, the silken stuffs are introduced into a very weak solution of sulphurous acid, and thereafter thoroughly washed.

Other substances employed in the arts and manufactures are subjected to a process of bleaching; as the rags which are being manufactured into PAPER (q. v.), the palm-oil which is being converted into CANDLES (q. v.) and night-lights, and the STRAW

(q. v.) of which hats or bonnets are made; but the details of the processes followed in these and other operations, will be described more properly under their respective headings.

BLEACHING POWDER, a combination of chlorine and dry slaked lime (see BLEACHING), was first manufactured on a large scale in Glasgow by Mr Charles Tennant, who obtained a patent for its preparation in 1799. The substances employed in preparing the chlorine are common salt (chloride of sodium), black oxide of manganese, and sulphuric acid. The operation may be conducted in one or in two stages. The vessel used is a still. The whole apparatus is made of strong sheet lead, or of cast iron, or of grooved stones fitting closely. The more general plan is to have the upper part of lead, and the under part of cast iron. The lower third of the still has usually a double jacket, or double walls, between which steam is admitted through a pipe for heating the contents of the still. In using the apparatus, 100 parts of black oxide of manganese ( $\text{MnO}_2$ ) and 150 parts of common salt ( $\text{NaCl}$ ) are introduced by an opening in the top, which is closed by a water-joint; 185 parts of sulphuric acid ( $\text{SO}_3$ ), of specific gravity 1600, are then poured in by a funnel, and on the admission of steam into the jacket, chlorine is evolved, and issued by a tube at the head of the still. The theory of the changes that occur in the still is represented in the following table, there being two equivalents or atomic weights of sulphuric acid for one equivalent of each of the other ingredients :

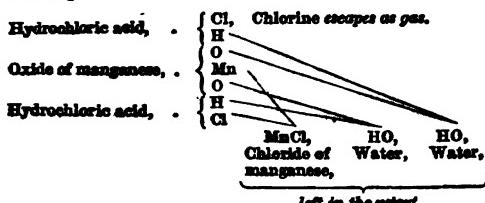

Chloride of sodium ( $\text{NaCl}$ ), . . . .	Cl, Chlorine escapes as gas.
Oxide of manganese ( $\text{MnO}_2$ ), . . . .	Na
Sulphuric acid ( $\text{SO}_3$ ), . . . .	O
Sulphuric acid ( $\text{SO}_3$ ), . . . .	Mn
	O
	$\text{SO}_3$
	$\text{SO}_3$
	MnOSO <sub>3</sub> , Sulphate of manganese,
	NaOSO <sub>3</sub> , Sulphate of Soda,
	left in still.

The pipe which carries away the chlorine gas is connected with a stone or leaden chamber, into which it enters at one or more points, and the chlorine entering, comes in contact with dry slaked lime in fine powder, with which the floor of the chamber is covered to the depth of some inches. The chlorine is rapidly absorbed by the lime, which, when the absorption flags, is stirred from time to time by wooden rakes. The process must not be allowed to proceed too quickly, as much heat is evolved during the combination of the chlorine with the lime; and if the temperature of the chamber rises beyond 110° F., the power of combination is very much lessened.

The material which is left in the still as a residuum, consisting of the sulphate of manganese and the sulphate of soda mixed together, is comparatively worthless, and accordingly it is found more economical in large chemical works to divide the process of the manufacture of B. P. into two stages, at each of which the residuum is of commercial use, and can be worked up into marketable products. The first stage is to heat the common salt and sulphuric acid together, when hydrochloric acid (q. v.) is disengaged in the gaseous state, and is received in proper vessels, and the sulphate of soda—from which common soda (q. v.) is prepared—is left in the retort or still. The hydrochloric acid thus obtained, is then placed along with the black oxide of manganese in the still, and on the steam-heat being applied, chlorine is evolved and is conducted to the lime chamber, while chloride of

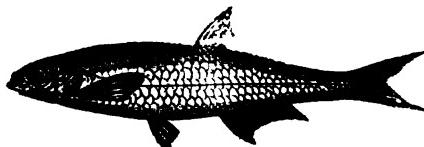

## BLEAK—BLEEDING.

manganese and water are left in the still. The decomposition is stated thus :

The chloride of manganese can be returned to the condition of black oxide of manganese, and used again and again. See MANGANESE. The B. P., prepared either in one or two stages, contains, when freshly and fully manufactured, generally between 30 and 40 per cent. of chlorine, and the strength of any sample is determined by the process of Chlorimetry (q. v.). The composition of B. P. is expressed by the formula  $\text{CaCl} + \text{CaOClO}$ , and it is regarded as a double salt of the chloride of calcium and hypochlorite of lime. For its employment as a decolorizing agent, see BLEACHING.

**BLEAK** (*Leuciscus Alburnus*), a small fresh-water fish of the family of *Cyprinidae* (q. v.), of the same genus with the Roach, Dace, Minnow, &c. See LEUCISCUS. It is seldom more than six or seven inches long; in general form it resembles the dace, but is more elongated; the dorsal fin is placed further back, and the base of the anal fin is longer; the nose is pointed, the under jaw the longest; the scales are of moderate size, and beautifully striated; the back is of an olivaceous green colour; the sides, belly, cheeks, and gill-covers, shining silvery white; all the fins nearly white. The tail is forked for half its length. The B. is found in

Bleak (*Leuciscus Alburnus*).

many of the rivers of Europe. On the inner surface of the scales of the B., as of white-bait, roach, dace, &c., a silvery substance, from which they derive their beautiful lustre, is found in such abundance as to be much used for making artificial pearls (q. v.), the white beads so common in ladies' head-dresses, and similar ornaments. That obtained from the scales of the B. is preferred to that of the roach and dace, but is inferior to that of the white-bait. It readily separates from the scales when they are soaked for a time in water, and settles to the bottom of the vessel. Small glass tubes are then dipped in it, and it is injected into thin hollow glass beads of the requisite forms and sizes, which are placed in a current of air to dry, and are sometimes further filled with wax.—The B. is singularly liable to be infested by a species of tape-worm.

The B. is an inhabitant of most of the English rivers which contain roach and dace. It is a very restless, active, little fish, constantly playing about the top of the water, in search of small flies or other food. A small piece of bread cast into the water becomes speedily surrounded by a shoal of them, and it is amusing to watch them darting to and fro at it with increasing pertinacity. It is not only a pretty little fish, but is, withal, delicate

eating; and a dish of well-cooked B. is scarcely inferior to gudgeons. They should be cooked in the same manner as sprats, which they rather resemble in shape and appearance. The best way to catch B. is to angle for them with a single gentle and a light quill-float, the bait being about a foot under water; they may be caught with very small flies, and all the more easily, if the hook be pointed with a gentle. They are so active, that the angler cannot strike too quickly, and where they abound, they form good preliminary practice for the young fly-fisher. The neighbourhood of running drains are very favourite resorts for B., and the angler can soon determine if there be any about, by casting on the water a handful of bran, when, if there be any, they will immediately rise at it.

**BLEBS** (allied to *bulla*—Lat. *bulla*, a bubble) are transparent bladders or blisters of the cuticle, which make their appearance in some forms of fever, in erysipelas, and in disorders of the digestive apparatus. There are three varieties of B. recognised by physicians : 1. The mild B., which vary in size from a pea to a hazel-nut, occur on the face, neck or arms, and legs of teething infants, and of young persons who have indulged in unripe fruit. They generally burst, discharge the clear fluid they contain, and heal up again in three or four days. 2. The tedious B., which most commonly affect aged and weakly persons, are seen as an eruption of numerous red elevations, which enlarge to the size of a pea, containing pale yellow serous fluid. These vesicles multiply to such an extent that the sufferer is disturbed at night from the irritation, and slight febrile attacks further debilitate him. 3. The solitary bleb generally selects old women for its victims, and appears, after much tingling of the skin, as one large vesication, and bursts in 48 hours, leaving a superficial sore.

The treatment consists in correcting the secretions, limiting the diet to what is farinaceous and easy of digestion, cooling drinks and tonics. For local treatment, the irritated surfaces are to be soothed by poultices and water-dressings.

**BLEEDING** (*hemorrhage*) is one of the most serious accidents which can happen to an animal, and constitutes the most anxious complication in surgical operations. As there is but a limited quantity of blood in the body, and as the sudden escape of a large portion of it is sufficient to cause death, every one should be instructed as to the measures which experience has shewn to be the most efficient for preventing a dangerous loss of blood.

B. may be either from a wounded artery or vein, or from a raw surface; and it may be in the form of a general oozing from the surface of a sore or a mucous membrane. We shall consider these varieties separately.

**Arterial** B. is recognised by the florid redness of the blood, and by its issuing from the cut vessel *per salsum* or by jerks. There are exceptions to this, however. When an artery has been tied, and bleeding occurs from below the ligature, the flow of blood is continuous, and of a dark colour.

If a large artery be wounded, the first gush of blood may prove fatal, but in general the patient faints, and nature takes advantage of the respite to place the cut artery in circumstances as favourable as possible to the preservation of life; viz., the artery draws up within its sheath (see ARTERY); the blood, no longer impelled vigorously by the heart, clots between the cut end and the cellular tissue surrounding it; the inner and middle coats not only retract but contract, and another clot forms within the arterial tube. These clots—which, with the faintness and the contraction and retraction of the artery, are termed natural *haemostatics* (blood-stanchers).

## BLEEDING.

stoppers)—are sufficient in many cases to prevent a recurrence of the B.; but such a happy concurrence is not to be depended on, and we must be prepared to adopt some of the many surgical or artificial means for restraining the flow of blood till adhesion (q. v.) can occur between the cut surfaces of the coats of the artery. The principal surgical means are:

*Immediate pressure*, which may be applied by pressing the finger-tip on the place whence the blood is seen to flow, and may be kept up by pads of lint, or a coin of convenient size wrapped in cloth, and secured with a bandage to the part.

*Pressure* on the artery above, or as it comes to the cut part. This requires some knowledge of anatomy, but not more than any intelligent person may easily acquire. Thus, pressure on the inside of the arm, about midway between its front and back, will press the brachial artery (q. v.) against the bone, and arrest any bleeding from wounds of the forearm and hand. Pressure on the middle of the groin with a thumb placed crosswise will control the stream of blood in the femoral artery, so that none can escape from any wound below where the pressure is made.

Pressure on the course of the vessel may be very efficiently effected by tying a handkerchief round the limb above where it is injured, and then inserting a stick, and twisting it sufficiently tight. This is the principle of the original tourniquet, which was invented by Morel, a French surgeon, at the siege of Besançon in 1674. He got the idea from seeing how carriers tightened the ropes which secured bales of goods on their carts. It has been modified from time to time. At present it consists of a strap and buckle, a pad which may be adjusted over the course of the artery wounded, or likely to be cut in an operation, and a screw by which the strap may be tightened as the surgeon may deem necessary. See *TOUNIQUET*. The objections to *pressure* as a means of arresting hemorrhage, are, that it is very painful, that it includes the vein, and thereby engorges the limb with blood, and may cause mortification, if continued for any length of time.

'Actual' *cautery*, or hot iron, is occasionally useful in bleeding from a bone, or at some points where pressure cannot be efficiently applied. It is the oldest method of stopping bleeding, and until the 18th c. was much in use; but its abuse, and the natural horror felt for it by both patient and surgeon, have almost banished it from the list of surgical haemostatics. If used, the iron should be at a white heat, the wound pressed for an instant, and then the iron should be held in contact with the bleeding vessel. It causes an eschar or slough, with shrivelling of the artery; and if the latter be small, it effectually stops the bleeding, until the eschar drops off, when the vessel may be found still pervious at the wounded part, and the danger of bleeding be as great as at first.

*Ligature*, or tying the artery, is a very old method of arresting hemorrhage, and certainly the best. It was not used generally, however, in operations until improved anatomical knowledge and more efficient tourniquets allowed surgeons the time necessary for its application. See *LIGATURE*.

Another method was introduced by the late Sir James Y. Simpson of Edinburgh, and has been already extensively used. He termed it *act-pressure*, or pressure from a long needle or pin inserted from without, so as to press the artery between it and the tissues. The pins are removed after twenty-four or forty-eight hours, the period being proportioned to the size of artery to be secured. This new plan promises to supersede the ligature, in amputations especially, where the vessels can be easily secured, and where occasionally they are found so brittle from disease

(see *ATHEROMA*) as to break under the pressure of a thread.

*Venous B.* is recognised by the dark colour of the blood, and its continuous flow. Pressure is generally found sufficient to arrest it, and it should be applied directly over the wounded part. Ligatures are not used to secure cut ends of veins, as inflammation of the lining membrane of these vessels is apt to spread along them towards the heart (see *PHLEBITIS*), and produce dangerous symptoms, and very frequently fatal results. There is not the same objection to the use of *act-pressure* pins. Of course, if a large vein is wounded in a part where compression cannot be readily applied, the surgeon should have no hesitation as to tying it; and if it is not cut quite through, he may pick up the cut edges in a forceps, and tie them so as to still permit a flow of blood through the vein.

*Oozing* from cut surfaces of course partakes of the characters of venous and arterial B., but there is no vessel sufficiently large to demand a ligature pressure. The actual cautery and cold may then be used, or one of the many styptics, the strong perchloride of iron may be specially recommended; it may be applied on lint or a sponge; or astringents, such as alum and tannin; there are also the puff-ball, mushroom, agaric, and matico leaves, cob-webs, felt, &c., which act mechanically, and owe their reputation chiefly to the pressure used in their application. Some persons have a congenital tendency to bleed (the hemorrhagic diathesis); if such a one have a trifling cut, or have a tooth pulled, he bleeds perhaps to death. A prudent surgeon will not perform cutting operations on one of a hemorrhagic family.

B. from the free surfaces of mucous membranes occurs when they are much congested. One may have fatal hemorrhage from the stomach, and yet no open vessel may be found after death, even on the most careful examination. In such a case, we must trust to cold and internal remedies, such as acetate of lead combined with opium.

**BLEEDING or BLOODLETTING.**—Blood may be drawn from a vein (*phlebotomy*—*venæsectio*), or from an artery (*arteriotomy*).

The veins most commonly opened for this purpose are those at the bend of the elbow (see *ARM*), but those of the lower limbs are occasionally selected. The patient should be placed sitting up in bed, as he may lose a dangerous amount of blood without shewing the usual premonitory symptoms, if his head be kept low.

The venous return should now be obstructed by a bandage, and when the veins swell, one should be selected, steadied with the left thumb, and slit obliquely with a lancet; the blood allowed to flow till the desired quantity has escaped, or till faintness comes on. The surgeon's thumb should now be replaced on the cut in the vein, and kept there till the bandage is removed, when a small pad of lint and figure of 8 bandage will sufficiently prevent the bleeding, and the wound will speedily heal.

*Phlebotomy* was at one time habitually resorted to in inflammatory diseases, or such as were thought so; and even when there was no positive disease, it was often applied periodically at particular seasons, as spring and autumn, as a hygienic precaution. A great change in this respect has taken place in medical practice; as physiological knowledge advances, the opinion seems gaining ground that abstracting blood from a sick man gives him but temporary relief, and renders him less able to combat with the disease. When there is a wound of the cavities of the body with internal hemorrhage, *venesection* is very useful in lowering the heart's action, and, perhaps, according to the old theory,

in exercising a *derivative* influence on the wounded vessels. Local B. is effected by cupping and leeches. See articles on these.

**Arteriotomy** is generally performed on the temporal artery, by a transverse cut about half-way through the vessel. When the required amount of blood has been abstracted, it ought to be completely cut across, to allow of its ends retracting and healing. If this precaution is neglected, an aneurism (q. v.) would form. A compress and bandage should be put on the head for a day or two.

**BLEIBACH**, a town of Austria, province of Carinthia, in the circle of, and about 8 miles west of Villach, pleasantly situated in the valley of the Drau, or Drave, near the celebrated Bleiberg (Lead Mountain). The population, 5600 in number, are chiefly engaged in the mines of the Bleiberg—from which 1500 to 1800 tons of lead are annually obtained—and in washing and smelting the ore.

**BLENDE** (Ger. *blenden*, to dazzle), a name given to a number of minerals composed chiefly of sulphur and of certain metals, all or almost all of splendid lustre, at least in fractures and the faces of crystals. It is also very often popularly applied more exclusively to one of these minerals, to which alone, perhaps, it originally belonged, **ZINC B.**, or **GARNET B.**; also called, according to its chemical composition, *Sulphuret of Zinc*. Among English miners, it is known as *Black Jack*. It is abundant both in primitive and in secondary rocks in many parts of the world, and is often associated with Galena (q. v.), or Lead-glaucite. It contains about 66 parts of zinc and 33 of sulphur, and is used as an ore of zinc (q. v.); but the reduction of it is attended with difficulty, which much diminishes its value. It is usually brown or black, sometimes red, yellow, or green. It occurs both massive and crystallised in rhomboidal dodecahedrons, octahedrons, and tetrahedrons. Macles, or twin crystals, are remarkably common. It is very brittle; before the blow-pipe, it decrystallises violently, but only fuses on thin edges.—**MANGANESE B.** is a rare mineral composed of sulphur and manganese.—**ANTIMONY B.**, or *Red Antimony*, is also a rare mineral, composed of sulphur and antimony.—**RUBY B.** is a name sometimes limited to Pyrargyrite, or Red Silver (see SILVER, ORES OF); sometimes extended as a sort of generic term to include a number of other minerals composed of sulphur and metals, among which are Cinnabar (q. v.), Realgar (q. v.), and Orpiment (q. v.).

**BLENEAU**, a village of France, in the department of the Yonne, about 29 miles west-south-west of Auxerre, celebrated as the place where Turenne gained a victory over the Prince de Condé in 1652. Pop. 1433.

**BLEINHEIM** (Ger. *Blindheim*), a village of Bavaria, 23 miles north-north-west of Augsburg, memorable in connection with Marlborough's great victory over the French and Bavarians, August 13, 1704. The battle, however, did not actually take place here, but at a village in the vicinity called Hochstädt, and is known to the Germans by that name. France and Bavaria, on the one hand, stood opposed to Holland, England, Austria, Savoy, Portugal, and the German empire, on the other. The French and Bavarian army consisted of 56,000 men, commanded by Tallard, Marsin, and the Elector of Bavaria. Opposed to it was an army of 52,000 men, under the command of Marlborough and Prince Eugene. The French and Bavarian generals had no idea that the allies would act on the offensive, and accordingly, when, about two o'clock in the morning, on the 13th August, the line of the allies put itself in motion,

they believed that it was about to retreat. Even at seven o'clock, when the heads of the eight columns advancing under Eugene and Marlborough became visible, Tallard regarded the whole proceeding as a stratagem to cover the retreat. When the mistake was discovered, the army was hastily drawn up in battle-array, and fought with dauntless courage; but at five in the afternoon Marlborough broke through the line of battle, and won a victory most complete and decisive. The French and Bavarians left about 10,000 killed and wounded on the field, vast numbers were drowned in the Danube, and about 13,000, including Tallard, were taken prisoners. Altogether their loss was estimated at between 30,000 and 40,000; 120 pieces of cannon, and 300 standards, were captured. The loss of the victors amounted to about 5000 killed and 8000 wounded. Near to B., also, the French defeated the Austrians in 1800.

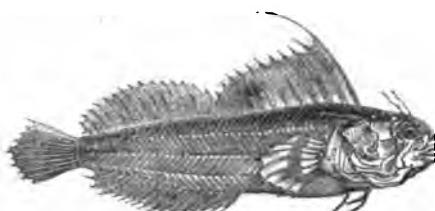

**BLEINHEIM DOG**, or **MARLBOROUGH DOG**, a small and very beautiful variety of spaniel, much resembling the Cocker (q. v.) in form and general appearance, but generally of a black colour, with flame-coloured spots above the eyes and on the breast and feet. The muzzle is also fuller. The B. spaniel is the *Pyrame* of Buffon. It derives its English name from Blenheim Palace, in Oxfordshire, the seat of the Dukes of Marlborough, where the breed has been preserved since the beginning of the 18th c. These dogs are sometimes sold at an enormous price.

**BLEINHEIM HOUSE**, near Oxford, the seat of the Duke of Marlborough, erected at the public expense in the reign of Queen Anne as a testimony of gratitude to the victor of Blenheim (q. v.). £500,000 was voted for the purpose, but that sum did not suffice for the completion of the work. The royal estate of Woodstock, in which it stands, was granted at the same time. The building was designed by Sir John Vanbrugh, and is a grand though heavy monument of his powers as an architect. The length of the principal front from wing to wing is 343 feet. The interior is proportionally magnificent, and the collection of paintings is one of the most valuable in Britain. Among the objects of interest in the grounds are a triumphal arch, and a column 130 feet high, surmounted by a statue of Marlborough. An inscription on the pedestal, written by Bolingbroke, recites the public services of the hero. The manor of Blenheim Park embraces a circuit of about 12 miles.

**BLENNORRHCE'A** (*blenna*, mucus; *rheo*, to flow) is a medical term for an unusually copious discharge from any mucous membrane; but as it does not completely express the nature of such fluids, modern writers do not often make use of it. *Mucus* is a pellucid,ropy substance, which, according to Mr James Paget, 'has no corpuscles or organised particles' of its own. In those discharges termed blennorrhceal, on the other hand, there is a mixture of epithelial scales shed in large quantities from the mucous membrane (mucus cells), and occasionally pus cells. In B. of the lachrymal sac, or what is called 'watery eye,' if the inner corner of the eye be pressed by the fingers, an opaque, milky fluid will appear between the lids, instead of the transparent tears which are present when the lachrymal apparatus is in health. After inflammations of the genito-urinary mucous membrane, a gleety discharge frequently occurs, and continues for a long period. The treatment consists in establishing a robust state of health by tonics and the preparations of iron, fresh air, and careful regimen, with astringent lotions applied directly to the mucous membrane, such as alum, tannin, &c., to lessen the

quantity of the secretion, and occasional caustic stimulants, as the nitrate of silver, to alter the depraved condition of the secreting membrane.

**BLENNY** (*Blennius*), a genus of Acanthopterygious (q. v.) fishes, the type of a family, *Blennidae*, very nearly allied to the family of *Gobiidae* (see GOBY), and by many naturalists included in it. To the B. family, the Wolf-fish (q. v.) and the Gunnel (q. v.) or Butterfish are referred. The fishes of this family are generally remarkable for the abundance of slimy matter with which their skin is covered.

Ocellated Blenny or Butterfly Fish (*Blennius ocellaris*).

Many are destitute of scales. The body is generally of an elongated form. They have only one dorsal fin, which, however, seems in many of them as if composed of two parts. They are distributed in the seas of all parts of the world.—The true blennies are small fishes, living in shoals, which do not consist of great numbers, frequenting rocky coasts, and often found in pools left dry by the tide, or even among the wet sea-weeds, among which they are capable of subsisting for a much longer time than that of the absence of the tide. They possess the power of using their ventral fins to aid them in moving about among rocks and sea-weeds. They have a fringed appendage over each eye. They are seldom thought of as an article of food, but are much in request for the aquarium, on account of their tenacity of life and their activity. They feed chiefly on small crustaceans. Several species are found on the British coasts.—Many of the B. family retain their eggs within the oviduct until they are hatched, so that the young are produced alive, and capable of seeking food for themselves. An example of this is found in the Viviparous B. (*Zoarces vivipara*) of the British coasts.

**BLÉRÉ**, a town in the department of the Indre-et-Loire, France, is situated on the left bank of the Cher, which is here crossed by a bridge, said to owe its origin to Henry II. of England, about 15 miles east-south-east of Tours. B. is the entrepôt for most of the traffic on the Cher. Pop. (1872) 1992. In its vicinity is the castle of Chenonceaux, the residence purchased by Henry II. of France for the celebrated Diana of Poitiers, who lavished much money on its embellishment, as did also Catharine de' Medici, after she had dispossessed Diana. In 1733, it became the property of M. Dupin, whose wife, by her beauty and wit, attracted to the castle almost all the distinguished literary and scientific men of that day, including Montesquieu, Voltaire, Fontenelle, Buffon, Bolingbroke, and Rousseau. The castle escaped the fury of the revolution, and is still in a good state of preservation. Among the curiosities shewn to the visitor is the mirror used by Mary Stuart (Queen of Scots) on her marriage with the Dauphin.

**BLESSED THISTLE.** See THISTLE.

**BLESSINGTON, MARGARET, COUNTESS OF**, born September 1, 1789, at Knockwist, near Cloonmel, Tipperary county, Ireland, where her father, Edward Power, was settled. At the early age of fifteen

she was married to Captain Farmer, and shortly after his death, to Charles John Gardiner, Earl of Blessington. With him she took several extensive journeys on the continent, where, as well as in London, she gathered around her all the most distinguished men of the time. In Genoa, she formed an intellectual friendship with Lord Byron, and afterwards resided in Paris, until the death of her husband, in 1829. The latter left her a good fortune, which enabled her to gratify her literary tastes. She held a little court of her own, at her family mansion, Gore House, Kensington, a suburb of the west end of London. Her celebrated soirées were frequented by many of her distinguished contemporaries. Her subsequent connection with Count d'Orsay placed her in an equivocal position as regards society, and consequently, on the accession to power of Louis Napoleon, with whom both were intimate, they left England for France. Her ladyship died at Paris, 4th June 1849. She was the authoress of two works of little importance, the *Idler in France*, and the *Idler in Italy*. Her only valuable production is her *Conversations with Lord Byron* (1834), which helped to place the poet in a more favourable light before his countrymen.

**BLETTINGLEY**, a town in the south-east of Surrey, 20 miles south of London. Pop. (1871) 1916, chiefly agriculturists. Many Roman coins have been found in the vicinity. Near B., 2000—3000 tons of fuller's-earth are raised annually. In cutting the B. railway tunnel, the fossil bones of the iguanodon, an extinct reptile, were found.

**BLETS**, rotten spots in apples, pears, and other fruits. The rotting of such fruits is often called *bletting*. It takes place chiefly by the decomposition of the protein (q. v.) compounds which the fruits contain, and the fermentation of the sugar; carbonic acid is formed; and the fibres of a fungus can be discovered by the microscope pervading the blotted part, to the rapid extension of which they no doubt greatly contribute, although it by no means follows that the presence of the spores or seeds of the fungus should be regarded as the original cause of the decay.

**BLICHER, STEN STENSEN**, one of the most distinguished of modern Danish poets and novelists, was born in 1782, at a village of Viborg; and took his theological degree at Copenhagen in 1803. He remained with his father, himself a pastor in Jutland, till 1819, when he obtained a living, which he exchanged, in 1825, for a better. Independent in character, and belonging neither to the poetical nor scientific circles of the capital, he was long known only as the successful translator of Ossian, 2 vols. (1807—1809). His *Sneeklokket* (1826), and still more, his contributions to the monthly periodical *Nordlyset*, brought him into fuller notice; and in 1829, his *Iydete Romanze* had a great measure of success, and his *National Noveller*, giving a poetical and faithful picture of country life in Jutland, were even better received. As a poet, B. is thoughtful, tender, and eminently national, but he lacks objectivity. His novels appeared in 5 vols. (Copen. 1833—1836), his poems in 2 vols. (1835—1836), and these were followed by *Samlede Noveller og Dichter* (1840), and *Gamle og nye Noveller* (1847—1848), &c. He died in 1848. Specimens of B. are given in *The Danes sketched by Themselves*, by Mrs Bushby (1864).

**BLIDAH**, a town of Algeria, in the province of Algiers, about 30 miles south-west of the city of that name. It is beautifully situated on the borders of the fine plain of Metidjah, is surrounded by gardens, and is a prosperous and rapidly growing place. It was occupied by the French in 1838. Pop. about 9000. It is a station on the first line of railway in

**Algeria.** The foundation-stone of the railway station was laid in 1859, in the presence of a large number of Arabs, who regarded the ceremony with intense interest.

**BLIGH, WILLIAM**, an English admiral, born 1753, celebrated in connection with the mutiny of the *Bounty*. Having made a voyage round the world under Captain Cook, he was sent out, December 23, 1787, by the British government, as commander of the ship *Bounty*, to Tahiti, there to collect bread-fruit-tree plants, and thence sail with them to the West India colonies, where government was anxious to introduce them. The ship arrived at her destination in October of the following year, and in six months after was ready to sail for Jamaica, with 1015 plants on board. Partly on account of their demoralisation by their lengthened residence on so charming and productive an island, and partly owing to the harsh and tyrannical treatment they met with from their commander, a part of the crew mutinied, after they had been twenty-four days out, on the 28th April, and forced the captain and eighteen men into the ship's launch, which they cast adrift, turning their own course back to Tahiti, and ultimately settling on Pitcairn's Island (q. v.). The captain and his companions, who had very little provision, and no sextant or map, arrived, after almost incredible hardship, at the island of Timor, on the 14th June, a distance of 3600 nautical miles from the point where they were abandoned. To the skill and prudence of B., the fact that not a single life was lost, is chiefly to be attributed. On B.'s arrival in England, a man-of-war, under Captain Edwards, was sent, at his instance, to capture the mutineers. Some of them were seized; the rest had escaped to Pitcairn's Island, with Fletcher Christian, the leader of the mutiny. Their place of refuge, however, was not discovered until 1808, when an American ship accidentally touched at the island. At that time, drunkenness, debauchery, and unbridled passion had left only one of the mutineers, John Adams, remaining. Their fortunes here were made the subject of a poem by Byron, entitled *The Island; or Christian and his Comrades*. B. was again sent out to collect bread-fruit trees, and convey them to the West Indies, in which he was completely successful. In the French revolutionary war, B. commanded a ship of the line, but again exciting the disaffection of his men by his harshness, they mutinied, and ran the ship into a French harbour. In 1806, B. was appointed governor of New South Wales, but his conduct here was so tyrannical as to cause universal dissatisfaction; and in 1808, unable to tolerate his rule, the civil and military officers of the colony summarily terminated his government by arresting him. He died in 1817.

**BLIGHIA.** See AKER.

**BLIGH ISLANDS**, that portion of the Feejee Archipelago originally discovered by Tasman, in 1643, which was seen by Captain Bligh of the *Bounty*, during his wonderful voyage in an open boat. The group lies in nearly 180° of long. and 15° 30'—19° 30' S. lat.

**BLIGHT**, a diseased state of the cultivated grasses, especially of the cerealia. The term has been very vaguely and variously used, having, in fact, been applied to almost every disease of plants caused by the condition of the atmosphere, or of the soil, the attacks of insects, parasitic fungi, &c. It is frequently limited to the disease in wheat and other grains, which is also called SMUT-BALLS, BUNT, PEPPER BRAND, or STINKING RUST, in which, while the grain retains its usual form and appearance, the interior of it is filled with a powder of a very fetid odour, consisting of balls so minute that it is

calculated that four millions of them may exist in a single grain. These are a parasitic fungus, *Uredo caries* (*U. sativa* of some botanists). See SMUT.—The name B. has been frequently applied to diseases which seem to be caused by errors in the manuring of land, by which crops are often seriously injured. Unhealthy plants are most liable to be attacked by parasitic fungi, and by aphides and other insects, to which the origin of the evil has often been, in all probability, erroneously ascribed. Mr Berkley, a high authority on such subjects, also states that 'there is a kind of B. sometimes very prevalent, which has been referred to fungi, but which is, in fact, nothing more than an excessive development of the epidermal cells, which are no longer kept within bounds by the real cuticle,' but become 'elongated and frequently branched in various ways, so as to form spongy or mealy patches, which are sometimes in such abundance as from their bright colour or peculiar aspect to attract general notice.' He adds that this is most common on woody plants, as vines and hawthorns, but that something analogous is to be seen on a few herbaceous species, 'a mere hypertrophy of the epidermal cells, or, indeed, mere fascicles of pubescence.' This kind of B., however, does comparatively little injury.

**BLIND, THE**, those who are either partially or totally deprived of the sense of sight. Only a few are born blind, the greater number becoming so by accidents, small-pox, or diseases of the Eye (q. v.), so that more than one half are above the age of fifty. Blindness prevails most in tropical, and least in temperate countries; more in the eastern than the western hemisphere. There are about 30,000 in the British Isles. The balance between the outer and the inner world being disturbed, there is a tendency among the blind to self-consciousness, self-opinionateness, and a desire to become the objects of attention, and, if possible, surprise, if not admiration; hence there is more avowed infidelity than in any other class, although probably much of it is assumed, to attract attention, and display their controversial powers. As these tendencies are not strong in individuals, but become intensified when they are congregated together, it is now generally admitted that the more they associate with the seeing, and the less with one another, the better.

The first institution for the blind was founded in Memmingen by Weef VI., in 1778; the second, in Paris, by St Luis, in 1260; the first for the employment of the adult blind was opened in Edinburgh by Dr Johnston, in 1793. There were in 1873 148 institutions for the blind in the world, two-thirds of which have only recently been established. Though the blind, in general, are more or less dependent, yet many have earned a comfortable living, and even attained distinction in departments generally supposed to be to them inaccessible. The employments most adapted to their abilities are the making of baskets, brushes, mattresses, rugs, and such-like; and for the women, sewing, knitting, and hair-plaiting. Many also have successfully competed with the seeing as musicians, music-teachers, and piano-tuners.

**PRINTING FOR THE BLIND.**—The first embossed book for the use of the blind was printed in Paris in 1784, by M. Valentine Houy, from flat movable letters, which his pupils had been previously taught to put together and read. Founts of types were cast and books printed; and having been approved by the Academy of Sciences, and exhibited before the royal family at Versailles, the art created at the time a great sensation. Large editions of a few volumes were printed at great expense; but as they were not easily read, and were used only for exhibi-

tion in the Paris Institution, the interest soon died away, and the greater part of the editions was long after sold for waste paper.

Printing can never be to the B. what it is to the seeing, and is chiefly of use for those gems of literature which can be read and re-read with interest. It is questionable, therefore, whether the art, after falling into abeyance for about forty years, would have been permanently revived had it not been for the Bible, the book least wanted in Paris, but most wanted in Britain and America.

The merit of reviving it in this country is due to Mr James Gall, of Edinburgh, who having in 1826 seen specimens of the Parisian books, and obtained a box of the types, was deeply impressed with the importance of putting the Bible into the hands of the blind, to employ their vacant hours. Being himself a printer and publisher, he at once saw the cause of the failure in France, and set himself to improve the alphabet, so as to make it more sensible to the touch. The following is a specimen of the Parisian type at that time: \*

# King of Jerusalem

The principles which he laid down for his guidance were these: *First*, that the common alphabet (modified so as to be easily felt) is the only safe basis on which a literature for the blind can rest. He did not believe that any arbitrary character would be universally adopted or permanently adhered to; and as he looked forward to the blind being taught in common schools, not only to read, but to communicate with their seeing friends, he thought it indispensable that the books should be legible to all. *Second*, that the printing should be so large and legible that the adult blind should be able to read it *fluently*. It would have been easy to print books in a small type, which could be read by children only, and which, besides being much cheaper, would have astonished the public more; but he was of opinion that unless the adults were able to read easily, the books would not be read in private, and the object he had in view would not be attained. He also unhesitatingly preferred the common (low-case) alphabet to the capitals, which, though sufficiently well known, are not fitted for the use of the blind. Their symmetry and general uniformity, which specially adapt them for titles and inscriptions, render them unsuited for common and easy reading, either for the blind or those who see. They are even less adapted for the finger than the eye, because the eye can see the interior parts of the letters by which they are distinguished; whereas the finger can feel only the exterior form. Thus E H K M N X appear to the finger as a succession of squares, B C D as a succession of rounds.

In 1827, after much study and many experiments, Mr Gall printed his 'First Book' for teaching the blind to read in a triangular modification of the common alphabet. The embossing was in high relief, and although it presented rather a rude appearance, being printed from wooden types, it excited great interest and wonder when it was found that the blind could read it easily with their fingers. This was followed by other little volumes, including a series of *Scripture Statements*, and a condensed *Epitome of Old Testament History*. These were received with so much favour, that in 1829 he issued a prospectus for the publication of the gospel by St John, at one guinea, which was to pay not only for the copies, but preliminary expenses.

This work was printed in 1832, but was not published till 1834; the delay being caused by the efforts of some zealous friends to induce him to adopt some arbitrary alphabet before printing the Bible, which, however, he firmly declined to do. The consequence was that, in 1832, the Scottish Society of Arts offered a gold medal, value £20, for the best alphabet for the blind; and this, although it increased the public interest in the newly revived art, had also the effect of paralysing Mr Gall's efforts, by preventing the public from giving him support until the result of the competition thus created had been ascertained. It would have greatly strengthened his hands if, as he hoped, they had awarded him the prize, for there was no other in the field; but after waiting two years, he could wait no longer, and in 1834,\* he published his great work, *The Gospel by St John*, which was the first book of the Bible which had ever been printed for the blind in any language. This volume was printed in a type so large and legible, that some of those whom he had taught, were able at the public meetings to read any passage put before them through six pieces of silk between the book and their fingers.

DEKOMA THE LAMB OF GOD

To make known the literature thus provided for the blind, Mr Gall visited England and Ireland, as well as different parts of Scotland, teaching the blind who were brought to him to read and write in a few lessons. The writing apparatus will be described hereafter. Letters thus written were transmitted by post, and as the same alphabet was used both inside and without, not only were the sealed contents read by the blind to whom they were sent, but the addressees also were read by the postmen who delivered them. Great interest began to be excited throughout Britain, and extended even to foreign countries. Abbé Carton was sent by the Belgian government to visit Mr Gall's establishment, and returned to set up a printing-press in Brussels which has continued to supply books for that kingdom. Dr Howe also, from Boston, visited Scotland, and having received from Mr Gall all the information which he could supply, established on his return to America a printing-press in the Perkins Institution. In 1834 he published the Acts of the Apostles, and completed the New Testament in 1836. About the same time, Mr Jacob Snider of Philadelphia, not knowing what had been done elsewhere, published the gospel by St Mark in 1834; but as he had unfortunately adopted the capital alphabet, his books could not compete with Dr Howe's; and after printing the gospel and a few other volumes his press ceased to be used. Dr Howe, on the contrary, had adopted an angular modification of the common alphabet, similar to, but much smaller than Mr Gall's, and with that printed the whole Bible, besides an ever-increasing number of other volumes in all departments, with which he continues to supply the whole of the United States. In Paris, also, the art was revived with great vigour, and a number of printing-presses were established in different parts of the continent.

Having thus succeeded so far as the blind were concerned, Mr Gall was next anxious to improve the printing and lessen the cost, so that any village printer could make it part of his ordinary trade, without requiring subscriptions from the public. By careful experiment, and with the help of his son, he

\* In this, as in all the specimens which follow, the size is reduced to one quarter—that is to say, they are half the length and half the breadth of the originals.

118

\* The award was not made till 1837. Sixteen arbitrary alphabets had been sent in, all of which were rejected, and the prize was awarded to a Dr Fry, of London, who had suggested the use of Roman capitals, which, in 1834, had already been tried in America.

was enabled to make the alphabet assume more of its usual form without losing its tangibility, and to enrich the sentences by the introduction of initial capitals for proper names, &c., as in common books. But the most important improvement consisted in the use of serrated types, by which the letters were formed of dots instead of lines. By this means the impression was not only sharper and more easily felt, but also more permanent, being better supported, as if by a series of arches, like corrugated zinc roofs. It was also found that when the paper was thus semi-punctured instead of being embossed, the common printing-press could print the sheets with half the pressure, and in half the time : and as the paper did not need to be nearly so thick as formerly, the books could be produced at one half of their former cost. In 1836, therefore, he offered to societies and publishers, to print books for the blind in the improved type at so much per sheet, as an ordinary business transaction, without either subscriptions or donations. Of this offer the London Sunday-School Union, the Religious Tract Society, and the British and Foreign Bible Society availed themselves in 1837, and in 1838 he printed for the British and Foreign Bible Society the gospel by Luke and the Acts of the Apostles (two of the eight volumes of the New Testament), which they were able to sell at 4s. each : and here ended Mr Gall's labours for the blind, extending over a period of twelve years, during eleven of which (1826–1837) he had been alone in the field.

As the Institutions for the blind in those days 'had not hitherto (as they expressed it) patronised any device of this kind,' Mr Gall had to contend single-handed with all the apathy and incredulity which every new thing has to encounter. But now the tide had turned, readers were multiplying over the country, schools for the blind were beginning to be formed, the institutions abroad had all 'patronised the device,' and printing-presses were busy both in America and on the continent ; so that when the Sunday-School Union, the London Tract Society, and the British and Foreign Bible Society began to publish class-books, tracts, and Bibles for the blind, they all at once became convinced of its importance, and took it up with so much energy, that there was now no longer any danger of its being abandoned ; and as Mr Gall's work was thus practically accomplished, it was neither his interest nor his inclination to compete with them.

The first, and by far the most energetic, of the number was Mr John Alston of Glasgow, who, having established a printing-press in the Blind Asylum, of which he was treasurer, printed in 1837 the gospel by St Mark in the same type in which (unknown to him) it had been printed in 1834 by Mr Snider in Philadelphia. Through his influence it was at once adopted in the other institutions throughout the kingdom ; and, having thrown himself with much enthusiasm into the work, he very soon raised funds by which he completed the New Testament in 1838, and the whole Bible in 1840. To him, therefore, belongs the honour of having printed the first complete Bible for the blind in any language, because Dr Howe of America, although he commenced the work earlier, did not finish it till 1842. The effect was immediate and decisive, rivalry was extinguished, hundreds of the blind were brought under instruction, and reading was thenceforth acknowledged to be a necessary department of the education for the blind.

If Mr Alston had adopted a modification of the low-case alphabet, and more especially, if he had printed his books in a much larger type, they would have been an unspeakable blessing to the blind in this country ; because, not only would they have

been universally adopted, but they would have continued to be used, and he would thus have prevented the lamentable confusion into which the printing for the blind in this country has fallen. But unfortunately, Mr Alston being encouraged by the decision of the Scottish Society of Arts, which he himself had very much helped to influence, fell into the double error of adopting the Roman capitals for his alphabet, and making his type too small. The consequence was, that a reaction very soon took place, the blind themselves being the first to rebel. The want of sufficient legibility was in their judgment a fatal objection, and outweighed all other considerations. Even the large amount of money that had been expended, and the extensive libraries that had been formed through Mr Alston's energetic labours, they were prepared to sacrifice, in order to obtain books which they could read with ease.

### Behold the Lamb of God

Gall's Serrated Type (*New Testament*, £1, 12s.)

### Behold the Lamb of God

Howe's American Type (*New Testament*, 16s.)

### BEHOLD THE LAMB OF GOD

Alston's Glasgow Type (*New Testament*, £2.)

The second in the field, or rather simultaneously with Mr Alston, was Mr Lucas of the Bristol Institution, who invented a most ingenious system of stenographic printing with arbitrary characters and

\* J O / C | R . ~ ) O \ ^

numberless contractions, by which he secured largeness of type and at the same time diminished the size of the books. He had in 1837 printed the gospel by St John, and in 1838 the Acts of the Apostles, but during the triumph and rapid multiplication of Mr Alston's books little attention was paid either to him or his system ; but when the tide turned, and legibility became the great desideratum, the value of his invention became apparent, and in 1839 a society was formed to aid Mr Lucas in printing the Bible and teaching the blind to read upon his system. The blind were delighted with his books ; his printing establishment was removed to London ; large funds were collected ; and the whole Bible and many other books were printed. (Price of the *New Testament*, £2.)

The third competitor was Mr Frere of London, whose objections to Mr Lucas's system were so strong, that he was induced to devise another,

L - O U \ . V U D \ V

which was (as he himself described it) 'a scientific representation of speech, the alphabet containing only one character for each of the simple sounds of the English language.' This opinion was shared by another large section of the friends of the blind ; and accordingly, in 1839, another society was formed, another Bible was printed, another literature was created, and another illustration was supplied of the difficulty of securing the universal and permanent adoption of any arbitrary character for the blind. Mr Frere had also the merit of inventing the 'return lines'—that is to say, the lines in his books are read from left to right, and from right to left alternately, the letters themselves being reversed in the return lines. He also devised a cheap and very ingenious method of setting up

\* In this, as well as in the specimens which follow, the words are : 'BEHOLD THE LAMB OF GOD.'

BLIND.

and stereotyping his books, the letters being formed of small bits of bent wire laid on a tin plate, and fastened with heat. (*New Testament*, £2, 10s.)

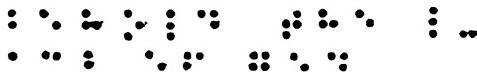

The fourth competitor was Mr Moon, of the Brighton Blind Asylum. He, too, uses an arbitrary alphabet, some of the letters resembling or suggesting the letters which they represent. He has also adopted Mr Frere's 'return lines,' but does not reverse the letters as Mr Frere does, his letters being the same both in going and returning. Mr Moon's printing is larger than any other, and therefore more easily felt. This is a great advantage to

לְרֹאשׁ כָּלִיל - אֶת לְבָבֵךְ

beginners, and to those whose touch is very obtuse, although no doubt his books are on that account both bulky and expensive. Nevertheless, this is by far the safest side on, which to err, and therefore Mr Moon's books are great favourites with the blind. A third society has been formed to extend this system; and, upon the whole, has been more successful than the others, having numerous branches throughout the country, which seek out the blind, and teach them to read. Mr Moon has printed a fourth Bible, and created a fourth very extensive literature. (*New Testament £4 10*s*.*)

A fifth system has been recently imported from Paris, invented by M. Braille, which consists of the sixty-two varieties of form which six dots, :::, can be made to assume by the omission of one or more of them. This supplies not only the letters of the alphabet, but numerous other signs, of which he

• • • • • • • • • • • •

makes valuable use. There are two advantages which it possesses over all the others, and which it is supposed will cause it to supersede them. The first is, that it can be written easily by the blind themselves, by an apparatus to be afterwards described. The other is, that it affords the best method of writing and printing music for the blind which has yet been discovered.

A sixth system is an improvement on Braille, by Mr Wait of New York, which, it is confidently predicted, will supersede all the others. The signs, like M. Braille's, are produced by six dots, but they are placed horizontally, thus, :::

At present, it is impossible to predict the triumph of any of these systems, as their respective advocates are not only determined, but able to keep their ground. But as recent legislation has made provision for the education of the blind in common schools, where the influence of rival societies and extraordinary geniuses, who are not the best guides for their less talented brethren, will not be felt, it is not improbable that some common system will gradually come into general use. In the Report of the Royal Commissioners of the Exhibition of 1851, surprise is expressed that Mr Gall's labours should have been so summarily set aside, and they recommend now the universal adoption of Dr Howe's books.

now the universal adoption of Dr Howe's books.

WRITING FOR THE BLIND.—This is of two kinds; first, writing to be read by *the blind*; and, second, writing by the blind, to be read by *the seeing*. Messrs Milne and M'Baine of the Edinburgh

Asylum invented the 'string alphabet' by which they were enabled to communicate with one another. The letters were represented by different kinds of knots tied upon a cord singly or combined. This was superseded in 1838 by Mr Gall's writing stampa, which, as they can be made to any pattern, have been much used. The paper is placed on a cushion frame, and a barred guide placed over it. The stamps are made of pins fixed in wood, and when pressed through thick writing-paper, produce a raised letter on the other side.

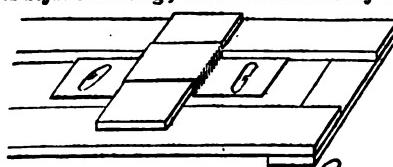

M. Braille's system of writing corresponds with his alphabet. Cartridge paper is placed over a grooved plate, with a guide having two rows of oblong holes. A blunt point forces the paper into the grooves, so as to produce the dots which form the letters on the other side. This is by far the most legible writing which has yet been provided for the blind, and is a strong recommendation of his alphabet for printing.

There are two methods of writing by the blind to be read by the seeing. The first is by Mr St Clair, a teacher of music in Edinburgh; the other is Mr Gall's Typhlograph. In both processes, the writing is produced by a hard pencil with a fine point, or by a blunt bodkin moving over carbonised paper, which deposits the blacking on the paper wherever it is pressed. Mr St Clair's guide consists of a line of small square holes, each of which represents a letter or a space. The steel point enters

ST. CLAIR

each hole, and makes a letter, guided by the four sides. Mr Gall's Typhlograph is a much more perfect instrument, and can be made to imitate any size or style of writing : but it is not so easily made.

It consists of a hole of this shape, , cut in a thin brass guide, which slides freely between two wooden fillets, united at each end. The upper half of the hole is used when the guide leans against the

# *Commandment*

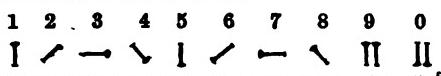

lower fillet, and the lower half is used when the guide leans against the upper fillet. When the steel point has traced a line round the upper or lower half of the hole, it is stopped by the small projection in the middle of the right side—thus :

# Mighty

**ARITHMETIC FOR THE BLIND.**—There are three methods: 1. The *Parisian*. Embossed types are dropped into square holes in a perforated board, and read by the finger. 2 *Sawderson's*. Angular pins are dropped into angular holes, and indicate the figures according to their position. The pentagonal is the most convenient form, because one pin having the two ends ◇◇ different can represent ten ciphers. 3. *Gall's* requires no apparatus at all, the ciphers being

represented by common pins stuck into a quilted cushion or cloth of any kind, and the lines by twine stretched across—thus:

Although reading, writing, and tangible arithmetic are of great importance to the B., yet oral instruction is that upon which we must chiefly rely for their education. For that reason, the recent Education Act for Scotland, under which blind children may be educated in common schools, will be a great blessing to them.

**BLINDAGE.** When a besieged town has little or no bomb-proof shelter, screens are sometimes used called B., made of timber and earth; or of trees inclined towards each other, or placed in an inclined position against walls.

**BLIND COAL.** See ANTHRACITE.

**BLINDNESS** may arise from any cause intercepting the rays of light on their way to the optic nerve, or from disease of the optic nerve, or of that part of the brain connected with it. B. may vary in degree; it may exist from birth, or be the result of extreme old age. It may only be present during the day or the night, or a few weeks of the year, or it may be permanent.

*Congenital* B. is generally from some deficient development of the nervous apparatus, and is detected by the child being indifferent to light, and throwing its head from side to side. Occasionally, but very rarely, the power of vision is subsequently developed. Amaurosis has been already described.

Opacity of the vitreous humour, or of the crystalline lens—the latter is generally known as cataract—causes B., which comes on gradually. The patient with cataract can see best in the evening, or when the pupil is dilated, as then some rays of light are able to enter by the side of the opacity. The B. from cataract is seldom so complete as to prevent the person from distinguishing day from night, or from being aware of opaque bodies passing between him and the light (see CATARACT). Opacities of the cornea, if extensive, or in the axis of vision, produce some degree of B., whether they are on or in its substance. In general, these are irremediable; but if there is a spot, an artificial pupil may be made. Some years ago, Mr Bowman, of London, met with a case in which the opacity consisted of a layer of phosphate and carbonate of lime: he removed it, and restored the vision, which had been totally lost for several years.

*Night* B. is a rare condition, in which a person finds, towards evening, that objects are becoming less and less distinct, and at last that he is totally blind. This may occur without previous warning, and cause great alarm, but next morning he finds that his sight is restored. This is repeated every night, but at last the eyes become weak during the day also, and may finally become amaurotic. This strange affection may be epidemic; it has attacked bodies of troops exposed to great fatigues and the glare of the sun's rays. If there are no symptoms of disease within the brain, recovery generally results from protecting the eyes from the light, entire repose, such remedies as correct any constitutional defect in the individual attacked, and repeated blistering.

*Day* B. is characterised by inability to see in a bright light; the subjects of it see more than usually well at night, but during the day have to be led about. Captives who have been long immured in dark cells

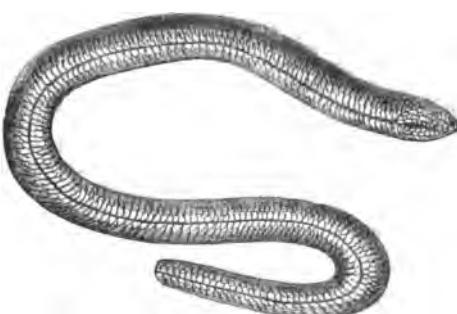

are often affected with it, as a galley-slave mentioned by Larrey, who had for thirty-three years been shut up in a subterraneous dungeon, and when liberated could only see by night.

The structural causes of B. will be better understood when the eye (q. v.) is described, when it will be seen that advances in our knowledge of its anatomy have enabled surgeons to restore sight in cases which, some years ago, would have been considered hopeless; but it can never be too strongly impressed, especially on the young, that overwork wears out the eyes, whatever be the pursuit, and that, without being wholly dark, a degree of blindness may be induced, such as to render the eyes useless for practical purposes. This condition, asthenopia or weak sight, is frequently met with in young lads with sedentary occupations, students, dressmakers; and, says Dr Mackenzie of Glasgow, 'what may be called the hot-house education of modern times is a fruitful source of it.' The only cure is avoiding the evident causes.

**BLINDNESS, COLOUR.** See COLOUR BLINDNESS.

**BLINDSTORY**, another name for the triforium (q. v.), the second or middle arcade in the wall which separates the body from the aisles of a church. It is so called obviously as opposed to the *clearstory* or *clerestory* (q. v.), the third and uppermost arcade, the apertures of which admitted light into the church, while the apertures of the triforium were dark—*obscure fenestra*, as they are termed by Gervase of Canterbury. The B., which is most common in cathedral, conventual, and collegiate churches, served to give access to the various parts of the building, and to suspend tapestry and banners on high holidays. Viewed aesthetically, the gloom of the B. contrasts well with the lustre of the clerestory.

**BLINDWORM (*Anguis fragilis*)**, a small reptile, which, although it has commonly been ranked among serpents by naturalists, in consequence of agreement in general form, exhibits remarkable points of difference from the true serpents, and constitutes one of an interesting series of links by which they are connected with lizards. Mr Gray has therefore recently united this, and other nearly allied genera, with the Scink and Sepia family of saurian reptiles under the name of *Saurophidia* (Lizard-serpents), amongst which the gradation from the lizard to the serpent structure is marked by the more and more complete disappearance of limbs, and the increasing elongation of the

Blindworm.

body. In the genus *Anguis* there is no trace of limbs externally, but the bones of the shoulder, the sternum or breast-bone, and the pelvis still exist in a rudimentary condition: the bones of the head, also, connect it with lizards, and do not

## BLISTERED STEEL—BLOCK.

admit of that dilatation of the gape which characterises true serpents. The common B. is the only species of this genus known in Britain. It is found also in almost all parts of Europe. In some districts of Britain it is plentiful; in others, it is very rare or even unknown. It is a perfectly inoffensive creature, although it has very generally been persecuted by the ignorant as extremely venomous. Its teeth are so small that even when it attempts to bite, which it only does upon much irritation, it cannot pierce the skin. No species of the group to which it belongs has poison-fangs. It is very timid, and when alarmed, contracts itself forcibly, and then becomes remarkably brittle, so as to be easily broken in two by a blow or by an attempt to bend it. This character of fragility is found also in other animals of this group. The name B. has apparently originated in a mistake caused by the smallness of the eyes, which, however, are very quick and brilliant. Another common name, *Slow-worm*, is more accurately characteristic. The length varies from 11 to 15 inches, and sometimes even exceeds this; the thickness is almost equal throughout, the tail is blunt at the end; the scales are small, and nearly equal; the tongue is notched at the extremity, but not bifid as in snakes; the colour is generally silvery gray, a dark line runs along the back, and frequently rows of dark spots along the sides. The food of the B. consists of slugs and insects. It retires in autumn under masses of decayed wood and leaves, or into soft dry soil. It changes its skin. It is viviparous (ovoviviparous), the number of young varying from 7 to 12 or 13 at a birth. The name B. is sometimes given to *Cecilia* (q. v.).

**BLISTERED or BLISTER STEEL.** This is the kind of steel from which, by hammering, rolling, &c., certain qualities of tools and files are fashioned. When broken up, piled, and welded under the hammer, it forms *shear steel* (see IRON), from which a finer class of tools is made, and when melted in crucibles it forms the finest kind of *cast steel* (q. v.) for cutlery. Blister steel is made from bar iron of superior quality by a process of *cementation*; and the furnace employed for the purpose is termed a converting furnace. It consists of two fire-brick rectangular chests or troughs, each being sixteen feet long and three feet deep by three feet wide, as a maximum size, placed alongside each other in an arched chamber, and surmounted by a wide conical chimney. One long fire-place, with a suitable arrangement of flues, heats both chests. Into each chest the iron bars are laid embedded in charcoal, about half an inch of which intervenes between each layer of iron bars. The whole is then plastered over with clay or grindstone-dust, and kept at a glowing red heat from seven to ten days, according to the purpose for which the blister steel is intended. When the bars are removed after cooling, they are found to have undergone a remarkable change. They are no longer tough, but quite brittle and fusible, and covered over with blisters. During the process, the iron absorbs and combines with from a half to one and a half per cent. of carbon. The blisters are supposed to be due to the evolution of carbonic oxide arising from the combination of carbon with a trace of oxygen existing in the iron.

**BLISTERING FLIES.** See CANTHARIDES.

**BLISTERS** are medicinal agents which, when applied to the skin, raise the cuticle into small vesicles filled with serous fluid. They are applied either in the form of plasters or in a fluid state, as suits the convenience of the person or part, and have for their object the establishing of a counter-irritation or diversion of inflammatory action from a part in which it cannot be reached by remedies,

or from some organ where it may do permanent mischief, to some more superficial part of the body.

The most common blister in use is made of cantharides (q. v.) or Spanish fly (*Cantharis vesicatoria*). Cantharides, mixed with a convenient proportion of lard and wax, form the blistering ointment of ordinary use; the only objection to this preparation being, that if applied too long it produces distressing affections of the urinary bladder. In young children and very thin-skinned persons, a layer of silver paper, or thin gauze wet with vinegar, may be laid between the blister and the skin. But under no circumstances should a blister be left long upon children, as it may produce sores which are apt to take on an unhealthy action, and are difficult to heal.

Mustard (*Sinapis nigra*) is frequently used, but seldom left on sufficiently long to produce blistering. Tincture of cantharides, croton oil, and strong liquor ammoniae, tartar emetic ointment, and many others are used in practice.

If the occasion for the blister passes off, the vesicles should be pricked, and their fluid contents allowed to trickle away, the vesicated surface being then dressed with some cold cream or lard. But if it should appear desirable to promote a discharge from the skin, the raised cuticles may be snipped off, and the blister either applied again at intervals, or some stimulating ointment as the savine (*Juniperus sabina*) made use of. Great cleanliness should be observed in dressing the part.

Of late years, B. have been much used for the dispersion of glandular tumours, and are also applied over the surfaces of indolent ulcers, with the view of increasing the vascularity of the part. For old diseases of joints, B. ought to be placed at a little distance from the affected joint.

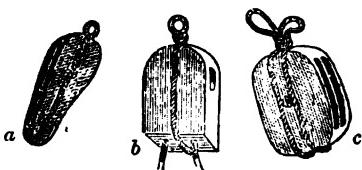

**BLOCH, MARCUS ELIESER**, a celebrated ichthyologist, born of poor Jewish parents, at Anspach, in Bavaria, 1723. He was allowed to grow up in extreme ignorance. At 19, he had read nothing except a few useless rabbinical treatises. About that age, however, he became assistant to a Jewish surgeon at Hamburg, where he took the opportunity of learning German and Latin. A slight knowledge which he had acquired of anatomy inspired him with an extraordinary desire to study that science thoroughly. For this purpose he went to Berlin, and devoted himself to it and other branches of natural history with indefatigable zeal. He took the degree of Doctor of Medicine at Frankfort-on-the-Oder; and returned to Berlin to practise his profession, where he died 6th August 1799. His great work is the *Allgemeine Naturgeschichte der Fische* (12 vols., Berlin, 1782—1795, with 432 coloured plates), long the most comprehensive work on ichthyology, and still valuable especially for its pictures. His *Systema ichthyologiae iconibus CX illustratum*, which was left in an unfinished state, was published by Schneider (Berlin, 1801). After his death, his collection of fishes was purchased by government, and forms a part of the Berlin zoological museum.

**BLOCK**, in the rigging of a ship, is an important part of the apparatus necessary for raising sails and yards, tightening ropes, &c. The B. comprises both the frame or shell, and the pulley or pulleys contained within it. In seamen's language, a *tackle* includes the rope as well as the B. through which it works. The uses of blocks are very numerous on shipboard; and to subserve these uses, they are distributed about the masts, yards, sails, and ropes. They vary greatly in size, shape, power, and designation; but nearly every B. comprises a *shell* or wooden exterior, a *sheave* or wheel on which the

## BLOCKADE.

rope runs, a *pin* or *axle* on which the sheave turns, and a *strap* (of rope or iron) to fasten the B. to any particular station (see PULLEY). A single B. contains only one sheave; a double B., two; and so on. Besides the designations of blocks according to the number of sheaves they contain (*single, double, treble, fourfold*), ships' blocks receive numerous other names—such as *bee-B.*, *cut-B.*, *cheek-B.*, *clew-garnet B.*, *clew-line B.*, &c. Some of these names depend on the kind of service, others on the place of fixing; while the rest are examples of the odd nomenclature adopted by seamen.

*Block-making.*—Ships' blocks were made by hand until about 80 years ago. But mere workers in wood could not produce them; it required unusual skill and practice to fashion the several pieces, and put them together so as to possess the requisite strength and facility in working. The trade was either carried on alone, or in conjunction with mast-making. More than 1400 such blocks were required for one of the old 74's, and a proportionate number for vessels of larger or smaller size.

Various forms of Ships' Blocks:

a, long-tackle block; b, clew-line block; c, double block.

In 1781, a Mr Taylor began to make the sheaves and shells of blocks by a process which he had invented. He made all the blocks for the royal navy until the expiration of his patent rights. The Admiralty then commenced the manufacture on their own account. In 1801, Mr (afterwards Sir) Mark Isambard Brunel submitted to the Admiralty a working-model of a very beautiful system of machinery for block-making; it was accepted, and the inventor engaged to set up the apparatus at Portsmouth. So intricate was the machinery, and so great the difficulty in procuring the several working-parts from the machinists of those days, that it was not until the year 1808 that the system was put into effective operation. It was then, however, so perfect, that very few additions or improvements have since been needed. The machinery made blocks more accurately than they had ever been made by hand, and with the aid of ordinary workmen only. It could effect £50,000 worth of work in a year, or 140,000 blocks, by the assistance of ten men attending the machine. Duplicate machinery was made for Chatham. Brunel received £20,000 for his invention and for his personal superintendence until the machinery was brought into working-order; this sum was money well laid out, for the machine saved to the country more than £20,000 a year, in the busy warlike period from 1808 to 1815. The machinery itself is too complicated to be described except at a length incompatible with the limits of this work; but it may be stated in a general way, that the system is made up chiefly of saws and lathes, combined with great ingenuity. The blocks are made of elm, and the sheaves of lignum vitae; the pins are of iron, carefully prepared to avoid friction as much as possible.

**BLOCKADE**, in military tactics, is an operation for capturing an enemy's town or fortress, without a bombardment or regular siege. The attacking party throws up works on the neighbouring heights and roads; these works may be redoubts, for 200 or 300 men each, raised around at distances of 1000 or 1500 yards asunder; or they may assume

other forms, according to the circumstances of each case. The rest of the besieging force remains under cover in villages, or in a temporary camp, ready to repel any sortie attempted by the besieged. The whole purpose in view is to prevent the besieged from receiving supplies of any kind, in order that, when the food or the ammunition is exhausted, they may be compelled to surrender. Fortresses situated on steep and rocky eminences, difficult to conquer by bombardment or assault, may often be reduced by a B.; because the roads or paths for the reception of supplies are few, and can be watched by a small number of troops. Towns situated on a plain are less frequently invested. If the inhabitants be numerous and commercial, they will soon be impatient of the restraint produced by a B., and may compel or induce the governor to adopt a plan opposed to his wishes as a soldier. If, however, a resistance be determined on, the governor sends out of the town as many non-combatants as possible; all the stores are collected in bomb-proof receptacles; economy is observed in the consumption of food; all the people within the walls are placed under military rules; and the governor endeavours, by frequent sorties, to prevent the besiegers from making too close an investment of the place.

*Blockading*, in a naval sense, is the prevention of the entrance or exit of the enemy's ships at a particular port. It occurs sometimes as an auxiliary to military operations by land; but on others it is limited to a maritime investment.

**BLOCKADE**, in international Law, is the means, in time of war, of rendering intercourse with an enemy's port unlawful on the part of neutrals; and it is carried into effect by an armed force (ships of war), which blocks up and bars export or import to or from the place blockaded. This right is described by all writers on the law of nations as clear and incontrovertible, having its origin in the soundest principles of maritime jurisprudence, sanctioned by the practice of the best times. It is explained on the reasonable theory, that if a potentate or government lays siege to a place, or simply blockades it, such potentate or government has a right to prevent any other power, or representative or subject of such power, from entering, and to treat as an enemy any one who attempts to enter the blockaded place, or in any way assist the besieged, for such a person opposes the undertaking, and contributes to the miscarriage of it.

Lord Stowell laid it down that there are two sorts of B.—one by the simple fact only, the other by a notification accompanied with the fact. In the former case, when the fact ceases—otherwise than by accident or the shifting of the wind—there is immediately an end of the B.; but where the fact is accompanied by a public notification from the government of a belligerent country to neutral governments, the B. must be supposed to exist till it has been publicly repealed. This notification it is the duty of the belligerent country to make immediately. His lordship also explained that, on the question of B., three things must be proved: 1st, The existence of an actual B.; 2d, The knowledge of the party; and 3d, Some act of violation, either by going in or coming out with a cargo laden after the commencement of blockade. On this last point, the time of shipment is very material; for although it might be hard to refuse a neutral liberty to retire with a cargo already laden, and by that act already become neutral property, yet, after the commencement of a B., a neutral cannot be allowed to interfere in any way to assist the exportation of the property of the enemy. After the commencement of a B., a neutral is no

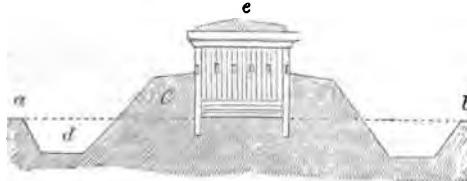

longer at liberty to make any purchase in that port. But the most essential element is *actual* B., and this state of things can only be proved to the satisfaction of a court of justice by the ships stationed on the spot to maintain the B. using their force for that purpose. A B., therefore, is only to be considered as actually existing when there is a power to enforce it.

To be valid, a B. must be accompanied by actual investment of the place, and it may be more or less rigorous, either for the purpose of watching the operations of the enemy, or, on a more extended scale, to cut off all access of neutral vessels to that interdicted place, which is strictly and properly a B.; for the former is, in truth, no B. at all, as far as neutrals are concerned. But to be binding on neutrals, it ought to be shewn that they have knowledge, or may be presumed to know of the B.; and this knowledge may arise in two ways—either by such a public and formal notification as we have already described, or by the notoriety of the fact. Yet it is at all times most convenient that the B. should be declared in a public and distinct manner, instead of being left to creep out from the consequences produced by it; and the effect of such notification to the neutral government is clearly to include all the individuals subject to the latter.

The breach of B. may be either by coming out of the blockaded port, or going in; such breach, however, may sometimes be excusable. It has been decided that intoxication on the part of the master of a ship will not be received as an excuse. The breach of B. subjects the property so employed to confiscation; there is no rule of the law of nations more established than this, and it is universally acknowledged by all civilised governments. The violation of B. by the master, however, affects the ship, but not the cargo, unless the cargo is the property of the same owner, or unless the owner of the cargo is cognizant of the intended violation.

On the proclamation of peace, or from any political or belligerent cause, the continuance of the investment may cease to be necessary, and the B. is then said to be *raised*. The blockading force then retires, and the port is open as before to all other nations.—See the law on the subject of this article extremely well stated in *A Manual of the Law of Maritime Warfare*, by William Hazlitt and Henry Philip Roche, Barristers-at-law, 1854; see, also, ORDERS IN COUNCIL, BRITISH.

BLO'CKHOUSE is to a temporary fortification what a tower is to one that is permanent. In a wooded country, it is easily and quickly made, and the enemy cannot readily bring guns to bear upon it; on flat open ground it is less useful. The B. is always a covered defence, unlike a battery; sometimes with only one story, sometimes with two, of

Elevation of Blockhouse.

which the lower forms a barrack for a few men. It is usually either rectangular or shaped like a Greek cross; the latter is preferred, as enabling the fronts of fire to flank each other. One among the many kinds of B. is shewn in the annexed cut: where ab denotes the natural level of the ground; c, a mound or parapet formed from the earth obtained out of the

ditch, d; and e, a mass of earth to cover the roof. The loopholes for musketry are shewn at the side. The defence is usually by musketry. If opposed to infantry only, single rows of trunks of trees, either upright or horizontal, make a very good B., loopholed at intervals of about three feet; and if there be earth enough quickly obtainable, by digging a ditch or from any other source, to embank it all round and to cover the roof, it will bear a great deal of rough usage. If opposed to artillery, the B. requires to be formed with double rows of trunks three feet apart, with well-rammed earth between them. The American backwoodsmen build blockhouses with great quickness and efficiency; several of these, with a curtain or continuous wall of stockading, may be made to enclose a large space, capable of accommodating a great number of defenders, and of repelling a considerable hostile force. The base of a wind-mill, on a hill, has in European countries often formed a good blockhouse. A regular B. should have a ditch, not only to supply earth, but to keep the enemy from approaching near enough to fire the timber of the blockhouse. There must be, at least, four feet of well-rammed earth on the roof, to resist the effect of artillery. Such a structure without a roof is not a B., it is simply a stockade.

#### BLO'CK-PRINTING. See PRINTING.

BLO'CKSBERG, the name given to various mountains and hills in Germany, but pre-eminently to the Brocken, the highest point of the Harz Mountains, and, indeed, of the north of Germany. According to the popular belief, it is the favourite haunt of the witches, where they celebrate the night of the 1st of May, *Walpurgisnacht* (q. v.), with wild orgies. Almost all mountains thus haunted, are known to have been famous places of sacrifice in the ages of paganism.

BLO'CK-SHIP, is a ship of war too old or too slow in sailing to render efficient service in action out at sea, but useful as a defence in great ports and naval arsenals. At the present time, when war-steamer are coming more and more into use, some of the old sailing men-of-war are nearly valueless except as block-ships. At the beginning of 1859 the English block-ships were about ten in number; at the present time there is a still greater number available for no other purpose.

BLOCK TIN is an inferior variety of tin. When the metal is reduced from its ore, it is first poured into moulds, and the ingots thus procured are heated to incipient fusion in a reverberatory furnace, when the pure tin first fuses, and is withdrawn; and the less pure tin which is left behind being melted at a higher temperature, is poured into moulds, and is known as block tin. See TIN.

BLOIS, a town of France, capital of the department of Loire-et-Cher, has a remarkably fine situation on the acclivity of a hill, and is built chiefly on the right bank of the Loire, over which there is here a good stone bridge. It is about 35 miles south-west of Orleans, on the railway between that place and Tours. The houses, in the upper part of the town especially, are mean and ill built, and the streets are crooked and narrow, but they are kept clean by water from the public fountains, which are supplied by a splendid aqueduct, supposed to have been constructed by the Romans. B. has a handsome cathedral; but its chief glory is its old castle, which has been the scene of many interesting historical events. Louis XII. was born in it, and under its roof Charles, Duc d'Alençon, and Margaret of Anjou, and Henri IV. and Margaret of Valois were married. Here also were sometimes held the courts of François I., Henri II., Charles IX., and Henri III. Here also

the Duc de Guise and his brother were murdered, by order of Henri III., on the 23d December 1588. Isabella, queen of Charles VI., here found a retreat; it served as a prison for Mary de' Medici; Catharine de' Medici died within its walls; and Maria Louisa here held her court in 1814, after Paris had capitulated. B. is a place of great antiquity. Stephen, who usurped the crown of England on the death of Henry I., was a son of one of the counts of B., by Adela the daughter of William the Conqueror. B. is an archbishop's see, has a tribunal of commerce, a communal college, a public library of 20,000 vols., a botanic garden, &c., and manufactures of porcelain and gloves, with a trade in brandy, wine, and wood. Pop. (1872) 14,496.

**BLOMFIELD, CHARLES JAMES**, Bishop of London, a learned and influential prelate of the Church of England, was born in 1786, at Bury St Edmund's, in Suffolk, where his father was school-master. Being well grounded by his father in the classics, B. went to Cambridge, where he took high honours. After he had filled several curacies, the Bishop of London appointed him his chaplain, in recognition of his acknowledged philological and theological acquirements. Shortly after, he was called to the living of St Botolph; in 1824, he was made Bishop of Chester; and in 1828, he was promoted to the see of London, on the translation of Bishop Howley to Canterbury. B.'s reputation for classical scholarship rests chiefly on his editions of *Callimachus* (Lond. 1815), and of several of the dramas of *Eschylus*. In connection with Rennell, he published the *Musa Cantabrigiensis*; and with Monk (1812) the *Posthumous Tracts of Porson*; and in 1814, the *Adversaria Porsoni*. He also published *Lectures on the Acts of the Apostles*. B. was exceedingly active in the superintendence of his diocese, and was a prime mover in the agitation for the erection of new churches. Under his presidency, more churches were erected in London than under any bishop since the Reformation. His conduct in regard to the controversies that latterly agitated his diocese was much animadverted on by both parties. He was accused at one time of leaning to Puseyism, and yet he proceeded against his clergy for alleged crypto-catholic practices. He died August 1857.

**BLOOMMAERT, PHILIP**, one of the most prominent of living Flemish authors, was born in 1809. In 1834, he published a volume of verse, characterised by much simplicity and earnestness, but so inartistic in form that it met with little success. He rendered better service to literature and to the patriotic cause by the publication (1836—1841) of *Theophilus*, an old Flemish poem of the 14th c., and of the *Oude Vlaemische gedichten* (Old Flemish Poems) of the 12th, 13th, and 14th centuries. Both works are enriched with glossaries and learned annotations. B. shews a predilection for middle-age literature generally, and has translated the *Nibelungen* into Flemish iambics. His most important work is a History of the Belgians (Brussels, 1849), in which he attempts to shew that the political destiny of the Low Countries has ever been identical with that of Germany, and that it is with the latter country, and not with France, she should seek to ally herself. B. has also contributed extensively to several Belgian journals, especially to the *Messager des Sciences Historiques*.

**BLONDEL**, a celebrated French minstrel of the 12th c., and the favourite of Richard the Lion-heart, king of England, whom he accompanied to Palestine. When Richard, on his return, was seized and imprisoned by Leopold, Duke of Austria, B. (according to the exquisitely romantic myth of an old chronicler) resolved to find out the place in

which his master was confined. He wandered through Germany in disguise, and at length coming to the castle of Löwenstein, in Austria, he heard that it contained some illustrious captive. Feeling assured that this was no other than the king, he tried all means to get a sight of him, but to no purpose. He then placed himself opposite to the tower in which he learned the unknown was imprisoned, and commenced singing one of those Provencal songs which Richard and he had composed together. Hardly had B. finished the first stanza, when a well-known voice from the tower took up the second, and carried it on to the end. So the minstrel discovered his monarch, and, returning with all speed to England, was the means of his being ransomed by his subjects. Only a few of B.'s poems have come down to us; these are preserved in the Library of the Arsenal at Paris.

**BLOOD**, the nutritive fluid of the tissues, consists of a transparent colourless fluid, the *liquor sanguinis*, and minute solid bodies, the 'corpuscles' which float in it. The liquor sanguinis consists of water, in which are dissolved fibrine, albumen, chlorides of sodium and potassium, phosphates of soda, lime, and magnesia, together with fatty and extractive matters, the latter the product of the metamorphosis of the tissues. The corpuscles are of two kinds—white and red; the white are larger and less numerous than the red, being in healthy blood in the proportion of 2 or 3 to 1000. In certain forms of disease the number of these white blood-corpuscles is increased.

#### Blood-corpuscles highly magnified.

They present a granular appearance on the surface, have a nucleoleus, which is speedily brought into view by the action of dilute acetic acid, and are identical with the lymph-corpuscle. Under the microscope they undergo a change of shapes similar to what is seen in the Amœba (q. v.); hence these movements are called *ameboid*. The red corpuscles are peculiar to vertebrates, and seem to have their origin in the white corpuscles, are oval and nucleated in fishes, reptiles, and birds, but in man and the mammalia generally they are non-nucleated, and are bi-concave flattened discs, their edges being thicker than the centre, hence the dark appearance of the latter when seen under the microscope. They have a great tendency to turn on their side and run into rouleaux, like piles of coins. Their colour is straw-yellow, and it is only when seen *en masse* that they give the blood its characteristic red colour. The size of the human red blood-corpuscles is  $\frac{1}{100}$ th of an inch. They are largest in reptiles, those of the Proteus (q. v.) being  $\frac{1}{10}$ th of an inch in their long diameter. Hoppe Seyler has shewn that, chemically, they consist chiefly of haemo-globin, with traces of albumen, cholestrin, protagan, phosphate of potash, but no fat. The specific gravity of B. is 1052 to 1057, and its mean quantity in an adult man about 344 lbs. On evaporation as a whole, the B. yields 790 parts in 1000 of water, and 210 of solid residue, which residue has nearly the same ultimate chemical composition as that of flesh.

When B. is set aside for a time, occasionally crystals consisting of globulin tinted with colouring matter appear. The B. crystals of man and the carnivora have a prismatic form, whilst those of the rat and mouse are tetrahedral, and those of the squirrel hexagonal (Carpenter).

**Coagulation of the Blood.**—When B. is drawn

## BLOOD.

from the vessels, the liquor sanguinis separates into two parts—into fibrine, which becomes solid, and a pale yellowish coloured liquid, *serum*. The fibrine coagulates, and in doing so entangles the corpuscles, and forms a red mass, the clot (*crassamentum*). Fibrine does not exist in the B. as such, but when it appears as a coagulum in a fluid, it is produced then and there by the union of two substances present in the blood, which separate as a solid matter (Schmidt)—the one, *globulin*, is contained in the blood-corpuscles; the other, *fibrinogen*, in the blood-plasma, the two uniting to form the fibre of the clot. The rapidity with which this change takes place varies with circumstances. Moderate heat, and exposure to the air, favour it; cold and exclusion from the air retard it. The B. remains fluid in the veins for some time after death. In glanders and some forms of malignant fever, and where the B. is poor, as in scurvy, it may remain fluid. The size and firmness of the clot depends on the amount of fibrine in the B., which in health averages about 2 parts in 1000. In inflammations it is much increased, and the B. forms slowly into a tough clot, which is almost destitute of red globules on its surface, and drawn in towards the centre. This colourless layer is termed the *buffy coat*, and the physicians of bygone times used to attach great importance to it, believing that it was a phenomenon peculiar to inflammation, and bled repeatedly, with the view to its removal; whereas anything which delays coagulation, great poverty of B., as in Chlorosis (q. v.), or any condition in which the fibrine is in greater proportion than the red blood globules, will cause this appearance; the clot of the impoverished blood will, however, be small and loose, and floating in an excessive quantity of serum. The colour of the B. varies. In the arteries it is of a bright-scarlet colour, while in the veins it is of a dark-purple colour. The chief difference between arterial and venous blood is that the former contains more oxygen and less carbonic acid than the latter. See CIRCULATION OF THE BLOOD. This change probably arises from the oxygen contracting the corpuscles, and altering their reflecting surfaces; carbonic acid, on the other hand, rendering them thinner and more flaccid. The changes in colour can be effected in B. drawn out of the body by the application of the gases mentioned.

The red blood-corpuscles possess great powers of absorbing oxygen. They receive oxygen in the lungs, where they become coloured, and carry it all over the body to the tissues to form new combinations. After a time, the corpuscles become dissolved in the liquor sanguinis, which fluid they serve to elaborate. The products of the metamorphosis of the tissues are poured into the B., so that it is really a very complex fluid. See RESPIRATION.

**BLOOD, AVENGER OF.** In the early ages of society, the infliction of the penalty of death for murder did not take place by the action of any tribunal or public authorities administering law, but, in accordance with the rude social condition, was left to the nearest relative of the murdered, whose recognised duty was to pursue and slay the murderer. He was called the Avenger of B., in Hebrew, *Goel* (q. v.), which term, however, was of wider signification. The Mosaic law (Numb. xxxv.) did not set aside this universal institution of primitive society, but placed it under regulations, prohibiting the commutation of the penalty of death for money, which appears to have become frequent, and appointing cities of refuge for the manalayer who was not really a murderer. See CITY OF REFUGE. The Koran sanctions the avenging of B. by the nearest kinsman, but also sanctions the pecuniary

commutation for murder. The primitive institution or custom subsists in full force among the Arabs at this day. Many of the hereditary feuds of families, clans, and tribes in all barbarous and semi-barbarous countries, have always been connected with the avenging of blood.

**BLOOD, CORRUPTION OF (IN LAW).** See TREASON.

**BLOOD, EATING OF.** The eating of B. was prohibited under the Old Testament dispensation, obviously for reasons connected with the use of animals in sacrifice. Christians, with a few exceptions, have always regarded the prohibition as having ceased with the reason for it; and the exhortation of the apostolic council of Jerusalem to the Gentile converts, to abstain 'from things strangled and from blood,' to have been merely an application of the great law of Christian charity to the circumstances of a transition period, with reference to the prejudices of Jewish converts.

**BLOOD OF OUR SAVIOUR,** was an order of knighthood in Mantua, instituted by Duke Vincent Gonzaga in 1608, on the occasion of the marriage of his son with a daughter of the Duke of Savoy. It consisted of 20 knights, the Mantuan dukes being sovereigns. The collar had threads of gold laid on fire, and interwoven with the words *Domine probasti*. To the collar were pendent two angels, supporting three drops of blood, and circumscribed with the motto *Nihil isto triste recepta*. The name originated in the belief that in St Andrew's Church, in Mantua, certain drops of our Saviour's blood are kept as a relic.

**BLOOD OF ST JANUARIUS.** See JANUARIUS, ST.

**BLOOD, THOMAS,** a most daring, unscrupulous, and successful adventurer, was born in Ireland about 1628, and served there in the parliamentary army. After the Restoration, he put himself at the head of an insurrectionary plot, which was to begin with the seizure of Dublin Castle, and of Ormond, the lord-lieutenant. On its timely discovery, he fled, while his chief accomplices were seized and executed. Escaping to Holland, he was received there with high consideration. He soon found his way back to England, to try what mischief might be brewed among the fifth-monarchy men. Finding no prospect of success, he repaired to Scotland, invited by the turbulent state of affairs, and was present at the fight of Pentland, November 27, 1660. On the night of the 6th December 1670, the Duke of Ormond was seized, in his coach in St James's Street, by a gang of braves, tied on horseback behind one of them, and hurried away towards Tyburn. The timely approach of his attendants at the moment that he had succeeded in struggling with his riding-companion to the ground, probably saved him from hanging. The leader in this daring villainy was B., and so well had he contrived it, that he did not even incur suspicion. His next enterprise was still more wild and dangerous. On the 9th of May 1671, disguised as a clergyman, and accompanied by his former accomplices, he entered the Tower with the determination to carry off the regalia of England. After nearly murdering the keeper of the jewels, he actually succeeded in carrying off the crown under his cloak, while one of his associates bore away the orb. They were immediately pursued, however, seized, and committed to the Tower jail. Now came a singular turn of fortune. At the instigation of Buckingham, who was accused of having hired B. to attack the Duke of Ormond, King Charles visited the dauntless miscreant in prison, and, dreading the threat that there were hundreds of B.'s associates banded together by

## BLOOD-BIRD—BLOOD-ROOT.

oath to avenge the death of any of the fraternity, pardoned him, took him to court, gave him an estate of £500 a year, and raised him so high in favour that for several years Colonel B. was an influential medium of royal patronage. This scandalous disregard of public decency was heightened by the fact, that the old jewel-keeper, who had risked his life in defence of his charge, applied in vain for payment of a small reward for his devotion. After the fall of the 'cabal' ministry, B. became hostile to Buckingham, and for a scandalous charge against him was committed to prison. He was bailed out, and died in his own house in 1680.

**BLOOD-BIRD** of New South Wales (*Myzomela sanguinolenta*), a beautiful little species of Honey-sucker (q. v.), which receives its name from the rich scarlet colour of the head, neck, breast, and back of the male. It inhabits thickets. A very similar species is found in Bengal.

**BLOOD-FLOWER** (*Hemanthus*), a genus of bulbous-rooted plants, of the natural order *Amaryllidæ* (q. v.), mostly natives of South Africa, some of which are among the prized ornaments of British green-houses. They take their name from the usual colour of their flowers, which form a fine head or cluster, arising from a spathe of a number of leaves. The fruit is a berry, usually with three seeds. The leaves of the different species exhibit considerable diversity of form, in some almost linear, in others almost round; in some, also, they are erect, in others appressed to the ground. The bulbs of some of the finest species of B. being very slow to produce offshoots, a curious method of propagating them is

Many-flowered Blood-flower:

a, leaves and fruit of flower-stem, in miniature; b, flower; c, seed-bud, shaft, and summit; d, seed-bud cut transversely; resorted to by gardeners, which is occasionally practised also with other bulbous-rooted plants, by cutting them across above the middle, upon which a number of young bulbs form around the outer edge.

The species of B. seem generally to possess poisonous properties. The inspissated juice of *H. toxicarius* is used by the natives of South Africa for poisoning their arrows.

**BLOOD'-HOUND**, a variety of Hound (q. v.) remarkable for its exquisite scent and for its great sagacity and perseverance in tracking any object to the pursuit of which it has been trained. It derives its name from its original common employment in the chase, either to track a wounded animal or to discover the lair of a beast of prey. It was also formerly called, both in England and Scotland, *slue-hound* or *steuth-hound*, from the Saxon *slue*, the track of a deer. The B. was formerly common and much in use in Britain, as well as on

Blood-hound.

the continent of Europe, but is now rare. The poetical histories of Bruce and Wallace describe these heroes as occasionally tracked by blood-hounds, when they were skulking from their enemies. The B. was at a later period much used to guide in the pursuit of cattle carried off in Border raids; it has been frequently used for the pursuit of felons and of deer-stealers; and latterly, in America, for the capture of fugitive slaves, an employment of its powers which has contributed not a little to render its name odious to many philanthropists. Terrible ideas are also, probably, suggested by the name itself, although the B. is by no means a particularly ferocious kind of dog, and when employed in the pursuit of human beings, can be trained to detain them as prisoners without offering to injure them. The true B. is taller and also stronger in proportion, and of more compact figure than a fox-hound, muscular and broad-chested, with large pendulous ears, large pendulous upper lips, and an expression of face which is variously described as 'thoughtful,' 'noble,' and 'stern.' The original colour is said to have been a deep tan, clouded with black. The colour appears to have been one of the chief distinctions between the B. and the Talbot (q. v.), but it is not improbable that this name was originally common to all blood-hounds. Many interesting anecdotes are recorded of the perseverance and success of blood-hounds in following a track upon which they have been set, even when it has led them through much frequented roads.—The CURAN B., which is much employed in the pursuit of felons and of fugitive slaves in Cuba, differs considerably from the true B. of Britain and of the continent of Europe, being more fierce and having more resemblance to the bull-dog, and probably a connection with that or some similar race. Many of these dogs were imported into Jamaica in 1796, to be employed in suppressing the Maroon (q. v.) insurrection, but the terror occasioned by their arrival produced this effect without their actual employment. It is this kind of B. which was chiefly introduced into the former slave-states of North America.

**BLOOD-ROOT**. See *GEUM*, *HEMODORACEÆ*, and *SANGUINARIA*.

## BLOODSTONE—BLOW-FLY.

### BLOODSTONE. See HELIOTROPE.

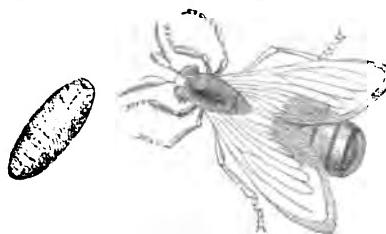

**BLOOM**, an appearance on paintings resembling in some measure the bloom on certain kinds of fruit, such as peaches, plums, &c. (hence the name), produced, in all probability, by the presence of moisture in the varnish, or on the surface of the painting when the varnish is laid on. The B. destroys the transparency, and is consequently very injurious to the general effect of a picture. It is best prevented by carefully drying the picture and heating the varnish before applying it; and best removed by a sponge dipped in hot camphine, after which a soft brush should be employed to smooth the surface of the picture, which should be finally placed in the sunshine to dry.

**BLOOMERISM**, a new and fanciful fashion of ladies' dress, partly resembling male attire, which arose out of what is termed the 'Woman's Rights' Movement' that began to be agitated in the United States about the year 1848. The first Woman's Rights' Convention was held at Worcester, New York, in 1850, under the presidency of Mrs Lucretia Mott. Its object was to advocate for women a more liberal education, training in trades and professions, and generally the social and political privileges possessed by the other sex. At the same date, and in close connection with this movement, arose an agitation for the reform of female attire. Its advocates said, justly enough, that if women were to take their place in the world as fellow-workers with men, they ought not to labour under the disadvantage of having a dress that deprived them of the use of their hands, and required nearly their whole muscular power for its support. In 1849, Mrs Ann Bloomer adopted the costume to which she has given her name, and lectured in New York and elsewhere on its advantages. The Bloomer dress consisted of a jacket with close sleeves, a skirt falling a little below the knee, and a pair of Turkish trousers. Though a few ladies followed the example of Mrs Bloomer, the dress was extremely unpopular, and exposed its adherents to a degree of social martyrdom which the more prudent, timid, or amiable declined to brave. A very elegant modification of the Bloomer dress was achieved by a New York lady—a Polish jacket, trimmed with fur, and a skirt reaching to within a few inches of the ground, avoiding a display of pantaloons, and showing off merely the trim furred boot, but still sufficiently short to avoid contact with the street; the filthy habit of spitting, which prevails in America, rendering such avoidance peculiarly necessary. The agitation for dress-reform has not died out on the other side the Atlantic. There is in New York a monthly publication, called the *Sibyl*, devoted to its advocacy, and whose editor, a married lady, as well as several of her contributors, personally illustrate their principles. A wood-cut at the head of the periodical represents the Reform Dress, as it is called. It looks by no means tempting in point of elegance—a fault fatal to its general adoption. The skirt is immoderately short, and the jacket cuts the figure awkwardly in two. The introduction of B. into England, soon after it had sprung up in America, was under such unfavourable auspices, that it failed to gain entrance into respectable society, and speedily disappeared. Still here, as in America, nothing is more frequently talked of, or desired with more apparent fervency, than a dress-reform. The heavy hooped skirts recently prevalent, injurious to health and fatal to comfort from their weight and amplitude, and liable to be equally dirty and ridiculous, were universally complained of; but the prejudice with which any innovation is sure to be met, long discouraged every attempt to introduce a reform.

**BLOOMFIELD, ROBERT**, the author of *The Farmer's Boy*, and other pastoral pieces, born 1766, at Honington, near Bury St Edmund's, was the son of a poor tailor, who died, leaving Robert an infant. His mother with difficulty subsisted by teaching a school, where B. learned to read. At the age of 11 he was hired to a farmer, but ultimately became a shoemaker in London, where he wrote his *Farmer's Boy* in a poor garret. It was published in 1800, had extraordinary popularity, and was translated into a number of languages. He subsequently published *Rural Tales*, *Wild Flowers*, and other pieces. Though efforts were made for him by persons of rank, his health broke down, and he died nearly insane, at Shefford, in Bedfordshire, in 1823.

**BLOUSE**, a name borrowed from the French for that loose, sack-like over-garment which, as worn in England by wagoners and farm-labourers, is called a smock-frock. The English smock-frock is made of coarse and imperfectly bleached linen, and is ornamented, particularly on the breast and shoulders, with plaits and embroidery. In the south of Scotland it is sometimes worn by butchers, and is then blue, as in Germany and France. In Germany, it is frequently tightened to the body by a belt, and is sometimes made of coarse woollen; but France is pre-eminently the country of blouses. There, they are worn universally, not only by the country people, but also by the labouring-classes in towns, not excepting Paris; and so characteristic is this garment, that the French populace are often called the 'blouses.' The white B. is Sunday dress with the working-classes in France, and has also often served as a countersign among the leaders of sections in secret societies. A lighter and neater garment of the sort, usually made of fine but imperfectly bleached linen, and buttoning in front, which the English smock-frock and the original continental B. do not, is much worn by summer tourists.

**BLOW-FLY** (*Sarcophaga carnaria*), an insect of the order *Diptera* (two-winged), (q. v.), and of the large family *Muscidae*, of which the common House-fly (q. v.), Flesh-fly (q. v.), &c., are familiar examples. The B. is very similar to these in its general appearance; its body is hairy, the expanse of its wings about one inch, the face silky and yellow, the thorax gray, with three black stripes, the abdomen of a shining blackish brown, which, in certain points

Blow-fly and Pupa.

of view, assumes a bluish tint, chequered with glittering yellowish spots. One of the distinguishing characters of the genus is, that the eyes are widely separate in both sexes. The species of this genus are not unfrequently ovoviparous, the eggs being hatched within the body of the parent. The generic name (Gr. *sarc*, flesh; *phago*, to eat) is derived from the circumstance that the larvae of most of the species feed upon the flesh either of dead or of living animals. The B. is common in Britain on heaths, in gardens, &c., and its larvae are to be found feeding upon meat, the carcases of animals, sometimes upon living earthworms, and too frequently upon sheep, of which it is one of the

## BLOW-PIPE.

most grievous pests, requiring the constant attention of the shepherd during most of the summer and autumn. Some districts are more infested with it than others; it is particularly troublesome in the feany districts of England. Unless the maggots are removed, they eat into the skin, the sheep suffer great torment, and soon die. At first they may be removed by shaking them out of the wool, into which dry sand is then abundantly sprinkled; but if they are very numerous, a mercurial ointment or wash of corrosive sublimate is applied; and when the skin is much broken, the wool is clipped away, an ointment of tar and grease is used, and a cloth sewed over the part. Like many other insects, the B. multiplies with excessive rapidity.

Another species of this genus, common in most parts of Britain, is *S. mortuorum*, so named from its frequenting burial-vaults and similar places. It is very similar to the B., but the abdomen is of a shining steel blue, and there is a reddish-brown line down the forehead.

**BLOW-PIPE**, a small instrument used in the arts for soldering metals, and in analytical chemistry and mineralogy, for determining the nature of substances by the action of an intense and continuous heat, its principle depending on the fact, that when a jet of air or oxygen is thrown into a flame, the rapidity of combustion is increased, while the effects are concentrated by diminishing the extent of space originally occupied by the flame.

The B. generally consists of a conical tube of metal, about eight inches long (fig. 1), closed at the wider or lower end, but open at the narrow or upper end, *a*, which latter constitutes the mouthpiece, and is turned over to admit of the lips closing perfectly round it. Near the lower end, a small tube, fitted with a finely perforated nozzle, *b*, is inserted at right angles to the large tube—the space below being intended as a chamber for condensing the moisture of the breath—through this nozzle, a fine current of air can be projected against the flame experimented with.

When a current of air from the B. is directed against a candle or gas-jet, the flame almost entirely loses its luminosity, owing to the perfect combustion of the gases evolved from the source of heat, and is projected in a lateral direction, as a long pointed cone, consisting of three distinct

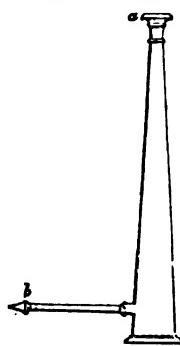

Fig. 1.

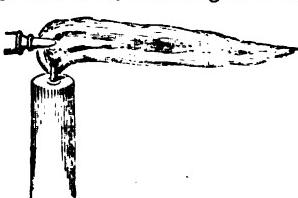

Fig. 2.

parts (fig. 2). The first or central cone is of a dark-blue colour, and there the combustion is complete from the excess of air thrown in from the small nozzle. The second cone, or that immediately surrounding the first, is somewhat luminous; and here the oxygen, being insufficient for the combustion of the carbon, any metallic oxide subjected to the action of this portion of the flame is deprived of its oxygen, and reduced to the condition of metal;

for this reason the luminous cone is generally termed the *reducing flame* of the blow-pipe. Beyond the second cone, or where the flame comes freely in contact with the atmosphere, and abundance of oxygen is present to effect complete combustion of the gases, is a third, or pale yellow envelope, containing excess of atmospheric air at a very high temperature, so that a portion of metal, such as lead or copper, placed at this point, becomes rapidly converted into its oxide: this outer part of the flame is on this account called the *oxidising flame* of the blow-pipe.

Substances under examination before the B. are generally supported either on wood-charcoal or platinum—the latter in the condition of wire or foil. In applying the B. test, the body to be examined is either heated alone, or along with some flux or fusible substance; in some cases, for the purpose of assisting in the reduction of metals from their ores and other compounds; in others, for the production of a transparent glassy bead, in which different colours can be readily observed. When heated alone, a loop of platinum wire, or a piece of charcoal, is generally employed as a support; the former when the colour of the flame is to be regarded as the characteristic reaction, the latter when such effects as the oxidation or reduction of metallic substances are to be observed.

The following are exemplifications of the difference of colour communicated to the flame by different substances: Salts of potash colour, the flame *violet*; soda, *yellow*; lithia, *purplish red*; baryta, *yellowish green*; strontia, *carmine*; lime, *brick red*; compounds of phosphoric acid, boracic acid, and copper, *green*. The commonly occurring metallic oxides reducible by heating on charcoal alone in the inner flame of the B. are the oxides of zinc, silver, lead, copper, bismuth, and antimony; the principal ores not so reducible are the alkalies and alkaline earths, as also the oxides of iron, manganese, and chromium. The fluxes generally used in B. experiments are either carbonate of soda, borax (borate of soda), or the ammonia-phosphate of soda, otherwise called *microcosmic salt* (q. v.). The carbonate of soda, when heated on platinum-wire in the oxidising flame, forms with silica a *colourless glass*; with oxide of antimony, a *white bead*, &c. The following metals are reduced from their compounds when heated with carbonate of soda on charcoal in the inner flame of the B.; viz., nickel, cobalt, iron, molybdenum, tungsten, copper, tin, silver, gold, and platinum. When compounds of zinc, lead, bismuth, arsenic, antimony, tellurium, and cadmium are similarly treated, these metals are also formed, but being volatile, they pass off in vapour at the high temperature to which they are exposed.

Borax, as a flux, is generally mixed with the substance under examination, and placed on platinum-wire. When thus heated in either of the flames, baryta, strontia, lime, magnesia, alumina, and silica, yield *colourless beads*; cobalt gives a *fine blue colour*; copper, a *green*, &c. With microcosmic salt, the results obtained are generally similar to those with borax, and need not be specially mentioned, as the test is applied in the same way. The B. has been long used by goldsmiths and jewellers for soldering metals, and by glass-blowers in fusing and sealing glass-tubes, &c.; it has also been applied in qualitative analysis for many years, but more recently chemists (especially Plattner) have devoted their attention to its use, and have even employed it with great success in quantitative chemical analysis; the advantages being that only a very small quantity of material is required to operate upon, whilst the results may be obtained with great rapidity and considerable accuracy.

## BLOW-PIPE AND ARROW—BLUCHER.

**BLOW-PIPE AND ARROW**, a kind of weapon much used by some of the Indian tribes of South America, both in war and for killing game. It consists of a long straight tube, in which a small poisoned arrow is placed, and forcibly expelled by the breath. The tube or blow-pipe, called *gravatana*, *pocuna*, &c., is 8—12 feet long, the bore not generally large enough to admit the little-finger. It is made of reed or of the stem of a small palm. Near Pará, it is in general very ingeniously and nicely made of two stems of a palm (*Iriartea setigera*, see *IRIARTEA*) of different diameters, the one fitted into the other, in order the better to secure its perfect straightness. A *sight* is affixed to it near the end. The arrows used in that district are 15—18 inches long, made of the spines of another palm, sharply pointed, notched so as to break off in the wound, and their points covered with *curari* (q. v.) poison. A little soft down of the silk-cotton tree (q. v.) is twisted round each arrow, so as exactly to fit the tube. In Peru, arrows of only 1½—2 inches long are used, and a different kind of poison seems to be employed. An accidental wound from one of these poisoned arrows not unfrequently proves fatal. In the hand of a practised Indian, the B. and A. is a very deadly weapon, and particularly when directed against birds sitting in the tops of high trees. As his weapon makes no noise, the hunter often empties his quiver before he gathers up the game, and does more execution than an English sportsman could with his double-barrelled fowling-piece.

**BLUBBER.** See *CETACEA*, *WHALE*, and *WHALE-FISHERY*.

**BLÜCHER, GEBHARD LIEBEREICH VON**, Prince of Wahlstadt, Field-Marshal of Prussia, was born at Rostock, in Mecklenburg-Schwerin, West Germany, 16th December 1742. At the commencement of the Seven Years' War, he joined a regiment of Swedish hussars, and in his first action was taken prisoner by the Prussian hussars, whose colonel persuaded him to exchange out of the service of Sweden into that of Prussia, and gave him a lieutenancy. A lieutenant, Jägersfeld, having been promoted over B.'s head, he immediately wrote to Frederick the Great as follows: 'Von Jägersfeld, who has no merit except that of being son of the Markgraf of Schwedt, has been put over my head: I beg to request my discharge.' The result was, that B. was put under arrest, and after repeated applications for discharge, he received from Frederick the curt intimation: 'Captain Blücher is at liberty to go to the devil!' B. went instead to his estate of Grossraddow, in Pomerania, and devoted himself to farming; but he soon tired of a bucolic life. In 1793, having returned to the army, he fought, as colonel of hussars, against the French on the Rhine, evincing great genius as a leader of cavalry. The breaking out of the war of 1806 led him, as lieutenant-general, to the battle of Auerstadt. B., with the greater part of the cavalry, occupied the left flank of the Prince of Hohenlohe in the retreat to Pomerania. He is accused, on this occasion, of not giving the prince due support, and thus leading to the capitulation at Prenzlau. B. himself then marched into the territory of the free town of Lübeck, and hastily fortified the city; but the French took it by storm, and B. was forced to surrender at Ratkow, near Lübeck, whither he had escaped with a few troops. A fortnight after, he was exchanged for the French general Victor; and immediately on his arrival in Königsberg, was sent, at the head of a corps, by sea, to Swedish Pomerania, to assist in the defence of Stralsund. After the peace of Tilsit, he was

employed in the war-department in Königsberg and Berlin, and subsequently became commander in Pomerania. At a later period, he was pensioned, along with several other men of note, at the instance, it was said, of Napoleon. He was one of the few to combat the general belief in the invincibility of Napoleon, which had grown into a sort of fatalism in high places. In common with Stein and Hardenberg, he laboured to remove all weak and unpatriotic counsellors from the person of the king. When all the leaders of the army lost courage, his constancy revived confidence, and made him the centre of all hope for the future. When the Prussians at last rose in opposition to France, B. was appointed to the chief command of the Prussians and of General Winzingerode's Russian corps. At the battles of Lützen, Bautzen, and Haynau, he displayed heroic courage. At the Katzbach, he defeated Marshal Macdonald, and cleared Silesia of the enemy. In vain did Napoleon himself attempt to stop the 'old captain of hussars,' as he called him, in his victorious career. In the battle of Leipzig he won great advantage over Marshal Marmont at Möckern, 16th October 1813, and on the same day pressed on to the suburbs of Leipzig. On the 18th, in conjunction with the crown-prince of Sweden, he had a great share in the defeat of the French, and on the 19th his troops were the first to enter Leipzig. B., in opposition to the policy of Austria, continually pressed the taking of Paris as the real aim of the war. On the 1st of January 1814, he crossed the Rhine, garrisoned Nancy on the 17th of the same month, and after winning the battle of La Rothière, pressed forward to Paris; but his scattered corps were routed by Napoleon, and he fought his way back to Chalons with great loss. On the 9th March, however, he defeated Napoleon at Laon; and at the end of the month, after being joined by Schwarzenberg and his corps, he again advanced towards Paris. The day at Montmartre crowned the brilliant deeds of this campaign, and, on the 31st March, B. entered the French capital. Frederick William III. created him Prince of Wahlstadt, in remembrance of the victory at the Katzbach, and gave him an estate in Silesia. In England, whither he followed the allied sovereigns, he was received with an enthusiasm never before excited by a German. The university of Oxford conferred on him the degree of Doctor of Law. After Napoleon's return in 1815, B. once more assumed the general command, and promptly led the army into the Netherlands. On the 16th June 1815, he lost the battle of Ligny, in which he was personally in great danger, from his horse falling on him. The victory of the allies at the battle of Waterloo was completed by B.'s timely appearance on the field. B. ordered his Prussians to pursue the flying enemy, which they did the whole night. Declining the offered truce, B. marched again against Paris, and on the second taking of that city manifested a strong desire to retaliate on Paris the spoliation that other capitals had suffered at the hands of the French; but he was held in check by the Duke of Wellington. In order to reward B.'s services to Prussia and the common cause, Frederick William III. created a new order, the badge of which consisted of an iron cross surrounded by golden rays. On the 26th August 1819, a colossal bronze statue was erected in his honour in his native town. B. died 12th September 1819, after a short illness, at his estate of Krieblowitz, in Silesia. In Berlin, a statue twelve feet high, modelled by Rauch, and cast in bronze by Lequine and Reisinger, was erected to his memory, 18th June 1826, and at Breslau another, also executed by Rauch, in 1827. In the beginning of the campaign of 1813, his characteristic activity

and the style of his attacks gained him the nickname of 'Marshal Forward' from the Russians; it soon became his title of honour throughout Germany. His tactics were always much the same: to attack the enemy impetuously, then to retreat when the resistance offered was too great for his troops to overcome; to form again at a little distance, and watch narrowly the movements of the enemy, and whenever an advantage offered itself, to charge with lightning speed, and throw him into disorder, make a few hundred prisoners, and retire ere the opposing force had recovered from its surprise. Such were his usual manœuvres. B., as a man and as a soldier, was rough and uncultivated, but energetic, open, and decided in character. His ardent enthusiasm for the liberation of Prussia and Germany from a foreign yoke, and his uncompromising pursuit of this noble aim, have justly rendered him a hero in the eyes of the German people. The old red uniform, and the old name of 'Blücher's Hussars,' were restored to the 5th Regiment of Hussars by Frederick William IV., on occasion of the centenary celebration of B.'s birthday.

**BLUE**, a colour of which there are several varieties used in the arts, noted below. See also COLOUR. Blue, or, as it is sometimes termed, *True Blue*, was the favourite colour of the Scottish Covenanters in the 17th century. When their army entered Aberdeen, says Spalding, there were few of them without a blue ribbon; this colour being probably adopted in contradistinction to the red of the royal forces. At the battle of Bothwell Bridge, the flag of the Covenanting army was edged with blue. From these usages, blue seems to have become the partisan colour of the Whigs, but commonly in association with orange or yellow, in memory of the House of Orange and the revolution settlement. This combination of blue and yellow is seen in the liveries of certain Whig families of distinction, and also in the cover of the *Edinburgh Review*. Blue is the colour of the uniform of the Royal Navy of England; it is of a dark tint, and is known as *Navy Blue*.

**AZURE BLUE** is a pigment prepared by mixing 2 parts of deep blue, 1 of oxide of zinc, and 4 of lead glass; the latter consisting of 4 parts of minium and 1 of sand. The above azure blue is for skies, but a pigment for more general use is prepared from 11 fused borax and 67 gray flux; the latter being itself made from 89 pebble flux, 75 minium, and 25 sand.—**BERLIN BLUE**. See PRUSSIAN BLUE.—**BRUNSWICK BLUE**, or *Celestial*, is made by precipitating the alumina from a solution of alum by carbonate of soda, washing the precipitate, and adding sulphate of baryta, sulphate of iron, yellow prussiate of potash, and some bichromate of potash. When dried, this mixture is known as Brunswick blue, but when the sulphate of baryta is left out, and the material not dried, it is called *Damp Blue*.—**CEBUANEAN BLUE** is a colour used in pottery, and consists of 79 parts of gray flux, 7 carbonate of cobalt, 14 hydrated carbonate.—**BLUE COLOUR OF FLOWERS**, or *Anthocyan*, may be obtained from those petals of flowers which are blue by digesting them in spirits of wine in the dark. The colour is soluble in alcohol, but is precipitated from its alcoholic solution by water. It is changed to red by acids, and to green by alkalies.—**BLUE COPPERAS**, or the Sulphate of Copper. See COPPER.—**BLUE DYES**. See INDIGO, LITMUS, PRUSSIAN BLUE, and DYING.—**IRON EARTH BLUE** occurs native amongst bog iron ore and in mossy districts in Europe and New Zealand. It mainly consists of a phosphate of iron with a little alumina, silica, and water. It is called *Native Prussian Blue*.—**INDIGO BLUE**, in pottery-ware, consists of 13 parts of carbonate of cobalt, 26 hydrated carbonate of zinc, and 61 gray flux.—**COBALT BLUE**

is the only really good and serviceable blue in the colouring of glass and porcelain, and is essentially the oxide of cobalt ( $\text{CoO}$ ), the colouring power of which is so great, that the addition of  $\frac{1}{1000}$  part to white glass is sufficient to render it blue. Several of the compounds named above owe their blue colour to this substance. See COBALT.—**DEEP BLUE** is employed in porcelain colouring, and is made from 1 part of oxide of cobalt, 4 glass of lead (2 minium, 1 white sand), 1 lead glass (2 minium, 1 sand, 1 calcined borax), and 1 oxide of zinc, all of which are placed together in a porcelain crucible, fused for 2 or 3 hours; the residue washed, dried, and ground to a fine powder.—**KING'S BLUE** is made from 29 parts carbonate of cobalt, 29 sand, and 42 carbonate of potash, by fusing these ingredients in a crucible. The residue is intense deep blue, bordering on a black blue, and is generally reduced to powder, and re-fused with about half its weight of pebble flux (3 minium or litharge, and 1 sand).—**MINERAL BLUE** and **PARIS BLUE**. See PRUSSIAN BLUE.

**PRUSSIAN BLUE** is the deep blue colour which is so frequently seen on cotton, muslin, and woollen handkerchiefs and dresses. It was discovered in the year 1710 by Diesbach, a colour-maker in Berlin, and hence called *Berlin Blue*. The mode of its manufacture was published in Britain, by Dr Woodward, in 1724. It may be prepared in several ways: 1. By the addition of a solution of yellow prussiate of potash (ferrocyanide of potassium) to a solution of sulphate of iron (green vitriol). The blue compound thus produced deepens in tint when exposed to the air; and where it is required of greater consistency or more body, some alum and carbonate of potash are added to the prussiate solution before mixing with the iron solution. 2. By mixing solutions of yellow prussiate of potash and perchloride of iron, which yields the variety known as *Paris Blue*. 3. By adding a solution of the red prussiate of potash (ferrocyanide of potassium) to a solution of sulphate of iron, and this mode of preparation gives *Turnbull's Blue*. The Prussian blue settles to the bottom of the mixing vessels, and may be collected and dried by exposure to the air, when it is obtained as a blue powder. If heat be applied during the drying, the material cakes, and when cut, exhibits a lustre and hue like copper. When alum has been used in its manufacture, the product has a dull earthy fracture. The composition of Prussian blue is that of a ferrocyanide of iron. See CYANOGEN. It is employed by washerswomen, under the name of *blue*, for neutralising the yellow tint of cotton and linen clothes; by paper-makers, to colour paper; and is very largely employed as a pigment in CALICO-PRINTING (q. v.) and DYING (q. v.). Mineral Blue is formed when the Prussian blue is precipitated along with a solution of zinc or magnesia, or moist carbonates of zinc or magnesia are added during the precipitation of the colour. In the formation of *Royal Blue*, a solution of tin is added, and Steam Blue is produced on the addition of solutions of tartaric acid and yellow prussiate of potash. The impurities liable to be present in Prussian blue are starch, chalk, and stucco, either of which necessarily decreases the intensity of the blue colour, and the utility of the substance.

**SAXONY BLUE** is prepared by dissolving indigo (q. v.) in Nordhausen sulphuric acid, and was first manufactured in Saxony in the year 1810, by taking the very finely powdered indigo and incorporating it with the acid cautiously heated, when the indigo dissolves, and yields a blue colour of great depth of tint. It is largely used in dyeing (q. v.).—**OLD SEVENS BLUE** is a cobalt blue used in pottery, and is made up of 19 parts oxide of cobalt, 39 dry carbonate of soda, 3 dry borax, and 39 sand.—

THENARD'S BLUE is the blue formed by heating alum with a solution of cobalt, or it may be formed by igniting a mixture of phosphate or arsenite of cobalt with eight times its weight of alumina in the hydrated state procured by precipitation from alum by ammonia. Used in pottery.—TURQUOISE BLUE is composed of 3 of oxide of cobalt, 4 of alumina, and 1 oxide of zinc. It is manufactured by dissolving the oxides of zinc and cobalt in dilute sulphuric acid, adding the liquid to a solution of 40 parts of ammonia alum, drying up and igniting at a red heat for several hours. The addition of a little chromate of mercury gives it a green shade.—VARIEGATED BLUE is used for colouring porcelain, and is formed by fusing 10 oxide of cobalt, 9 oxide of zinc, 5 lead glass (2 minium, 1 sand, and 1 calcined bones), and 25 glass of lead (2 minium and 1 sand).

BLUE STONE, or BLUE VITRIOL, is sulphate of copper. See COPPER.

BLUEBEARD, the name given to the hero of a well-known tale of fiction, which is of French origin. According to this romance, the Chevalier Raoul has a blue beard, from which he gets his designation. This personage tests his wife's curiosity by intrusting her, during his absence on a journey, with the key of a chamber, which she is forbidden to enter. She is unable to stand the test, and he puts her to death. Several wives share the same fate, but at length the seventh is rescued at the last moment by her brothers, and B. is slain. The tale appears in innumerable collections, under various forms. Tieck, in his *Phantasus*, has worked up this material into a clever drama, with numerous romantic and satirical additions, and Grétry has made use of it in his opera of *Raoul*.

The historic original of Chevalier Raoul would appear to be one Giles de Laval, Lord of Raiz, who was made marshal of France in 1429, and fought valiantly in defence of his country when invaded by the English; but his cruelty and wickedness seem to have eclipsed even his bravery, as he is remembered chiefly for his crimes, which credulous tradition has painted in the blackest and most fearful colours. He is said to have taken a pleasure, among other atrocities, in corrupting young persons of both sexes, and afterwards in murdering them for the sake of their blood, which he used in his diabolical incantations. Out of this fact, in itself probably half-mythical, the main feature of the tale of B. has probably grown. Laval was burnt alive in a field near Nantes, in 1440, on account of some state-crime against the Duke of Brittany.

BLUE-BELL. See HYACINTH.

BLUE BIRD, BLUE WARBLER, BLUE REDBREAST, or BLUE RO'BIN (*Sylvia sialis*, or, according to the most recent ornithological systems, *Erythaca* or *Sialia Wilsoni*; see SYLVIADE), an American bird, which, from the confidence and familiarity it displays in approaching the habitations of men, and from its general manners, is much the same sort of favourite with all classes of people in the United States that the redbreast is in Britain. Except in the southern states, it is chiefly known as a summer bird of passage, appearing early, however, as a harbinger of spring, and visiting again 'the box in the garden, or the hole in the old apple-tree, the cradle of some generations of ancestors.' Few American farmers fail to provide a box for the B. B.'s nest. In size, the B. B. rather exceeds the redbreast, which, however, it much resembles in general appearance. Its food is also similar. The upper parts of the B. B. are of a rich sky-blue colour, the throat and breast are reddish chestnut, and the belly white. The female is duller in colours than the male. The B. B. lays five or six pale-blue eggs,

and has two or three broods in the season. Its song is 'a soft agreeable warble.' The male is remarkably attentive to his mate, and both exhibit extraordinary courage in driving away intruders from the

Blue Bird (*Sylvia sialis*).

vicinity of their nest. A hen, with her brood, has been seen to flee from the attacks of an enraged and pugnacious blue bird.—The B. B. is known as an inhabitant of the Bermudas, Mexico, the West Indies, Guiana, and Brazil.—In the western and in the more northern parts of North America, its place is taken by nearly allied and very similar species.

BLUE-BOOKS, the name popularly applied to the reports and other papers printed by parliament, because they are usually covered with blue paper. The term was, for like reasons, long applied to the reports sent annually by the governors of colonies to the colonial secretary; and even in technical official phraseology, these are called 'blue-books.' The practice of printing, and to some extent publishing, the proceedings of the House of Commons, began in the year 1681, when disputes ran high on the question of excluding the Duke of York from the succession to the throne. The proceedings on the occasion are extremely interesting. It was stated, that especially after parliaments were dissolved, false accounts of their proceedings were circulated, and, as a remedy, Sir John Hotham moved that the votes and proceedings of the House be printed. Mr Secretary Jenkins opposed the motion, saying: 'Consider the gravity of this assembly: there is no great assembly in Christendom that does it; it is against the gravity of this assembly, and is a sort of appeal to the people.' He was answered by Mr Boscowen: 'If you had been a privy council, then it were fit what you do should be kept secret, but your journal-books are open, and copies of your votes in every coffee-house, and if you print them not, half votes will be distributed to your prejudice. This printing is like plain Englishmen, who are not ashamed of what they do, and the people you represent will have a full account of what you do.' Colonel Mildmay said: 'If our actions be nought, let the world judge of them; if they be good, let them have their virtue. It is fit that all Christendom should have notice of what you do, and posterity of what you have done—and I hope they will do as you do, therefore I am for printing the votes.' The motion was carried. See *Parl. Hist.* iv. 1307; *Kennet*, iii. 396. The documents printed by the House of Commons accumulated gradually in bulk and variety, until they reached their present extent. In 1836, the House adopted

## BLUE-BOTTLE FLY—BLUE PILL.

the practice of selling their papers at a cheap rate. A curious legal and constitutional question immediately arose out of this practice, a publisher having taken proceedings for libel against the officers concerned in circulating the papers, because it was stated in a report concerning prisons that the prisoners read indecent books printed by him. The chief contents of these papers at present are—the votes and proceedings of the House; the bills read in their several stages; the estimates for the public services of each year; the accounts of the expenditure of the moneys voted in the previous year; any correspondence or other documents which the ministry may voluntarily, or at the demand of the House produce, as connected with a question under discussion; reports of committees of inquiry appointed by the House; reports of commissions of inquiry appointed by the crown; and annual reports by the permanent commissions and other departments of the government, stating their proceedings during the year. The B. of a session, when collected and bound up, now often fill fifty or sixty thick folio volumes. Nothing can seem more hopelessly chaotic than those of a few sessions huddled together unarranged. It deserves to be known, however, that they are all printed according to a peculiar sequence, which enables the whole papers of a session to be bound up in such an order that any paper can be found by consulting an ample index in the last volume. In any library where the B. are preserved and properly bound up, the most trifling paper of any session may thus be found with ease; and it need hardly be said that with much that is useless or unimportant, there is an enormous mass of valuable matter hidden in the blue-books.

There is no doubt, however, that although the means are thus provided for finding what the B. contain, their contents are heterogeneous, and to a great extent cumbersome and valueless. They are not prepared on any uniform system, or subjected to general revision, or what may be called editing. Each officer prepares his own report in his own way, sometimes lauding his own services, or arguing in favour of his own peculiar principles on some public question, so that it has been remarked that the B. contain a large number of articles like those in the periodical press, but too cumbersome and dull to get admission there. It has been matter of complaint that the public are burdened with the expense of widely distributing such documents. It is stated in a treasury minute, circulated among the government departments in May 1858, with the view of in some measure remedying the abuse, ‘that the cost of printing the report of the commissioners appointed to inquire into the endowed schools of Ireland, and the three volumes of evidence and appendices (including the cost of the paper), was £5200, and that the weight of the paper used in printing them was about 34 tons.’

BLUE-BOTTLE FLY. See FLESH-FLY.

BLUE CARDINAL. See LOBELIA.

BLUE-COAT SCHOOL, the name ordinarily given to Christ's Hospital, London, in which the boys wear blue coats or gowns, according to an old costume. See CHRIST'S HOSPITAL.

BLUE-EYE (*Entomyza cyanotis*), a beautiful little bird, abundant and very generally dispersed in New South Wales, although not found in the more southern Australian colonies. It is a species of Honey-sucker (q. v.) or Honey-eater, and is sometimes called the Blue-cheeked Honey-eater. The B. seeks its food almost exclusively among the blossoms and small leafy branches of *Eucalyptus*. Its food consists partly of insects and partly of honey; perhaps also of berries. It is a bold and spirited bird, of most

elegant and graceful movements. Numbers are often seen together clinging and hanging in every variety of position, frequently at the extreme ends of the small thickly-flowered branches, bending them down with their weight.

BLUEFIELDS, a river of the Mosquito Territory, in Central America, which, after a course of several hundred miles to the east, enters the Caribbean Sea in lat. 12° N., and long. 83° W. Its lower stream is navigable to a distance of 80 miles from the sea. At its mouth is a good harbour, above which stands a town of the same name, the residence of the king of the Mosquito Territory.

BLUE-GOWNS, the name commonly given to a class of privileged mendicants in Scotland. The proper designation of these paupers was the King's Bedesmen, or Beadsmen. In ancient times, a beadsmen was a person employed to pray for another. See BEAD. From practices of this kind, there sprang up a custom in Scotland of appointing beadsmen with a small royal bounty, who ultimately degenerated into a class of authorised mendicants. Each of the beadsmen on his majesty's birthday received a gown or cloak of blue cloth, with a loaf of bread, a bottle of ale, and a leathern purse containing a penny for every year of the king's life. Every birthday, another beadsmen was added to the number, as a penny was added to each man's purse. The most important part of the privilege was a large pewter badge, attached to the breast of the gown, which, besides the name of the bearer, had the inscription, *Pass and Repass*. This inferred the privilege of begging, and bespoke the kindly consideration of all to whom the beadsmen appealed for an alms or a night's lodging. The fictitious character of Edie Ochiltree, in Sir Walter Scott's tale of the *Antiquary*, is a fair sample of this ancient and picturesque fraternity. The practice of appointing beadsmen was discontinued in 1833, at which time there were sixty on the roll. The whole have since died out. The last beadsmen drew from the Exchequer in Edinburgh his last allowance in May 1863.

BLUE-MANTLE, the title of an English purvant-at-arms. See PURSUVANT.

BLUE MOU'NTAINS, the name of two mountain-chains, the one in New South Wales, the other in Jamaica.—1. The B. M. of New South Wales run very nearly parallel with the coast, and being impassable by nature, long threatened to cut off the maritime part of the colony from the interior. To cross this apparently insurmountable barrier was the grand aim of the colony during the first 24 years of its existence, Surgeon Bass, the discoverer of the strait that bears his name, standing pre-eminent among the adventurous and patient explorers. It was not till 1813 that a practicable passage was found, or rather made, for it terminated towards the west in a zigzag road down a nearly perpendicular height of 670 feet; but it was not before 25th April 1815—a day ever memorable in the local annals—that Governor Macquarie, with a numerous retinue, actually opened a route into the Bathurst Plains, then yielding the richest pasture in the colony, and now forming its gold-field. The B. M. are the dividing-ridge between the rivers of the coast and those of the interior. They are of very considerable height, for some parts of the road which crosses them are about 3400 feet above the sea—an elevation nearly equal to that of any point in England or Wales.—2. The still loftier range of the same name in Jamaica traverses the whole length of the island from east to west. These B. M. in some places attain an altitude of 6000 feet.

BLUE PILL (*Pilula hydrargyri*) is the most

## BLUE RIDGE—BLUM.

simple form in which mercury can be administered internally. It consists merely of two parts of mercury rubbed up with three parts of conserve of roses, till globules of mercury can no longer be detected; to this is added powdered liquorice-root, so that a pill of five grains contains one grain of mercury.

In cases of torpid condition of the liver or inflammation of that organ, B. P. is much used as a purgative, either alone or combined with some other drug, such as rhubarb. When it is given with the view of bringing the system under the influence of mercury (Salivation, q. v.), small doses of opium should be added to counteract its purgative tendency, and the state of the gums watched carefully from day to day, so that the first symptoms of salivation may be noticed, and the medicine omitted. As a purgative, the common dose of B. P. is one or two pills of five grains each, followed by a purgative draught. When the system is to be saturated with it, or salivated, one pill may be given morning and evening, or one every night combined with  $\frac{1}{2}$  of a grain of opium, repeated till the gums become sore. But the sensibility to the action of mercury varies with the individual; some may take large quantities before it exhibits its physiological symptoms, and on the other hand, three blue pills, one taken on three successive nights, have brought on a fatal salivation. When taking blue pills, all sudden changes of temperature should be avoided; and, indeed, though they are found in every domestic medicine-chest, neither they nor any other form of mercury should be given without good cause and without the greatest caution.

**BLUE RIDGE**, the most easterly range of the Alleghanies, in the United States. It forms an almost continuous chain from West Point in New York down to the north of Alabama, through New Jersey, Pennsylvania, Virginia, the Carolinas, and Georgia. It divides Virginia into Eastern and Western. Mount Mitchell, in North Carolina, the loftiest point of the B. R., is 6470 feet above the sea; while the Otter Peaks in Virginia, next in elevation, have an altitude of 4200 feet.

**BLUE STOCKING**, a name given to learned and literary ladies, who display their acquirements in a vain and pedantic manner, to the neglect of womanly duties and virtues. The name is derived from a literary society formed in London about the year 1780, which included both men and women. A gentleman of the name of Stillingfleet, who was in the habit of wearing blue stockings, was a distinguished member of this society; hence the name, which has been adopted both in Germany and France.

**BLUETHROAT**, or **BLUEBREAST**, also called Bluethroated Warbler and Bluethroated Robin (*Phoenicura Suecica*, or *Sylvia Suecica*, see *SYLVIIDÆ*), a beautiful bird, a very little larger than a redbreast, and much resembling it, but having the throat and upper part of the neck of a brilliant sky-blue, with a spot in the centre, which in some specimens is pure white, and in very old males is red. Below the blue colour is a black bar, then a line of white, and again a broad band of bright chestnut. The B. is well known as a summer bird of passage in many parts of Europe, from the Mediterranean Sea to the Arctic Ocean, but is very rare in Britain, only a few instances of its occurrence having been recorded. It is supposed to spend the winter in Africa. Great numbers are caught for the table in Lorraine and Alsace. The bird is one of those known by the names of *Becfin* (q. v.) and *Beccafico* (q. v.), and esteemed a delicacy. It is a bird of very sweet song. It imitates, to an unusual degree, the notes of other birds, so that the Laplanders give it a name which signifies the bird of a hundred tongues.

**BLUEWING**, according to some naturalists, a genus of *Anatidae*, which has been named *Cyanopterus* (by a sort of Greek translation of the English name), but more generally regarded as a mere section or subsection of the restricted but still large genus *Anas*. See DUCK. The tail-feathers are only 14 in number, instead of 16, as in the common duck, teal, &c.; but the character from which the name is derived is, after all, that which chiefly distinguishes the bluewings, and never fails to arrest attention. The best known species, the Common or Lunate B. (*Anas* or *Cyanopterus discors*), is generally called the Blue-winged Teal in the United States of America, where it is very abundant. Vast numbers spend the winter in the extensive marshes near the mouth of the Mississippi, to which they congregate both from the north and from the coast regions of the east; but the summer migrations of the species extend as far north as the 57th parallel, and it is plentiful on the Saskatchewan in the breeding-season. It breeds, however, also in the marshes of the south, even in Texas; and is common in Jamaica, where it is supposed to be not a mere bird of passage, but a permanent resident. None of the duck tribe is in higher esteem for the table, and it has therefore been suggested that the B. is particularly worthy of domestication, of which it seems to be very easily susceptible. In size it is rather larger than the common teal; in the summer plumage of the male, the upper part of the head is black, the other parts of the head are of a deep purplish blue, except a half-moon shaped patch of pure white before each eye; the prevalent colour of the rest of the plumage on the upper parts is brown mixed and glossed with green, except that the wings exhibit various shades of blue, the lesser wing-coverts being of a rich ultramarine blue, with an almost metallic lustre; the lower parts are reddish orange spotted with black; the tail is brown, its feathers short and pointed.—The B. is a bird of extremely rapid and well-sustained flight. The flocks of the B. are sometimes so numerous and so closely crowded together on the muddy marshes near New Orleans, that Audubon mentions having seen 84 killed by the simultaneous discharge of the two barrels of a double-barrelled gun.—There are other species of B., also American; but this alone seems to visit the more northern regions.

**BLUM, ROBERT**, was born in very humble circumstances at Cologne, 10th November 1807. After a brief military service in 1830, he became scene-shifter, afterwards secretary and treasurer, to Ringelhardt, director of a theatre at Cologne, and subsequently at Leipzig, in which situation he remained, devoting his leisure time to literature and politics until 1847, when he established himself as bookseller and publisher. In 1840, he founded at Leipzig the *Schillers-Verein*, i. e., Schiller's Society, which celebrated the poet's anniversary, as a festival in honour of political liberty. In 1845 he acquired, in connection with the German Catholic movement and the political outbreak in Leipzig, great reputation as a popular orator; and in 1848, was elected vice-president of the provisional parliament at Frankfort, and as such he ruled that turbulent assembly by presence of mind and a stentorian voice. In the National Assembly he became leader of the Left; and was one of the bearers of a congratulatory address from the Left to the people of Vienna, when they rose in October. At Vienna he joined the insurgents, was arrested, and shot on the 9th November. B. was a man of strong character, of great natural intelligence, and a speaker of stirring eloquence. For heading a party, he possessed cleverness and ambition enough, but he had not that passion and fanaticism which scorns to consider

the consequences likely to flow from unbridled popular licence. The news of his execution caused an indignant outcry among the democrats in Germany, who, besides instituting commemorations for the dead, made an ample subscription for his widow and children.

**BLUMENBACH, JOHANN FRIEDRICH**, a very eminent naturalist, was born at Gotha, 11th May 1752. He studied at Jena and Göttingen, in the latter of which universities he became extraordinary professor in 1776, and ordinary professor in 1778. Here he lectured for fifty years on natural history, comparative anatomy, physiology, and the history of medicine. In 1785, consequently before Cuvier, he made natural history dependent on comparative anatomy. His *Manual of Comparative Anatomy and Physiology* has been translated into almost all the principal languages of Europe. The natural history of man was always his favourite study; and his *Collectio Craniorum Diversarum Gentium*, commenced in 1791, and completed in 1808, gave to the learned world the result of his observations on the skulls of different races, of which he had an extensive collection (see ETHNOLOGY). He published many other works on natural history, all of which were favourably received; for, both as a writer and a lecturer, he was eminently successful. His *Manual of Natural History*, indeed, has gone through 12 editions. Towards the end of the 18th c., he visited England, where he met with a distinguished reception from the most famous naturalists. On the 19th September 1825, his friends celebrated the jubilee of his doctorate, presented him on the occasion with a medal struck on purpose, and founded an exhibition in his name, the proceeds of which were to assist young physicians and naturalists in the prosecution of their researches by travel. In 1835, the increasing infirmities of age compelled him to resign his academical functions. He died on the 22d January 1840.

**BLU'NDERBUSS** is a kind of short musket with a very wide bore, sufficient to take in several shot or bullets at once. It has a limited range, but is very destructive at close quarters. As a military weapon, it is chiefly of service in defending passages, door-ways, staircases, &c. Some of the English and German troopers in the 17th c. were armed with the B.; but the carbine has since superseded this weapon.

**BLUSHING**, a sudden reddening of the face, neck, and breast, owing to some mental shock, most commonly of the character of humiliation or shame. The nature and cause of this effect have been recently elucidated by physiological researches. It is produced by an increased flow of blood into the capillary vessels over the parts where the blush extends. Besides reddening the complexion, it creates a sensible augmentation of heat in those parts. The feeling that accompanies the state is of a distressing kind.

The phenomenon of B. is part of a general influence exerted on the capillary circulation by mental causes operating through the brain. The experiments whereby the existence of this influence has been established, may be described as follows: The *small blood-vessels*, by which the blood is brought into proximity with the various tissues of the body, are kept in a state of balanced distension between two forces: the one the propulsive power of the heart's action, which fills and distends them; the other, an influence derived from the nervous centres, and acting upon the muscular fibres so as to contract the vessels. The first of the two forces—the agency of the heart—is quite well

understood: it is simply like the case of distending the hose of a fire-engine by working the pump, and driving the water along. The counteracting force of the nerve-centres is proved by the following experiments: When the sympathetic nerve proceeding to the vessels of the head and face of an animal is cut, there follows congestion of the blood-vessels with augmented heat over the whole surface supplied by the nerve. The ear is seen to become redder; a thermometer inserted in the nostril shews an increase of temperature, the sign of a greater quantity of blood flowing into the capillaries. The inference from the experiment is, that, from the withdrawal of a counterpoise, the force that *distends* the small blood-vessels—that is to say, the heart's action—has an unusual predominance. It is further proved that this nervous influence, acting upon the minute muscular fibres of the small vessels, proceeds from the nerve-centres lodged in the head, for, by cutting the connection between the brain and the ganglion in the neck, from which the above-mentioned nerve is derived, the same restraining influence is arrested, and the congestion takes place. By stimulating the divided nerve galvanically, the suffusion disappears, the vessels shrinking by the galvanic contraction of their muscular coats.

The agency now described is of a piece with the action of the brain upon involuntary muscles generally, as the heart and the intestinal canal, and by it many organic functions—digestion, nutrition, absorption, &c.—are affected by those changes in the cerebral substance that accompany mental states. It is known that mental excitement has an immediate influence in all those functions; one set of passions, such as fear, tend to derange them, while joy and exhilaration operate favourably upon them.

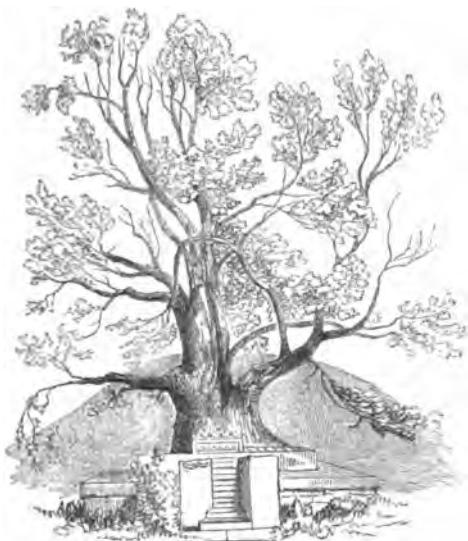

To apply these observations to the case in hand. Supposing a person in the average mental condition, and something to arise which gives a painful shock to the feelings—a piece of ill news, a reproach from some one whose good opinion is much valued, an open shame, or the fear of it, a fit of remorse, an occasion of grief—the pain is accompanied with a sudden loss, or waste, or decrease of cerebral power; none of the functions that the brain aids in maintaining is so strongly stimulated as before; and in particular, that stream of nervous energy which balances the heart's action in regulating the distension of the small blood-vessels, is abated, the abatement being made apparent in the redness and heat over the face and neck. In a great stroke of mental depression, the influence is of a much more extensive kind, though still of the same nature essentially as regards the enfeeblement of the nervous energy, and may lower the action of the heart itself: in which case there will be a widespread pallor, perhaps without a blush. In all probability, it is when the loss of cerebral influence extends only to the relaxation of the muscular fibres of the small vessels, leaving the heart in its usual vigour, that the state of B. is most fully manifested. Hence it is more apt to arise out of the smaller modes of painful apprehension, than from the more serious calamities that prostrate the system throughout.

It is said that, in the Circassian slave-market, a young woman that blushes fetches a higher price. Some complexions do not shew the increased flow of blood in this way, and all persons are not equally sensitive to the cerebral shock that causes it.

**BO TREE**, the name given in Ceylon to the **PEPUL** (q. v.) of India (*Ficus religiosa*). It is held sacred by the Buddhists, and planted close by every temple, attracting almost as much veneration as the statue of Buddha itself.—The B. T. of the

## BO TREE—BOA.

sacred city Anarajapoora, is in all probability the oldest tree in the world, of which the age can

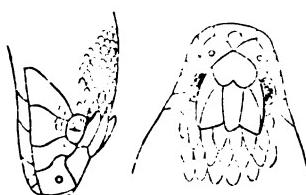

Bo Tree.

From a Drawing in Tennent's work on Ceylon.

be ascertained by historical evidence. It was planted in 288 B. C., and is therefore now (in 1860) 2148 years old. Sir James Emerson Tennent, in his work on Ceylon, gives reasons for believing that the tree is really of this wonderful age, and refers to historic documents in which it is mentioned at different dates, as 182 A. D., 223 A. D., and so on to the present day. This tree is invested, in the estimation of the Buddhists, with wonderful sanctity. 'To it,' says Sir James, 'kings have even dedicated their dominions in testimony of their belief that it is a branch of the identical fig-tree under which Gotama Buddha reclined at Uruvelaya when he underwent his apotheosis.' Its leaves are carried away as treasures by pilgrims; but it is too sacred to be touched with a knife, and therefore they are only gathered when they fall.

BO'A, in popular language, the name of all those large serpents which kill their prey by entwining themselves around it, and constricting it in their coils; but by zoologists of the present day, limited as the name of a genus to a very small portion of their number, all of which are natives of the warm parts of America—the similar large serpents of Asia and Africa forming the genus *Python* (q. v.). The name *B.*, however, was certainly not originally applied to American serpents, for it is used by Pliny, who accounts for its origin by a fable of serpents sucking the milk of cows, thus referring it, very improbably, to the Latin *boe*, an ox. The Linnaean genus *B.* comprehended all serpents having simple subcaudal plates, but without spur or rattle at the end of the tail, and was thus very artificial, as founded chiefly upon a single unimportant character, and consisted of a very miscellaneous assemblage of species, venomous and non-venomous. The *B.* family, or *Boidae*, as now constituted (containing the *Pythons*, &c., of the old world, as well as the true *Boas* of the new), is almost exclusively confined to tropical climates, and all

the species are of large size and great strength, some of them far exceeding in these respects all other serpents. The story related by the ancients of a serpent 120 feet in length, which devoured several soldiers, and caused alarm to a Roman army in Africa, may perhaps be deemed unworthy of credit, although the skin is said to have been long preserved at Rome; but there is good reason to believe that serpents in more modern times have attained at least half this length, and have made even the larger mammalia, and sometimes man, their prey. The *Boidae* are not venomous; but their mouth, although destitute of poison-fangs, is so furnished with teeth as to make their bite very severe. Their teeth are numerous, long, and directed backwards, so as the more effectually to prevent the escape of the prey, which is first seized by the mouth, and then the serpent, with a rapidity of

Head of Boa.

motion which the eye of the closest observer fails perfectly to follow, coils itself around it; the powerful muscles of the body are afterwards brought into action to compress it, so that usually in a few minutes its life is extinct, and its bones are broken. Deglutition then takes place—not, as has been alleged, after the prey has been licked and covered with saliva by the tongue, but accompanied with an extraordinary flow of saliva, which seems not only to serve for lubrication, but to have the property of hastening the decomposition of animal substances, and so to assist in making the prey more easy to be swallowed. It is always swallowed entire, and the process is sometimes rather a tedious one, and seems to require no small muscular effort; but the muscles of the serpent are capable of acting for this purpose, even at the neck, when that usually narrowest part of the body is distended to an enormous degree as the prey passes through it. The lower jaw is not simply articulated to the skull, but by the intervention of other bones, a structure without which the prodigious dilatation of the throat would be impossible. The lungs consist of two lobes, one much larger than the other, and at the extremity of the larger is an extremely capacious air-bag, which is supposed to serve for the necessary aeration of the blood whilst respiration is impeded in the process of deglutition.

The tail in all the *Boidae* has great prehensile power, and its grasp of a tree round which it may be coiled is aided by the opposing action of two claws, one on each side of the anus, which are really the representatives of the hinder limbs of the superior vertebrate animals, and which, on dissection, are found to be connected not only with strong muscles, but with bones entirely concealed within the serpent, one jointed to another, so as to make the character of a rudimentary limb very apparent. These serpents, being almost all inhabitants of watery places, often lie in wait for animals that come to drink; thus the largest of the American species, *Boa (Eunectes) murina*—sometimes called *Anaconda*,

Claw of Boa.

## BOADICEA—BOARD OF ADMIRALTY.

although Anaconda seems to be originally, like B., the name of a serpent of the old world—is to be found where rivers or narrow lagoons are overshadowed by gloomy forests. Perhaps the want of sufficient supplies of water, more than the greater cold of the climate, may account for the short time that specimens of the Boidae brought to Europe have generally lived in confinement.

After a repast, these serpents spend a considerable time in a state of comparative torpidity—several weeks generally elapsing before they waken up to require a new supply—and in this lethargic state they are easily killed. When they do waken up, the demands of appetite seem to be very urgent. Many of our readers must still remember the interest excited some years ago concerning a B. in the London Zoological Gardens, which, to the astonishment of its keepers, swallowed its rug; but this, after a trial of a week or two, it found indigestible, and the animal then gratified public curiosity by a reversal of the process of deglutition.

The head in the *Boidae* is thick, yet somewhat elongated; the eyes are small; the body is thickest in the middle; the tail usually has a blunt termination. The scales are numerous and rather small. The colours are various, and in many of the species rather bright and elegantly disposed. The true boas have the plates underneath the tail single, whilst in the pythons they are double. The species to which the name *Boa Constrictor* is appropriated, is far from being one of the largest, seldom attaining a length of more than twelve feet. It is common in Surinam and Brazil, where its skin is used for making boots and saddle-cloths. The name *Boa Constrictor* is, however, popularly extended to almost any of the species.—The number of species, whether in the genus or in the family, is far from being well ascertained.

Boas are much infested by intestinal worms, which appear often to cause their death. The excrement of the B.—the urine and faeces being combined as in other reptiles, and voided by a single vent—is a solid white substance, and consists mainly of urate of ammonia, accompanied by phosphate of lime (bone-earth). It is employed as an easy source of uric acid.

BOADICE'A, a warrior-queen of the Iceni, a tribe inhabiting the eastern coast of Britain, in the time of the Romans. She flourished after the middle of the 1st century. Prasutagus, her husband, who died A. D. 60, or 61, had left his wealth jointly to the Roman Emperor Nero, and to his two daughters, hoping that by this sacrifice his kingdom would be protected from oppression; but the Roman soldiery, taking advantage of the defenceless condition of the country, began to plunder unscrupulously. B. herself was scourged, her daughters were violated, and the noblest among the Iceni were treated as slaves. These outrages soon drove the Britons to revenge. B. gathered round her a large army; attacked and captured the Roman colony of Camulodunum; defeated Petilius Cerialis, legate of the ninth legion, who was marching to its relief; took Londinium and Verulamium; and destroyed, it is said, somewhere about 70,000 Romans, many of them by torture. Suetonius, the Roman governor of Britain, now advanced at the head of 10,000 men against B., who, we are informed, had under her command no less than 263,000. A dreadful battle ensued (62 A. D.), in which, according to Tacitus, 80,000 Britons perished, and only 400 Romans. These figures, of course, cannot be trusted; but the victory must have been decisive, as it finally established the authority of the Romans in Britain. B., overwhelmed with despair, committed suicide.

BOARD, the general name applied to persons in

their collective capacity, who have the management of some public office or department, bank, railway, charity, or, indeed, of any other trust. Thus, the Commissioners of Customs, when met for the transaction of business, are called the B. of Customs; the Lords of the Treasury, the B. of Treasury; Commissioners of Excise, B. of Excise; directors of railways, B. of Directors; poor-law guardians, B. of Guardians, &c. See CUSTOMS, TREASURY, &c.

BOARD, BOARDING. In nautical language, board is used with many significations. Besides its ordinary application to a plank of wood, B. is a space or portion of sea over which a ship passes in tacking; hence the phrases, ‘to make a good board,’ ‘to make short boards,’ ‘to make a stern-board,’ ‘to leave the land on back-board,’ &c.—all of which refer to the direction of a ship’s movement at a particular time and place. Again, board or aboard relates to the interior of the ship, in such phrases as ‘to go aboard,’ ‘to heave overboard,’ &c.

But the most important of these meanings is that which relates to the boarding of an enemy’s ship, or making a forcible entry for the sake of capturing it. Whenever this bold operation is determined on, certain seamen are told off to act as boarders. It is very rarely that, between two men-of-war, this operation is ventured on; it would, in most cases, be too perilous to the assailants, who more frequently conquer by cannon and musketry. Boarding is, in most instances, attempted by privateers against merchantmen, where the defenders are few in number. The assailant well considers all the circumstances for and against him—the relative sizes of the two vessels, the relative strength of the crews, the state of the wind and sea, and the chances of escape if foiled. Besides the pistols, cutlasses, and boarding-pikes of the seamen, there are provided powder-flasks for producing smoke and confusion on the enemy’s deck, and shells called stink-pots, for producing an intolerable stench. The moment and the spot being selected, the fuses of the flasks and stink-pots are lighted; these combustibles are thrown upon the enemy’s deck; and while the fire, smoke, and stench are doing their work by confusing the enemy, the boarders climb on board, and gain a mastery by their personal prowess—that is, if the calculations of relative strength have been duly made. Sometimes terrible hand-to-hand encounters take place on deck before victory decides for or against the assailants.

General Sir Howard Douglas, in his able work on ‘Warfare with Steam,’ expresses an opinion that steam war-ships are likely sometimes to come to close quarters; and that, on that account, they should be provided with a larger quota of marines and of boarding-implements than have hitherto been supplied to sailing ships. The defenders, he adds, should construct loopholed barricades across the terminations of the quarter-deck and the forecastle, to prolong the defence within board. The French naval officers, it is known, look forward to a great increase in all such military resources on board war-steamer; and Sir Howard endeavours to impress similar convictions on the English authorities.

BOARD OF ADMIRALTY, a government department which has the management of all matters concerning the British navy. In the article ADMIRAL, the steps are noticed by which the duties of the Lord High Admiral, in former days, were transferred to a Board of Commissioners. The constitution and functions of this body will now be described.

The B. of A. comprises five lords commissioners, who decide collectively on all important questions. Besides this collective or corporate action, each has

## BOARD OF ORDNANCE—BOAR'S HEAD.

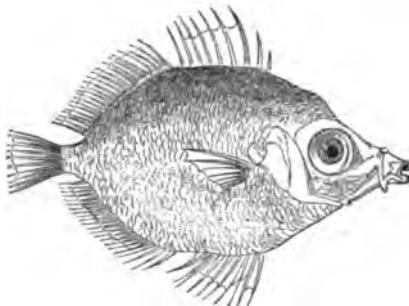

special duties assigned to him. There are two civil or political lords, and three naval or sea lords. The first lord, who is always a cabinet minister, besides a general control, has the management of naval estimates, finance, political affairs, slave-trade prevention, appointments, and promotions. The first naval lord manages the composition and distribution of the fleet, naval discipline, appointment of inferior officers, commissioning ships, general instructions, sailing orders, and the naval reserve. The second naval lord attends to armaments, manning the navy, the coast-guard, the marines, marine artillery, and naval apprentices. The third naval lord has control over the purchase and disposal of stores, victualling-ships, navy medical affairs, transports, convicts, and pensioners. The junior civil lord attends to accounts, mail-packets, Greenwich Hospital, naval chaplains, and schools. Naval architecture, the building and repairing of ships, steam-machinery, and new inventions are superintended by the controller of the navy, who is not a member of the Board, but is directly responsible to the first lord. Under the lords are the first secretary (parliamentary), the second secretary (permanent), and the naval secretary (professional), who manage the daily office work. The lords all resign when the prime minister resigns, and those who have seats in parliament are replaced by others. This change gives rise to many evils. There is likely to be a change of views and of system: the new Board is not bound to act on the plans of its predecessors; and many of the costly novelties in the navy within the last ten years are directly traceable to this cause. The system is defended on the plea that these changes infuse new blood into the Admiralty, and give fair-play to increased knowledge and new plans. Some statesmen advocate a modified plan: proposing to render a few naval officers of rank permanent lords of the Admiralty, and only changing the others on a change of ministry. A connecting-link between the old and new Boards is the controller of the navy, who is a permanent officer. The secretaries and the lords determine which letters ought to be submitted to the Board collectively; and that portion of the correspondence is treated as in most boards and committees. All delicate or doubtful matters are specially reserved for the first lord; but in the Board meetings he has only one vote, like the rest, though, from his general parliamentary responsibility, he has practically at once an absolute veto and an absolute power of giving action to his views. The Admiralty offices are at Whitehall and Spring Gardens, close adjoining.

BOARD OF ORDNANCE, a government department formerly having the management of all affairs relating to the artillery and engineering corps, and to the *materiel* of the British army. Under this precise designation, the Board no longer exists; a change having been made which requires brief explanation. The Board existed from the time of Henry VIII until 1855, when it was abolished, its functions being vested in the Secretary of State for War as regarded *materiel*, and in the commander-in-chief as concerned the military command of the artillery and engineers. The B. of O., until 1854, comprised the master-general of the Ordnance, the surveyor-general, the clerk of the Ordnance, and the principal storekeeper, all of whom were usually members of parliament. There was no chairman at the meetings, and the Board often consisted of only one officer. The master-general had a veto, and was in that respect more powerful than the chief member of the Board of Admiralty; although, not having necessarily a seat in the cabinet, he had less political power. The Board days were thrice a week; and each of the

four members had control over certain departments—the patronage of which was generally vested in him. Scarcely any improvements were made from 1828 till 1854, and the general arrangements were very defective. Of the four members, the master-general had a sort of general authority and veto; the surveyor-general had control over the artillery, engineers, sappers and miners, ordnance medical corps, contracts, laboratory, gunpowder, barracks, and navy gunners; the clerk of the Ordnance managed the estimates, money-arrangements, civil establishment, pensions, superannuations, and Ordnance property; while the principal storekeeper had charge of stores, store-rooms, naval equipments, and naval war-stores. In matters relating to coast-defences, it was often difficult to decide between the Admiralty and the Ordnance, each Board claiming authority. When the Crimean disasters took place in 1854, the defects of the B. of O. became fully apparent: it could not work harmoniously with the other government departments. The Board was dissolved, and the office of master-general abolished. By the War-office Act of 1870, the post of surveyor-general of the Ordnance was revived as one of the principal officers of the Secretary of State for War. He is responsible for the *materiel* and supplies of the army.

### BOARD OF TRADE. See TRADE, BOARD OF.

BOA'R-FISH (*Capros*), a genus of fishes of the Dory (q. v.) family, or *Zetida*, differing from the genus *Zeus*, or Dory, in the still more protractile mouth—the resemblance of which to the snout of a hog is supposed to have given origin to the name—in the want of spines at the base of the dorsal

Boar-Fish (*C. Aper*).

and anal fins, and of long filaments to the dorsal spines. The body has the usual oval, much compressed form of the family. The common B. (*C. Aper*) is a well-known inhabitant of the Mediterranean, rarely caught on the coasts of England. The eyes are very large, and placed far forward; the body is of a carmine colour, lighter below, and with seven transverse orange bands on the back. The flesh is little esteemed.

BOAR'S HEAD. The B. H. is the subject of a variety of legends, poetic allusions, and carols connected with the festivities of Christmas in England. At this wintry season, the wild boar was hunted, and his head served up as the most important dish on the baronial table. According to Scott's graphic lines:

Then was brought in the lusty brawn  
By blue-coated serving-man;  
Then the grim boar's head frowned on high,  
Crested with bay and rosemary.  
Well can the green-garbed ranger tell,  
How, when, and where the monster fell;  
What dogs before his death he tore,  
And all the baiting of the boar.

## BOAST—BOATING.

Referring to the article CHRISTMAS for a notice of some of the observances on this occasion, we need here only say, that in the 'boar's-head carols' are found some of the most interesting specimens of the old English convivial verses. The following, from a carol printed by Wynkin de Worde (1521), may be given :

*Caput Apri deferō  
Readdens laudes Domino.*

The boar's head in hand bring I,  
With garland gay and rosemary;  
I pray you all sing merrily  
*Qui estis in convivio.*

The boar's head, I understand,  
Is the chief service in this land;  
Look wherever it be found,  
*Servite cum canticō.*

The boar's head 'erased,' according to heraldic phraseology, is a well-known cognizance of a number of old families, particularly the Gordons; it also formed the sign of a tavern at Eastcheap, London, which has been immortalised by Shakespeare. On the site of this famed tavern now stands the statue of William IV.

**BOAST** (Fr. *Ebaucher*), a word in use with sculptors. To B., as its French original implies, is to block out a piece of stone or wood, so as to form a rude approach to the ultimate figure, leaving the smaller details to be worked out afterwards. Ornamental portions of buildings are often inserted in their places in this condition, and frequently remain so if they are in an obscure position.

**BOAT** is the general name for a small open vessel. Boats differ, however, greatly one from another. They may be slight or strong, sharp or flat-bottomed, decked or undecked, swift for despatch or roomy for cargo, ornamental for pleasure or plain for hard service, deep or light of draught for deep or shallow water. The chief varieties supplied to ships of war are the following—*Long-B.*: the largest B. of a ship, furnished with mast and sails; it is either armed and equipped, to render warlike service in certain situations, or it is employed to fetch water, wood, provisions, and heavy stores on board. *Launch*: longer and more flat-bottomed than the long-B.; being rowed with a greater number of oars, it makes more rapid progress up rivers. *Barge*: a long, narrow, light B., employed in carrying the principal officers to and from the ship; for other kinds of boats or vessels under this name, see **BARGE**. *Pinnace*: a B. for the accommodation of the inferior officers; it has usually eight oars, whereas the barge has ten or more. *Cutter*: broader, deeper, and shorter than the barge or pinnace; it is rowed with six oars, sometimes hoisting a sail, and is chiefly employed in carrying light stores, provisions, and crew. *Jolly-B.*: a smaller cutter, rowed with four oars instead of six. *Yawl*: small in size, and used for nearly the same purposes as cutters and jolly-boats. *Gig*: a long narrow B., rowed with six or eight oars, and employed by the chief officer on expeditions requiring speed. Some of the above-named boats are diagonal-built for strength; the others are clincher-built, to be as light as possible. The largest ships of war carry boats of all these various kinds, varying in weight from 110 cwt. down to 10 cwt.; the smaller ships carry fewer; while merchant-ships have seldom more than three—except passenger-ships, which are bound by law to carry boats enough to save all the passengers and crew in case of disaster. There are other kinds of boats which do not belong to ships. See **BOATING**.

In reference to the legal regulation of boats in the merchant-service, the following are the chief

provisions : When a B. belongs to any ship or other vessel, the name of the vessel and of the place to which she belongs must be painted on the outside of the stern of the B., and the master's name within side the transom—the letters to be white or yellow on a black ground. Boats not belonging to ships or other vessels must be inscribed with the name of the owners and the port to which they belong. All boats having double sides or bottoms, or any secret places adapted for the concealment of goods, are liable to forfeiture.

The boats intended for the rescue of shipwrecked persons, or crews and passengers exposed to that danger, are described under **LIVE-BOAT**.

**BOAT-FLY** (*Notonecta*), a genus of insects of the order *Hemiptera* (q. v.), suborder, *Heteroptera*, and of the family of the *Hydrocorixæ*, or Water-bugs (q. v.). All of them, like the rest of the family, are aquatic insects. Their English name is derived from their boat-like form, eminently adapted for progression in water, and probably also from their remarkable habit of always swimming on their back—peculiar to the genus *Notonecta*, as restricted by recent entomologists—and of resting in this posture suspended at the surface of the water. The known species of this genus are not numerous. One of them, *N. glauca* (sometimes called the *Water Boatman*), is common in Britain : it is about half an inch long, and varies considerably in colour; but exhibits a general greenish tinge, the other colours being black, brown, and gray. They fly well, but seldom use their wings. They move with difficulty on dry ground. When they descend into the water, they carry down a supply of air for respiration in a hollow between their folded wings. They feed on animal substances, and often kill and devour those of their own species.

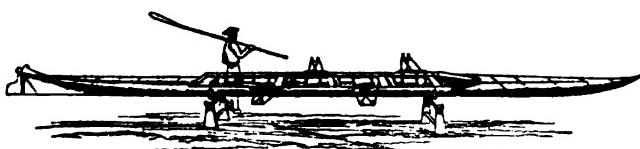

Water Boatman  
(*N. glauca*).

**BOATING**, the art of managing and propelling a boat. This is done either by means of oars or sails. As sailing is fully treated under the head of **YACHTING**, rowing only is dealt with here. The most ancient form of boat known to have been used in the British Islands is the coracle; it is still much used in Wales. The coracle is but a large wicker-work basket, covered with skins, or some thin waterproof substance stretched over the wicker-work, strengthened by a cross seat. Seated in one of these rude boats, with but a single paddle, it is astonishing with what dexterity the paddler will skim over broken water, and avoid dangers which would infallibly destroy a heavier or less manageable craft. From the coracle spring all the varied classes of boats now in use, either as pendants to ships, or as used for pleasure traffic or a means of conveyance upon our rivers and inland waters. The *wherry* next claims attention. There are many kinds of wherries, but we only notice the Thames wherry. This is stoutly built, and is constructed to carry about eight passengers. It is usually managed by one sculler or two oarsmen; it is almost entirely employed by watermen for the conveyance of passengers or pleasure-parties. The boats used for rowing as a sport or pastime are of a much lighter and sharper build. They are constructed of all sizes, to carry from twelve oarsmen down to a single sculler. Of this class of boats, for racing purposes, we have the 8, 6, 4, 2, and single pair oared boats; while in contests between single scullers, we have what is denominated the *wager-boat*—a boat so frail and light in its proportions, that none but a most experienced sculler can sit in one without danger of upsetting. For pleasure, we have another class of

## BOATING—BOAT-LOWERING APPARATUS.

boats denominated *gigs*, of stouter and more capacious build; they are constructed either for four oars, a pair of oars, or single sculls. Boat-racing is a practice of some antiquity, but it has only culminated in our day. Many prizes have been given from time to time for competition, some of which have been made annual. Perhaps the most famous of all these is Doggett's coat and badge, which is rowed for yearly on the Thames by water-

men's apprentices, on the 1st of August. But the events of most note in the rowing world are the Oxford and Cambridge 8-oared match, rowed annually upon the Thames, from Putney to Mortlake. This match has not been a regular yearly match, there having been occasional intervals at times of a year or two. In 1829, 1842, 1849, 1852, 1854, 1857, and 1859, and from 1861 to 1869 inclusive, the Oxford boat carried off the prize; Cambridge hav-

Four-oared Racing-boat.

ing wrested it from Oxford in the years 1836, 1839, 1840, 1841, 1845, 1846, 1849, 1856, 1858, 1860, 1870, 1871, 1872, and 1873. Thirty matches have come off in 45 years, the balance being on the side of Oxford. It will be noticed that two matches were rowed in 1849. The best picked men from each university are selected to contest this great event, and the hardest exercise and the severest training gone through by the crews, to improve their wind, strength, and endurance, for months before the day of rowing; their diet consisting mainly of the plainest cooked lean meat and potatoes, with malt liquors, spirituous drinks being prohibited, and the duties of temperance, soberness, and chastity strictly enforced. It was at one time thought that light men stood the best chance in these matches, but experience has shewn this to be an error, and ten, eleven, and twelve stone men are now chiefly selected. The distance rowed upon this course is  $4\frac{1}{2}$  miles. The time chosen is usually at slack-tide, and the time taken in rowing varies according as there is little or no tide or wind, or the reverse, from 18 to 26 minutes. The introduction of sliding-seats has added very greatly to the power of the rower by lengthening the stroke. The sliding-seat is a small piece of board on which the rower sits, and which works on rollers, and slides backwards and forwards as the rower makes his stroke. From 36 to 44 strokes of the oar per minute is held to be fair racing-pace; and a long steady even stroke—the blade of the oar not being dipped too deeply in the water, or thrown too high above the surface when withdrawn, the arms being well extended in taking the stroke, and the elbows brought well home to the sides at the conclusion—is the kind of stroke now preferred by connoisseurs. The other great events of the boat-racing world are the regattas of Henley and Putney. At the former, the Oxford and Cambridge crews usually fight their battle over again in conjunction with others, for the challenge-cup; and at these also many scullers' matches are rowed, though single scullers' races for the championship of the Thames, &c., are usually events of themselves. Campbell was one of the first sculling champions, beating Williams in 1831. He was beaten by Robert Coombes in 1846, who held the championship for about six years. He at length succumbed to the prowess of Cole in 1852. Cole, in 1854, was beaten by Messenger; Messenger yielded the palm to Kelly in 1856; and Kelly was, in 1859, beaten by Robert Chambers, the champion of the Tyne. In 1865, Kelly recovered his laurels, and beat Chambers. In 1867, he beat him also on the Tyne; and in 1868 he had in turn to yield to Renforth, having been champion off and on for twelve years, a long while for a rowing-man to remain in his

prime. So much is B. favoured at our universities and schools, that almost every college has its club.

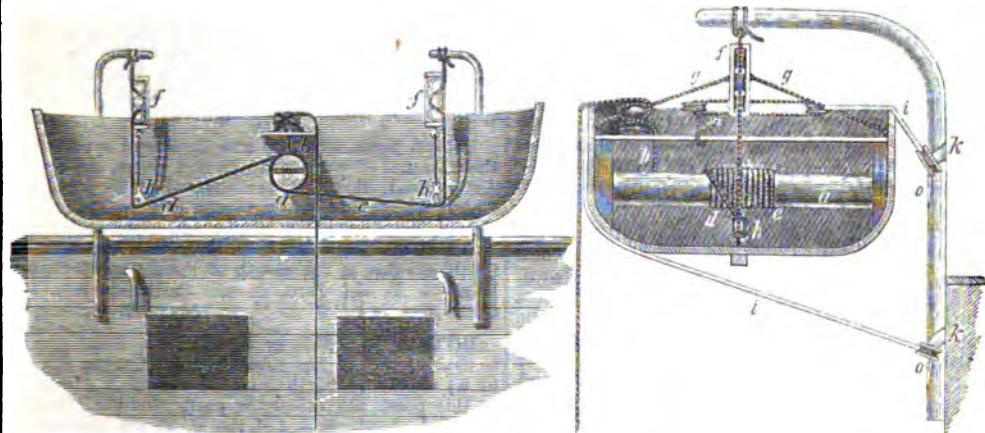

**BOAT-LOWERING APPARATUS** is the name given to certain ropes and pulleys for lowering boats from ships quickly and safely, in case of emergency. Every passenger-ship is compelled by law to carry a certain number of boats, depending on the tonnage; and every ship of war necessarily carries boats (see BOAT) for minor services; but until recent years the apparatus was very inefficient for lowering these boats from the davits or cranes by which they are usually suspended. In shipwreck or other emergencies at sea, the boats were, until recent years, often so difficult to extricate that they could not be lowered in time to save the crew and passengers; or in lowering they capsized, and plunged the unhappy persons into the sea. Many inventors have recently directed their ingenuity to this subject, with a hope of devising a remedy. In Lacon's apparatus, the principal feature is the employment of a friction-brake, by which one man can regulate the rate of descent to varying degrees of speed. Captain Kynaston's *disengaging hooks* are intended not only to lower boats quickly and safely when suspended over the side of the ship, but also to hoist them out quickly when they happen to be stowed in-board. Wood and Rogers's apparatus resembles Kynaston's in this: that the actual lowering from the ship is effected by the crew on shipboard, leaving to the person or persons in the boat only the duty of disengaging it from the tackle. But the apparatus which now engages most attention is Clifford's, the leading principle of which is, that the lowering and the disengaging are both effected by one man seated in the boat. Two ropes or lowering pendants, *c* and *d* (see fig.), descend from two davits; pass through blocks or sheaves, *f*; then through other blocks, *a*, within and near the keel of the boat; and finally, round a roller, *a*, placed horizontally beneath the seat on which the manager of the boat takes his place. By means of a winding-rope, *b*, held in one hand, he can regulate the speed with which the other two ropes uncoil themselves from the roller, thus graduating the boat's descent to the water's level. When lowered, the two ropes can be thrown off and the boat set free. The slings or lifts, *g*, are intended to prevent the canting or upsetting of the boat. The lanyard, *m*, belongs to the lashings, *i*, which hold the boat to the side of the ship; but by the thimbles, *k*, slipping off the prongs, *o*, the boat is liberated. The efficiency of the apparatus is most remarkable. In 1856, by order of the Admiralty, experiments were made with the starboard-cutters of H.M.S. *Princess Royal*. Twelve men got into the boat while it was hanging

## BOATSWAIN—BOBBINS.

from the davits ; it weighed, with the crew and the gear, nearly three tons ; nevertheless, this cutter, thus laden, was successfully and quickly lowered by one of the twelve men, to a depth of 40 feet from

the davits to the water. Many other experiments of similar kind were made. Clifford's apparatus is now supplied to many ships of war and merchant vessels ; and many lives have been saved by its

CLIFFORD'S BOAT-LOWERING APPARATUS.

Longitudinal section of Boat.

Transverse section of Boat.

means, under circumstances which would almost certainly have proved fatal under the old mode of lowering boats from the davits.

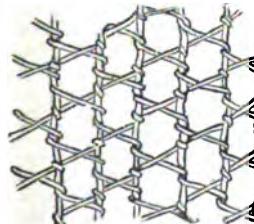

Other systems have since been partially adopted ; but none has yet been found which is wholly satisfactory to naval men.

**BOATSWAIN** is a warrant-officer on board her Majesty's ships, who has charge of the boats, sails, rigging, cables, anchors, flags, and cordage. He is immediately under the master in some of these duties ; he frequently examines the masts and yards, sails and ropes, to report on their condition and efficiency. He also keeps account of all the spare rigging, &c., and superintends the replacement of old by new. The B. has certain duties in connection with the crew : he assists in the necessary business of the ship, and in relieving the watch. In bad weather, he looks well to the boats and anchors, especially when night is coming on. A B. should be a good sailor, a good rigger, and a vigilant, sober, firm man.

The *boatswain's mate* assists in all the above-named duties ; and to him is assigned the repulsive, though now, happily, very rare, office of inflicting the flogging awarded to very serious offences.

**BO'BIN-NET** is the name of a kind of net-fabric, usually made of cotton-thread. It is of the

nature of lace, but is made in the lace-frame instead of by hand. The texture is peculiar : it consists in the interlacing of a set of long threads, representing the warp in common weaving, with a set of cross ones (the weft), in such a manner as to form a mesh-texture. B. is one of the most elegant of

Bobbin-net texture.

textile fabrics, and forms an extensive branch of business, the chief seat of the manufacture in this country being Nottingham. See LACE MANUFACTURE.

**BO'BINS** are small wooden rollers, flanged at

the ends, and bored through the centre lengthwise, so that they can be placed on a spindle or skewer. The bobbin on which ordinary sewing-thread is wound, although generally of small size, is a good example of their prevailing shape. One or two kinds are, however, of a different type ; thus the bobbin, called in Scotland *pirl*, for delivering the weft from the shuttle, is simply a tapered pin, bored, it may be, throughout, with but the rudiments of a flange at the thick end ; and the bobbin used for a similar purpose in lace-weaving, is merely a thin metal pulley, about the size of a halfpenny. For the machines used in the various spinning processes of the textile industries—namely, the slubbing, the roving, the drawing, and spinning frames, bobbins of various sizes, and in enormous numbers, are required. Some of these are 15 inches long by 5 inches in diameter, and diminish in size for each succeeding process, those for the spun-yarn being scarcely larger than a good-sized thread-bobbin. There are also winding and warping bobbins for the weaving processes. For some purposes paper tubes have of late years superseded bobbins.

We are so familiar with the neat and convenient thread-bobbin, now seen in every house, that we are apt to think it a very old invention. Yet people are still living who can remember when all the sewing-thread used for domestic purposes was wound in the form of balls.

In the making of thread-bobbins, ingenious automatic machinery is now employed. Transverse slices of common birch, the wood chiefly used for these, are first cut to the length of the bobbins. From each of these a number of circular bobbin blanks are next cut out by an annular saw, a hole being drilled through the centre of each at the same time. These blanks are then fed into a self-acting turning-machine, operating with a compound cutting tool, whose form is the reverse of the profile of the bobbin. One of these machines produces from 80 to 100 gross of bobbins per day, while an expert hand-turner could not produce more than eight gross in the same time. As most of the bobbins required for spinning purposes are larger than those required for thread, they are made by turning the barrels and

ends separately, and then gluing them together, in order to save wood.

Bobbins are made of various kinds of wood, but principally of birch, beech, ash, and plane tree. Sometimes two kinds are used in the same bobbin; and for some special purposes, bobbins are made entirely of metal, such as iron or tinplate. Of late years, some bobbin manufactories have been erected in the Highlands of Scotland, in neighbourhoods where birch is plentiful. When we consider that there are now about 40 millions of spindles in the spinning-mills of Great Britain, we get some idea of the prodigious number of bobbins constantly wanted to supply the tear and wear of those used in the spinning processes. One or two of the larger bobbin manufacturers in England employ about 300 hands.

BO'BIO, a town in Northern Italy, in the province of Turin, is situated near the left bank of the Trebia, about 37 miles north-east of Genoa. B. is an ancient place, having originated from a church and convent erected here in the end of the 6th, or beginning of the 7th c., in the crypt of which St Columbanus and some of his disciples lie buried. B. has a cathedral, an episcopal palace, and a palace belonging to the Malaspina family. It is guarded from the inundations of the Fellice by a long embankment, built by a money-grant from Oliver Cromwell, during whose protectorate the town was nearly destroyed by an inundation. Pop. about 4000.

BO'BIA, or PIRATE ISLE, a singular island in the Bay of Amboise, off the coast of Guinea, Africa. Originally of considerable size, it has been greatly reduced by the action of the waves, and the same agency is still gradually lessening it. It is difficult of access, on account of the precipitous character of its shores, but is said to be densely peopled.

BO'B-O-LINK, or BO'BLINK, REED BIRD, or RICE BIRD (*Dolichonyx oryzivorus*), a bird nearly allied to buntings and sparrows, but of a genus characterised by stiff-pointed tail-feathers. It is rather larger than a yellow-hammer; and the male in his summer or nuptial plumage exhibits a fine contrast of colours, black, yellow, and white. The female differs greatly from the male in colour of plumage, yellowish-brown chiefly prevailing; and in the latter part of summer, the males assume the comparatively dull hue of the females. The B. is a bird of passage, spending the winter in the West Indies. In summer it is found as far north as the banks of the Saskatchewan, in lat. 54°, but is most plentiful in the Atlantic states and other eastern parts of America, where it is to be seen in every meadow and cornfield. It renders good service by the destruction of insects and their larvae; but the immense flocks which congregate on their return southwards in autumn, commit great ravages in the rice-plantations of Carolina. At this season, these birds become extremely fat, and are killed in great numbers for the table. Their flesh is delicate, and resembles that of the ortolan.

The B. generally makes its nest in a grassy meadow, an artless structure of a few dry stalks and leaves, with a lining of finer grass. It displays the same instinct with many other birds, of seeking to lead intruders away from its nest, by pretending great anxiety about some other part of the field. During the breeding-season, the males are very musical, singing mostly in the air, in which they seem to rise and fall in successive jerks. Their song is very pleasing, and is 'emitted with a volubility bordering on the burlesque.' On account of their beauty and powers of song, many are caught, caged, and sold in the New York and other markets.

BOBRUI'SK, a fortified town of Russia, in the government of Minak, and 88 miles south-east of the city of that name. It is situated on the right bank of the Beresina, and is a station for the steam-packets navigating the Dnieper and Beresina. It was besieged ineffectually by the French in 1812. Pop. (1867) 24,681.

BO'B-STAY, in the rigging of a ship, is a rope used to confine the bowsprit down to the stem or cut-water; its purpose is to keep the bowsprit steady, by counteracting the force of the stays of the foremast, which draw it upwards.

BO'CA (Span. meaning *Mouth*), a term applied to the entrance of various straits and rivers, chiefly in America.—1. B. *Chico*, the channel of 28 miles in length, which leads to Cartagena in New Granada.—2. B. *de Navio*, the largest and most southerly outlet of the Orinoco.—3. B. *Grande*, a bay of the Caribbean Sea, at the mouth of the Zucar, in Costa Rica.—4. B. *del Toro*, on the Caribbean Sea, in Costa Rica, in lat. 9° 20' N., and long. 82° W.

BO'CCHA TI'GRIS, or BOGUE, the name given to that portion of the estuary of the Canton River (q. v.) extending north from lat. 22° 45' N.; south of this point, the estuary is designated the 'Outer Water.' In the centre of the B. T. are the rocky islands of North and South Wantung, while on the east the B. T. has the islands of Anunghoy and Chuenpee, and on the west the Ty-cock-tow island. On these islands are situated the Bogue forts, which have been more than once captured by the British. The last time they were taken was in November 1856, the occasion of quarrel being the refusal of the Chinese to make proper reparation for the capture of a vessel under British protection, but alleged, on the other hand, to be nothing but a smuggling craft, contriving to hide its real character by hoisting the British flag.

BOCCA'CCIO, GIOVANNI, the celebrated author of the *Decameron*, was born in Paris, 1313. He styled himself *Da Certaldo*, and was sometimes named *Il Certaldese* by others, because his family sprang from Certaldo, a village in the Florentine territory. From an early period he displayed an invincible attachment to poetry, which his father attempted in various ways to thwart; but as soon as B. had attained his majority, he commenced to follow vigorously his own inclinations, poetising both in the Italian and Latin tongues, but not with any 'fine issues.' In prose he succeeded far better, developing quickly that airy grace of style which suits so admirably his light and lively tales, and which soon placed him in the highest rank of Italian prose-writers. He studied Dante closely, but did not confine himself to literature properly so called. In 1350, B. formed an intimate friendship with Petrarch, and, following his friend's example, collected many books and copied rare MSS., which he could not afford to buy. It is said that he was the first Italian who ever procured from Greece a copy of the *Iliad* and the *Odyssey*. He also wrote a *Genealogy of the Gods*, in 15 books, which was unquestionably the most comprehensive mythological work that Europe had as yet seen. But not only was B. one of the most learned men of his time, he was also one of the most enlightened in his scholarship. He helped to give a freer direction and a greater expansiveness to knowledge, stimulated his contemporaries to the study of Greek, and wished to substitute the wisdom of antiquity for the unprofitable scholasticism that prevailed.

While in Naples (1341), B. fell passionately in love with a young lady who was generally supposed to

be an illegitimate daughter of King Robert. His passion was returned, and to gratify his mistress, B. wrote *Il Filocofo*, a prose-romance, and afterwards *La Teseide*, the first attempt at romantic epic poetry, and written in *ottava rima*, of which B. may be considered the inventor. In 1342, he returned to Florence, but in 1344, went back to Naples, where he wrote his *Amorosa Fiammetta*, *Il Filostrato*, and *L'Amorosa Visione*. Here also he composed his famous *Decamerone*, to please Joanna, the daughter and successor of King Robert. It consists of 100 stories, ten of which are told each day by seven ladies and three gentlemen, who had fled from Florence during the frightful plague of 1348, to a country villa, and who try to banish fear by abandoning every moment to delicious gaiety. It is impossible to exaggerate the literary merits of the book. In abundance of incident especially, it is almost inexhaustible, though many of the stories are taken from older collections of *Contes et Fabliaux*. It is, however, unfortunately steeped in impurity. B. once more returned to Florence about 1350. He was now honoured with several diplomatic appointments by his fellow-citizens, and subsequently even thought of entering into holy orders as a penance for the immoral life he had previously led. From this artificial course of repentance he was wisely dissuaded by Petrarch, who advised him to be content with changing his conduct. In 1373, B. was appointed Dantean professor at Florence; that is to say, he was to deliver elucidatory lectures on the *Divina Commedia* of the great poet, and zealously devoted himself to the difficult task thus imposed on him; but his health failing, he resigned the office, and retired to his little property at Certaldo, where he died, December 21, 1375, 16 months after his friend Petrarch. Besides those works we have already mentioned, B. wrote *Origine, Vita e Costumi di Dante Alighieri*, and *Commentario sopra la Commedia di Dante*. This commentary on the Divine Comedy extends only to the 17th canto of the *Inferno*. In Latin, B. wrote, beside the *Genealogia Deorum*, a work arranged in alphabetical order, *De Montibus, Silvis, Fontibus, Lacubus, Fluminibus, &c.*; *De Casibus Virorum et Faeminarum Illustrium*; *De Claris Mulieribus, &c.*

**BOCCAGE, MARIE ANNE FIGUER DU**, a French poetess, was born at Rouen, 22d October 1710, and received her education in the monastery of the Assumption at Paris, where her poetic tendencies early developed themselves, though only furtively. She first appeared as an authoress in a small volume of poems, published in 1746; next as an imitator of Milton in her *Paradis Terrestre* (1748); and in 1756, issued her most important work, *La Colombiade*. The letters which she addressed to her sister, Madame Duperron, while travelling through England, Holland, and Italy, are the most interesting things which have fallen from her pen. During her life, she was excessively admired and praised, especially by Voltaire, Fontenelle, and Clairant. She used to be described as *Forma Venus, arte Minerva!* The complimentary poems addressed to her would, if collected, fill many volumes. She was elected member of the academies of Rome, Bologna, Padua, Lyon, and Rouen. She died 8th August 1802. Her poems fail now to explain the reputation she once enjoyed, and dispose us to believe that her personal attractions must have given a charm to her verses.

**BOCHART, SAMUEL**, a learned Protestant divine, was born of an ancient family at Rouen, in 1599. He very early exhibited remarkable talent, chiefly philological. After studying at Paris, Sedan, and Saumur, visiting England in 1621, and finishing his

education at Leyden, he was chosen pastor of the Protestant church at Caen, where he became very popular. In 1629, he gained great reputation by his victory, in a public discussion of several days' duration, over the famous Jesuit, Doctor Verin. The meetings gained additional eclat from the occasional presence of the Viceroy of Normandy, the Duke of Longueville. In 1646, appeared his *Sacred Geography*, bearing the title of *Phaleg and Canaan*. His *Hierozoicon*, or Scripture Zoology, to which he devoted many years of his life, appeared posthumously in 1675. In 1652, B. was invited to Stockholm by Queen Christina, and went thither accompanied by his friend Huet. The court-life, however, did not suit him, and his visit was short. He died suddenly, in 1667, while speaking at a meeting of the Caen Academy of Antiquaries. A complete edition of his works, with a life by Morin, was published at Leyden in 1712; and a new improved edition of the *Hierozoicon*, his most valuable work, at Leipsic, in 3 vols. 4to (1793—1796), by Rosenmüller.

**BO'CHNIA**, a town of Austrian Galicia, capital of a circle of the same name, and about 25 miles east-south-east of Cracow. The houses are built chiefly of wood. There are extensive mines of rock-salt in its vicinity, which employ upwards of 500 miners, and yield annually about 13,000 tons of salt. Pop. (1869) 8040.

**BOCKH, AUGUSTUS**, the most erudite classical antiquary of Germany in recent times, was born 24th November 1785, at Carlsruhe, and entered the university of Halle in 1803. The prelections of Wolf determined him to the science of philology. His first publication was *Commentatio in Platonis qui vulgo fertur Minoem* (Halle, 1806). In 1808, appeared his *Grecorum Tragadic Principum, Aschyli, Sophoclis, Euripidis, num ea quae supersunt et genuina omnia sint*. In 1809, he became ordinary professor at the university of Heidelberg; and in 1811, he was translated to the chair of Rhetoric and Ancient Literature, at Berlin, where he taught for upwards of forty years, forming many excellent scholars, and extending his reputation through all the learned circles of Europe. His conception of philology as an organically constructed whole, which aims at nothing short of an intellectual reproduction of antiquity, excited for a long time great opposition among his professional contemporaries, but it undoubtedly gave an impetus to a deeper study of the old classical world. His lectures include not merely a grammatico-historical interpretation of the ancient authors, but also archaeology proper, the history of ancient literature, philosophy, politics, religion, and social life. The four great works of B. which have, in fact, opened up new paths in the study of antiquity, are, 1st, his edition of Pindar (2 vols., Leip. 1811—1822), in which the metre and rhythm of the poet, as well as his artistic skill, are investigated and discussed with profound knowledge of the subject; 2d, *The Political Economy of Athens* (2 vols., Berlin, 1817), a work which remains unsurpassed for subtle research, surprising results, and clear exposition. It treats of the prices of goods, rate of workmen's wages, rent of houses and land, and other points of commercial economy, as well as of the larger questions of the state income and expenditure. It has been translated into English by Sir George Cornwall Lewis, under the title of *The Public Economy of Athens* (Lond. 2d edit. revised, 1842). 3d, *Investigations concerning the Weights, Coins, and Measures of Antiquity* (Berl. 1838). 4th, *Records of the Maritime Affairs of Attica* (Berl. 1840). The most important of his lesser works are the *Development of the Doctrines of Philolaus*, 181

the *Pythagorean*, his edition of the *Antigone* of Sophocles, and a *Dissertation on the Silver Mines of Laurion in Attica*. B. has also the honour of having commenced, in 1824, the great work entitled *Corpus Inscriptionum Graecarum*, published at the expense of the Royal Academy of Berlin, which was afterwards continued first by Franz, and then by Kirchhoff. In 1852, appeared his *Researches on the Cosmical System of Plato*; in 1855, *The Lunar Cycles of the Greeks*; and, in 1863, *On the Four-year Solar Cycles of the Ancients*. He died in 1867.

BO'C'KLAND, BOCLAND, or BOOKLAND, one of the original modes of tenure of manor-land, also called charter-land or deed-land, which was held by a short and simple deed under certain rents and free services. It was land that had been severed by an act of government from the *Foldland* (q. v.), and converted into an estate of perpetual inheritance. It might belong to the church, to the king, or to a subject; it might be alienable and divisible at the will of the proprietor; it might be limited in its descent, without any power of alienation in the possessor. It was often granted for a single life or for more lives than one, with remainder in perpetuity to the church. It was forfeited for various delinquencies to the state.

The estate of the higher nobility consisted chiefly of bockland. Bishope and abbots might have B. of their own, in addition to what they held in right of the church. The Anglo-Saxon kings had private estates of B., and these estates did not merge in the crown, but were devisable by will, gift, or sale, and transmissible by inheritance, in the same manner as B. by a subject. (Kerr's *Blackstone*, vol. ii., p. 88; and see *An Inquiry into the Rise and Growth of the Royal Prerogative in England*, by John Allen, 1830, pp. 143—151; and Wharton's *Law Dictionary*, 2d ed., under *Bockland*.)

**BODEN-SEE.** See CONSTANCE, LAKE OF.

**BODE'S LAW**, an arithmetical relation subsisting between the distances of the planets from the sun. It may be thus stated: Write, in the first instance, a row of fours, and under these place a geometrical series beginning with 3, and increasing by the ratio 2, putting the 3 under the second 4; and by addition we have the series 4, 7, 10, &c., which gives nearly the relative distances of the planets from the sun.

4	4	4	4	4	4	4	4	4
3	6	12	24	48	96	192	384	

4	7	10	16	28	52	100	196	388
---	---	----	----	----	----	-----	-----	-----

Thus, if 10 be taken as the distance of the earth from the sun, 4 will give that of Mercury, 7 that of Venus, and so forth. The actual relative distances are as follow, making 10 the distance of the earth—

Mercury.	Venus.	Earth.	Mars.	Asteroids.	Jupiter.	Saturn.	Uranus.	Neptune.
3.9	7.2	10	15.2	27.4	52	95.4	192	300

Close as is the correspondence between the law and the actual distances, no physical reason has been given to account for it, although there is little room for doubt that such exists. B. L., therefore, in the present state of science, is termed empirical. Kepler was the first to perceive the law, and Bode argued from it that a planet might be found between Mars and Jupiter, to fill up the gap that existed at the time in the series. The discovery of the Asteroids has proved the correctness of this prediction. The greatest deviation from the law is seen in the case of Neptune; but if we were acquainted with the principles from which the law proceeds, we might also be able to account for the discrepancy. Similar relations, though expressed in different

numbers, are found to subsist in the distances of the satellites of Jupiter and Saturn from their primaries.

**BODKIN**, an instrument used by women of antiquity to fasten up their hair behind. It was the method commonly adopted by the priests of Cybele, as well as by the female characters in Greek tragedy, the B. being highly ornamented. Silver bodkins are still worn in a similar way by the peasant girls of Naples. The term B. is also applied to a sharp-pointed instrument for piercing holes in cloth, and it was at one time a very common name for a dagger.

**BODLE**, an ancient copper coin in Scotland, in value the sixth of a penny sterling. According to Jamieson, the B. is said to have been so called from a mint-master of the name of *Boltswell*.

**BODLEY**, SIR THOMAS, the restorer of the library originally established at Oxford by Humphrey, Duke of Gloucester, was born at Exeter, March 2, 1544. His family being forced to flee from England during the persecutions of Mary, settled at Geneva, where B. studied languages and divinity under the most distinguished professors of that city. On the accession of Elizabeth, he returned to England, and completed his studies at Oxford, where he took the degree of M. A., and was afterwards elected a proctor. After travelling some time abroad, he was employed by the queen in diplomatic missions to Denmark, France, and Holland, and returned to his favourite city, Oxford, in 1597, where he devoted himself to literature, especially to the extension of the university library, now called the BODLEYAN (q. v.), in B.'s honour. In collecting rare and valuable books from many parts of Europe, B. expended a very large sum, and also left an estate for salaries to officers, repair of the library, and purchase of books. He was knighted by King James, and died at Oxford, January 28, 1612. B.'s autobiography, extending to the year 1609, together with a collection of his letters, has been published under the title *Reliquiae Bodleianae* (Lond. 1703).

**BODLEYAN** or **BODLEIAN LIBRARY**, the public library of Oxford university, restored by Sir Thomas Bodley (q. v.) in 1597, his first act being the presentation of a large collection of valuable books, purchased on the continent at an expense of £10,000. Through his influence and noble example, the library was speedily enriched by numerous other important contributions. Among the earliest subsequent benefactors of the B. L., which was opened in 1602, with a well-assorted collection of about 3000 volumes, were the Earl of Pembroke, who presented it with 250 volumes of valuable Greek MSS.; Sir Thomas Roe; Sir Kenelm Digby; and Archibishop Laud, who made it a magnificent donation of 1300 MSS. in more than twenty different languages. Upwards of 8000 volumes of the library of the famous John Selden (q. v.) went to the Bodleyan Library. General Fairfax presented the library with many MSS., among which was Roger Dodsworth's collection of 160 volumes on English history. During the present century, the most important bequests have been the collections of Richard Gough, on British Topography and Saxon and Northern Literature; of Edmund Malone, the editor of Shakespeare; and of Francis Douce; also a sum of £40,000, by the Rev. Robert Mason, the interest to be expended on books. By purchase, the library acquired some magnificent collections of Oriental, Greek, Latin, and Hebrew books and MSS. The B. L. is particularly rich in biblical codices, rabbinical literature, and materials for

British history. By the Copyright Act, it is entitled to a copy of every book printed in the United Kingdom. The number of volumes it possessed in 1859 is estimated at 260,000, in addition to 22,000 in manuscript. The first catalogue of the printed books was published by the first librarian, Dr James, in 1600; the last, nearly two centuries and a half later (in 1843), in three volumes, by Dr Bandinel, the eleventh who held the office since the institution of the library. In the interval, several catalogues of various departments of the library were published; and a supplemental volume was added by Dr Bandinel in 1850. By statutes drawn up for the government of the library by Sir Thomas Bodley, it was decreed that the vice-chancellor, the proctors, and the regius professors of divinity, law, medicine, Hebrew, and Greek, should be visitors and curators; a statute passed in 1856 added 'five more residents to be elected by congregation for ten years, if continuing to reside, and to be re-eligible.' Members of the university who have taken a degree are admitted to the use of the library—a small addition on the matriculation fees, and an annual payment, being charged for the privilege. Literary men, properly recommended, are allowed to make extracts from the works in the library, which is open between Lady-Day and Michaelmas from nine o'clock in the morning till four in the afternoon, and during the other half of the year from ten to three. It is shut during certain holidays, and for visitation purposes, in the aggregate about 34 days in the year, besides Sundays. Since 1856, a reading-room, open throughout the year from ten o'clock in the morning to ten in the evening, has been attached to the library.

**BO'DMANN** (ancient *Bodami Castrum*), a village of Baden, at the mouth of the Stockach, on Lake Constance, with ruins of a castle, formerly the residence of the lieutenants (*Botemann* or *Bodmanno*, messenger or *legatus*) of the Carlovingian kings; hence the German name of the lake, Bodman-see, or Boden-sea. Pop. 900.

**BODMER, JOH. JAK.**, a German poet and *litterateur*, was born at Greifensee, near Zurich, 19th July 1698. The study of the Greek and Latin writers, together with the English, French, and Italian masters, having convinced him of the poverty and tastelessness of existing German literature, he resolved to attempt reformation. Accordingly, in 1721, along with a few other young scholars, he commenced a critical periodical, entitled *Discourse der Maler*, in which the living poets were sharply handled. After 1740, when B. published a treatise on *The Wonderful in Poetry*, a literary war broke out between him and Gottschee, which was long waged with great bitterness; yet it was not without fruits, inasmuch as it partly prepared the way for the Augustan epoch of German literature. B. died at Zurich (in the university of which he had held the chair of history for 50 years), 2d January 1783. As an author, he was marked by inexhaustible activity, but his poems, dramas, and translations have no vigour or originality. His best known production is the *Noactide* (Zurich, 1752). He did greater service to literature by republishing the old German poets, the Minnesingers, and a part of the *Nibelungen*, as also by his numerous critical writings.

**BO'DMIN**, the county town of Cornwall, in the middle of the county, 26 miles north-north-west of Plymouth. It is situated partly in a valley and partly on the side of a hill, and consists principally of one street a mile long. Its chief trade is in cattle and sheep. Among the more important recent buildings are a market house, the county jail, and the new Cornwall Lunatic Asylum. B. arose in a priory founded in the 10th c., and was

long an important place, having, besides the priory, a cathedral and 13 churches. The priory was once the property of Thomas Sternhold, one of the translators of the Psalms of David into English metre. 1500 persons in B. are said to have died of the pestilence in 1351. Pop. (1871) 6758. It returns one member to parliament.

**BODO'NI, GIAMBATTISTA**, a distinguished type-cutter and printer, born at Saluzzo, in Sardinia, 1740; went to Rome in 1758, where he secured an engagement as compositor in the printing-office of the Propaganda, and where he remained till the death of his patron, Abbate Ruggieri, in 1762, or, according to others, 1768. In 1768, he went to Parma, where he published several specimens of his workmanship; among others—on occasion of the marriage of the Prince of Piedmont with the Princess Clotilde of France—the *Epithalamia Exoticis Linguis Redita*, which exhibited the alphabets of twenty-five languages. In 1789 the Duke of Parma made him superintendent of his private printing establishment, and from this press he sent forth his edition of the *Iliad* (3 vols. 1808), dedicated to Napoleon. It is a splendid specimen of typography; but the correctness of the text is by no means equal to the beauty of the printing. His editions of Virgil (2 vols. 1793), and several Greek, Latin, Italian, and French classics, as also his Lord's Prayer in 155 languages, are admired for their elegance. He died at Parma, 1813.

**BODY, HUMAN**, will be treated of under the names of the several organs and functions. For BODY-SNATCHING, see ANATOMY (in Law).

**BODY COLOUR**, a term which, in oil-painting, is applied to the opaque colouring produced by certain modes of combining and mixing the pigments. When, in water-colour painting, pigments are laid on thickly, and mixed with white, to render them opaque, instead of in tints and washes, the works are said to be executed in body colour.

**BODY OF A CHURCH**, more commonly called the *Nave* (q. v.), though this latter term is sometimes employed to include the Aisles (q. v.), is also known as the main or middle aisle.

**BOECE, OR, more properly, BOYCE, HECTOR**, a distinguished Scottish historian, was born of an old family, about 1465, at Dundee. He completed his education at Montague College, in the university of Paris, and in 1497, was appointed a professor of philosophy. Among other learned men whose friendship he here acquired was Erasmus. About the beginning of the 16th c., he was invited by Bishop Elphinstone to preside over the university newly founded by him at Aberdeen. B. accepted the office after some natural hesitation, the yearly salary being 40 merks, or about £2. 4s. 6d. sterling. The value of money, however, it has to be remembered, was immensely greater then than now, and the learned principal was at the same time made a canon of the cathedral, and chaplain of St Ninian. There is every reason to suppose that he discharged his duties with high success. In 1522, he published his lives, in Latin, of the Bishops of Mortlach and Aberdeen. This work, a great part of which is occupied with the life of his excellent patron, Bishop Elphinstone, was reprinted by the Bannatyne Club in 1825. Five years later, B. published the *History of Scotland*, on which his fame chiefly rests, a work which, though proved to contain a large amount of fiction, is worthy of the commendation it has received even on the score of style. The author was rewarded by the king with a pension of £50 Scots, until he should be promoted to a benefice of 100 merks, which appears to have occurred in 1534. B. died two years later.

**BOEHMERIA**, a genus of plants of the natural order *Urticaceæ*, included, until recently, in the genus *Urtica* or Nettle (q. v.). The fibres of a number of species are used for making ropes, twine, nets, sewing-thread, and cloth; and some of them appear likely to acquire much economical and commercial importance. *B. nivea* (formerly, *Urtica nivea*) has been recently ascertained to yield great part of the fibre employed in China in the manufacture of the beautiful fabric known as *China-grass* (q. v.) cloth. It is a perennial herbaceous plant, with broad ovate leaves, which are white and downy beneath, and is destitute of the stinging powers of the nettles. It is carefully cultivated by the Chinese, by whom it is called *Tchou Ma*. It is propagated either by seeds or by parting the roots. It loves shade and moisture. Three crops are obtained in the season, new shoots springing up after it has been cut. Great attention is bestowed upon the preparation of the fibre; the stems are sometimes tied in little sheaves, and instead of being steeped, are placed on the roof of a house, to be moistened by the dew, and dried by the sun, but are carefully preserved from rain, which would blacken them; and in rainy weather, they are placed under cover in a current of air. Another plan is to steep the separated fibres for a night in a pan of water, and sometimes they are steeped in water containing the ashes of mulberry-wood. A patent was obtained in Britain, in 1849, for the preparation of this fibre, by boiling the stems in an alkaline solution, after previously steeping them for 24 hours in water of the temperature of 90° F., then thoroughly washing with pure water, and drying in a current of high-pressure steam.—It seems now to be ascertained that this is the same plant which Dr Roxburgh strongly recommended to attention about the beginning of the 19th c., under the name of *Urtica tenacissima*, and of which the Court of Directors of the East India Company, in 1816, declared the fibre to be 'stronger than Russian hemp of the best description,' and to have been 'brought to a thread, preferable to the best material in Europe for Brussels lace.' It may well be regarded as curious that, after this, it was lost sight of for a considerable time, although the commendation bestowed upon it is found not to have been exaggerated. The plant grows naturally, and is cultivated not only in China, but in Sumatra, Siam, Burmah, Assam, and other parts of the East. The fibre is called *Calee* in Sumatra, *Ramee* by the Malays, and *Rheea* in Assam.—*B. candicans* and *B. utilis*, from which a fine silky fibre is obtained in Java, are either varieties of this or nearly allied species.—*B. frutescens* is another important species, common in Nepaul, Sikkim, and other parts of the Himalaya, to an elevation of 3000 feet above the sea. It is not cultivated, but often overruns abandoned fields. It grows to a height of 6 or 8 feet, and varies from the thickness of a quill to that of the thumb. The leaves are serrated, dark-green above, silvery-white below, not stinging. The plant is cut down for use when the seed is formed, the bark is then peeled off, dried in the sun for a few days, boiled with wood-ashes for four or five hours, and beaten with a mallet to separate the fibres, which are called *Pooah* or *Poe*, and also *Kienki* or *Yenki*. When properly prepared, the fibre is quite equal to the best European flax.—The fibres of a number of coarser species are employed in different parts of the East Indies for making ropes. See Royle's *Fibrous Plants of India*.

**BOEO'TIA**, one of the ancient political divisions of Greece, was bounded on the N. and N.W. by Locris and Phocia, on the E. by the Euboan Channel, on the S. by Attica and Megaris, and on the W. by the Corinthian Gulf. B. had

a surface estimated at 1120 square miles. The plains enclosed on the south by Mounts Cithæron and Parnæa, on the west by Mount Helicon, on the north by the slopes of Mount Parnassus and the Opuntian Mountains, fall naturally into three divisions—the basin of the lake Copais, now called Topolias, that of the Asopus, and the coast-district on the Crisscean Sea. The principal stream was anciently called the Cephissus. It entered the country from Phocis at Charonea; and in the spring, when it was swollen by innumerable torrents, almost converted the Copaic plain into a lake. There were several natural channels for the outlet of the waters that congregated in this plain, but they were not sufficient to carry off the whole surplus, and the surrounding country was in consequence frequently deluged. In order to guard against this inundation, two tunnels had been cut in the rock for the discharge of the water. One of these tunnels, which carried the water to Upper Larymna—where it emerged in a natural outlet after a subterraneous course of nearly four miles, whence it flowed above ground a mile and a half to the sea—was no less than four miles in length, with about twenty vertical shafts let down into it, some of which were from 100 to 150 feet deep. The other tunnel, which united the Copais Lake with that of Hylica, was much shorter, but still an extensive and striking work. The date of these gigantic engineering undertakings is not precisely known, but they are generally attributed to the Minya of Orchomenus. B. was in ancient times very productive of marble, potters' earth, and iron, besides abounding in corn and fruits; and it was also particularly celebrated for flute-reeds. The earliest inhabitants belonged to different races, the two most powerful of which were the Minya and Cadmeans or Cadmeones; but were at an early date (about 60 years after the Trojan war, according to Thucydides) in part dislodged by the Boeotians, an Aeolian people who were driven from Thessaly, and in part incorporated with them. The Boeotians excelled as cultivators of the soil, and were gallant soldiers both on foot and horseback; but they were rude, unsociable, and took little part in the gradual refinement of manners and intellectual development of the rest of Greece, so that the name became proverbial for illiterate dullness. This was usually ascribed to their thick damp atmosphere. Yet there have not been wanting amongst them eminent generals, as Epaminondas; and poets and historians, as Herodotus, Pindar, Corinna, Plutarch, &c. The greater cities, of which the number was about fourteen, Thebes, Haliartus, Thebes, &c., with their territories, formed the Boeotian League. At the head of this was an archon, and next to him a council, which was composed of four persons, and had its head-quarters in Thebes. The executive authority was intrusted to Boeotarchs, who were elected in popular assemblies of the separate states, and could only hold office for one year. Of this League, a shadow still remained down to the times of the empire; but after the battle of Charonea, in which Philip established the Macedonian throne on the ruins of Grecian liberty, the political importance of the country declined so rapidly, that about 30 a. c. only two cities, Tanagra and Thebes, were of any consideration.—Along with Attica, B. now forms one of the 'monarchies' of the kingdom of Greece.

**BOERHAAVE**, HERMANN, the most celebrated physician of the 18th c., was born at Voorhout, near Leyden, December 13, 1668. In 1682, he went to Leyden, with the intention of becoming a clergyman, and there studied Greek, Latin, Hebrew, Chaldee, history, ecclesiastical and secular, and mathematics.

In 1689, B. was made doctor of philosophy, and in 1690 began the study of medicine, reading carefully Hippocrates among the ancients, and Sydenham among the moderns. Though mainly self-educated in medicine—as in chemistry and botany—he gained his doctor's degree at Harderwyck, 1693, and returned to Leyden, where, in 1701, having abandoned theology, he was appointed lecturer on the theory of medicine, and in his inaugural lecture recommended to the students the ancient method of Hippocrates in medicine; but in 1703 his views had become greatly enlarged. He saw the necessity of *a-priori* speculations, as well as of the Hippocratic method of simple observation, and elaborated various mechanical and chemical hypotheses to explain the diseases of the body, especially in the case of the fluids. In 1709, he was elected professor of medicine and botany in the place of Hotton. About this time, he published the two works on which his great fame chiefly rests: *Institutiones Medicæ in Usus Annua Exercitationis Domesticos* (Leyd. 1708), and *Aphorismi de Cognoscendis et Curandis Morbis, in Usu Doctrinae Medicinae* (Leyd. 1709), both of which went through numerous editions, and were translated into various European languages, and also into Arabic. In the first work—a model of comprehensive and methodical learning—he gives a complete outline of his system, including a history of the art of medicine, an account of the preliminary knowledge necessary to a physician, and a description of the parts and functions of the body, the signs of health and disease, &c.; in the second, he gives a classification of diseases, with their causes, modes of treatment, &c. B. also rendered important services to botany. One of his best lectures is that delivered on his resignation of the office of rector of the university, *De Comparando Certo in Physicis*. To combine practice with theory, he caused a hospital to be opened, where he gave clinical instructions to his pupils. Though so industrious in his own profession, he undertook, in 1718, after Lemort's death, the professorship of chemistry, and published in 1724 his *Elementa Chemia*, a work which did much to render this science clear and intelligible; and although now entirely superseded by more advanced researches, one that will always occupy a high place in the history of chemistry. His fame had meanwhile rapidly increased. Patients from all parts of Europe came to consult him. Peter the Great of Russia visited him; and it is even said that a Chinese mandarin sent him a letter, addressed 'HERRE BOERHAAVE, celebrated physician, Europe.' He was a member of most of the learned academies of the day. He died September 23, 1738, having realised from his profession a fortune of two millions of florins.—Burton, *Account of the Life and Writings of B.* (2 vols., Lond. 1743); Johnson, *Life of B.* (Lond. 1834).

#### BOERHAAVIA. See NYCTAGINACEÆ.

BOERS (Ger. agriculturists, farmers), the name applied to the Dutch colonists of the Cape of Good Hope who are engaged in agriculture and the care of cattle. The B., generally, according to Dr Livingstone, 'are a sober, industrious, and most hospitable body of peasantry.' Very different, however, are certain of their numbers who have fled from English law, on various pretexts, and formed themselves into a republic in the Caasan Mountains. Coming 'with the prestige of white men and deliverers' from the cruelty of Kaffir chiefs, they were received by the Betjuans gladly, who, however, soon found out that their new friends were much less desirable as neighbours than their old enemies. The B. force even those tribes of the Betjuans who are

most friendly towards them to perform all kinds of field-labour for nothing; and not only this, but they also compel them to find their own implements of labour and their own food. They steal domestic servants from the more hostile tribes in the most cowardly and cold-blooded way imaginable. The plan of operation is thus described by Dr Livingstone: 'One or two friendly tribes are forced to accompany a party of mounted Boers, and these expeditions can be got up only in the winter, when horses may be used without danger of being lost by disease. When they reach the tribe to be attacked, the friendly natives are ranged in front, to form, as they say, "a shield;" the Boers then coolly fire over their heads, till the devoted people flee, and leave cattle, wives, and children to the captors. This was done in nine cases during my residence in the interior, and on no occasion was a drop of Boer's blood shed.' And yet these B. proudly boast themselves 'Christian!' They have an immense contempt for the ignorance of the natives, and told Dr Livingstone that he might as well teach baboons as Africans. They, however, declined a test which the missionary proposed—viz., to be examined whether they or his native attendants could read best. In his opinion, they are quite as degraded as the blacks whom they despise. See ORANGE RIVER FREE STATE.

BOËTHIUS, ANICIUS MANLIUS SEVERINUS (to which a few MSS. add *Torguatus*), a Roman statesman and philosopher, was born between 470 and 475 A.D. The family to which he belonged had been distinguished both for its wealth and dignity for two centuries. His own father held the office of consul, but dying while B. was still a boy, the latter was brought up under the care of Festus, Symmachus, and other honourable Romans. He studied with sincere enthusiasm philosophy, mathematics, and poetry, translated and elucidated with laborious care the writings of Aristotle, and of the old mathematicians Euclid, Archimedes, Ptolemy, and others; but the story of his eighteen years' stay at Athens is entirely unhistorical. B. soon attracted notice; he became a patrician before the usual age, a consul in 510, and also *princeps senatus*. Having, moreover, gained the esteem and confidence of Theodoric, king of the Goths, who had fixed the seat of his government at Rome in the year 500, he was appointed by that monarch *magister officiorum* in his court. His influence was invariably exercised for the good of Italy, and his countrymen owed it to him that the Gothic rule was so little oppressive. His good-fortune culminated in the prosperity of his two sons, who were made consuls in 522. But his bold uprightness of conduct, springing from what seem to have been the essential characteristics of the man—viz., a strong faith in the truth of his philosophic ethics, and a courage to regulate his official conduct by them—at last brought down upon his head the unscrupulous vengeance of those whom he had checked in their oppressions, and provoked by his virtues. He was accused of treasonable designs against Theodoric; and the king, having become despondent and mistrustful in his old age, was induced to listen to the charges. B. was stripped of his dignities, his property was confiscated, and he himself, after having been imprisoned for some time at Pavia, was executed in 524 or 526; according to one account, with circumstances of horrible cruelty. During his imprisonment, B. wrote his famous *De Consolatione Philosophie*, divided into 5 books, and composed in the form of dialogue, in which B. himself holds a conversation with Philosophy, who shews him the mutability of all earthly fortune, and the insecurity of everything save virtue. The work is composed in a style which happily imitates the best

models of the Augustan age, and the frequent fragments of poetry which are interspersed throughout the dialogue are distinguished by their truthfulness of feeling and metrical accuracy. The *Consolatio* is piously theistic in its language, but affords no indication that B. was a Christian; and if the doctrinal treatises ascribed to him are, as the acutest criticism maintains, not genuine, we must class him in religion rather with Marcus Aurelius than with his alleged friend, St Benedict. He was the last Roman writer of any mark who understood the Greek language and literature. During the middle ages, he was regarded with profound reverence, as the *Augustine* of philosophy, but on the introduction of the Aristotelian metaphysics in the 13th c., his reputation gradually sank. The first edition of B.'s entire works appeared at Venice, 1491—1492; a more correct one at Basel, 1570. The oldest edition of the *Consolatio* is that published at Nürnberg, 1473, but many manuscript translations into various languages had appeared long before the invention of printing. Among these may be mentioned that by King Alfred into Anglo-Saxon.

**BOG**, land covered with peat, the spongy texture of which containing water, converts it into a kind of quagmire. The term PEAT-BOG is sometimes employed as more perfectly distinctive of the true bog from every other kind of swamp or morass; the term PEAT-MOSS is also sometimes employed, particularly in Scotland, and even simply MOSS. The word Bog is of Irish origin, being from a Gael root, signifying a bobbing, quaking motion.

Bogs of great extent exist in some of the northern parts of the world. A very considerable part of the surface of Ireland is occupied with them. The Bog of Allen (see ALLEN, BOG OR) is the most extensive in the British Islands, although its continuity is not altogether unbroken, strips of arable land intersecting it here and there. The Solway Moss (q. v.), on the western borders of England and Scotland, is about seven miles in circumference. Chatmoss (q. v.), in Lancashire, famous for the engineering difficulties which it presented to the formation of the first great English railway, is twelve square miles in extent. The swamps of the east of England are in general not peat-bogs, but consist chiefly of soft mud or silt.

The general surface of a bog is always nearly level, but it is usually varied with rushy tussocks rising above the rest, and having a rather firmer soil. By the continued growth of peat, the surface of a bog is gradually elevated; that of Chatmoss, for example, rises above the level of the surrounding country, having a gradual slope of thirty or forty feet from the centre to the solid land on all sides. In rainy weather, it sensibly swells, the spongy mass imbibing water, whilst the mosses and other growing plants on the surface prevent evaporation. Occasionally, the quantity of water becoming excessive, a bog *bursts*, and pours a terrible deluge down the course of a stream, causing great devastation, not only by the force of its torrent, but by the enormous quantities of peat which it deposits upon meadows and cultivated fields, as has recently happened in some memorable instances in Ireland. The depth of a bog is sometimes more than forty feet. The spongy mass of which it is formed shakes on the least pressure. Sometimes it is impossible to traverse it; in other cases, it is possible only for those who are well accustomed to it, a false step being a plunge into a quagmire, in which a man sinks as in a quicksand. Safety is sometimes insured by 'pattens'—boards fastened upon the soles of the feet—a method which Mr Roscoe of Liverpool, in his extensive operations for reclaiming land from Chatmoss, employed also to enable horses to work

upon its surface. It was not the least remarkable triumph of the genius of Stephenson, to extend the same principle to the support of the railway. Tradition reports that at the battle of Solway, in 1542, a fugitive troop of horse plunged into the moss, which instantly closed upon them; and in the end of the 18th c., this tradition was confirmed by the discovery, made in peat-digging, of a man and horse in complete armour.

One of the remarkable phenomena of peat-bogs is the frequent presence of roots and fallen trunks of trees, in a good state of preservation, many feet below the surface. From the black bog-oak of Ireland, various small fancy articles are manufactured. The circumstance of trees being found imbedded in bogs, leads to the conclusion that in many instances these morasses originated in the decay or partial destruction of ancient forests. This subject, however, along with all that relates to the origin and nature of bogs, will be treated in the article PEAT. It may be proper here to mention that there is a popular division of bogs into two classes—*Red Bogs* and *Black Bogs*; the decomposition of the vegetable matter in the former being less perfect, and the substance, consequently, more fibrous and light than in the latter. There is indeed no precise line of distinction, and all intermediate conditions occur. The most extensive bogs are red bogs, and they are said to cover 1,500,000 acres in Ireland. Black bogs, although comparatively of small extent, are more numerous, particularly in elevated districts, for which reason they are sometimes called *mountain bogs*. The depth of red bogs is usually much greater than that of black bogs.

The conversion of bogs into good pasture or arable land, is a subject of national importance. There can be no doubt that much of the land now occupied by bog is capable of being rendered very productive, whilst the effects of extensive bogs upon the climate are always injurious. The reclaiming of shallow mountain bogs is comparatively easy, and in some cases it is effected by a very simple and inexpensive drainage, and by throwing them at once under cultivation in a manner analogous to that known in Ireland as the *lazy-bed* method of planting potatoes—the soil upon which the bog rests being partially digged up, and thrown over its surface. Great difficulties, however, attend the reclaiming of red bogs. It has unfortunately happened, particularly in Ireland, that the tenures of land, and the want of capital on the part of the owners of estates, have formed the most insuperable of all obstacles to improvements of this kind, which, however, have been carried on to no inconsiderable extent since the middle of the 18th c., and have in general proved highly remunerative. A chief difficulty, in some cases, is caused by the low situation of the bog, and the want of *fall* for drainage. Another great difficulty is presented by the spongy substance of red bogs being extremely retentive of water, so that a deep ditch only drains a very narrow strip on each side of it. A difficulty has been also found in disposing of the peat, where a good soil being known to exist below, it has been attempted to reclaim land by removing the peat instead of draining it and converting its own surface into soil. To some extent, in such cases, the peat is advantageously disposed of for fuel, or to be used as a species of manure for other soils; but the demand for these purposes is often insufficient for any other than a very slow process of improvement in an extensive bog. The peat is therefore, sometimes, by various means, floated off, as in the long-continued operations at Blair-Drummond, on the banks of the Forth, the results of which have for many years formed a

## BOGAN—BOG IRON ORE

peculiar feature on the shores and in the bays of the upper part of the Firth of Forth. But when a similar method was more recently introduced in an extensive moss in the low lands of Renfrewshire, the Clyde trustees interposed to prevent it, in the interests of the navigation of the river. A portion of the peat, taken from the upper surface, is not unfrequently burned in heaps upon the spot, the ashes becoming a manure, and assisting in the formation of a soil.

Of course, the first essential in the reclaiming of bogs is drainage. The method of effecting this must be varied according to circumstances; but very frequently, after a general outlet with sufficient fall has been secured, wide open drains are cut, by which the bog is divided into strips, which again are traversed and subdivided by smaller drains. When these drains begin to serve their purpose, the surface of the bog sinks, and their depth is reduced; they are then often deepened, and at last a permanent system of covered drains emptying themselves into open ditches is thus formed, and fits the land for all the purposes of agriculture. It is, however, often ploughed before this state of things is attained, the plough-horses being shod with the *pattens* already mentioned, and socks and coulters of unusual sharpness being employed for the cutting of the bog. Various implements have also been devised for cutting the moss, to facilitate cultivation. Lime, calcareous sand, clay, and other manures are applied, according to circumstances, to promote the conversion of the peat into useful soil. Sometimes the first crop taken from the ploughed bog is a crop of oats; sometimes it is found preferable to begin with rape, turnip, or the like. In some places in the North of Ireland, flax grass (see BINT GRASS) has been sown on bogs in process of being reclaimed, and enormous crops have been obtained.—See WASTE LANDS.

**BOGAN**, or NEW-YEAR RIVER, the *Allan Water* of Oxley, an interior stream of East Australia, joins the Darling, after a generally north-west course of more than 300 miles, about lat. 30° S., and long. 146° E. Its source is in the Harvey Range, about lat. 33° S., and long. 148° 30' E.

**BOG BUTTER**, a very peculiar mineral substance, which is found in some of the bogs of Ireland. It is evidently of vegetable origin, and has been formed by the decomposition of the peat amidst which it is found. In composition and qualities it exhibits a general agreement with bitumen, asphalt, amber, and the other mineral resins; all of which are not improbably supposed to resemble it also in their origin, although perhaps it is the most recent of them all. It contains about 74 per cent. of carbon; its remaining constituents being oxygen and hydrogen in nearly equal proportions. In colour and consistency, it much resembles butter, and at 124° F. it becomes liquid. It is not soluble in water, but is readily dissolved by alcohol.

**BOGDANOVITCH**, HIPPOLYTUS THODOROVITCH, a distinguished Russian poet of the 18th c., was born at Perevolotchna, Little Russia, in December 1743. His fame rests entirely upon his poem *Dushenka*, published in 1775. The story of Psyche forms the groundwork of the poem, which is characterised by a refined and graceful style, and vivacious playfulness of language. Its publication made him at once famous, as well as obtained for him the high favour of the court; but there can be no doubt that the popularity of the work was as much owing to the adventitious circumstances in which it was produced—nothing of the kind having been previously attempted in Russia—as to its intrinsic

merits. B., though he wrote much afterwards, never equalled his first performance. He died in January 1803.

**BOGEN**, a town of Bavaria, in the circle of Lower Bavaria, situated on the left bank of the Danube, about six miles east of Straubing. It has extensive breweries, but is chiefly celebrated for its chapel, still a place of pilgrimage, built on a neighbouring height. Hera, according to tradition, a hollow stone image of the Virgin floated up by the river, remained stationary; and its miraculous arrival had the effect of converting a notorious robber-chief, the ruins of whose castle now enclose the church. Innumerable pilgrims flocked to the image, including, at various times, three German emperors, and the monks grew very wealthy on their offerings. Pop. 1200.

**BOGERMANN**, JOHANN, who occupies a place in history as president of the far-famed synod of Dort, was born in 1576, at the village of Oplewert, in Friesland. He took a violent part in the religious controversies which inflamed, with unwonted fire, the Dutch mind at the beginning of the 17th century. His hatred of Arminianism extended itself (as theological hatred generally does) to the persons who upheld it, and his zeal was on various occasions gratified by securing the punishment of those who had the misfortune to differ in opinion from him. He translated and recommended Beza's book on the *Capital Punishment of Heretics*; and about the year 1614, ventured to assail the great Grotius in a polemical treatise, which, along with most of the angry literature of the period, has properly perished. In 1618, B. was elected president of the synod of Dort; but his conduct there does not seem to have given satisfaction to the Frielanders who had delegated him, for he was accused on his return of having exceeded his instructions. For one thing, however, B. deserves great credit, his translation of the Bible into the vernacular. Four other persons were associated with him in the task, but the translation of the Old Testament is chiefly B.'s work, and is characterised by taste, fidelity, and purity of language. It is still used in the Dutch churches. B. died in 1633, at Franeker, in the university of which he was primarius professor of divinity.

**BOGHAZ KIE'UI**, KE'WEE, or KOI, a village of Asia Minor, pashalic of Sivas, 88 miles S. W. of Amasia. In its vicinity are the ruins of a magnificent temple, supposed to be that of Jupiter which Strabo mentions (lib. xii.). A perfect ground-plan of the building still remains; the length outside is 219 feet, the breadth, 140 feet, while the cells measures 87 feet by 65. There are several other ruins which seem to identify B. K. as the ancient Tavium.

**BOG IRON ORE**, a mineral of very variable composition, but regarded as consisting essentially of peroxide of iron and water; the peroxide of iron often amounts to about 60 per cent., the water to about 20. Phosphoric acid is usually present in quantities varying from 2 to 11 per cent. Silicic acid, alumina, oxide of manganese, and other substances, which seem accidentally present, make up the rest. B. I. O. occurs chiefly in alluvial soils, in bogs, meadows, lakes, &c. It is of a brown, yellowish-brown, or blackish-brown colour. Some of its varieties are earthy and friable, formed of dull dusty particles; some are in masses of an earthy fracture, often vesicular; and some more compact, with conchoidal fracture. It is abundant in some of the northern and western islands of Scotland, and in the northern countries of Europe generally; also in North America. When smelted, it yields good iron. See IRON, ORES OF. From what source the iron in B. I. O. is derived, has often been a subject of discussion; but Ehrenberg appears to have determined

that it proceeds from the shields of animalcules, and he regards the mineral itself as composed of incalculable multitudes of these shields. He found in the marshes about Berlin a substance of a deep-ochre yellow passing into red, which covered the bottom of the ditches, and which, when it had become dry after the evaporation of the water, appeared exactly like oxide of iron; but which under the microscope was found to consist of slender articulated threads, formed of the partly silicious and partly ferruginous shields of *Gaillonea ferruginea*.

**BOG MOSS.** See SPHAGNUM.

**BOGNOR BEDS.** See LONDON CLAY.

**BOGODOUKHOV**, or BOHODUKHOV, a fortified town of Russia, in the government of Kharkov, 29 miles north-west of the city of that name. It is situated on the Merle—the chief industry of its population, which amounts to about 10,000, consisting in leather-dressing and boot-making. B. has also a considerable trade in cattle and hides.

**BOGOMILI**, a religious sect of the 12th c., whose chief seat was in Thrace. They resembled the Paulicians and Kathari. Their name, which is derived from the Bulgarian *Boj*, 'Lord,' and *milui*, 'have mercy,' refers to the frequency of their prayers. The basis of their creed was as follows: Out of the eternal Divine Essence or Being sprang two principles—Satanael and Logos; the former, at first good, afterwards rebelled, and created in opposition to the original spiritual universe a world of matter and human beings. These human beings, however, received from the Supreme Father a life-spirit; but this was kept in slavery by Satanael until the Logos or Christ came down from heaven, and assuming a phantom body, broke the power of the evil spirit, who was henceforth called only Satan. The B., like all similar sects, practised a severe asceticism, despised images, and rejected the sacraments. Instead of baptism, they placed their hands, and an apocryphal gospel of St John, on the head of the neophyte, singing at the same time the Lord's Prayer, which they repeated seven times during the day, and five times during the night. They looked on the Lord's Supper as a sacrifice offered to the demons. They accepted the whole of the New Testament, but of the Old Testament only the Psalms and Prophets, which they interpreted allegorically. In 1118, that vehement hater of heretics, Alexius Comnenus, burned their leader Basilius, and imprisoned the rest. Nevertheless, the B. continued to exist in the neighbourhood of Philippopolis down to the 13th century.

**BOGOTA**, more fully SANTA FE DE BOGOTÁ, in South America, the federal capital of the united states of Colombia, formerly New Granada. It is situated within the limits of Cundinamarca, in lat. 4° 6' N., and long. 78° 30' W., on a table-land, which, at an elevation of 8694 feet above the sea, separates the basin of the Magdalena from that of the Orinoco. Independently of its political importance, B. occupies a commanding position in relation to commerce. It lies on the most convenient route between Quito and the Caribbean Sea; while, by navigable affluents of the Orinoco and the Magdalena, distant respectively 37 and 55 miles, it enjoys a two-fold access to tide-water. Its immediate vicinity, too, is favourable to the growth of a great city and the maintenance of a large population. The table-land measures about 60 miles from north to south, and about 30 from east to west, being bounded on all sides by mountains which, though lofty enough to give shelter, are yet below the line of perpetual snow. This extensive plain—a temperate zone on the verge of the equator with a singularly genial and salubrious climate—is exceedingly fertile, yielding abundant

crops of wheat and barley, as also generally of the leguminous plants cultivated in Europe; while, favoured as it is with two rainy seasons in a year, it is as rich in pasture as in grain, affording ample sustenance to numerous flocks of sheep and herds of cattle. B. was founded in 1538, consisting then of 12 houses in honour of the 12 apostles. In 1800, it contained 21,464 inhabitants; and in 1821, 30,000; and now it is stated at 46,000. Prospectively, also, the surrounding mountains promise, one day, to give to industry many valuable minerals, such as iron, coal, and salt. The last two, in fact, have already been obtained to some extent. Mines of emeralds, gold, silver, and copper are also said to exist within the same district. B. is regularly and handsomely built. It has 4 public squares and 5 elegant bridges over 2 small rivulets—the San Francisco and the San Augustin. Like every place in Spanish America, it teems with churches and convents—two of the latter overhanging the city on twin hill-tops at a height of 2500 feet above the general level. B. likewise possesses, in addition to official buildings, a mint, a theatre, a university, and spacious barracks. A short way from the city, the rivulets above mentioned join a stream of the same name as the town itself.—The river Bogota, otherwise called the Funcha, is in itself an object of physical interest. It is the single outlet of the waters of the table-land, which, both from geological features and from aboriginal traditions, appears to have once been a land-locked basin, somewhat like the still loftier and larger plateau of Titicaca. Be this as it may, the river B. has found, if it has not forced, a passage for itself towards the Magdalena. At the cataract of Tequendama the waters plunge over a precipice 900 feet high; and the clouds of spray clothe the adjacent grounds in the most luxuriant vegetation. About the centre of this cataract, known as the Fall of Tequendama, stands the natural bridge of Icononzo, formed as if by the fortuitous jamming of rocks from the opposite sides of the cleft. Between the crest and the foot of this fearful torrent, there exists a difference of climate, which is obviously disproportionate to the mere difference of elevation; and the excess may perhaps be ascribed, in conjunction with the ceaseless moisture, to the wall-like precipice behind, which, besides intercepting the winds, increases by reflection the heat of the sun.

**BOGOUSLAV**, or BOGUSLAW, a town of Russia, in the government of Kiew, about 70 miles south-south-east of the city of that name. It is situated on the Rossa, and has a population of 6000, chiefly Jews.

**BOG SPA'VIN.** This singular name has been applied to a lesion of the hock-joint of the horse, consisting in distension of the capsule enclosing the joint. It usually arises suddenly from a sprain in action. It most commonly affects young horses with defective hocks, and is associated with other indications of weakness of the injured joint.

**Symptoms.**—As the immediate result of a violent sprain, the hock becomes swollen, hot, and tender, and there is considerable lameness. The acute symptoms subside readily, but a circumscribed swelling remains towards the front, inner, and lower part of the joint. The swelling is soft, partly disappears on pressure, if the joint is moved; but on the horse standing firmly on its limbs, the projection is distinctly visible. At every recurring strain, lameness supervenes, but commonly passes off within a short time. If the B. S. has accidentally occurred in a young horse with good hocks, it may never be attended with inconvenience, and the acute symptoms mentioned do not relapse.

*Treatment.*—The treatment of B. S. consists in the application of stimulating embrocations, or mild blisters, in the early stage; in severe cases, the golden ointment of iodine is the best application; but we can only obtain a reduction in the inflammatory symptoms, and disappearance of the lameness. The capsular ligament which is injured is never again completely restored, and the horse is more or less blemished for life. See SPAVIN.

**BOG-TROTTER**, an appellation sometimes contemptuously given to the lower class of the Irish peasantry, has its origin in the ability acquired by many of them of traversing the extensive bogs of their native country, passing from tussock to tussock, where a stranger would find no secure footing, and in the frequent use which they have made of this ability to escape from soldiers, officers of police, or other pursuers.

**BOGUE**, Rev. DAVID, the founder of the London Missionary Society, was a native of Berwickshire, being born at Hallydown, February 1750. After studying at the Edinburgh University, and obtaining his licence as a preacher in connection with the Church of Scotland, he, in 1771, went to London, where he was for some time engaged in tuition. He afterwards accepted the charge of an Independent church at Gosport, where he established a seminary for the education of students who purposed to become Independent ministers, an institution which had a great influence on the connection, as well when it had this object in view as afterwards, when it became a school for the training of missionaries. B. now conceived the idea of a grand missionary scheme, which was ultimately realised in the London Missionary Society. He also took an active part in the establishment of the British and Foreign Bible Society and the Religious Tract Society. From this time until his death, which took place in October 1825, he devoted himself zealously to the cause of missions. On his death, an extraordinary meeting of the London Missionary Society was convened, and resolutions passed expressive of its sense of bereavement, and of the benefits which the deceased had conferred on the Society. B. was the author of *An Essay on the Divine Authority of the New Testament*, which has had a circulation only second to that of Bunyan's *Pilgrim's Progress*, having been translated into French, Italian, German, and Spanish; also *Discourses on the Millennium*; and in connection with Dr James Bennet, a *History of Dissenters*, from the Revolution of 1688 to 1808.

**BOHEMIA** (Ger. *Böhmen*), formerly one of the kingdoms of Europe, now forming a part of the Austro-Hungarian monarchy, is situated in lat.  $48^{\circ} 33' - 51^{\circ} 3'$  N., and long.  $12^{\circ} - 16^{\circ} 46'$  E. It is bounded N. by Saxony and Prussian Silesia, E. by Prussia and Moravia, S. by Lower Austria, and W. by Bavaria. It has an area of 19,822 sq. miles, and a pop. (1869) of 5,140,544. It is divided into thirteen circles—viz., Prague, Leitmeritz, Jung-Bunzlau, Jišín, Königgrätz, Chrudim, Caslau, Tabor, Budweis, Pisek, Pilsen, Eger, and Saaz. It contains nearly 400 cities; 250 market-towns; and 650,000 dwelling-houses. B. is surrounded on all sides by lofty mountain-ranges, the principal of which are the Riesengebirge (part of the Sudetic chain) on the north-east, dividing B. from Prussia and Silesia, and attaining, in the peak of the Schneekoppe, a height of 5275 feet; on the north-west, the Erzgebirge, with a height, in some places of more than 4000 feet; on the south-west, the Böhmerwald, reaching in its highest point an elevation of 4613 feet. Offsets from these traverse the interior of the country, which has an undulating surface, sloping generally to the centre. B. has

several fine valleys, the chief of which are those of the Moldau and the Elbe. The country belongs to the upper basin of the Elbe, which rises in the Riesengebirge range; and it is well watered by the affluents of that river, the principal of which are the Moldau—which has its source in the Böhmerwald, and which is navigable from Budweis to Melnik, where it joins the Elbe, a distance of 148 miles—the Eger, Iser, Aupa, Metau, Biela, and Erlitz. B. has no lakes.

The climate of B. is cold in the mountainous regions, the higher peaks being covered with snow during a great portion of the year, but mild in the valleys, and, on the whole, healthful.

The mineral wealth of B. is varied and extensive, consisting of silver, tin, copper, lead, iron, cobalt, alum, sulphur, graphite, calamine, cinnabar, porcelain clay, with several precious and ornamental stones, such as Bohemian garnet (*Pyrope*), rubies, sapphires, &c. Of coal, B. produces more than all the rest of the Austrian empire together. It also yields a large supply of asphaltum. Mineral springs are abundant, and those of Carlsbad, Marienbad, Eger-Franzensbad, Teplitz, Elisenbad, &c., are celebrated places of resort.

The soil of B. is generally fertile. More than one-half of the area consists of arable land; nearly one-eighth is laid out in meadows and gardens; pastures form about a twelfth; vineyards a very small portion; and forests cover nearly a third. The wheat raised in B. is about a seventh of the produce of the whole Austrian empire. The rye, barley, and oats are, the first a fourth, and the latter two a sixth of all the produce of these kinds of grain. This indicates an agricultural importance to the country, in relation to the Austro-Hungarian empire, not to be easily estimated. Flax and hops are important products in a manufacturing point of view; the yearly crop of flax amounts to 200,000 cwts. Bohemian hops are famous, and 50,000 cwts. are on an average produced yearly. A great variety of fruit is cultivated and exported in large quantities. The culture of the vine is confined to the vicinity of Prague and the lower part of the Elbe.

Various kinds of game are found, and the breed of pheasants is celebrated. Horned cattle, sheep, goats, and swine are reared extensively in some districts; and in the south, geese form an important item in the resources of the country.

In manufactures, B. holds a very high place among continental countries. It is the chief centre of dyeing and calico-printing. The linen manufacture, which is more extensive than that of all the other Austrian provinces together, consists of damask, cambric, lawn, and other fine varieties, in addition to the ordinary qualities of cloth. Of the 403,000 spindles employed in flax-spinning in the empire, Bohemia reckons 260,400. The chief seat of the woollen manufacture is Reichenberg and its neighbourhood. Another important branch of industry is the paper-manufacture, of which B. possesses more than the half. The glass-works of B. are celebrated, and very numerous and extensive, affording employment to thousands. Beet-root sugar is manufactured extensively, and there are hundreds of breweries and brandy distilleries throughout the country, but they are mostly on a small scale. The manufacture of iron is considerable. The position of B. secures it a large transit trade. Steam-packets ply on the Elbe and Moldau, and the latter river is connected with the Danube by a horse-railway from Budweis to Linz. B. has good roads, but the only railways of any consequence are those uniting the capital, Prague, with Vienna, Dresden, and Bavaria.

*Population, Religion, and Education.*—The Czechs, a Slavonic race, form the bulk of the people. They

number 2,930,300, and dwell chiefly in the centre and east of the country. The German population, amounting to 1,635,830, reside mainly on the outskirts, especially in the north-east. The few remaining are Jews. The vast majority of the population (4,599,400) belong to the Roman Catholic Church, but other religions are tolerated; the number of Protestants only amounts to 166,000, and the number of Jews is 99,700. The Roman Catholics are under the supervision of the Archbishop of Prague, and the three bishops of Leitmeritz, Königgrätz, and Budweiss. The monasteries and convents number between 70 and 80. Education is much more widely diffused than in any of the other provinces of Austria. The total number of educational establishments includes 17 universities and superior institutions devoted to literature, science, and art. B. sends 54—about a fourth of the 203—members to the Lower House of the Austrian Reichsrath, or parliament of the western part of the empire.

*History.*—The Boii (q. v.), from whom B. derives its name, settled in the country in the 2d c. B.C., but were expelled by the Marcomanni about the beginning of the Christian era. The victors themselves soon gave place to others, and as early as the 5th c. A.D., we find B. peopled by the Czechs, a Slavic race. In the latter part of the 9th c., Swatopluk, the king of Moravia, subjugated Bohemia and introduced Christianity. After his death, the dukes of Prague, who in 1061 had the title of king conferred on them, by the Emperor Henry IV., ruled the country as a state in the German Empire until 1306, when the last of the dynasty was assassinated.

From 1310 to 1437, B. was ruled by kings of the House of Luxemburg. In the time of Wenzel IV. (Wenceslaus), a reformation of religion took place under John Huss (q. v.) and Jerome of Prague (q. v.). After the death of Wenzel IV., the imprudent measures adopted by the Emperor Sigismund excited in B. a war of sixteen years' duration, which ended in making B. an elective kingdom. In 1458, the shrewd and able Protestant noble, George von Podiebrad, ascended the throne. His successor, Ladislaus (1471–1516), was elected (1490) to the throne of Hungary, and removed the royal residence to Ofen, where also his son and successor, Lewis (1516–1526), resided. After his death in battle against the Turks at Mohacz (1526), B. and Hungary passed into the hands of Ferdinand I. of Austria, who had married Lewis's sister. From that time, the history of B. merges in the history of Austria (q. v.).

*Bohemian Literature.*—The Czechs of B. possess a literature older than that of any other people of the Slavonic stem. Its origin may be dated with certainty as early as the 10th century. Of the oldest period—or before the time of John Huss the reformer—21 poetical, and more than 50 prose works are extant. Among the former, the remains of a collection of ballads, &c., made in the 13th c., are remarkable for their poetical merit. John Huss in B., like Luther in Germany, began a new era in literature (1409–1526); but the impulse of his example was far more important than his own writings. The literary remains of the Hussite sects in the 15th c.—dogmatic, polemic, and ascetic works—are still numerous in the old libraries and archives of B., though very many of them perished in the flames the Jesuits kindled during the Thirty Years' War. Even so late as 1750, the Jesuit, Antony Konias, boasted that he had burned 60,000 Bohemian books. Of historical works of this period, some remains have been edited by Palacky in his *Scriptores Rerum Bohemicarum*, 1829.

The period 1526–1620 is regarded by the Bohemians as their golden age of literature. In this

time, especially under Rudolf II. (1576–1611), the arts and sciences were generally cultivated. Prague had two universities and sixteen schools, and the Bohemian language had reached its highest point of cultivation. It cannot, however, be said, that the literary works of this period display any great originality of genius. Among the most noticeable is a Bohemian translation of the Bible, which was finished in 15 years by 8 scholars, assembled by John of Zerotin at his castle of Kralic, in Moravia, and was published 1579–1593. It is a model of pure and elegant Bohemian.

In December 1774, an imperial decree was issued, ordaining that the German language should be employed by all teachers, lecturers, &c., in the upper schools. This harsh measure excited considerable opposition; and several writers came forward to vindicate the claims of the persecuted dialect, and to develop its powers; but their efforts were attended with little success.

A new and better era began in 1818, with the discovery of valuable remains of old literature, and the publication of edicts favourable to the use of the Bohemian language in schools. Since that time, the progress of the language, as a vehicle of literature and science, has been rapid, and a love of the old dialect has been extended through all classes of society. In Bohemian poetry and belles-lettres, the names of Czelakowsky, Kollar, Holly, Langer, and Schneider, are distinguished. Among scientific writers, mention may be made of Jungmann, Schafarik, Wenzel Hanka, and Presl. In history and archaeology, the names of Palacky, Tomek, Schafarik, and Wocel are worthy of notice. Journalism flourishes vigorously. Papers entirely political and of mixed politics and literature circulate more largely in B. than in any other part of the empire. Since 1831, a committee for the cultivation of Bohemian literature has been connected with the Bohemian Museum in Prague. Several important works, among them Schafarik's *Slavonic Antiquities*, and Jungmann's *Large Lexicon*, and his *Literary History*, have been published by aid of the committee.

The *Bohemian language* is one of the best dialects of the West-Slavonic; it is spoken not only in B., but also in Moravia, and among the Slovaks in Hungary. Among its sister-dialects, it is distinguished by copiousness of root-words, great flexibility in combinations, precision, and accurate grammatical structure; but, like all the Slavonic and most modern dialects, it has no specific form for the passive voice of the verb. The orthography introduced by John Huss in the 15th c. is precise and consistent with itself. Every letter of the Roman alphabet has its one distinct sound. Bohemian prosody is distinguished from that of most European languages by the use of quantity instead of accent, so that it can copy faithfully all the ancient Greek and Roman metres. No other modern language can translate the ancient classics so readily, and yet so completely and forcibly, as the Bohemian. Its grammatical forms are complicated and difficult.

**BOHEMIAN BRETHREN** is the name of a religious society which was first instituted in Prague about the middle of the 15th century. It was originally composed of remnants of the Hussites. Dissatisfied with the conduct of the Calixtines (q. v.), they betook themselves, in 1453, to the borders of Silesia and Moravia, where they settled. Here they dwelt in separate communities, and were distinguished by the name of Brothers of the Rule of Christ. Their adversaries often confounded them with the Waldenses and Picards, while, on account of their being compelled during persecution to hide in caves and solitary places, they were also called Cave-dwellers

(*Grubenheimer*). In spite of oppression, such was the constancy of their faith and purity of their morals, that they became profoundly respected, and their numbers greatly increased. The chief peculiarity of their creed was the denial of the ordinary Catholic doctrine of transubstantiation; but, in truth, they rejected tradition generally, and professed to found their tenets only on the Bible. Their ecclesiastical constitution and church-discipline—of which the Lutheran reformers spoke highly—was a close imitation of that of the primitive Christian communities. They even went the length of practically denying anything to be secular; and, under the impression that religion should consciously penetrate and characterize the entire life of men, they extended ecclesiastical authority over the very details of domestic life. Their chief functionaries were bishops, seniors and conseniors, presbyters or preachers, sediles, and acolytes. Their first bishop was consecrated by a Waldensian bishop, though they never united themselves with the Bohemian Waldenses. It was against their principles to engage in war; and having, on several occasions, refused to take up arms, they were at last deprived of their religious privileges. The result was, that, in 1548, about a thousand of the Brethren removed to Poland and Prussia. The contract which these exiles entered into with the Polish reformers at Sandomir, 14th April 1570, and, still more, the religious peace concluded by the Polish States in 1572, secured their toleration; but subsequently, in consequence of the persecutions of King Sigismund III., they united themselves more closely to the Protestants, though even at the present day they retain something of their old ecclesiastical constitution. The Brethren who remained in Bohemia and Moravia obtained a little freedom under the Emperor Maximilian II., and had their chief seat at Fulnek, in Moravia. In the 17th c., a number removed into Hungary, but during the reign of Maria Theress, were coerced into Catholicism. The Thirty Years' War, so disastrous to the Bohemian Protestants, entirely broke up the societies of the B. B.; but afterwards they united again, though in secrecy. Their exodus about 1722 occasioned the formation, in Lusatia, of the *United Brethren*, or *Herrnhuters*. See MORAVIANS.

BOHEMOND I., eldest son of the Norman conqueror of Apulia and Calabria, Robert Guiscard, was born about 1056, and during his youth distinguished himself in his father's war against the Byzantine emperor, Alexis Comnenus (1081—1085). After his father's death, he was excluded from the throne of Apulia by his brother Roger, and only gained the principality of Tarentum after a long contest. He joined the crusade of 1092 with a large army—most of which he had won over from his brother's service—and took a prominent part at the fight of Doryleum, in Cilicia, in 1096, and at the capture of Antioch, 1098. While the other Crusaders advanced to storm Jerusalem, B. remained in Antioch, where he established himself as prince. Being soon after besieged, the Christians, reduced to extremities, came out, and gave the sultan battle, and entirely routed his forces. B. greatly distinguishing himself in the fight. He was afterwards made prisoner by a Turkish emir, and remained two years in captivity. Tancred, meanwhile, looked after his interests in Antioch. B. returned to Europe to collect troops, and after defeating Alexis in several engagements, was acknowledged by that emperor as Prince of Antioch. He died in Apulia, 1111.—His son, B. II., a minor at the death of his father, assumed the government of Antioch (after Tancred had been regent for some years) in 1126, and was

killed in battle, 1130.—B. III., grandson of the former, was allowed to retain sovereignty only by the clemency of Saladin, and died 1201.—B. IV. (1233—1251) and B. V. (died 1275) were insignificant princes; and with B. VI. the Christian dynasty in Syria was brought to a close.

BÖHME, or BÖHM, JACOB, a German theosopher and mystic, was born of poor parents at Alteidenberg, near Görlitz, in Upper Lusatia, 1575, and spent his boyhood in tending cattle. He received no instruction till he was ten years of age; but even then, the contemplation of earth and sky had so excited his naturally pious imagination, that he conceived himself inspired. He learned the trade of a shoemaker, but continued to devote much of his time to meditation on divine things. About 1612 was published his first book, called *Aurora, or the Morning Redness*. It contains revelations and meditations upon God, Man, and Nature; betokens a remarkable knowledge of Scripture, especially of the apocalyptic books; as also a familiarity with the writings of the mystico-philosophic alchemists. It was condemned by the ecclesiastical authorities of Görlitz; but the persecutions to which its author was subjected, had not the effect of convincing him of his errors. B.'s fundamental speculation is, that the forthcoming of the creation out of the divine unity—which is itself distinguishable into a trinity—can be contemplated by mystic illumination, and expressed in words. The object of his mystic contemplation, accordingly, is two-fold: first, God himself apart from creation, or, to use some of B.'s own synonyms, the groundless, the eternal one, the silent nothing, the *temperamentum*; and, secondly, the forthcoming of the creature out of God. This forthcoming of the creation, which is also an in-going of the silent nothing, is, according to B., the principle of negation, and he calls it 'contrariety.' 'All things,' he says, 'consist in Yes and No. The Yes is pure power and life, the truth of God, or God himself. The No is the reply to the Yes, or to the truth, and is indispensable to the revelation of the truth. So, then, the silent nothing becomes something by entering into duality;' and so on into what most minds will think utter unintelligibility. Numerous attacks from theologians disturbed B.'s last years, but he bore them all with great meekness. They were probably occasioned by a tract on repentance which his friends had printed without his knowledge; and so great was the interest excited, that he was induced by the solicitations of certain courtiers and of his friends to visit Dresden for the purpose of having his doctrines investigated. The court applauded and protected him. On returning to Görlitz, he took ill, and died 27th November 1624. The first collection of his writings was published by Betke (Amsterdam, 1675); the most complete in 1730, at the same place; and the latest (1831—1846) by Schiebler, at Leipzig. Next to Germany, Holland and England are the countries in which B.'s works have been received with most favour. Sir Isaac Newton studied him, and used to make extracts from his works; William Law of Oxford published the best English translation of them in two quarto volumes, 1764; in 1697, Jane Lead, a fanatical disciple of B., founded a sect, called the Philadelphists, for the exposition of his writings; and John Perdage, a physician, is also famed among his English interpreters. Abraham von Frankenbergh, who died in 1652, published the earliest biography of Böhme. In modern times, and in connection with speculative philosophy in Germany, his views, which had come to be regarded as empty mysticism, have acquired fresh interest and importance. This arises from the kindred character of

his fundamental principle with the spirit pervading the systems of Spinoza, Schelling, and Hegel. The intellectual contemplation of the absolute, out of which the contradictions in the world of phenomena proceed, and into which they return, is common to these systems and to B.; Hegel, indeed, expressly represents B.'s negativity, the active principle of development, as an obscure foreshadowing of his own intuitions, and on that account places him at the head of modern philosophy. The terminology of his philosophy, as will be seen from what we have quoted, is utterly fantastic; but his imagination often conceives splendid ideas, which are more profoundly appreciated in the 19th than they were in the 17th century. The latest German treatise on both the life and the doctrine of B. is Wuller's (Stuttgart, 1836).

**BOHN,** HENRY G., a well-known author, translator, and publisher, of German parentage, was born in London, January 4, 1796. It is impossible to estimate too highly the services he has rendered to the community by republishing, at a cheap rate, a vast number of the most valuable works in literature, science, philosophy, theology, &c. Such collections as the Standard Library (130 vols.), the Scientific Library, Library of French Memoirs, the Illustrated Library, the Classical Library (consisting of translations into English of the Greek and Latin authors), the Antiquarian Library, the Ecclesiastical Library, &c., contain the intellectual wealth both of the ancients and moderns. Mr B. has also obtained distinction as the editor of the *Biblioteca Parriana*, of Lowndes's *Bibliographer's Manual*, &c., and as translator of Schiller, Goethe, and Humboldt. He has compiled a *Polyglot of Foreign Proverbs*, an *Illustrated Handbook of Geography*, and a *Handbook of Pottery and Porcelain*.

**BOIARDO, MATTEO MARIA**, Count of Scandiano, one of the most celebrated Italian poets, was born at Scandiano in 1430 or 1434. After completing his studies at the university of Ferrara, he was introduced at the court of Duke Borso d'Este, by whose successor, Ercole I., he was promoted to several honourable offices. In 1478, he was made governor of Reggio; in 1481, governor of Modena; and six years later, he again became governor of Reggio, where he died in 1494. His chief work is the romantic chivalrous poem, *Orlando Innamorato*, which he left unfinished in three books. Former writers had described Orlando only as a cold, pure, champion of Christendom; but B. introduced the element of love, to give an additional charm to romantic adventure. The method in which he does this not only proves him to have possessed a truly creative faculty, but also brings his conception nearer to the reality of history. B. furnished to all his poetical successors, even to Ariosto himself, the personages who figure in their adaptations of the old romance. His work was printed sixteen times before 1545, and was translated into French as early as the 16th century. As it was written in the dialect of the court of Ferrara, it failed to give satisfaction to the Florentines. Accordingly, after several attempts had been made to purify its diction, Lodovico Domenichi (died 1564) produced a *Riformazione* of the poem, 1545, without making any important change in the substance. Berni, in his *Rifacimento*, proceeded further, and gave to the whole poem a tone of burlesque; but his version enjoyed such popularity that it took the place of the original, which was almost entirely forgotten, until it was republished with introduction and critical observations by Panizzi (9 vols. Lond. 1830), and afterwards by Wagner in his *Parnaso Italiano Continuato* (Leip. 1833). The other works

of B. include *Sonetti e Canzoni* (Reggio, 1499); *Il Timone*, a five-act drama (1500); *Cinque Capitoli in Terza Rima* (1523); and *L'Asino d'Oro*, a version of the *Golden Ass* of Apuleius (1523); besides a translation of Herodotus (1533), and of Riccobaldi's *Chronicon Romanorum Imperatorum*.

**BOII**, the name of a Celtic people who at a very remote period seem to have inhabited either the southern part of Belgium, or portion of France in its immediate vicinity, whence they emigrated to Italy. Having crossed the Po, they established themselves in the territory of the Umbrians, lying between that river and the Apennines, and for some hundreds of years waged a fierce war with the Romans. They were defeated at the Vadimonian Lake in 233 B.C.; at Telamon, in Etruria, in 225 B.C., during the great Gallic war, of which they were the original cause; rushed into rebellion on hearing of Hannibal's march, joined him at the battle of the Trebia in 218 B.C., destroyed the entire army of the consul Postumius in 216 B.C., took a prominent part in the revolt of the Gauls under Hamilcar, and in the destruction of Placentia, 200 B.C.; but at length, in 191 B.C., they were completely subdued by Scipio Nasica, who, besides killing a vast number, took from them nearly one-half of their land. At a later period, they were dispossessed of the whole, and driven across the Alps. Their subsequent history and geographical position are not very clear. Those who settled south of the Danube were, after a century, exterminated by the Dacians; those who returned to Gaul, were destroyed by Caesar. The most important migration of the B., however, was to the north of the Danube, where they founded the extensive kingdom Boiohemum, which was overthrown by the Marcomanni under Marobod. But though the dynasty of the B. was thus destroyed, the kingdom retained the name Boiohemum—i. e., home of the B., whence comes the modern Böhmen, or Bohemia.

**BOIL** (allied to Lat. *bulla*, a bubble) is a hard painful swelling of the skin. It begins as a small hard point of a dusky red colour, which is hot, painful, and throbbing. This point extends, and these symptoms increase in severity till about the sixth to the ninth day, when it ceases to enlarge, is of a conical form, with a broad firm base, and on the apex a whitish blister, which contains a little matter; this opens, and after a few days more there is discharged a core or slough of cellular tissue, and the small cavity left heals rapidly, leaving a white depressed scar.

Many kinds of boils have been described, but they may, like other diseases of an inflammatory nature, be divided into those which are *acute* and run a rapid course, as above described; and the *chronic*, which take three or four weeks to 'come to a head.' Boils are most common in the spring, and in young and plethoric persons, and their appearance is quite consistent with robust health. Men in training for boat-races, or others who have suddenly changed their diet and daily habits, are said to be very subject to them. There is a form of B. which generally occurs on the back of the neck, after some disorder of the stomach, in elderly people, hence it is called 'Old People's Boil.' In some, boils continue to succeed each other for a length of time; others are attacked during the night, after having experienced feelings of nausea and languor, by pustules, which are called night-boils (*epinyctis*).

The treatment of boils varies with the subject of them: in many, they are merely critical—in other words, a natural effort 'to relieve some function of the body by a peculiar inflammation of the skin.' The intestinal canal should be cleared out by

laxative medicines, and the digestive powers improved by tonics and antacids. The skin should be kept healthy by frequent washing, while the inflamed spot should be poulticed with poppy-heads or hemlock, mixed with other materials. Wet lint is a sufficient application after the core has been thrown off. If the patient chooses to submit, however, to a momentary pain, he will have the greatest, most permanent, and immediate relief from a cut carried quite through the boil. John Hunter, the great surgeon, got rid of habitual boils by taking repeated doses of soda in milk.

**BOILDIEU.** ADRIEN FRANÇOIS, an eminent French composer, was born at Rouen in 1775. His talent for music was early developed. At the age of eighteen, he brought out a one-act opera in his native town, and two years afterwards he repaired to Paris, where he produced many successful compositions. When the Conservatoire de Musique was established, B. was elected a professor. In 1803 he went to Russia, where he was appointed, by the Emperor Alexander, *maître de chapelle* at the imperial court. He remained in Russia eight years, during which time he produced several operas. In 1811, he returned to Paris, where he brought out *La Dame Blanche*, his most popular piece, *Jean de Paris*, *Le Petit Chaperon Rouge*, and other works. He died in October 1835; and, as a tribute to his genius, the nation honoured him with a public funeral. His native city claimed his heart, and to defray the pomp of its reception in the cathedral, the municipality voted 12,000 francs. The government further marked its sense of his merit by granting a pension to his son.

**BOILEAU DESPRÉAUX.** NICOLAS, an illustrious French poet, was born near Paris, November 1, 1636. After hesitating for some time in the choice of a profession, he betook himself to *belles-lettres*. In 1660, his fine powers first obtained an adequate expression in the satire, entitled *Adieu d'un Poète à la Ville de Paris*. In 1666, he published his seven *Satires*. The favourable reception which they met with, induced him to continue, until he had increased the number to twelve, of which the eighth and ninth are considered the best. In these satires, B. even ventures to castigate the *coryphæi* of the world of letters—Chapelin, Cotin, Scudery, &c. To his honour, however, it must be said that malice does not once animate his pen; he is always pleasant and gay, never cruel. His contemporaries are his laughing-stocks, not his victims. Between the years 1669 and 1696 appeared his *Twelve Epistles*. They indicate a riper genius than the Satires. The versification has more ease and grace; the style, a quicker movement and a firmer consistency; the thoughts are more vigorous, and more strictly concatenated; everywhere there is greater truth, colour, and energy. The one addressed to Racine, who, along with B., filled the office of royal historiographer, is reckoned among his finest. In 1674, B. published *L'Art Poétique*, accompanied by a translation from the Greek of *Longinus on the Sublime*, and the greater part of *Lutrin*. These are by many French critics considered his *chef-d'œuvre*. The first is indeed an exquisite performance, and has been copiously imitated in Pope's *Essay on Criticism*. It lays down rules for almost every species of poetry, in a clearer and more methodical manner than had ever been done before, while the whole poem is sprinkled with touches of delicate satire. The second, *Lutrin*, is a comic epic in six cantos, immensely admired by his countrymen. Besides these, B. wrote several minor pieces, both in prose and verse, such as—*Dialogue des Héros de Roman*, *Diastation sur Joconde*, *L'Arrêt Burlesque*, and *Discours sur la Satire*. A large number of his letters have

been collected. Among them are twenty to Racine. The letters of B. are in general extremely valuable, from the fact that they contain a large proportion of the literary history of the time. They also enable us to form a just idea of his character. He was high-minded, generous, and pure. In fact, his impulsive disposition and imprudent warmth of heart quite contradict the common notion of what a satirist is. When Corneille's pension was ordered to be stopped, after the death of Colbert, B. flew to the king, remonstrated against so 'barbarous a spoliation,' and threatened to resign his own, if the decree were carried into effect. He courageously denounced the persecutors of the nuns of Port-Royal; expressed his admiration of Arnauld, when the latter was on the point of being arrested; extricated out of pecuniary embarrassments many friends; and through sheer kindness of heart, forced on a reconciliation with various of his literary adversaries. An admirer of Pascal, and a friend of the Jansenists, he could yet render homage to the talents of such Jesuits as Bourdaloue, Bonhours, and Rapin; but his most intimate and cherished companions were Molière, Racine, and Lafontaine. Until 1706, B. lived much in public, but after that his bodily infirmities induced him to retire to Auteuil. He died March 13, 1711. B.'s influence on French literature has been immense, and, on the whole, beneficial. Voltaire proclaimed him 'the legislator of Parnassus.'

**BOILER** (Fr. *chaudière*, Ger. *kessel*), the name given to a vessel in which steam, usually for a steam-engine, is generated. In its simplest form, it consists of a close vessel made of metal plate, having apertures for the admission of water and egress of steam, fitted with apparatus for shewing the level of the water and the pressure of the steam, and in connection with a furnace, either internal or external. When water is boiled in an open pan, the temperature of the water and of the steam rising from it, remains at or very near 212° F., and the tension or pressure of the steam is no more than sufficient to make its way into the atmosphere, being exactly equal to that exerted in all directions by the atmosphere itself—namely, 14·7 lbs. per square inch. In a close vessel, on the other hand, the temperature and pressure to which we can raise the steam are only limited by the strength of the vessel or boiler against bursting.

The form of a boiler is determined by two considerations—namely, strength to withstand internal pressure, and efficiency in producing steam; and the object of the designer is to combine in one apparatus sufficient strength to work safely at the proposed pressure, with such a form and arrangement as shall abstract the maximum of heat from the gases of combustion, and at the same time be in all respects suitable to the special circumstances of the case. The globular form is that best adapted for strength, and was the earliest to be used. It presents to the fire, however, the minimum area in proportion to its contents, and therefore has a minimum efficiency. After spherical boilers, cylindrical ones came into use, at first set on end, and afterwards laid on their sides, and later on, these were furnished with internal cylindrical tubes for furnaces. Watt's 'wagon boiler' (so called from its shape) was used for many years, but being quite unfit for any but the lowest pressures, it has long been discarded; and the 'egg-end' boiler, or plain cylinder with hemispherical ends, also much used at one time, has now almost disappeared on account of its small evaporative efficiency. At present, it is quite common to use a working steam-pressure of 50 lbs. per square inch in ordinary factory boilers, and in some cases this is already greatly exceeded, while the tendency to use higher pressures seems to

## BOILER.

grow yearly. Under these pressures, the only forms of boiler which can be used without heavy and expensive internal stays to prevent the danger of bursting, are the globular and the cylindrical. The former shape is rejected for the reason already given, and the latter form is used almost invariably in the construction of modern boilers, as will be seen from the examples given below. The ends of the cylinders, when it is necessary to make them flat, must, of course, be strengthened by stays.

Boilers may be classified in several ways—as (1.) Horizontal and Vertical; (2.) Internally and externally fired; and (3.) Plain, Multitubular, and Tubulous. Large boilers are almost invariably horizontal, but small vertical boilers are often used. They are employed in Steam-cranes (q. v.) and other situations where great length would be an inconvenience, and often in traction-engines, where steep inclines have to be traversed, and where, if a locomotive boiler were used, one or the other end of its tubes might become uncovered, and so get burned. In Great Britain, when moderately good fuel is used, boilers with an internal furnace are generally preferred; but on the continent the common brown coal is much inferior to our fuel, and a correspondingly larger quantity of it must be used to generate a given volume of steam. As the size of a furnace limits the fuel which it can burn, this frequently involves having a much larger grate than could be conveniently arranged inside the boiler, and on this and other accounts boilers are, on the continent, more frequently externally fired than in this country. Under the head of 'plain' boilers come all ordinary cylindrical boilers, with or without internal furnaces, horizontal or vertical. They are the cheapest and simplest which can be made, and, if properly proportioned, possess a considerable evaporative efficiency. When it is necessary, however, to economise fuel, or space, or both, 'multitubular' boilers are used. These derive their name from the fact that in them the flame and gases of combustion are made to pass through a great number of small tubes (surrounded by the water) on their way to the chimney. The steam-generating power of a boiler depends greatly on the extent of surface which it presents to the flame, and it is obvious that a great number of small tubes present a much larger surface than one large tube occupying the space of them all. Thus, with the same heating surface, a multitubular boiler will occupy much less space than a plain one, and at the same time the efficiency of its surface is found to be greater. It is, however, necessarily more expensive and more liable to get out of order. Tubulous boilers differ from multitubular boilers in not only containing tubes, but consisting of them, and having no large cylinders whatever. Their chief advantages are (a) their great strength, for it is easy to make a wrought-iron tube strong enough to withstand pressures far higher than any at present in use; and (b) the peculiarity, that if any accident happens, or explosion occurs, it will only be to one tube at a time, and not to an immense boiler shell (as with the common boiler), and its evil consequences will thus be greatly reduced. For this reason tubulous boilers are often called 'safety' boilers. It will be readily understood that there is no distinct line of demarcation between the three classes of which we have been speaking, but that on account of the immense variety of boilers which have been designed and constructed, those of one class pass through gentle gradations into those of the next.

The commonest form of boiler for factories, &c., is that known as the *Cornish*, and shewn in fig. 1. It consists simply of a cylindrical shell, *a*, *a*, inclos-

ing a much smaller cylinder, *f*, *f*, called a *flue*. The ends of the flue are open, but the space between it and the shell, which contains the water, is of course closed up and made steam-tight. The fire-grate, *d*, is in the interior of the flue, and at the end of it is a brick bridge, *c*, made so as to cause the flame to impinge on the upper side of the flue.

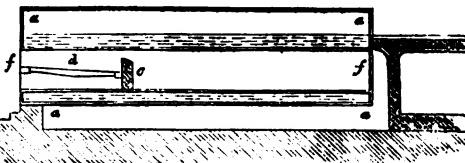

Fig. 1.

The boiler is set in brick-work; and the flame, passing out at the back end of the flue, is made to traverse the whole length of the boiler twice through brick flues before passing away to the chimney.

The Cornish boiler has often two internal flues or tubes, which is a much more advantageous construction than that shewn in fig. 1. The *Galloway* boiler (called after its inventor) is a very excellent modification of the Cornish, which in outward appearance it exactly resembles. It has two furnaces, but these join together in one chamber just behind the bridges, and the gases are made to pass through a space considerably narrowed by side pockets projecting inwards in order that they may be well mixed. From this point to the back of the boiler there is just one flue, made oval in section, and crossed by a considerable number of vertical taper tubes, which form a direct communication between the water beneath and that above the flue. These tubes (called 'Galloway tubes') both promote circulation and strengthen the flue. Multitubular boilers of many kinds are used, both for stationary engines and other purposes, but the largest number of those constructed are certainly for steamers, and a common type of marine boiler is shewn in fig. 2. The shell, *a*, *a*, is cylindrical, and contains one or more cylindrical furnaces; *c* is the fire-grate; *d*, a brick bridge; *e*, a combustion chamber or flame-box; *f*, the tubes through which the flame passes back to the front of the boiler; and *g*, the smoke-box at the

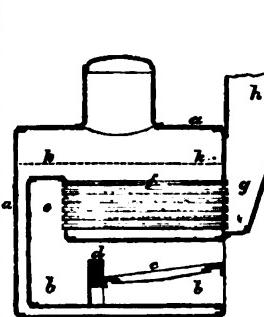

Fig. 2.

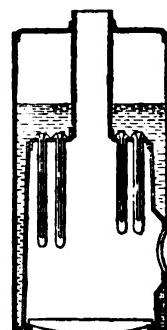

Fig. 3.

base of the funnel, *h*. The line *k*, *k*, shews the ordinary level of the water in the boiler. On board ship it is of course an object to take up as little space as possible with the boiler and machinery, and at the same time to have boilers which shall use as little coal as possible, both because of the saving in cost, and because of the saving in the

## BOILER—BOILING, BOILING-POINT.

room taken up by coal. For all these reasons, marine boilers are invariably multitubular.

The varieties of vertical boilers are as numerous as those of horizontal. When dirty water, or water containing much insoluble sediment, has to be used (as e.g. in steam-cranes frequently), they are of the simplest construction, with nothing but an inner fire-box and an outer shell (both cylindrical), the space between them being filled with water all round and over the top of the fire-box. If clean water can be had, however, and it is desired to be at all economical of fuel, some kind of multitubular vertical boiler must be used, and of these probably the best is that known as the *Field* boiler, and shewn in fig. 3. The peculiarity of it consists in the tubes, which are closed at the bottom, and hang down from the top of the fire-box over the grate bars, and contain inner tubes of much smaller diameter. The latter are intended to aid the circulation of the water, which passes down the inner tube and up again through the annular space around it, where, being most exposed to the action of the flame, it is hottest. Of the different varieties of tubulous boilers, those manufactured by Messrs Howard of Bedford have found most favour; but so far as can be said in the absence of any extended experience as to their working, Sinclair's patent boilers seem to be even more satisfactory. They consist of horizontal wrought-iron welded tubes placed in vertical rows, each row being connected at each end with a vertical tube, also of wrought-iron and of larger diameter. In order that the horizontal tubes may be properly fixed in the vertical ones, a hole must be provided in the side of the latter, opposite the mouth of each of the former. That these holes may be kept tight at any pressure of steam, the ingenious device is adopted of closing them with taper plugs put in *from the inside*, so that the pressure of steam keeps them shut, and the higher the pressure the less possibility of leakage there is. Locomotive boilers are always multitubular, for much the same reasons as marine boilers. The boiler of a single locomotive often contains 1500 or 1800 square feet of heating surface, and occasionally as much as 2000 square feet.

The principal test of the efficiency of a boiler is the quantity of water (generally expressed either in pounds or gallons), which it will evaporate with the consumption of one of coal. Of course this varies very much with the quality of the fuel, but with good pit coal (not dross), a Cornish boiler should evaporate 6 to 8 pounds of water per lb. coal, and a multitubular boiler, such as fig. 2, about 10 or 11 lb. per lb. coal. The best rate of combustion on the grate varies with the construction of the boiler, from 10 to 18 or 20 lb. per square foot of grate surface per hour.

Boilers are almost invariably made of wrought-iron plates riveted together. The parts most exposed to the action of the flame are made of the best quality of iron, and the other parts of inferior qualities, according to their position in reference to the flame. Occasionally boilers are made of steel, where lightness is the chief requisite, but makers have not yet sufficient confidence in steel plates to use them very largely. Copper is often used in the fire-boxes of locomotives, but seldom in any other description of boiler. Brass boiler tubes are often seen, and on account of its better conducting qualities, brass is to be preferred to iron, but its dearness prevents it superseding iron in the great majority of cases.

Every boiler has, to render it complete and workable, a number of *fittings* or *mountings*, of which the following are the principal: A glass gauge to shew the level of the water inside the boiler, and gauge-cocks for the same purpose; a gauge to shew the

pressure of the steam; a cock for admitting water; a cock at the bottom for emptying or 'blowing off'; a valve for the discharge of the steam; one or two safety valves, weighted so that, when the pressure of steam in the boiler reaches a certain height, they open and allow the steam to rush into the air; a door by which a man can get in to clean the boiler, &c.

In order to induce a current of air through the furnace so that a proper combustion may be maintained, stationary boilers are generally provided with a chimney of considerable height, and made of brick or sheet-iron, to which the products of combustion are conducted after they have left the boiler. In locomotive boilers, and in some other cases where a sufficiently tall chimney cannot be made use of, a very powerful current is made by the ejection of the waste steam through a blast-pipe with a contracted nozzle at the base of the chimney. To prevent loss of heat by radiation, and the consequent waste of fuel, boilers should always be covered, in all parts exposed to the atmosphere, with felt or some non-conducting composition.

For further details see also BOILING, MANOMETER, SAFETY-VALVE, STEAM, STEAM-ENGINE, and (in SUPP., Vol. X.) STEAM-CRANE.

**BOILING** (of Liquids)—**BOILING-POINT.** When heat is applied to a vessel containing water, the temperature gradually rises, and vapour comes silently off the surface; but at a certain degree of heat, steam (q. v.) begins to be formed in small explosive bursts at the bottom, and rising through the liquid in considerable bubbles, throws it into commotion. If, after this, the steam is allowed freely to escape, the temperature of the water rises no higher, however great the heat of the fire. The water is then said to *boil*, and the temperature at which it remains permanent is its *boiling-point*. The boiling-point of water is ordinarily 212°; but every liquid has a point of its own. Thus, sulphuric ether boils at 96°; alcohol, at 176°; oil of turpentine, at 316°; sulphuric acid, at 620°; and mercury, at 662°. The boiling-point of liquids is constant, under the same conditions, but is liable to be altered by various circumstances. Water with common salt in it, e.g., requires greater heat to make it boil than pure water. The nature of the vessel, too, exerts an influence; in a glass vessel, the boiling-point of water is a degree or two higher than in one of metal, owing to the greater attraction that there is between water and glass than between water and a metal. But what most affects the boiling-point is variation of pressure. It is only when the barometer stands at 30 inches, shewing an atmospheric pressure of 15 lbs. on the square inch, that the boiling-point of water is 212°. When the barometer falls, or when part of the pressure is in any other way removed, it boils before coming to 212°, and when the pressure is increased, the boiling-point rises.—Thus, in elevated positions, where there is less air above the liquid to press on its surface, the boiling-point is lower than at the level of the sea. An elevation of 510 feet above the sea-level, makes a diminution of a degree; at higher levels, the difference of elevation corresponding to a degree of temperature in the boiling-point increases; but the rate of variation once ascertained, a method is thus furnished of measuring the heights of mountains. See HEIGHTS, MEASUREMENT OF. At the city of Mexico, 7000 feet above the sea, water boils at 200°; at Quito, 9000 feet, at 194°; and on Donkia Mountain, in the Himalaya, at the height of 18,000 feet, Dr Hooker found it to boil at 180°. Boiling water is thus not always equally hot, and in elevated places, many substances cannot be cooked by boiling. Under the receiver of an air-pump, the

## BOILING.

same effect is still more strikingly seen; water may be made to boil at the temperature of summer, and ether when colder than ice. In complete vacuo, liquids, in general, boil at a temperature 140° lower than in the open air. The knowledge of this effect of diminished pressure is now largely turned to account in sugar-boiling, in distilling vegetable essences, and in other processes where the substances are apt to be injured by a high temperature.—By increasing the pressure, again, water may be heated to any degree without boiling. Papin's Digestor (q. v.) is formed on this principle. Under a pressure of two atmospheres, the boiling-point rises to 234°; of four atmospheres, it is 294°; of ten atmospheres, 359°; of fifty atmospheres, 510°.

In a deep vessel, the water at the bottom has to sustain the pressure not only of the atmosphere, but also of the water above it. At a depth of 34 feet, the pressure of the water above is equal to an atmosphere, or 15 lbs. on the square inch; and thus, at the bottom of a vessel of that depth, the water must be heated to 234° before it is at its boiling-point. This principle has been successfully applied to explain the phenomena of the Geysers (q. v.).

If a small quantity of water be poured into a silver basin, heated above the boiling-point, but below redness, it will begin to boil violently, or perhaps burst into steam at once. But if the basin is heated to redness, the water will gather itself into a globule, and roll about on the hot surface, without becoming heated to the boiling-point. For the explanation of this and other interesting phenomena connected with it, see SPHEROIDAL CONDITION OF LIQUIDS.

**BOILING**, in Cookery. One important preliminary rule in boiling rests on the fact, explained in the preceding article, that water cannot be heated in an open vessel, or in one with the ordinary fitting lid of a cooking utensil, to a higher point than 212°. When a vessel, then, has once begun to boil, a stronger fire than is just sufficient to keep it boiling will only evaporate, or waste, the water in steam, but will not cook the food any faster; on the contrary, the outside will be rendered so hard by the quick boiling, that the interior will not be reached by the heat.

By long soaking in cold or tepid water, fresh meat loses much of its albumen and nutritive juice. When a piece of meat is to be boiled, it is necessary, for the preservation of these juices, and its consequent tenderness and nutritious quality, that the outside should be sealed up, by immersing it in boiling water, and keeping up the temperature for a minute; this closes up the pores, and coagulates the albumen of the exterior. The boiling water should then be taken off, and as much cold put in as will reduce it to a tepid state; it should then be gradually warmed until it reaches a degree slightly under the boiling-point, called simmering; at this point it must be kept without suffering any interruption of the heat, till the time elapses that is allowed for cooking the food. The cooking goes on through the agency of the natural moisture of the flesh. Converted into vapour by the heat, a kind of steaming takes place within the piece of meat; it is, when skilfully done, cooked by its own steam.

To prepare meat for *B.*, it should be trimmed, washed, and dried before it is placed in the water. As it simmers, the water should be kept well skimmed with a skimming-spoon, as frequently as any scum is thrown up, but with due remembrance of the fact, that raising the lid of the vessel lowers the temperature of the water; and the preservation of an equal degree of heat throughout the operation is of the greatest importance.

196

For fresh meat, 20 minutes is the allowance for each pound. The weather must also be considered: in frosty weather, or with very thick joints, extra 20 minutes should be given. Mutton loses in boiling, in 1 lb., 3½ oz.; beef, in 1 lb., 4 oz. Meat that has been salted and dried has its outer coat already sealed up; it requires, therefore, to be thoroughly washed, soaked for two hours in cold water, dried, and put to boil in cold water, gradually brought to the boiling-point, and kept simmering for a time, proportioned to the size of the piece. Hams and tongues to be eaten cold, should be allowed to cool in the water in which they have been boiled. The following is a time-table for the cooking of these meats, reckoning from the time the water boils: A ham of 16 lbs. takes 4 hours; a tongue of 16 lbs., 2 to 4 hours; a pig's face of 16 lbs., 2 hours; a piece of bacon of 4 lbs., 2 hours.

**Poultry, and white meats**, as veal or rabbit, should be put at once into tepid water, gradually brought to the boiling-point, drawn back immediately, and simmered, carefully skimming the water as scum rises. A chicken, or small fowl, or rabbit, will take 35 minutes; a fowl, or old rabbit, an hour, or an hour and a half, according to size. Some cooks add milk to the water, but this is apt to cause the scum to stick to the meat in streaks; some also use a cloth to enclose the meat, but this frequently imparts to it a disagreeable taste. Having trimmed, washed, and dried the meat, all that is necessary to keep it white, is to use a perfectly clean utensil, to be attentive to the skimming, and careful that no soot falls from the lid into the pot when doing this. Meat should only just be covered with water; if it wastes, a cupful of water at the same temperature should be added. The liquor in which fresh meat has been boiled, is an excellent foundation for soups and gravies.

**Fish** should be well cleaned and scraped; liver and roe should be carefully preserved, and boiled with the fish, in a fine net: they are used to garnish the fish. The sound of cod should be carefully cleaned, and left in the fish. Fish should be placed in cold water, in which a tablespoonful of salt and one of vinegar is mixed; should be gradually brought to the boiling-point, and simmered carefully, lest the outer part should crack before the thick part is done. If on drawing up the fish-plate, a thin knife will easily divide the flesh from the bone in the thick parts, and if the eyes contract, and become like balls, the fish is sufficiently cooked. Drain by laying the plate across the kettle covered with the lid, and dish perfectly dry on the strainer, which should be covered with a napkin.

**Vegetables** require generally to be well washed, and placed in boiling water, in which is mixed a large spoonful of salt. When they sink, they are done. Green vegetables should be well picked, soaked in salt and water, drained and boiled in plenty of water, in a vessel without a lid. Cabbage requires two waters; spinach, very little, as it is full of moisture. Pease and beans should not soak, but be merely rinsed in a colander. Winter potatoes should soak for an hour or more; whether they should be placed in cold or *B.* water, depends on the sort. A piece of soda the size of a small marble assists the *B.* of pease and cabbage, if the water is very hard.

**For *B.* meat**, the best vessel is one made of iron, tinned inside or not, but one kept perfectly dry, and free from grease or rust. Tinned vessels are proper for *B.* fish and vegetables; they require to be kept very dry, the moisture entering between the metals rusts the iron, and makes holes that cannot be mended. A tinned vessel in daily use should be polished once a week with fine whiting and oil; too frequent

## BOIS BLANC—BOJAR.

polishing wears off the tin. The advantage of a tin over an iron utensil is, that it gains heat sooner.

**BOIS BLANC**, an island of the United States of America, situated in Lake Huron, between Michillimackinac and Michigan. It measures ten miles by three, and has a light-house at its east end.

**BOIS-DE-BOULOGNE**. See BOLOGNE.

**BOIS-LE-DUC** (Dutch, 's Hertogenbosch, 'Duke's Forest'), a fortified town of the Netherlands, capital of the province of North Brabant, is situated at the junction of the Dommel and the Aa, about 28 miles south-south-east of Utrecht. B., which is a clean and well-built town, is about five miles in circumference, and is intersected by canals, has a citadel, two forts, a cathedral—one of the finest ecclesiastical buildings in Holland—an academy of arts, a grammar-school, in which Erasmus was educated, an arsenal, several hospitals, manufactures of linen-thread, woollens, ribbons, cutlery, &c., and several distilleries. Pop., including garrison (1873), 24,162. B. is a place of considerable antiquity, having been founded in the midst of a forest—hence its name—in 1184, by Godfrey III., Duke of Brabant. The forest was cut down by his son and successor Henry, who surrounded the town with walls. In the 16th c. B. separated itself from the States, and was ineffectually besieged, in 1601 and 1603, by Prince Maurice of Nassau, but had to surrender to a Dutch force in 1629. In 1794, B. was taken by the French; and in 1814, retaken by the Prussians.

**BOISSERÉE**, SULPIZ, a celebrated archaeologist, was born at Cologne in 1783. A visit which he and his brother Melchior (born 1786), along with their friend Joh. Bapt. Bertram, paid to Paris in 1803, inspired the trio with the idea of collecting and preserving the scattered specimens of early German art. The realisation of this idea became the single object of their lives. After many years of patient and unwearied research, they gathered together 200 pictures, which received the name of 'the Boisserée Collection.' The king of Würtemberg having presented the brothers with a spacious edifice in Stuttgart, the pictures were transferred thither, and skilfully arranged, according to their age and importance. This brought to light a very important historical fact, previously unknown—viz., that in the 14th c. Germany possessed a school of art based on Byzantine traditions. Great light was also thrown upon many of the Flemish masters, and especially on the influence exerted by Jan Van Eyck. The collection was divided into three sections corresponding to three historical periods—the first comprising the works of the Cologne school in the 14th c.; the second, those of Van Eyck and his disciples in the 15th; and the third, those of the German painters at the close of the 15th and beginning of the 16th centuries. In 1827, the collection was sold to the king of Bavaria; and in 1836 was transferred to the picture-gallery (*Pinakothek*) in Munich, whither the brothers followed it. Sulpiz died in 1841, and Melchior in 1851. The former has left several interesting and valuable works; such as, *Monuments of Architecture on the Lower Rhine, from the 7th to the 13th c.* (Munich, 1830—1833); *Concerning the Temple of the Holy Grail*, 1834; *Collection of Old Low and High German Paintings, with Notices of the Early Painters*, by Sulpiz and Melchior B. and Joh. Bapt. Bertram, *lithographed by J. V. Strixner* (Munich, 1822—1839); and a very magnificent work, entitled *Views, Plans, Sections, and Details of the Cathedral of Cologne, with Restorations after the Original Plan, accompanied by Researches on the Architecture of Ancient Cathedrals, &c.* (Paris and Stuttgart, 1823—1832).

**BOISSY D'ANGLAS, FRANÇOIS ANTOINE, COUNT**, an eminent French statesman, was born at St Jean Chambre, in the department of Ardèche, December 8, 1756. After filling for some time the office of major-domo to the Count of Provence (Louis XVIII.), he was about to devote himself to the peaceful pursuits of science, when he was elected a deputy to the States-general. While a member of the Constituent National Assembly, he was accused of having a design to change the French monarchy into a Protestant Republic. During the Reign of Terror, fear of 'the Mountain' kept him quiet; but, yielding to the solicitations of Tallien and Barère, he joined the conspiracy against Robespierre. Two months after the execution of the tyrant, he was elected secretary of the Convention; and shortly after, a member of the Committee of Public Safety, in which capacity he displayed remarkable talent and discretion. As director of the supply of provisions for Paris, he was exposed to popular hatred and great peril during the riotous and sanguinary proceedings of the 12th Germinal and 1st Prairial in the year 3 of the Republic; but firmness and presence of mind preserved him. He was afterwards president of the Council of Five Hundred; was called into the senate by Napoleon; and made a peer by Louis XVIII. Through all the changes of the times, he maintained the principles with which he had commenced his career. He died in Paris October 20, 1826. His chief writings are, *Recherches sur la Vie, les Ecrits, et les Opinions de Malesherbes*, 1819, and *Études Littéraires et Poétiques d'un Vieillard*, 1826; but, in addition to these, he published numerous essays, pamphlets, and letters.

**BOJADO'R, CAPE**, a headland on the west coast of Africa, in lat. 28° 7' N., long. 14° 29' W., forming the western extremity of the Jebel Khal (or Black Mountains), a rocky ridge running eastward into the Sahara. In consequence of its extreme flatness, and the shoreward tendency of the currents, the coast, extending northwards to Cape Nun, is one of the most dangerous that mariners have to encounter, and is frequently the scene of shipping casualties. The Portuguese doubled this cape in 1433, and from them it received its name B.C., signifying 'a round cape.'

**BOJA'NO**, a town in the province of Campobasso, Italy, 13 m. S.W. of the town of Campobasso. It is situated on the Biferno, in a deep gorge at the foot of the mountain-range of Matese; has a cathedral and some ancient remains. It has suffered greatly from earthquakes, and especially from one which occurred in 1805. Pop. 3000. The site of B. has been identified as that of the famous Samnite city of *Bovianum*, which played so conspicuous a part in the Samnite, Punic, and Social wars. Unsuccessfully besieged by the Romans in 314 B.C., it was taken by them in 311, and yielded immense spoils. Passing out of their hands, it was retaken by them in 305 B.C.; and once more reverting to its original owners, was a third time captured by the Romans, in 298 B.C. During the second Punic War, it formed the head-quarters of the Roman army on more than one occasion; and in the great Social War, the confederates, on the fall of Corfinium, made it their capital and the seat of their general council. Surprised by Sulla, it was retaken by the Mariac general, Pompeius Silo. Caesar established a military colony here; and afterwards, under the Roman empire, the town seems to have recovered considerably from the ruin which overtook it on the general devastation of Samnium.

**BOJAR** (pronounced *Boyar*), a word originally of the same meaning as Czech, Lech, and Bolgarin, i.e., free proprietor of the soil. The Bojars, in old

Russia, were the order next to the knjazes or knjesses (ruling princes). They formed the immediate 'following' of these princes, and bore somewhat of the same relation to them as the lesser English and Scottish knights of the feudal ages did to the great barons Percy, Douglas, &c. They had their own partisans, who served them as a kind of body-guard; they gave their services to a prince of their own choice, whom, however, they left again at their pleasure, and, in consequence of this, the knjazes could only secure their allegiance by the bestowment of privileges which were often abused. They held exclusively the highest military and civil offices, and were so universally looked up to by the mass of the people, that the most powerful rulers, even Ivan the Cruel, considered it prudent to use this form of expression in their ukases: 'The Emperor has ordered it; the Bojars have approved it.' Rank among the Bojars was always proportioned to length of state-service, and was observed with the utmost rigour, so that the B. who had obtained an office, as it were, yesterday, looked down with proud contempt on him who only entered on his to-day. This singular mode of securing gradation of rank was called *miesniczestwo*. It was a most peculiar phenomenon of Slavie life, equally unlike feudalism and modern aristocracy, and must be regarded as a strictly national development. In their housekeeping the Bojars were excessively fond of splendour, and their contempt for the serfs or 'lower orders' was immeasurable. In the lapse of time, many Chinese customs—as might be expected from their theory of rank—crept into their public life. Their power, and the respect which was paid them, acted as a wholesome check upon the otherwise unbridled authority of the princes; in consequence of which, the latter became their bitter enemies, and often sought to destroy their power. This was finally done by Peter the Great, who abolished the order of Bojars by giving them a place among the Russian nobility, but, at the same time, stripping them of their peculiar privileges. The last B., Kniaz Ivan Jurjewicz Trubeckoj, died 16th January 1750.

In Moldavia and Walachia, bojars still exist. They have a seat and vote in the council of the Prince, and, as recent history shews, exercise at times a most extensive influence.

BOKHARA (i. e., Eastland), or USBEKISTAN, is the name given to the countries of Independent Tartary, under the rule of the khan of Bokhara. The most important part of it formed the ancient Sogdiana. The extent of the khanate of B. has been constantly undergoing changes. Until recently, it included the whole basin of the Zar-afshan; but the Russians have now annexed Samarcand, and the lower basin of the river forms the essential part of the territory. The population of the present khanate has been estimated at from 1,000,000 to 2,500,000.

Only in the neighbourhood of the rivers is cultivation possible. The rest of the soil of B. is composed of a stiff arid clay, interspersed with low sand-hills. B. belongs exclusively to the basin of the Sea of Aral. It has only three rivers of any importance—the Amu or Jihun (anciently the Oxus), the Zar-afshan, and the Kurshi. Entering B. at Kushtappa, the Amu flows through the country in a west-north-west direction to the Sea of Aral. Its banks in some parts are very fertile, especially in the neighbourhood of Balkh. The Zar-afshan, which rises in the spur of the Thian-shan Mountains, after a course of about 200 miles, issues out into the plain near Samarcand, and thence fertilises the district (Meankal) to the city of Bokhara. Before reaching the city, it sends out a northern branch, which, after a fertilising course of several miles, is absorbed in the sand. The

southern branch passes B. to the north, and terminates in the lake of Kara-kool, a sheet of salt water about 25 miles in circumference, which is connected with the Amu by irrigating canals. The valley of the Zar-afshan is the richest as well as the most populous in Bokhara. The Kurshi has a course of about 60 miles before it is lost in the desert.

The climate of B. is moderate and healthy. Its geographical position secures B. the transit-trade between Russia and the south of Asia. The rains usually commence and end with February. Violent sand-storms are frequent, and occasion ophthalmia among the inhabitants, who are also subject to the attacks of the guinea-worm, which penetrates into the flesh, causing great pain and annoyance.

Minerals are scarce. The sands of the Oxus yield gold. Salt deposits are numerous. Alum and sulphur are found in the vicinity of Samarcand, and sal-ammoniac in the mountainous districts. The other products include rice and cotton, wheat, barley, beet-root, vegetables, hemp—which is only used in the preparation of an intoxicating liquor called *bhang*—alk, fruits in immense abundance, and tobacco. The camel's thorn, a plant that grows luxuriantly in Samarcand and Kurshi, exudes a saccharine gum or manna, extensively used as sugar.

Sheep and goats form a great source of wealth. Camels are numerous and valuable; the horses are celebrated for their strength and endurance; and the breed of asses is excellent.

The industry includes the manufacture of silk-stuffs, cotton-thread, shagreen, jewellery, cutlery, and fire-arms. The population, like that of the other khanates of Turkestan, consists chiefly of Tajiiks of Persian, and of Usbekhs and Turkomans of Turkiah origin.

B. was conquered by the Arabs in the beginning of the 8th c., who were dispossessed of it in 1232 by Genghis Khan. It fell into the hands of Timur in 1303, and was taken by the Usbekhs in 1505, and it has since remained under the rule of the same Turkish race. During the 18th c., the khans were characterised by the worst abominations of eastern vice and fanaticism; and Bokhara lost its pre-eminence among the khanates of Turkestan. The canals, which alone gave fertility to the country, were neglected; and large areas were again overspread by the desert; the population diminished; B. became a centre of corruption and anarchy. About thirty years ago, it was ruled by the Khan Nasrullah, a barbarous and incapable tyrant. It was he who caused, in 1843, the murder of Colonel Stoddart and Captain Conolly, who went on a mission to B. Dr Wolff, who visited the country in 1844, with a view to ascertain their fate, narrowly escaped with his life, after a detention of some months. After the capture of Tashkend by the Russians in 1865 (see TURKESTAN), a religious war was preached against the Russians, and the khan, Muzaffer-Eddin, was compelled to oppose them. He was defeated at the battle of Idjar on 20th May 1866, and in May 1868, Samarcand (q. v.), one of the most important cities of B., was taken. The command of the upper course of the Zar-afshan, which fertilises the central part of B., placed the khan entirely under the power of Russia. On the 30th July 1868, a peace was concluded, by which Samarcand was ceded to the czar, and stipulations were entered into, favourable to Russian trade. The treaty caused great dissatisfaction to the fanatic Mussulmans of B. They rose in rebellion, placing at their head Khan Abdul Malik Mirza, the son and heir of the khan. The Russians, on the intercession of the khan, aided him; and in October the rebels were defeated near Karchi. The rebel prince sought refuge in Afghanistan. Shere Ali, the ameer, gave him a warm

welcome, and would have invaded Bokhara had he not been restrained by Lord Mayo, the Indian viceroy, who told him that England could not encourage him in any attack on his neighbours. While Shere Ali was meditating an invasion of B., Abdulrahman, a nephew of Shere Ali, who had married a daughter of the khan of B., endeavoured to obtain Russian aid in invading Afghan Turkestan with a Bokharian army. But, in this case, Russia opposed the enterprise (see AFGHANISTAN). During the invasion of Khiva in 1873, the khan of B. efficiently assisted the Russians, and was rewarded by a large addition to his territory from the Khivan possessions on the right bank of the Oxus, under the treaty entered into between Russia and Khiva in July 1873.—See *History of Bokhara from the Earliest Period to the Present Time*, by Arminius Vambery (1873).

**BOKHARA** (honoured with the title of the 'Treasury of Sciences'), a famous city of Central Asia, capital of the above khanate, is situated on a plain in lat.  $39^{\circ} 48' N.$ , long.  $64^{\circ} 26' E.$ , in the midst of trees and gardens. It is between 8 and 9 miles in circumference, and surrounded by embattled mud-walls, about 24 feet high, and pierced by 11 gates. The houses, which are small, ill-lighted, and, with the exception of those belonging to the wealthy, uncomfortable inside, are built of sun-burnt bricks on a wooden framework; and the roofs of all are flat. The streets are ill-paved and very narrow, the widest barely sufficing for the passage of a loaded camel, while others are not more than 3 or 4 feet across. The palace of the khan occupies an eminence of between 200 and 300 feet in height in the centre of the city. It is surrounded by a brick-wall of 60 or 70 feet high. The area includes, besides the palace, the harem, which is quite embosomed in trees; various public offices, the residences of the vizier and other important state-functionaries, the barracks, royal stables, &c., and three mosques. The mosques, which are said to be 360 in number, necessarily form one of the greatest features of Bokhara. The most imposing one occupies a square of 300 feet, and has a cupola 100 feet high, ornamented with blue tiles. Attached to it is a tower of about twice the height, built by Timur, from which criminals are hurled. B. is celebrated as a centre of learning, and has, in addition to a vast number of schools, 103 colleges, at which, in 1840, it is stated there were 10,000 students. As a commercial town, B. is the most important in Central Asia. A canal intersects the city, but during the summer months it is often dried up, and water becomes very scarce. Pop. estimated at 70,000. See TURKESTAN.

**BOKHARA CLOVER.** See MELILOT.

**BO'LA BO'LA**, or **BONA BONA**, or **BORA BORA**—the liquids *i.*, *n.*, *r* being interchangeable, or rather, perhaps, undistinguishable in the languages of Polynesia—one of the Society Islands, about 200 miles to the north-west of Tahiti. It is in lat.  $16^{\circ} 32' S.$ , and long.  $151^{\circ} 52' W.$ , presenting a valuable landmark in a double-peaked mountain of considerable height. It contains about 1800 inhabitants; and it is about 24 miles round, beset by coral-reefs, some of them rising into islets.

**BOLAN PASS**, a hollow route ascending in a generally west direction from Sind, on the Indus, through Beloochistan to Candahar and Ghuzni. Its entrance and its outlet are respectively 800 and 5793 feet above the level of the sea. The total ascent, therefore, is about 5000 feet, which, on a length of barely 55 miles, gives an average of fully 90 feet to the mile. Along the bottom of the pass descends a torrent, which the road generally

follows. The route, without being impracticable, is highly defensible in a military point of view. It is bounded throughout by eminences of at least 600 feet in height; and yet, in 1839, a division of the British army, which invaded Afghanistan, accomplished, with a heavy train of artillery, the whole distance in 6 days. From the outlet of the B. P. there is no fall towards the west, the spacious plateau of the Dasht-i-Bedowlut retaining the level of the upper extremity.

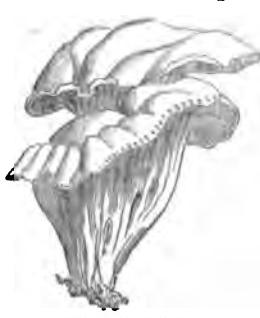

**BOLBEO**, a well-built town of France, in the department of Seine-Inférieure, about 18 miles north-east of Havre, on the railway between that place and Paris. B. is situated on a stream of the same name, which supplies the water-power for several mills, where woollen, linen, cotton, and chemicals are manufactured. Pop. (1872) 9048.

**BOLE** is the term applied to an earthy mineral resembling clay in structure, and consisting essentially of silica, alumina, and red oxide of iron. It occurs in nests and veins in basalt and other trap rocks, in Scotland, Ireland, France, Armenia, Italy, Saxony, and South America. It feels more or less greasy when placed between the fingers; is of different colours—yellow, red, brown, and black; has a dull resinous lustre, but a shining streak; is readily friable; and often adheres to the tongue when brought in contact therewith. *Armenian B.* has a red tint, is often used for colouring false anchovies, and is also employed in colouring tooth-powders. *Lemnian Earth* is the B. from the island of Lemnos, is red in colour, and was at one time prescribed by medical men as a tonic and astringent medicine; and acted beneficially, no doubt, from the large percentage of oxide of iron present. The boles which are employed in veterinary practice in Europe are generally made from Armenian bole. The savage tribes in South America eat B. to allay the pangs of hunger; and the inhabitants of Java use cakes made of it, under the name of *Tanaampo*, when they wish to become slender. When B. is calcined, it becomes hard; and when afterwards levigated, a coarse red kind is used as a pigment in Germany under the names of *English red* and *Berlin red*. *French B.* is pale-red; *Bohemian B.*, reddish-yellow; *Silesian B.*, pale-yellow; and *Elois B.* is yellow.

**BOLERO**, a Spanish national dance, mostly in the time of a minut, with a sharp, marked, and peculiar rhythm. It is accompanied with the castanets and the cithera, and frequently with the voice; and the dancer in the movements seeks to represent the different degrees of feeling from coyness to the highest ecstasies of love.

**BOLETUS**, a genus of *Fungi* (q. v.), of the division *Hymenomycetes*, subdivision *Polyporei*. The older botanists included in it the numerous species

now forming the genus *Polyporus* (see *AMADOU*, *DREY ROT*, and *POLYPORUS*) and other genera; but even as now restricted, it is a very extensive genus. Most of the species resemble the common mushroom and other species of *Agaricus* in form; but instead of gills, the under-side of the cap (*pileus*) is occupied by a layer quite distinct from it in substance, and

*Boletus edulis.*

pierced by pores so as to be composed of a multitude of small tubes united together, on the inside

of which the spore-cases or seed-vessels are produced. Some of the species are edible. *B. edulis* is much used in France, also in Germany, Hungary, Russia, &c. It is the *Ceps ordinaires* of the French markets. It grows on the ground in thin woods of oak, chestnut, or beech, and sometimes in mountainous districts, in places covered with moss, heath, or grass. In moist warm summers, it sometimes appears in prodigious quantities. It has also been partially cultivated, by enclosing a portion of a wood, and watering the ground with water in which the plant has been steeped, thus, in fact, sowing its minute seeds or spores. In Britain, it is comparatively rare. The cap is smooth, 6 or 7 inches across, with a thick margin, varying in colour from light-brown to brownish-black; the tubes at first white, then yellow, and finally yellowish-green; the stem thick and solid, beautifully reticulated. The tubes are removed along with the skin and stem, and only the flesh of the cap is eaten, which is firm, white, delicate, of agreeable smell, and is prepared like the common mushroom, dried to flavour sauces, ragouts, &c., or eaten raw with salt and pepper. It is wholesome and nutritious, and this is certainly to be reckoned one of the very best of the edible fungi, and deserves much more attention than it has yet received in Britain.—*B. scaber* is another edible British species, but much inferior.—*B. aeneus* is the *Ceps noir* of the French markets, and *B. aurantiacus* is the *Gyrole rouge* or *Roussille*. They are used like *B. edulis*.

BOLEYN, ANNE, wife of Henry VIII., king of England, was born about the year 1507. Her father was Sir Thomas B., afterwards Viscount Rochford and Earl of Wiltshire; her mother, the daughter of the Duke of Norfolk. In her seventh or eighth year, Anne B. went to France with Mary, sister of Henry VIII., and remained in France after Mary—who had married Louis XII.—returned to England as a widow, under the protection of Queen Claude, wife of Francis I., who was much pleased with her beauty and liveliness. It is not known exactly when she returned to England, but it is certain that she was one of Queen Catharine's maids of honour in 1527, in which year the king appears to have conceived and expressed a passion for her, to which she apparently refused to listen on other condition than that she should become his wife. Henry's religious scruples regarding the lawfulness of his marriage with Catharine, whether he had entertained them before (as is alleged) or not, certainly became much more impatient than they had hitherto been—much too urgent, indeed, for the slow decision of the court of Rome. He, accordingly, without waiting for the award of his Holiness, entered privately into matrimonial relationship with Anne B., in January 1533, or, as some authorities have it, in the November previous. In September 1533, the Princess—afterwards Queen—Elizabeth was born. The new queen, naturally light and gay of heart, and educated at the French court, where these qualities were likely to be developed to the utmost, conducted herself towards the courtiers with an easy familiarity not customary in England for one in her position. Concerning the first two years of her married life, we have little information, only it is known that she was favourable to the Reformation, and promoted a translation of the Bible. In 1535, the affections of the king appear to have become alienated from her. According to some historians, the amorous monarch had already fixed upon a successor to Anne B.; others make out that his passion had nothing to do with her death, and assert that Henry contracted his unseemly hasty marriage with Jane Seymour solely at the request of the peers and privy council. If this

latter statement could be thoroughly relied on, it would no doubt tell strongly against Anne B., as there would then be no apparent motive for Henry seeking her condemnation if she were innocent. Between conflicting historians, one may well hesitate to decide on this point. In February 1536, the queen gave birth to a son, still-born. The king now became more and more estranged from her; and her freedom of manners had given but too good grounds for her enemies to speak evil of her. On the 1st of May, the annual tournament was held at Greenwich, in presence of the king and queen. The tilting had commenced, the challengers being Viscount Rochford, brother to the queen, and Sir Henry Norris, one of the gentlemen of the king's privy chamber. Suddenly the king rose—his outward bearing manifesting inward disturbance—left the tourney, and with a small party rode up to London, leaving the queen at Greenwich. The popular account is, that the king's sudden departure was occasioned by the discovery of a handkerchief belonging to the queen in the possession of Norris; but the necessity for any such romantic and sudden cause of jealousy is obviated by the fact, that, in the previous week, a commission, composed of members of the privy council, had been secretly engaged in examining into charges of adultery against Anne; and two of her alleged accomplices in the crime, Sir William Brereton, a gentleman of the king's household, and Mark Smeton, a musician at court, had been already arrested. The queen remained at Greenwich that night. On the following morning, she was examined before the privy council, under the presidency of the Duke of Norfolk, her uncle, but a bigoted Roman Catholic, and protested her innocence. In the afternoon, however, she was sent up the river to the Tower. Sir Henry Norris, and Sir Francis Weston, another courtier, along with Smeton, were also examined, and all at first declared their innocence of the charge imputed to them; but afterwards the musician confessed to the crime. Norris, too, it is said, made a like confession; but he indignantly repudiated it the next day, on the ground that he had been entrapped into it unwittingly. In the Tower, the queen's every action and word were watched and reported on; but anything she said while a prisoner seems quite as compatible with innocence as guilt, although her words unquestionably prove her to have exhibited a dangerous levity towards the courtiers; for which, however, her French education may be held to account. Her letter to Henry, written on the 6th May, speaks decidedly in her favour. On the 10th May, the grand jury of Middlesex found a 'true bill' on the indictment, which charged the queen with committing adultery with no less than five persons, including her own brother, Lord Rochford, and of conspiring with them, jointly and severally, against the life of the king, the adultery being alleged to extend over a period of nearly three years. On the 11th, the grand jury of Kent found a true bill likewise. On the 12th, the four commoners, Brereton, Weston, Norris, and Smeton, were found guilty, the last confessing to the charge of adultery only, the other three pleading not guilty to both charges. On the 15th, the queen and her brother were tried before twenty-seven peers, the president being the Duke of Norfolk. They affirmed their innocence; but they were found guilty, and condemned, the queen to be burned or beheaded on the Tower green. On the 17th, Smeton was hanged, and the other four beheaded; general protestations of unworthiness by them at the hour of death being regarded by some historians as evidence of particular guilt. On the 19th, the queen was beheaded—having

previously confessed to Cranmer some engagement that rendered her marriage with the king illegal—with her last words praying a blessing on Henry, who, she said, had ever been to her a good and gentle lord, but making no confession of guilt.

It is difficult, if not impossible, to form anything like a just and satisfactory estimate of the character of Anne B.; historians, for the most part, having made her but a lay-figure upon which to hang the drapery of religious partisanship, or to display the colours of individual sympathy. That, with the courtiers, she maintained not that dignity which becomes a queen, but was unguarded in manner, and thoughtlessly free of speech, there can be no question; there is much room to doubt that she was guilty of the heinous offences laid to her charge. A woman who resisted for years the criminal solicitations of the king, was not likely to seduce systematically grooms of the chamber; nor is it at all probable that one so diabolically bad as she must have been, if the charges alleged against her were true, could be so utterly devoid of that cunning necessary to the practice of successful wickedness. Again, it seems scarcely possible that such an extensive system of conspiracy and crime could have been carried on for nearly three years without being noticed by the lynx eyes, and blown upon by the calumnious tongues, of her numerous and powerful enemies, especially if there were truth in the statement in the indictment, that her accomplices were 'very jealous of each other.' On the other hand, it appears monstrous to suppose that seventy noblemen and commoners of England, before whom the case in its various stages came, against most of whom even slander had not a word to say, should have deliberately condemned a queen and five of her associates, and their own, without conclusive evidence. In the absence of the evidence which they had before them, however, it appears to us that the proper verdict for history to pronounce is the intermediate one of *not proven*.

**BOLINGBROKE, HENRY ST JOHN, VISCOUNT,** born at Battersea, October 1, 1678, was educated at Eton and Oxford, after which he travelled for about two years on the continent, and in 1700, shortly after his return, married the daughter of Sir Henry Winchcomb, from whom, however, he soon separated. Up to this period, he was chiefly notable for his extreme dissipation; but having entered parliament in 1701, he devoted himself to politics, and joining the Tory party, soon made himself prominent as an orator. In 1704, he was made Secretary at War. This office he retained till 1708, when the Whigs came into power, after which he retired from politics, and gave himself up to study, but still retained great influence as the queen's favourite counsellor. On the fall of the Whig party in 1710, he was made Secretary of State for Foreign Affairs. In 1712, he was called to the House of Lords by the title of Viscount Bolingbroke, and in 1713, against the wish of nearly the entire nation, concluded the peace of Utrecht. Having previously quarrelled with his old friend Harley—now Earl of Oxford, and his most powerful rival—he contrived his dismissal in July 1714, and immediately proceeded to form a strong Jacobite ministry, in accordance with the well-known predilections of his royal mistress, whose death, however, a few days after, disconcerted his dangerous and unprincipled schemes. The accession of George I proved a death-blow to his prospects. On the 28th of August, he was deposed from office; in March 1715, he fled to France; and in August of the same year was attainted. For some time he held the office of Secretary of State to the Pretender; but his

restless and ambitious spirit yearned for the 'large excitement' of English politics. His efforts to obtain a pardon not proving in the meantime successful, he retired to a small estate which he had purchased near Orleans. In 1718, his first wife died, and in 1720 he married the rich widow of the Marquis de Vilette. A judicious use of this lady's wealth enabled him to return to England in September 1724. His property was restored to him, but he was never permitted to take his seat in parliament. He therefore betook himself to his villa at Dawley, near Uxbridge, where he occasionally enjoyed the society of Swift, Pope, and others of his old friends with whom he had corresponded in his exile, and where he diversified his moral and metaphysical studies by his attacks on the ministry in his periodical the *Craftsman*, in which the letters forming his *Dissertation on Parties* first appeared. In 1735, finding his political hopes clouded for ever, he went back to France, in deep chagrin, and continued there till 1742. During this second residence abroad, he wrote his *Letters on the Study of History*, in which he violently attacked the Christian religion. He died, after a long illness, 1751. His talents were brilliant and versatile; his style of writing was polished and eloquent; but the fatal lack of sincerity and honest purpose which characterised him, and the low and unscrupulous ambition which made him scramble for power with a selfish indifference to national security, hindered him from looking wisely and deeply into any question. His philosophical theories are not profound, nor his conclusions solid, while his criticism of passing history is worthless in the extreme. He was one of those clever, unscrupulous men, unhappily too common, who forget that God has something to do with the government of this world as well as themselves, and who, in spite of all their ability, can never see that swift destruction treads, like Nemesis, on the heels of those who dare to trifle with the interests and destinies of a great people. His collected writings were published by Mallet (5 vols., Lond. 1753—1754).

**BOLIVAR, SIMON** (named *El Libertador*, for having rescued South America from the Spanish yoke), was born at Caracas, July 25, 1783, descended from a noble and wealthy family. Having studied law at Madrid, he travelled extensively on the continent, married, and returned to his native country, where his wife soon after died. On her death, he again visited Europe, and in 1809 the United States, from which he returned with the determination to free his country from foreign despotism. Arriving at Venezuela, he at once associated himself with the patriots there; and after the insurrection of Caracas, April 19, 1810, he was sent to London with a view to interest the British cabinet in their aims. The British government, however, declaring its neutrality, B. speedily returned, and fought under General Miranda in several successful engagements. The Spaniards having again obtained possession of Venezuela, B. had to flee to Curaçoa. He did not, however, remain long inactive. Sympathised with by the republican president of New Granada, he raised a force of volunteers; defeated the Spaniards several times, his army increasing with each victory; and on August 4, 1813, entered Caracas as a conqueror, was hailed as the liberator of Venezuela, and made absolute dictator in all civil and military affairs. After defeating the Spaniards in several engagements, he was himself worsted at the battle of La Puerta, and again in August at San Mateo, where he had a narrow escape. He now went to Cartagena, and afterwards to Kingston, in Jamaica, where an assassin, hired by the Spaniards, tracked his steps,

## BOLIVAR—BOLIVIA.

but, by mistake, murdered his secretary. Having visited Hayti, and assembled there the insurgent refugees, he landed with them on the island of Margarita, December 1816, where he convoked a congress, instituted a government, proclaimed the abolition of slavery, and immediately manumitted his own slaves. The following two years were marked by successes over Morillo. In February 1819, a congress was opened at Angostura, and B., chosen president, was armed with the power of dictator. Having conducted his forces over the almost impassable Cordilleras to New Granada, he achieved the victories of Tunja and Bojaca, and soon afterwards declared New Granada united with Venezuela as a republic, under the name of Colombia. The office of president was conferred upon him. 1822 saw the new republic completely cleared of royalist troops, and B. was summoned the same year to help the Peruvians, and was named dictator of Peru. After two years' fighting, the Spaniards were driven from Peru also.

B. now made a tour through the southern provinces of Peru, where he was hailed with every demonstration of rejoicing. The name of the country was changed in his honour to Bolivia (q. v.), and a million of dollars was given him, which he devoted to the liberation of 1000 slaves. The Bolivian code was adopted by Bolivia in December 1826, and in the following year by the congress of Lima, where B. was made president for life. In the meantime, dissatisfaction prevailed in Colombia, to which he returned, and, notwithstanding some dissent, was confirmed in the presidency in 1826, and again in 1828. About this time a conspiracy threatened his life, but was suppressed by the execution of the leaders and the banishment of seventy accomplices. Meanwhile, his famous code was renounced in Peru, and B. was ejected from the presidency. In 1829, Venezuela separated itself from the republic of Colombia, which was generally disturbed by faction, and B.'s ambition was loudly denounced. B. accordingly laid down his authority in January 1830, notwithstanding earnest entreaties to retain it, and retired, in failing health, to Cartagena. The congress of Bogota voted him a pension of 30,000 piastres, and awarded him the thanks of the Colombian people. He died at San Pedro, December 1830, having, shortly before his death, written a farewell address to the people of Colombia, in which he vindicated his character from the aspersions that had been cast on it, and complained bitterly of ingratitude. The war of liberation, and the peculiar elements with which he had to deal, compelled him to assume dictatorial power; but there is no proof that he was ever insincere in his devotion to liberty. His property was mainly devoted to the service of his country. He has been described as the Washington of South America. Like other great men, he was rightly estimated after his death. By a resolution of congress, New Granada, 1842, his ashes were removed with great pomp from Santa Marta to Caracas, where a triumphal arch was erected to his memory.

**BOLIVIA**, or **UPPER PERU**, a republican state on the west side of South America, deriving the former name from Bolivar (q. v.), and the latter from the fact that it had originally been subject to the Incas. It extends between lat. 10° and 23° S., and long. 57° 30' and 70° 10' W., touching the Pacific on the S.W., Peru on the W. and N., Brazil on the N. and E., and lastly, the Plate Provinces and Chili on the S.; its area, now better defined than formerly, by treaties made with Chili and Brazil in 1866 and 1867, being about 529,200 square miles. In 1861, the population of European origin was estimated to be 1,742,352;

later returns give 1,811,368. The Indians are said to number about 245,000. B. is divided into the departments of La Paz, Potosi, Oruro, Chuquisaca or Sucre, Cochabamba, Beni, Santa Cruz, Tarija, and Atacama. Hydrographically, the country may be regarded as unique. Its maritime territory, known, in fact, as the Desert of Atacama, is a sandy waste, which, with the inconsiderable exception of the Loa, does not send a single stream that is worthy of notice into the Pacific. Again, the plateau, chiefly Bolivian, of Titicaca, shut out alike from either ocean, loses its entire drainage in the Lake of Paria. Lastly, the region to the east of the Andes is a cradle at once of the Plata and the Amazon, gathering for the former the Pilcomayo and the Paraguay, and for the latter the Beni, the Mamore, and the Guapai. In each section of B., the hydrography may be said to be a clue to the rainfall. On the almost riverless shore of the Pacific, the air is nearly as dry as the earth; to the east of the mountains, the trade-wind vapours from the Atlantic are copious enough not only to feed, but to flood the parent-streams of the mightiest rivers on the globe; and within the valley of Titicaca, which has a minimum height of 12,441 feet, the clouds barely supply the comparatively scanty evaporation of so lofty a surface. With regard to temperature, B., almost entirely a tropical region, may claim to embrace all the zones in the world. Each locality, excepting, of course, the sandy wastes on the Pacific, has its own peculiar vegetation. Even the arid brows of the Andes yield a coarse grass, which forms the favourite food of the guanaca, llama, alpaca, and vicunha—animals almost as independent of water as the camel. The table-land of Titicaca produces abundantly maize, rye, barley, and wheat. Hitherto, however, B. has been remarkable mainly for its mineral productions. The silver mines of Potosi, after having, on a well-founded estimate, completed the full tale of 2000 millions of dollars, are believed to be inexhaustible; while gold, lead, tin, salt, sulphur, nitre, and copper are abundant. The foreign trade labours under heavy disadvantages. In the days of Spanish connection, it was almost exclusively carried on—though quite as much by land as by water—along the line of the Plata; but since then, it has found its most convenient channel through the Peruvian marts of Arica and Tacna. With the aid of steam, however, the external traffic might make for itself great highways of the Plata and the Amazon. The imports, confined to articles of the highest value or of the first necessity, are principally iron, hardware, and silks; and the exports, besides the precious metals, are copper, guano, nitre, cacao, Jesuits' bark, skins, tobacco, and native manufactures. The total imports are annually about £900,000; the exports, £750,000. In 1871, B. exported to Great Britain copper valued at £95,819; guano, at £75,003; nitre, at £94,671. The constitution of the republic, as founded by Bolivar, has suffered important modifications. According to the constitution, the executive is vested in a president, elected for four years, while the legislature consists of a congress of two chambers, called the Senate, and the House of Representatives, both elected by universal suffrage; but in reality, the fundamental law of the republic requiring the election of the president every four years has fallen into disuse; and since the presidency of Marshal Santa Cruz (from May 1828 to January 1839), the history of B. is a history of military insurrections, the supreme power having been almost invariably seized by successful commanders. In 1870, the revenue was £1,400,000, and the expenditure £2,000,000. The republic is burdened with an internal debt of £1,500,000, and a foreign debt,

consisting of a six per cent. loan of £1,700,000 nominal capital—issued at the price of 68—contracted in England in 1872, ‘to subsidise the National Bolivian Navigation Company, for the purpose of opening communication between the republic and the Atlantic Ocean.’ In 1872, the army consisted of about 4000 men. The seat of the executive government, formerly La Paz, was transferred in 1869 to Oruro.

**BOLKHOV**, an ancient town of Russia, in the government of Orel, about 30 miles north of the city of the same name. B. is situated on the Nougra, is chiefly built of wood, has upwards of twenty churches, besides a monastery and nunnery. Its manufactures consist of gloves, hats, hosiery, leather, &c., and it has a trade in tallow, hemp, hides, and oil. Pop. (1867) 18,491.

**BOLL**, an old dry measure in Scotland, varying in quantity according to locality and the article measured. It is sufficient to say that a B. of oats is equal to six bushels, or six-eighths of an imperial quarter. Although superseded by imperial measures, the B. is still very commonly in use; but, as in the case of all old weights and measures, bargains by it cannot be legally enforced. See WEIGHTS AND MEASURES.

**BO'LLANDISTS**, an association or succession of Jesuits by whom the *Acta Sanctorum* (q. v.), or Lives of the Saints of the Christian Church, were collected and published (1643–1794). They received their name from JOHN BO'LLAND, born in the Netherlands 1596, died 1665, who, with the help of Gottfried Henschen, edited the first 5 vols., containing the month of January, in 2 vols., published in 1643, and the month of February, in 3 vols., published in 1658. The project had been undertaken by a Flemish Jesuit, Herbert of Rosweyd, and on his death in 1629, his collections were intrusted to Bolland, who established himself in Antwerp, opened a correspondence all over Europe, and associated young men of his order with himself in the work. Several distinguished names are ranked among the B., as Gottfried Henschen (died 1681), Daniel Papebroek (1714), Conrad Janning (1723), Peter Bosch (1736), Suyckens (1771), Hubens (1782), Dom Anselmo Berthod (1788), and Jos. Ghequière (1802). The abolition of the order of Jesuits in 1773 caused the removal of the Bollandist Society to the monastery of Candenbeg, in Brussels, till the persecutions under Joseph II. brought about its dissolution. In 1789, the Abbey of Tongerloo, in Brabant, took up the colossal task of carrying on the *Acta Sanctorum*; but scarcely had the 53d vol. appeared in May 1794, when the French occupation put an end to the work. It was not till 1827 that a new Bollandist association of Jesuits was formed, under the patronage of the Belgian government, which set aside a yearly sum of 6000 francs for this object. In 1845 this new society published, in two parts, the 54th vol. of the work, containing, among others, the life of St Theresa, extending to 671 folio pages. Other volumes have since appeared, and more are in preparation, so that there is room to hope that at least the next generation may see the completion of this vast work, of which Gibbon has truly said, that ‘through the medium of fable and superstition it communicates much historical and philosophical instruction.’ M. Guizot, having ascertained that the 3 vols. for April contain 1472 lives, estimates that the 53 vols., published before the French revolution suspended the progress of the undertaking, contain more than 25,000 lives of saints.

**BOLO'GNA**, a delegation of the former Papal States, but now a province of the kingdom of Italy. It was bounded N. and E. by the delegations of

Ferrara and Ravenna, and W. and S. by the duchies of Modena and Tuscany. The area of the province is 1374 square miles; population in 1871, 439,166. Sloping gradually up from the plains of Lombardy in the north, its surface becomes mountainous in the south, which is traversed by offsets from the Apennines. B. is well watered, and the streams are extensively used in the irrigation of rice-fields. It is very productive, yielding corn, wine of middling quality, olive-oil, fruit, vegetables of all kinds, hemp, flax, and saffron. Silk-worms are reared in great numbers. Marble, chalk, and gypsum are the mineral products; hemp, rice, and silk the principal articles of trade.

**BOLO'GNA**, one of the most ancient cities of Italy, is beautifully situated on a fertile plain at the foot of the lower slopes of the Apennine Mountains, in lat. 44° 30' N., long. 11° 21' E. It is enclosed by a high brick-wall, some five or six miles in extent, but without fortifications; the canal of Reno intersects it, and, on either side, the rivers Reno and Savena sweep past its walls. B. was, next to Rome, the most important city of the Papal States. The streets in the newer parts of the city are spacious and well paved, with rich and varied colonnades, affording shelter alike from sun and rain; in the older portion, the streets are narrow, crooked, and dirty, and the arcades correspondingly low and gloomy. The city is adorned with many fine palaces of the nobility, which are rich in fresco-paintings by the great masters. Pre-eminently worthy of notice is the Piazzo Maggiore, ‘the Forum of B. in the middle ages,’ which includes among other fine buildings, the Palazzo Maggiore del Pubblico, and the Palazzo del Podestà. Among the fine frescoed rooms and galleries of the former, that of the Sala Farnese is the most imposing; the latter is interesting as having been the prison and death-scene, in 1272, of Enzio, the son of the Emperor Frederick II., and also as containing the archives of the city. The great feature of B., however, is its religious edifices, which are remarkable both for the beauty of their architecture, and the abundance and splendour of the art-treasures they contain. It has more than 70 churches, the most remarkable of which are San Stefano, which is rich in reliefs, ancient tombs, and Madonnas, Lombard architecture, and Greek frescoes of the 11th and 12th centuries; San Petronio—which, though unfinished, is the largest church in B.—a noble specimen of Italian Gothic, with a meridian traced on the floor by the astronomer Cassini, and numerous splendid bas-reliefs by Jacopo della Quercia and Tribolo, as well as master-pieces by other artists both in sculpture and in painting; San Domenico, with works by Michael Angelo and Niccold di Pisca, and many other eminent sculptors—and paintings and frescoes by Guido, Francia, Lodovico Caracci, Marchesi, Simone da Bologna, Colonna, and others; and the cathedral dedicated to St Peter, also rich in works of art, and interesting historical associations, which, indeed, cluster around all the structures mentioned. In the centre of the city are two remarkable leaning towers, constructed about the beginning of the 12th c.; the tallest, called the Asinella, has a height of 256 feet, with, in 1706, an inclination of 3 feet 2 inches. In 1813, a careful measurement shewed that this inclination had slightly increased. The other tower, the Garisenda—which is alluded to in the 31st canto of Dante's *Inferno*—has an elevation of 130 feet, with a lean of 8 feet. The university of B. is said to date its origin from the 5th c., when it was founded by Theodosius II., and to have been afterwards restored by Charlemagne. It was not, however, until the 12th c., when it was founded anew by Irnerius or Wernerus, that it attained

celebrity. Its reputation during that century was so great, chiefly on account of its school of jurisprudence, that students from all parts of Europe were attracted to it. In 1262, the number receiving instruction is stated to have been 10,000, and it was found necessary to appoint professors specially for the students from each country. The university is also celebrated as the first school for the practice of dissection of the human body, as well as for the fact, that for centuries learned female professors have prelected within its walls. The famous linguist, Cardinal Mezzofanti, was a professor here. Though the number of students is now comparatively small, the university of B. still holds a first place among Italian educational institutions. Medicine is now the principal study. The university library contains 130,000 vols., and 6000 MSS., 20,000 vols. having been presented by Benedict XIV. Many of the books are very rare and valuable. In the church of San Domenico there is a public library of 90,000 vols., accessible on holidays, when all others are closed. The Accademia delle Belle Arte is particularly rich in the works of those native artists who founded the far-famed Bolognese school of painting, and it has also some fine specimens of other schools. Besides being the birthplace of those painters that have made its name illustrious, B. gave to the pontifical chair Honorius II., Lucius II., Gregory XIII., Innocent IX., Gregory XV., and Benedict XIV.

B. has some important manufactures, including silk goods, velvet, crêpe, wax-candles, musical instruments, chemical products, paper, and sausages almost as celebrated as its paintings. Pop. (1872) 115,957.

B. owes its origin, which is said to be much more remote than that of Rome, to the Etruscans, by whom it was called *Felsina*. It afterwards fell into the hands of the Boii, from whom it passed to the Romans, who made it a colony, under the name of *Bononia* (189 B.C.). In 53 A.D., it was nearly destroyed by fire, but was restored by Claudius. After the fall of the Roman empire, it passed into the hands of the Longobards, from whom it was taken by the Franks. Charlemagne made it a free city, and its independence was confirmed by a charter from Henry V., in 1112, which also invested the citizens with the choice of their own judges, consuls, and magistrates. The feuds of the Guelph and Ghibeline factions led to the downfall of the republic, and the supremacy of the papal see, B. being made a delegation in 1513. In 1796, B. was taken by the French, and was constituted the chief town of the Cispadane Republic; and afterwards, when the kingdom of Italy was established, capital of the department Del Reno. It reverted to the pope in 1815. After that time, B. made several efforts to throw off the authority of the pope. One, in 1831, was successful, but the papal authority was restored in the following year. In 1848, the Austrians attempted to obtain possession of B., but were repulsed. In the following year, however, they succeeded in capturing the city after a siege of ten days. B. was then, like the rest of the Romagna, declared to be in a state of siege, and was made the head-quarters of the Austrian second Italian corps. From the commencement of the Italian campaign of 1859, the Bolognese gave an active sympathy to the national cause; and long before the peace-negotiations at Zurich had been brought to a close, they had intimated their intention of placing themselves under the rule of Victor Emmanuel, as a part of the new kingdom of Italy. Notwithstanding the menaces of the Vatican, they persisted in their resolve; and when the question of 'Annexation to Piedmont, or separate government,' was submitted to the universal vote of the people, in March 1860, the votes for annexation

exceeded those for separate government in the proportion of 1000 to 1.

**BOLO'GNA PHI'AL**, or **PHILOSOPHICAL PHIAL**, is a short, thick, narrow glass vessel, close at one end, and open at the other, which the glass-blower prepares from each pot of metal before employing it in the fashioning of tumblers, glasses, bottles, &c. See **GLASS**. It serves the purpose of enabling the glass-manufacturer to judge of the colour and other conditions of the fused glass or metal; and as the jar is not subjected to annealing, it is very friable, and a small angular fragment of any mineral allowed to drop into it, at once causes it to fly in pieces. It is curious to notice, however, that a B. P. will bear a very heavy blow on the outside without being fractured.

**BOLO'GNA STONE**, an old popular name of a radiated variety of heavy spar or sulphate of barytes (see **BARYTES**), found near Bologna, which is phosphorescent in the dark. It has been also called Bologna Phosphorus; but this name more strictly belongs to it when calcined, pulverised, and made into little cakes with gum-water. These, after being exposed to a vivid sunlight, are very phosphorescent, either in the air or under water.

**BO'LOR-TA'GH**, a supposed lofty mountain-chain of Central Asia, extending from lat. 35° to 45° N., and from long. 70° to 75° E., which was said to divide Turkestan into an eastern and western portion. Conjecture even went so far as to assign to its highest points an elevation of 19,000 feet. It was described as dividing Turkestan (q. v.) into two parts, and being connected with the Thian-shan range and others farther north, as well as with the Hindu Kush on the south. Recent explorations have shewn, however, that no such range exists, but that there is a lofty plateau which in part corresponds to its supposed position.

**BOLSENA**, an Italian town, in the former delegation of Viterbo, about 20 miles north-north-west of the town of the same name. It is situated on the north shore of the Lake of Bolsena (*Lacus Volsciensis*), on the road from Florence by Siena to Rome. It has now less than 2000 inhabitants; but in early ages it was a place of great importance, forming one of the twelve Etruscan cities, under the name of *Volscini*. When finally subjugated by the Romans (280 B.C.), as many as 2000 statives are said to have been taken from it; but, though this is doubtless an exaggeration, we may gather from it that the Volscians had achieved a high reputation for wealth and artistic skill. The Romans razed the Etruscan city to the ground, but built another in its place, which, however, is not much celebrated in history, except as the birthplace of Sejanus, the favourite and minister of Tiberius. Pliny records that it was the scene of supernatural occurrences, King Porsenna having here called down fire from heaven to destroy a monster, Volta, that was ravaging the surrounding country. In later ages, according to the traditions of the Roman Catholic Church, a doubting Bohemian priest was here convinced of the truth of the doctrine of transubstantiation, by witnessing the flow of blood from the Host he was consecrating; and in commemoration of this supernatural occurrence, Urban IV. instituted the festival of the Corpus Domini. Raphael has immortalised the incident. No remains of the Etruscan city exist, but many traces of the Roman one remain. The Lake Bolsena is a fine expanse of water, about 10 miles long and 8 broad, but its shores are very unhealthy. The Marta river carries its waters into the Mediterranean. It has two islands, Bisentina and Martana, which were favourite autumnal retreats of Pope

## BOLTON—BOMBARDMENT.

Leo X. Martana is famous as the scene of the exile and murder of the Gothic queen Amalasontha, by her cousin Theodosius.

BOLTON (-La-Moo'rs), an important English manufacturing town, in South Lancashire, on the Croal, 11 miles north-west of Manchester. It was celebrated as far back as the time of Henry VIII. for its cotton and its woollen manufactures, introduced by Flemish clothiers in the 14th century. Emigrants from France and the Palatinate of the Rhine subsequently introduced new branches of manufacture; and the improvements in cotton-spinning of the middle of the 18th c., rapidly increased the trade of the town. Though Arkwright and Crompton belonged to B., the opposition of the working-classes long retarded the adoption, in their native town, of their inventions—the spinning-frame and the mule. B., containing more than 70 cotton-mills, with 2½ million of spindles, is now one of the principal seats of the cotton manufacture in Lancashire. Muslims, fine calicoes, quiltings, counterpanes, dimities, &c., are manufactured. There are 40 foundries and iron-works, and numerous dye-works. The lexicographers Ainsworth and Lempiere were masters of B. grammar-school. During the civil war, the parliament garrisoned Bolton. In 1644, it was stormed by the Earl of Derby; and after the battle of Worcester, that unfortunate nobleman was beheaded there. Pop. (1871) 92,655. Since 1832 it has returned two members to parliament. B. parish has numerous coal-mines. Between B. and Wigan much cannel-coal occurs, and is often made into snuff-boxes, candlesticks, &c.

BOLT-ROPE, in the rigging of a ship, is the rope to which the edges of sails are sewn, to strengthen and prevent them from tearing. It is of three kinds, according to its position—a *leech*-rope up the perpendicular edge of the sail, a *foot*-rope along the bottom edge, and a *head*-rope along the top edge. Some sails, owing to their shape, have no head-rope. All the cordage employed in furling and unfurling the sail is fastened to the bolt-rope.

BOLTS, in ship-building, are usually either of iron or copper; they are employed either for bolting together certain of the timbers, or for fastening any loose body. The B. are of various sizes and shapes, and the heads variously fashioned, according to the services to be rendered. The heads are named ‘common,’ ‘saucer,’ ‘collar,’ ‘tee,’ ‘calking,’ ‘conical,’ &c. The B. vary from half an inch to nearly three inches in diameter, and from a few inches to many feet in length. The longest are driven through the dead-wood and through the knee of the head; others are used for securing the great guns, the stoppers of the cable, &c.; but the greater number penetrate the timbers of the ship. Some of the smaller are secured at the points by riveting, clinching, or forelocking.

BO'LUS (Gr. *bolos*, a clod or lump), a soft mass of any kind of medicine, intended to be swallowed at once; a B. differs from a pill in being larger.

BO'MARSUND. See ALAND ISLANDS.

BOMB, a missile which also receives the names of *bomb-shell* and *shell*. It is a hollow ball, usually of cast iron, fired from a mortar or other large piece of ordnance, and filled with combustibles which work great havoc when the ball bursts by the firing. All such projectiles were formerly fired from mortars only, and there was thus a definite relation between the B. and the mortar; but since the invention of shell-guns, and other modern pieces of artillery, the name *shell* has been generally substituted for that of *bomb*. The 13-inch B., which is the largest size used in ordinary warfare (instances of exceptional

magnitude are noticed under MORTAR), weighs about 195 lbs., with a thickness of metal varying from 1½ to 2 inches at different parts; it bursts with about 8 lbs. of powder. The vent through which it is filled with powder is, after the filling, closed with a plug called a *fuse*, which sets fire to the powder, and at the proper moment bursts the B. into fragments. The 10-inch B., weighing about 90 lbs., is proportionably less in all dimensions than that just described; and so on for those of smaller diameters. It should be understood, however, that the above are conventional quantities prescribed and adopted more than half a century ago. Modern artillerists try experiments on bombs of various degrees of thickness, and various charges and fuses. Some of the results of these experiments, and some of the modern achievements in B.-practice in actual warfare, are noticed under MORTAR and SHELL.

BO'MBA, a kind of nickname given to Francis II., king of Naples and Sicily, in consequence of his cruel bombardment of Messina, in September 1848, in which the slaughter and the destruction of buildings was immense.

BOMBA'CEÆ. See STERCULIACEÆ.

BO'MBARD, among the now disused engines of war, was a piece of ordnance very short, thick, and wide in the bore. It differed from the Balista (q. v.) in being worked with gunpowder instead of by mechanical force; and from the mortar, in shooting forth stones instead of iron shells. Some of the bombs used in the 15th c. propelled stones weighing from 200 to 500 lbs. each.

BOMBARDIER is an artillerist versed in that department of arms which relates especially to bombs and shells, mortars and howitzers, grenades and fuses. He has learned to load shells and grenades, fix fuses, prepare composition for fuses and tubes, &c.; and on the field or at sieges, he fires the mortars. In some foreign armies, the Bombardiers form a separate corps; but in the English army, there are some attached to every battery.

BOMBARDIER BEETLE, a name common to many species of Coleopterous (q. v.) insects of the genera *Brachinus* and *Aptinus*, of the tribe *Carabidae* (q. v.). They have received this name in consequence of the remarkable power which they possess of discharging, for their own defence, an extremely acrid volatile fluid from the abdomen, which diffuses around them a pungent odour, and which explodes on coming in contact with the air. The species of the genus *Aptinus* have no membranous wings beneath their elytra; those of the genus *Brachinus* have. Both are found chiefly under stones. The larger and more brilliant species are tropical. Several small species of *Brachinus* are natives of England. The most common English species is only about four lines long. When roughly handled, it will make more than a dozen discharges in rapid succession. When the reservoir which contains the liquid is opened by dissection, it effervesces and evaporates instantaneously. It changes blue vegetable colours to red, and then to yellow; produces sharp pain when applied to the tongue; and leaves a yellow spot upon its surface, like that produced by a drop of nitric acid.

BOMBARDMENT is an attack upon a fortress or fortified town by means of shells, red-hot shot, carcasses, rockets, &c., to burn and destroy the buildings and kill the people. A bombardment is most likely to be successful when the place is destitute of bomb-proof cover; or when the governor is

too humane to expose the unoffending inhabitants to this dreadful ordeal; or when the population is strong enough to compel him to yield. A bombardment requires little engineering science; whereas to reduce a place by regular siege requires the aid of engineers to direct the attack against fortifications, guns, and soldiery, leaving the inhabitants and buildings untouched. Military engineers generally regard a B. as a cruel operation; it is especially directed against the civilians and their buildings, as a means of inducing or compelling the governor to surrender the place, and terminate their miseries. In a well-defended place, the soldiers, the ammunition, and the defence-works suffer comparatively little, seeing that the bombardiers aim at pitching their terrible missiles into the heart of the place. In modern times, a B. is mostly adopted as an adjunct to a siege, distracting the governor by an incessant fire of mortars day and night. At Sebastopol, for instance, the mortars fired shells into the centre of the city, to weaken the defence of the forts which were cannonaded by the siege-guns. B. is more frequently a naval than a military operation. The stores required for a vigorous B. are immense. Thus, in 1759, Rodney threw 20,000 shells and carcasses into Havre; in 1792, the Duke of Saxe-Teschen threw 36,000 shot and shell into Lille in 140 hours; in 1795, Pichegrus threw 8000 shells into Mannheim in 16 hours; and in 1807, the English threw 11,000 shot and shell into Copenhagen in 3 days.

#### BOMBAX. See SILK-COTTON TREE.

BOMBAY, an island of 8 miles by 3, on the west of Hindustan, having its southern extremity in lat. 18° 57' N., and long. 72° 52' E. It consists of two rocky ridges, which embrace a valley so low as to require embankments against the tide. Its productions, of course, are scanty and unimportant. The rain-fall, with an annual mean of 80 inches, gave, in 1831, 99·64, and in 1838, only 50·78. The temperature, ranging between 70° and 100°, averages, during the year, about 80°. The climate, at one time very unhealthy, has latterly been so much improved by drainage and other appliances, that, in favourable seasons, the proportion of deaths is said very little to exceed that of London. In 1509, about a year before the capture of Goa, the Portuguese visited the island; and by 1530, they had made it their own. In 1661, they ceded it to Charles II. of England, as part of the dowry of his bride, the Infanta Catherine. In 1668, his majesty granted it to the East India Company, which, in 1685, transferred what was then its principal presidency to B. from Surat. The name of the island, though manifestly a corruption of the native *Mambai*, may yet, with reference to the goodness of the harbour, have owed its specific form to the Portuguese *buon bahia*. The bay towards the mainland, even in its natural state, presents one of the finest havens in India, more particularly as being one of the few on the east side of the Arabian Sea which are accessible during the south-west monsoon. Anchoring-ground, of about 50 square miles, available for vessels of any burden, is sheltered on the north by Trombay and Salsette, and on the west by B. itself and its two insular appendages—Old Woman's Isle and Colaba; and lastly, the open passage at the south, which thus makes an entering wind of the monsoon already mentioned, is narrowed on the east by the island of Caranja. Art also has done much to aid nature. The islands on the north and west—all but Trombay, which, in fact, is itself enclosed—are welded into one by three causeways; while, at the south end of this continuous breakwater, the light-house of Colaba, 150 feet high, indicates to

mariners the entrance of the port along a radius of 20 miles.

BOMBAY' (City) occupies the entire breadth of the south end of the island, bordering at once on the harbour inside, and on Back Bay outside. Next to Old Woman's Isle, which, along with Colaba, may be regarded as a suburb, is the European town; about a mile to the north is the much larger Black Town; and between them is the esplanade with the barracks and the railway terminus. The population, which is exceedingly heterogeneous and dense—as many as 31 persons, on an average, inhabiting each house—amounted, in 1872, to 644,406. The Hindus form the largest section; the Parsees number about 50,000; and the rest are Mussulmans, native Christians, Europeans, Indo-Portuguese, Jews, &c. Amid these various classes, the Parsees or Persians, descendants of fire-worshippers driven from their homes by Mohammedan bigotry, rank next to the English, grade for grade, in respectability and influence. The late Sir Jamsetjee Jeejeebhoy, in fact, stands forth to say nothing of fabulous wealth, as the faultless model of a merchant-prince in enterprise and integrity, in munificence and patriotism; and ever since the introduction of the ship-building business in 1735, the Lowji family, assisted chiefly by operatives of the same race, has been at the very head of this, one of the most important interests of the city—not merely the Indian navy, to be noticed more at large under the next subdivision, but likewise several imperial men-of-war, both frigates and line-of-battle ships, having been almost exclusively the work of Parsees. Besides the dockyard, which covers about 200 acres, at the south-east of the European town, the objects most worthy of note are the town-hall, the Library of the Asiatic Society, the Mint, Cathedral, and Custom-house; the Post-office, and Public Works Office; the Missionary Houses, the Elphinstone Institution, the Grant Medical College, the University, and Saasoon's High School; the Jamsetjee Hospital, and the Jamsetjee Obstetric Hospital. The city also possesses a Chamber of Commerce, offices of the Agra Bank, Government Savings Bank, B. Steam-Navigation Company, and several insurance companies. Always favourably situated for foreign trade, B. has profited largely by the re-opening of the ancient thoroughfare through Egypt, as saving more distance in proportion than any other emporium in the East, and also as being on the direct line between Madras and Calcutta on the one side, and Aden on the other. When the civil war in the United States caused a sudden cessation of the American supplies, cotton began to be exported from B. in vast quantity; and although the re-opening of the southern ports soon checked the extraordinary activity of trade, B. was permanently benefited by the stimulus its commerce then received. Since 1855, the exports have increased from £16,000,000 to £45,000,000. The chief articles of export are cotton, shawls, opium, coffee, pepper, ivory, and gums; the chief imports, piece-goods, thread, yarn, metals, wine, beer, tea, and silk, with the best and most durable timber from Malabar and Gujerat. The chief mail line to India is now by Suez, Aden, and B.; and from B., letters are sent to Calcutta, Madras, &c.

BOMBAY' (Presidency) has become what it is mainly in the present century. During ninety years, it was confined, with now and then a temporary and insignificant exception, to the island and the two rocky islets on the south. Even the adjacent islands, such as Salsette and Caranja, were acquired only in 1775—the very year in which a younger presidency, after absorbing Bengal, Bahar, and Oriissa, annexed

## BOMBAY ARMY—BONA.

Benares. With the exception of the detached territory of Sind, this presidency, reared principally at the expense of Mahratta dominion, physically divides itself into three parts: the two Concanas, between the Western Ghauts and the Arabian Sea; the eastward slope of the Western Ghauts; and, to the north of both these divisions, the alluvial tracts towards the mouths of the Taptee and the Nerbudda. Of these three regions, the first, though in a higher latitude than the second, is by far the hottest—its temperature occasionally reaching 115°. The first two differ widely as to rainfall. In the Concanas, the vapours of the south-west monsoon, intercepted by the mountains, have been known to yield, at three different places in the same year, 106, 130, and 248 inches; while, almost as a necessary consequence, the eastward slope is generally liable to suffer from droughts. Without anticipating details, which will be given under the respective districts, it may be stated that B., as a presidency, contains 147,532 sq. m., with (1872) 14,042,695 inhabitants—Sinde alone having an area of 48,782 square miles, with only 1,730,323 inhabitants. In 1871, the revenue was £10,097,831, and the expenditure £8,266,178. The administration of the country is vested in a governor and three councillors, subject, however, to the ‘superintendance, direction, and control’ of the governor-general of India in council. The ecclesiastical establishment, without reckoning the missions of various denominations, consists of a bishop of the Church of England, who has under him an archdeacon and many clergymen, and a number of chaplains of the Church of Scotland. The schools are of two classes—seminaries under the various missions, and schools managed by a board of education—the latter being by far the more numerous. The majority of the scholars use merely the vernacular tongues. In 1871, the entire number of schools and colleges aided by government was 3036, attended by 178,130 pupils. The University of B. was founded in 1857, on the model of London University. In 1871, the B. army consisted of 10,583 European soldiers, with 1312 officers, along with 27,107 native officers and men. During the mutiny of 1857, the local army remained, on the whole, steady and faithful; and it was, in fact, a portion of it which, under Sir Hugh Rose, acted, if not actually the first, at least the second part in the suppression of the insurrection. It is to this presidency that the naval force for all the presidencies belongs. To the island of Bombay, as to Great Britain itself, ‘wooden walls’ were from the beginning a necessary of life, more especially on waters proverbial for piracy from time immemorial. Accordingly, as early as 1670, a ship-of-war in the local squadron beat off 40 Mahratta vessels. On various subsequent occasions, too, the Company’s navy was doing battle for the crown. It assisted in the capture of the Mauritius or Isle of France; it was eminently useful in the expedition against Java; and in the first Chinese war, it was at least as effective as that of her Majesty. Of late years, the manufacturing industries have been extremely active in B. Many great cotton-mills have been erected; and the presidency, commanding, as it does, the richest cotton-fields in India, has improved to the utmost its natural advantages, by adding English machinery to its cheap labour and ready material. Government has been liberal in supplying money for public works.

**BOMBAY ARMY.** See EAST INDIA ARMY.

**BOMBAY DUCK.** See BUMMALOTI.

**BOMBAZINE** is a plain fabric of cloth, for dresses, in which the distinguishing characteristic is that the warp is silk and the weft worsted. The cloth has thus a bare look. It is rather fine and

light in the make, and may be of any colour; and is about 24 inches in width. The fabric is now little used. It was extensively made, and chiefly at Norwich, from about 1816.

**BOMB-PROOF BUILDINGS** are military structures of such immense thickness and strength that bomb-shells and cannon-balls cannot penetrate them. Two of the chief kinds will be found noticed under CASEMATE and MAGAZINE.

**BOMB-VESSEL.** The various kinds of *B., bomb-ketch, mortar-vessel, and mortar-boat*, may all be conveniently described under MORTAR-VESSEL.

**BOMBYX.** See SILK-WORM.

**BOMMEL** (Dutch, *Zalt-Bommel*), a town in the province of Gelderland, Holland, situated on the Waal, 25 miles east of Dort. The streets are spacious, and the houses having gardens attached to them, the town presents a very pleasant appearance. It has manufactures of nails and iron utensils, tanneries and soap-works, and carries on a considerable trade in agricultural produce. Pop. 3600. B. was formerly an important fortress, but its defences are now destroyed. Its port is also much obstructed by shoals.

**BOMMELERWAARD**, an island of Holland, in the province of Gelderland, formed by the union of the Waal and the Maas. Its length is about 16 miles, and its greatest breadth about 6 miles. The pop., 15,000, two-thirds of whom are Protestants, are chiefly engaged in agricultural pursuits, flax and hops being cultivated extensively. The town of Bommel, described in the preceding article, is situated in B., which contains about seventeen villages besides. Fort St André defends it on the east, and Fort Loeventein on the west.

**BONA**, a seaport town of Algeria, in the province of Constantine, situated on a bay of the Mediterranean, in lat. 36° 54' N., long. 7° 46' E., and known among the Arabs by the name of Beled-el-Areb. The town, divided into two parts, Upper and Lower B., is situated in a beautiful, but unhealthy district, at the foot of a hill near the embouchure of the Sebus; is surrounded by walls flanked with square towers, and further defended by Fort Cigogne, on the top of the hill. Pop. about 12,000. Since the occupation of B. by the French in 1832, the town has been much improved, and has now good bazaars, shops, markets, reading-rooms, &c.; manufactures of tapestry, saddlery, and native clothing, and a trade in wool, hides, corn, coral, and wax. A telegraph cable was laid between B. and Marseille in 1870; and there is regular steam communication with France, Algiers, and Tunis. Among the public buildings, the Catholic church, and the convent of the Sisters of Mercy, are most remarkable. Near B. are some scanty remains of the once famous city Hippo Regius, the favourite residence of the Numidian kings, and the episcopal seat of St Augustine, who died here in 430. This city was probably connected with the ancient *Aphrodisium* (the present Bona) by a canal, of which the outline may still be seen in a morass. Hippo Regius, in early Christian times, was the central station of commerce and civilisation in North Africa, and was celebrated for its schools, theatre, aqueducts, palaces, and temples, afterwards changed into churches and monasteries. It was totally destroyed by the Mohammedans under the Calif Osman in 646.

BONA itself, a Latin vocable, literally signifying ‘goods,’ and often used in pleading, and otherwise technically to designate personal estate, has several applications in the law of England, of which the following are instances: *Bona Confiscata* are forfeitures of lands and goods for offences, and form a branch of the ordinary revenue of the crown.—*Bona Notabilia*

are chattels to the value of 100 shillings, or personal estate of £5 or upwards, excepting in London, where the sum is £10. Where such small estate was in different dioceses or jurisdictions, it was to be proved in the prerogative court of the archbishop of the province; and so late as the year 1847, an act of parliament was passed (10 and 11 Vict. c. 98), by the 4th section of which it is enacted that the law of bona notabilia should be continued unaltered. But now, by the 20 and 21 Vict. c. 77, amended by the 21 and 22 Vict. c. 95, the whole jurisdiction and authority in relation to granting administration is exercised by the new Court of Probate.—*Bona Vacantia*, or stray goods—such as wrecks, treasure-trove, waifs, and estrays, contrary to the general rule, which gives such things to the finder—vest in the crown.—*Bona Wariata* are also given to the crown. They consist of goods waived or thrown away by a thief in his flight, for fear of being apprehended.

**BO'NA DE'A** (the good goddess), a mysterious Roman divinity, who is variously described as the wife, sister, or daughter of Faunus. She was worshipped at Rome from the most ancient times, but only by women, even her name being concealed from men. Her sanctuary was a grotto on Mons Aventinus, which had been consecrated to her by the virgin Claudia; her festival, however (the 1st of May), was not celebrated there, but in the house of the consul, inasmuch as the sacrifices were then offered up for the whole Roman nation. The solemnities were performed generally by aristocratic vestals. At this celebration, no males were allowed to be present; even portraits of men were veiled. The wine consumed was called milk, in order that its name might not be discovered, and the vessel in which it was served *Mellarium*. The symbol of the goddess was a serpent, indicating her healing powers, and certain herbs were sold in her temple.

**BO'NA FIDÉS**, a Latin expression literally signifying good faith, enters largely into the consideration of legal questions, particularly matters of agreement, contract, damage, trust, and other departments of the law; and in all of them it implies the absence of fraud, or unfair dealing or acting. This term, however, does not appear to occupy any formal or technical place in the law of England. It is the foundation of many just and enlightened maxime in the Roman jurisprudence, which in this respect, as in many others, has been followed by the legal system of Scotland. In the law of that country, a person who possesses and enjoys property upon a title which he honestly believes to be good, although it may be bad, is protected against the consequences of this illegal position by his *B. F.*, and he is entitled to retain the fruits or profits which he has reaped or received during his *bona-fide* occupancy. But such *B. F.* ends when the possessor becomes aware of the insufficiency of his title, whether by private knowledge or otherwise. In the Scotch law, again, while *B. F.* gives no support to the parties, or either of them, in a second marriage, the first subsisting, it would, it is thought, have the effect of rendering the children of such second marriage—that is, children born while the *B. F.* continues—*legitimate*. The reason of this is, that legitimacy in Scotland is not the result merely of a lawful marriage, but may be otherwise acquired; and no offence against the laws being intended by one or both of the parties, it is inexpedient to impose bastardy on the issue. The contract itself is null, because, otherwise, a sanction would be given to bigamy. But the contract having been entered

into in *bona fide*, the law considers that it ought to attribute to it all the effects of a valid marriage; and such appears to have been the Scotch law from very ancient times. The law of England is not so indulgent, for there, children born under such circumstances would certainly be deemed bastards. See **BASTARDS**, **BASTARDY**; and see on the subject of this article generally, **CONTRACT**, **DAMAGE**, **MARRIAGE**, **GUARDIAN**, **EXECUTOR**, **TRUSTEE**.

The interpretation of the term *Bona Fide Traveller* has recently given no little trouble to the magistrates of Scotland in reference to the famous 'Forbes Mackenzie Act' (q. v.).

**BONALD**, LOUIS GABRIEL AMBROISE, VICOMTE DE, a celebrated publicist, was born in 1753 at Monna, near Milhau, in Aveyron. Compelled to emigrate during the French Revolution, he joined the emigrant corps, and, when it was dissolved, removed to Heidelberg, where he employed his pen in the composition of politico-philosophic works on behalf of monarchy. His first important work, *Théorie du Pouvoir Politique et Religieux* (3 vols., 1796), was seized by the Directory. It prophesied the restoration of the Bourbons. Having returned to France, B. was induced to accept the patronage of the Bonaparte family, and in 1808 was appointed Minister of Instruction. In 1815—as deputy for his department—he voted with the ultra-montane or theocratic party in the *Chambre Introuvable* (q. v. in *SUPE.*, Vol. X.), and was one of the most influential members of the Chamber of Deputies in abolishing the revolutionary law of divorce, against which he had written in 1806; in opposing all projects of electoral reform, the alienation of forests, the efforts to get rid of the Swiss mercenaries, the freedom of the press, &c. In 1823, he was elevated to the peerage by Louis XVIII. The July revolution brought his public career to a close, as he refused to take the oath of allegiance to the new dynasty. He died at Monna, 1840. His most important writings are: *Législation Primitive* (3 vols., Par. 1802), and *Recherches Philosophiques sur les Premiers Objets des Connaissances Morales* (2 vols., Par. 1818), which have been immensely applauded by his own party. Their non-agreement with the fundamental facts of history has been proved by impartial criticism. His florid and incorrect style is often detrimental to his logic; and even his admirers must admit that his faith in papal infallibility, and his veneration of the Jesuits, were carried beyond all reasonable bounds. A complete edition of his works, in 12 vols., was published under his own supervision (Par. 1817—1819).—His son, LOUIS JACQUES MAURICE B., Archbishop of Lyon, 1839, made a cardinal in 1842, faithfully adhered to his father's political and religious principles. He died, February 24, 1870.

**BONAPARTE** (pron. in Ital. in four syllables; in Eng., usually in three), **FAMILY OF**. In the 13th c., and afterwards, several families named B. appear in Italian records—at Florence, San Miniato, Sarzano, and Genoa; and towards the close of the 15th c., a branch of the Genoese B. family settled at Ajaccio, in Corsica, where they occupied a respectable position as patricians, *padre del commune* or *cittadini*, in the middle of the 16th century. In the 18th c., this family was represented by three male descendants, all residing at Ajaccio: the archdeacon, Lucien B.; his brother, Napoleon B.; and their nephew, Charles.—CHARLES BONAPARTE, father of the Emperor Napoleon, was born March 29, 1746; studied law at Pisa; and married in 1767—without the consent of his uncles—a beautiful young patrician, named Letizia Ramolino. In 1768, he removed with his family, accompanied by his uncle Napoleon, to Corte, in order to assist

General Paoli in defending the island against the French invasion. As the French prevailed, and further resistance was useless, Charles B. attached himself to the French interest, and in 1771 was included by Louis XV. in the election of 400 Corsican families to form a nobility. In 1773, through the influence of Marboeuf, governor of Corsica, Charles B. was appointed royal counsellor and assessor of the town and province of Ajaccio. In 1777, he was a member of the deputation of Corsican nobles to the court of France. In this capacity he resided for some time in Paris, where he gained for his son Napoleon, through the interest of Count Marboeuf, a free admission into the Military School at Brienne. In 1779, he returned to Corsica, and in 1785 went to Montpellier, for the benefit of his health, where he died of cancer in the stomach, February 24, 1785. He was a man of prepossessing exterior and amiable character. By his marriage with Letizia, he left eight children: Joseph B., king of Spain; Napoleon (q. v.), Emperor of the French; Lucien B., Prince of Canino; Maria Anna (afterwards named Elise), Princess of Lucca and Piombino, wife of Prince Bacciochi; Louis B., king of Holland; Charlotte (afterwards named Marie Pauline), Princess Borghese; Annunziata (afterwards named Caroline), wife of Murat, king of Naples; Jerome B., king of Westphalia. These members of the B. family, with the children of Beauharnais (q. v.), adopted at the Emperor Napoleon when he married Josephine, are distinguished as the *Napoléonides* of modern French history. By a decree of the senate, November 6, 1804, the right of succession to the throne was restricted to Napoleon and his brothers Joseph and Louis, with their offspring. Lucien and Jerome were excluded on account of their unequal marriages. Napoleon intended to give the right of succession also to Lucien, by the additional act of April 22, 1815; but this was never concluded. As Joseph, the eldest brother of the emperor, had no son, the descendants of Louis became nearest heirs to the throne.—**MARIA LETIZIA RAMOLINO**, mother of Napoleon I., lived to see her family placed on the thrones of Europe, and also witnessed their downfall. She was born at Ajaccio, August 24, 1750. After the death of her husband, she lived for some time in Corsica, and in 1793, when the island came under British rule, removed with her family to Marseille, where she lived in poverty, mainly supported by the pension given to Corsican refugees. After her son became First Consul, she removed to Paris, and when her son was crowned in 1804, received the title Madame Mère. A brilliant court-household was given to her, which, however, was never pleasing to her modest tastes. Remembering former adversities, and foreboding reverses of the splendid success of her sons, she was prepared for all that followed. After the downfall of Napoleon, Letizia lived with her step-brother, Cardinal Fesch, in winter at Rome, and in summer at Albano, and submitted to her change of fortune with remarkable dignity. She died February 2, 1836, leaving a considerable property, the result of saving habits during prosperity.

**BONAPARTE, JOSEPH**, eldest brother of Napoleon, was born at Corte, in Corsica, January 7, 1768, and was educated at Autun. On the death of his father, he returned to Corsica, exerted himself to support the younger members of the family, and removed with them to Marseille in 1793. In 1797 he was elected a member of the Council of Five Hundred, and in the same year was sent as ambassador from the republic to Rome. In 1800, after he had proved his ability in several offices of state, he was chosen by the First Consul as plenipotentiary to conclude a treaty of friendship with the United States of North

America. He signed the treaty of peace at Lunéville, February 9, 1801, and that of Amiens, 1802; and with Cretet and Bernier conducted the negotiations relative to the *concordat*. After the coronation of Napoleon, new honours fell to the share of Joseph B., who was made commander-in-chief of the army of Naples; in 1805, ruler of the Two Sicilies; and in 1806, king of Naples. Though, during his reign, some beneficial changes of government were effected—such as the abolition of feudality, the suppression of convents, the formation of roads, the repression of banditti, the organisation of laws, &c.—yet these reforms were not managed judiciously; and the collision that frequently occurred between his own humane endeavours and the reckless promptings of his imperial brother, who looked upon Naples simply as a province of the French empire, exposed only too well to the Neapolitans the weakness and dependence of their new sovereign. But, in truth, he was far too fond of the fine arts to be a vigorous ruler in stormy times; and he is accused of leaving affairs too much in the hands of his minister, the subtle Salicetti. In 1808, Joseph B. was summarily transferred by his brother to the throne of Spain, and Murat took his place as king of Naples. For Joseph, this was no favourable change: he found himself unprepared to cope with the Spanish insurgents, and after the defeat of the French at Vittoria, he returned to his estate at Morfontaine, in France. In 1813, when Napoleon recognised Ferdinand VII. as king of Spain, Joseph B. refused, at first, to abdicate, though he had many times before implored his brother to release him from his royal chains; but he soon submitted, as in all other matters, to the Emperor's will.

After the battle of Waterloo, he accompanied Napoleon to Rochefort, whence they intended to sail separately for North America. In his last interview with Napoleon, Joseph generously offered to give up the vessel hired for his own escape, but meanwhile Napoleon had determined to surrender himself into the hands of the English. After a residence of some years at Point-Breeze, in New Jersey, United States, where he employed himself in agriculture, and was highly esteemed by his neighbours, Joseph B. came to England in 1832, having previously, on hearing of the July revolution, written a letter to the House of Deputies, in which he advocated the claims of his nephew, the late Emperor of France, and in 1841 was allowed to return to his wife, who had remained in Italy since 1815. He died in Florence, July 28, 1844. Joseph was the only one of his brothers for whom Napoleon professed to care anything. He was a handsome, intelligent-looking man, distinguished by the elegance of his manners and conversation. His wife, **JULIE MARIE CLARY**, born December 26, 1777, was the daughter of a wealthy citizen of Marseille, and the sister-in-law of Bernadotte, king of Sweden. She was a quiet unambitious woman, with no taste for the splendours of royalty, which fell to her share during a few weeks only at Naples, for she never went to Spain. Ill health appears to have prevented her accompanying her husband to America. She died in Florence, April 7, 1845. By her marriage with Joseph B., she had two daughters—1. Zenaide Charlotte Julie, born July 8, 1801, who became the wife of Lucien B.'s son, the Prince of Canino; 2. Charlotte Napoléone, born October 31, 1802, died March 3, 1839, who married Louis Napoleon, second son of Louis B., king of Holland. Her husband died March 17, 1831.

**BONAPARTE, LUCIEN**, Prince of Canino, and brother of Napoleon, was born at Ajaccio in 1775, and received his education in the college of Autun, the military school at Brienne, and the seminary at Aix.

Rising gradually from one office to another, he was elected deputy for the department Liamone, and in the Council of Five Hundred, spoke against the squandering of state-property, and formed a party favourable to the views of his brother Napoleon. Shortly before the 18th Brumaire, he was elected president of the Council of Five Hundred, and was the hero of that day. During the ferment which followed Napoleon's entrance, Lucien left his seat, mounted his horse, and riding through the ranks of the assembled troops, called upon them to rescue their general from assassins. Afterwards appointed Minister of the Interior, he was active in the encouragement of education, art, and science, and organised the prefectures. As ambassador to Madrid, 1800, he contrived to gain the confidence of King Charles IV. and his favourite Godoy, thus putting aside the British influence which had until then been exercised at the court of Spain. It is said that for his services in the treaty of peace concluded between Spain and Portugal, September 29, 1801, he received 5,000,000 francs.

His constant opposition to Napoleon's progress towards monarchy involved Lucien in several misunderstandings with his brother; and their quarrel was brought to an issue by Lucien's second marriage against the views of Napoleon. On condition that he would divorce his wife, the crowns of Italy and Spain were offered to Lucien; but he refused them, and preferred living in retirement at his estate of Canino, in the province of Viterbo, near the frontiers of Tuscany, where he devoted his time to art and science. Here he enjoyed the friendship of the pope, who created him Prince of Canino and Musignano; but having denounced in his private capacity the arrogant and cruel policy of his brother towards the court of Rome, he was 'advised' to leave the city in which he was at that period residing. In 1810, he took ship for America, but fell into the hands of the English; was brought to England; and after a debate in parliament, was declared to be a prisoner, but treated with distinction. After his brother's downfall, he returned to Rome.

After the defeat at Waterloo, Lucien B. alone seems to have preserved his presence of mind. He immediately advised his brother to dissolve the chambers, and assume the place of absolute dictator. After the second ascent of the throne by Louis XVIII., Lucien lived for some time in and near Rome. In 1830, he went to England, visited Germany in 1838, and died at Viterbo, June 30, 1840. Lucien B. possessed considerable talents and firmness of character. He was in his early years a keen republican, but the weakness of the Directory convinced him that a military consulship was necessary to allay the social anarchy of France. He consequently threw himself eagerly into the designs of his brother, but protested against Napoleon giving way to his desire for a hereditary monarchy. As a writer, he was by no means successful. His long and tedious epic poem, *Charlemagne ou l'Eglise Délivrée*, in 24 cantos, was written and published in London, and was dedicated to the pope, 1814. Another heroic poem, *La Cyrnède ou la Corse Sauvée*, followed in 1819. The *Mémoires Secrets sur la Vie Privée Politique et Littéraire de Lucien B.* (2 vols. Lond. 1819), of which Alphonse de Beauchamp is supposed to be the author, is an untrustworthy book. Lucien B. was the father of a numerous family. In 1795, he married Christine Boyer, the daughter of a private citizen of St Maximin. After her death, he married, in 1803, the widow of a stockbroker, Madame Jouberthon, who was his survivor. By his first marriage, he had two daughters, Charlotte, born 1796, who married Prince Gabrielli of Rome; and Christine, born 1798, who married first a

Swedish count named Posse, and then Lord Dudley-Stuart. By his second marriage, Lucien had nine children: the eldest daughter, LETIZIA B., born 1804, married, in 1824, Mr (afterwards Sir) Thomas Wyse, an Irish gentleman; but a separation took place in a few years.—The second daughter, JEANNE B., distinguished by her beauty and taste for poetry, was born in 1806, and died soon after her marriage with the Marchese Honorati.—The third daughter, ALEXANDRINE MARIE B., born in 1818, married, in 1836, Count Vincenzo Valentini de Canino, and gave birth to two sons and one daughter.—CONSTANCE, the youngest daughter of Lucien B., was born in 1823.—CHARLES LUCIEN JULES LAURENT B. (eldest son of Lucien B.), Prince of Canino and Musignano, was born at Paris in 1803. He never exhibited any inclination for political life, preferring the more quiet and wholesome pursuits of literature and science. He acquired a considerable reputation as a naturalist, and especially as a writer on ornithology. He died 29th July 1857. He was a member of the principal academies of Europe and America. His chief publications are a continuation of Wilson's *Ornithology of America*, and the *Iconografia della Fauna Italica*.—The second son, PAUL MARIE B., born in 1806, took a part in the Greek war of liberation, and died by the accidental discharge of a pistol, 1827.—The third son, LOUIS LUCIEN B., born January 4, 1813, has distinguished himself by his studies in chemistry, mineralogy, and languages.—PIERRE NAPOLEON B., the fourth son, born September 12, 1815, passed through many changes of fortune in America, Italy, and Belgium, returning to France after the catastrophe of 1848. In 1871, he shot a journalist, Victor Noir, for which he was tried the same year at Tours, and acquitted of the charge of murder, but condemned to pay £1000 to Victor Noir's relatives.—The youngest son, ANTOINE B., born October 31, 1816, fled to America after an affair with the pope's gendarmerie in 1836, and returned to France in 1848, where he was elected into the National Assembly, September 1849.

BONAPARTE, LOUIS, third brother of Napoleon, was born September 2, 1778, and was educated in the artillery school at Chalons, where he imbibed anti-republican principles. After rising from one honour to another, he was made king of Holland, 1806; but, in fact, he was never more than a French governor of Holland, subordinate to the will of his brother. Amid all the faults which marked his reign, it must be remembered to his advantage that on several occasions he firmly withheld the demands of France; that he replied to one requisition by saying that, since he had been placed on the throne of Holland, he had 'become a Dutchman'; that he nobly refused to accept the tendered crown of Spain; and lastly, that he did not enrich himself during his reign. After the restoration of the House of Orange, Louis considered himself free from all responsibility, and returned to Paris, January 1, 1814, where he was coldly received by the emperor. After living for some years in Rome—where he separated from his wife—he removed in 1826 to Florence, where he lived in retirement. On the escape of his son, Louis Napoleon, from the prison of Ham, the ex-king of Holland was removed as an invalid to Livorno, where he died, July 15, 1846. Louis B. was the writer of several works: *Marie, ou les Hollandaises*, 1814, a novel, giving some sketches of Dutch manners; *Documents Historiques, &c., sur le Gouvernement de la Hollande* (3 vols. Lond. 1821); *Histoire du Parlement Anglais*, 1820; and a critique on M. de Norvins's *History of Napoleon*. Louis B. was married in 1802 to Hortense Beauharnais, daughter of General Beauharnais (q. v.) by his wife

Josephine, afterwards Empress of the French. As this marriage was wholly a matter of submission to his brother's will, and put aside a former engagement, it naturally ended in unhappiness and separation.

The amiable and accomplished HORTENSE EUGENIE BEAUBHARNAS, the adopted daughter of Napoleon, queen of Holland, and Countess St Leu, was born in Paris, April 10, 1783. After the execution of her father, she lived for some time in humble circumstances, until Napoleon's marriage with Josephine. In obedience to the plans of her step-father, she rejected her intended husband, General Dessaix, and married Louis B. in 1802. In 1814, she was the only one of all the *Napoleoniæ* who remained in Paris. After the Hundred Days, she visited Augsburg and Italy, and then fixed her residence at Arenenberg, a mansion in the canton Thurgau, where she lived in retirement, sometimes spending a winter in Italy. In 1831, when her two sons had implicated themselves in the Italian insurrection, the countess travelled in search of them through many dangers, and found the elder deceased, and the younger, the late Emperor of the French, ill at a place near Ancona. Returning with her son to Paris, she was pleasantly received by Louis Philippe and by Casimir Périer, but was obliged, in the course of a few weeks, to remove with her son to England. After some stay there, she removed to her country-seat, Arenenberg, where she died, after severe suffering, October 3, 1837, and was buried near the remains of her mother, Josephine, at Ruel, near Paris. She was the authoress of *La Reine Hortense en Italie, en France, et en Angleterre, pendant l'année 1831*, and wrote several excellent songs. She likewise composed some deservedly popular airs; among others the well-known *Partant pour la Syrie*, which the late Emperor of the French, with a delicate union of political tact and filial pride, made the national air of France. Of her three sons, the eldest, NAPOLEON LOUIS CHARLES, born 1803, died in childhood, March 5, 1807. The second, LOUIS NAPOLEON, born 1804, crown-prince of Holland, married his cousin Charlotte, daughter of Joseph B., and died at Forli, March 17, 1831. The third, CHARLES LOUIS NAPOLEON, became Emperor of the French. See LOUIS NAPOLEON.

BONAPARTE, JEROME, youngest brother of Napoleon, was born at Ajaccio, November 15, 1784. After receiving his education in the college at Juilly, he served as naval lieutenant in the expedition to Hayti. When war broke out between France and England in 1803, Jerome was cruising off the West Indies, but he was soon compelled to take refuge in the port of New York. While in America, he married Elisabeth Patterson, daughter of a merchant in Baltimore, December 27, 1803. Subsequently, he was employed by Napoleon in the liberation of Genoese prisoners who had been captured by the Dey of Algiers. In the war with Prussia, he commanded, in concert with General Vandamme, the tenth corps in Silesia, and on the 1st December 1807, was made king of Westphalia. He was recognised with great pomp at Cassel, where he lived in splendour, caring very little for government, not even taking the pains to acquire the vernacular language of the country. After the war with Austria, the finances of Westphalia, through mismanagement, plunder, and extravagance, as well as war-expenditure, were found in an exhausted condition. The battle of Leipzig brought the reign of Jerome to a close. After the peace of 1814, he left France, and resided in Switzerland, at Grütz, and in the beginning of 1815, at Trieste. He was made a peer when Napoleon returned from Elba, and fought by the side of the Emperor at Ligny and

at Waterloo. After his brother's abdication, he left Paris, June 27, and visited Switzerland and Austria, but ultimately settled in Florence. His request to be allowed to return to France was rejected in 1847, by the Chamber of Peers, but was afterwards granted, and at the outbreak of the February revolution, Jerome B. was in Paris, where he was appointed Governor of the Invalides, December 23, 1848; and in 1850, was made a French maréchal.

His marriage with Elisabeth Patterson having been declared null by Napoleon, Jerome was forced, after he had gained the Westphalian crown, to marry Sophia Dorothea, daughter of King Frederick I. of Würtemberg. After the battle of Waterloo, her father wished to annul the marriage; but the wife of Jerome declared her resolution to share through life the fortunes of her husband. Jerome B. left in America one son by his first marriage, and had three children by his second wife—JEROME B., the elder son, born August 24, 1814, died May 12, 1847; MATHILDE LETTIA WILHELMINE B., Princess of Montfort, born at Trieste, May 27, 1820, married the Russian Count Anatol Demidov, and lived with her husband at the court of Louis Napoleon during his presidency. The younger son, NAPOLEON JOSEPH CHARLES PAUL B., born at Trieste, September 9, 1822, passed his youth in Italy; entered the military service of Würtemberg, 1837; afterwards travelled in several countries of Europe; and was banished from France, 1845, on account of his intercourse with the republican party. He returned to Paris with his father, 1847, and after February 1848, was elected into the Legislative National Assembly. He commanded an infantry division of reserve at the battles of Alma and Inkermann the following year. In 1859, he married the Princess Clotilde, by whom he has two sons and a daughter. When war with Prussia was declared in 1870, Prince N. proceeded on a diplomatic mission to his father-in-law, at Florence, but failed to obtain the co-operation of Italy with his cousin. After the fall of the empire, he ultimately took up residence in England. He revisited France in 1873.

BONA'SIA, a genus of gallinaceous birds of the Grouse (q. v.) family or *Tetraonida*, perhaps more properly only a sub-genus of Grouse (*Tetrao*), distinguished by having the toes and the lower part of the tarsus (or shank) destitute of feathers; also by the elongated feathers of the upper part of the head. To this genus belongs the Hazel Grouse of the continent of Europe (*Tetrao Bonasia* of Linnaeus), a species which, although not found in Britain, is very widely distributed from Siberia to Africa, and throughout that continent. In size, it scarcely exceeds the common partridge, is prettily mottled with gray and reddish brown, and has a black band near the extremity of the lateral tail-feathers. It loves the deepest solitudes of forests. The eggs are 12–18 in number. The flesh of this bird is highly prized, and German etiquette has long assigned it a place above all other dishes at the tables of princes, as the only dish which may be served twice in succession.—Another species of B. is the Ruffed Grouse of America (*B. Umbellus*, or *Tetrao Umbellus*), known also in some parts of the United States by the names of Pheasant and Partridge. It is nearly equal in size to the black-cock of Europe. Besides having the feathers of the upper part of the head elongated, the male has a large shoulder-tuft on each side. This bird is found in almost all parts of North America, from the Gulf of Mexico to Hudson's Bay, and from the Atlantic to the Pacific Ocean. It is polygamous, and in spring the males make a noise called drumming, by rapid clapping of their wings, to attract the attention of the other sex, whilst they

also strut with erected ruff and tail, and with wings depressed, after the manner of the turkey-cock. At this time they have fierce battles with one another, and advantage is sometimes taken of their jealous pugnacity to attract them within shot, by an imitation of their drumming, accomplished by means of a bladder and a stick. The nest is formed on the ground in the woods, often under a bush, and 5–12 eggs are laid in it. The flesh of the Ruffed Grouse is much esteemed, and the markets of the American cities and towns are well supplied with it in the winter months.—It seems probable that both these species of B. might be easily introduced into Britain, and they would be very desirable additions to the game of woods and plantations.

BONASUS, or BONA'SSUS. See BISON.

BONAVENTURA, SR, one of the most eminent Catholic theologians, whose real name was John of Fidanza, was born in 1221 at Bagnorea, in Tuscany. In 1248, he became a Franciscan monk; in 1253, a theological teacher at Paris, where he had studied; and in 1256, general of his order, which he governed strictly, but affectionately. The influence of his character now began to penetrate the church; and it was mainly through his eloquent persuasion that the differences which had sprung up among the cardinals on the death of Clement IV. in 1268 were reconciled, and all induced to unite in electing to the papal dignity Tedaldus Visconti (Gregory X.). The new pope created B. Bishop of Albano, and cardinal in 1273, when he accompanied Gregory to the Council of Lyon, where he died, July 15, 1274, from sheer ascetic exhaustion. He was honoured with a splendid funeral, which was attended by the pope, the king, and all the cardinals.

On account of his unspotted character from earliest youth, as well as the miracles ascribed to him, he enjoyed, even during his lifetime, especial veneration. Dante, who wrote shortly after, places him among the saints of his *Paradiso*; in 1482, he was formally canonised by Sixtus IV.; and in 1587, was ranked by Sixtus V. as the sixth of the great doctors of the church. The religious fervour of his style procured for him the title of *Doctor Seraphicus*, and his own order are as proud of him as the Dominicans are of Thomas Aquinas. A great part of his writings is devoted to the praise of his order, and to the defence of Mariolatry, celibacy, transubstantiation, communion in one kind, and other doctrines and practices of the middle ages, which he attempts to deal with in a philosophical manner. His most important works, the *Breviloquum* and *Centiloquum*, are properly text-books on dogmatics. Unfortunately, his efforts to philosophise the church creed, and that deep mysticism in which his spirit revelled, make him often obscure and unintelligible even in his most popular treatises. With B., theology is the goal of all art and science; and in his *Itinerarium Mantis in Deum*, as also in his *Reductio Artium in Theologiam*, he represents union with God, to which the soul attains through six stages, as the highest good. He did more than any other of the early theologians to give a scientific form to the mystical theology. His *Biblia Pauperum*, or ‘Poor Man’s Bible,’ is a mystico-allegoric explanation of the plain contents of the sacred books for the benefit of the laity. In warmth of religious feeling, however, and in the practical tendency of his ethics, he far excels the hair-splitting scholastics. In his commentary on the *Sententia* of Peter the Lombard, he acutely argued against the eternity of the world, and also advanced some original proofs of the immortality of the soul. The most complete edition of his works appeared at Rome (8 vols. 1588–1596).

BONA VISTA, a bay and cape on the east coast of Newfoundland, in lat. 48° 42' N., and long. 53° 8' W.

BONCHAMP, CHARLES MELCHIOR ARTHUR MARQUIS DE, one of the bravest leaders of the Vendean party in the civil war consequent upon the French Revolution, was born at Jouverdeil, in the old province of Anjou, May 10, 1760; took part, like many young French officers, in the American war of liberation; and when he returned to France, was made captain. Of strong royalist principles, he looked with disfavour on the revolution. After living for some eighteen months in solitude, he allowed himself to be chosen leader of the Anjou insurgents. The army of La Vendée would have been more formidable if B.’s tactics had been adopted, but this was not done until it was too late. In the sanguinary encounter at Chollet, October 17, 1793, B. received a fatal shot in the breast, and when his followers vowed to revenge his death on five thousand republican prisoners, the dying hero exclaimed: ‘Spare your prisoners. I command it.’ This last command was obeyed.

BOND, in Masonry, is the connection established among the stones or bricks in a wall, by disposing them so as to overlap one another. See BRICK-LAYING.

BOND, in Law, is an instrument on stamped paper, by which the party granting it becomes bound to pay a sum of money, or perform any act or duty, according to the terms of agreement. In England, a B. is said to be an instrument under seal, whereby one person becomes bound to another for the payment of a sum of money, or for the performance of any other act or thing. The person who is thus bound is called the obligor, and he to whom the B. is given, the obligee; and this obligation may be either by or to one or several persons. The B. may be unconditional simply for the payment of money, or it may be accompanied with a condition, the performance of which is secured by a penalty; but in any event, the debt created by a B. is of the high nature of a *Specialty Debt* (q.v.).

The requisites of a good B. are as follow: 1. The B. must have an obligor and obligee. In regard to such parties, it is to be observed that in general no person who is under any legal disability to contract, can become an obligor, though it is otherwise of an obligee. Thus, B. by a married woman neither binds herself nor her husband, but is absolutely void. This is a rule, however, which is liable to some qualifications. See HUSBAND AND WIFE. Nor can an infant bind himself, unless the B. be for necessaries. But although a married woman is incapable of executing a B., yet one given to her is valid, and the interest in it will vest in her husband, without whose concurrence in its acceptance indeed the B. will lose its force. In the same way, a B. may be given to an infant, a lunatic, or an alien. 2. The next requisite of a B. is, that it must state the precise sum in which the obligor is bound; any omission in this respect will invalidate the instrument. If, however, the sum be merely erroneously stated, the courts will make the necessary correction, and construe the B. so as to give effect to the intention of the parties. In practice, the sum stated is generally double the sum intended to be secured—the excess being meant to cover the interest and any costs. 3. A B. must be so expressed as to create a clear legal obligation. But for this purpose no particular form of words is necessary; any mode of expression by which the intention appears, will suffice. A B., again, may be in the first or third

person, only it must be expressed in the English language, and not in Latin or French. 4. The B. must be duly executed. Such execution, in general, is the same as that of deeds, the sealing being the essential solemnity; and although it is usual for the obligor to sign the B., his signature is not necessary to its validity. Then the B. must be delivered, but it need not be dated; a B. has even been held good, though it bear a false or impossible date, on the principle that deeds take effect from, and have relation to, the time of their delivery, and not in reference to their date. Such, in general, is the form and structure of an English B., and it is used in an infinite variety of contracts.

In Scotland, the B.—personal B., as it is called—differs in several points of form from the English instrument. Its general structure is different, and it is executed in a different manner, with much solemnity and particularity, but without sealing; it does not bear to be for double the sum due, or any sum other than the correct one, which it states with precision, with a liquidate penalty, which is usually one-fifth of the principal sum; and it must have a *true* date, and be very specific in all its details. As in English practice, there are in Scotland two kinds of these instruments: first, bonds for money simply; and secondly, bonds for the performance and accomplishment of some act, or, as they are called in the Scotch practice, bonds *ad facta præstanda*.

A mortgage over land or other real estate is also in Scotland in the form of a B., by which name, indeed, the mortgage is technically described. Thus, there is the *heritable B.*, and the *B. and disposition in security*, the latter being the more modern form. By these mortgage bonds, the borrower not only becomes personally bound in the repayment of the loan, but 'in further security and more sure payment' he also conveys to the lender the land, or other real property, itself, on which the sum is to be made a charge, with, in a certain event and under certain conditions, a power of sale, by means of which the creditor, on the debtor's default, may recover his money. There are, in England, bonds by which expectant heirs may operate on their reversions, and these are called *post obit bonds*.

According to the law of both countries, certain bonds are void; such as a B. conditioned either to do something which the law considers wrong in itself, or which is legally prohibited, or to omit doing something which is a duty, or to encourage the performance of anything which is in the nature of a crime or offence against the law. In like manner, bonds to procure marriage, called marriage brocage bonds, or to restrain marriage, or for immoral considerations, or in restraint of trade, are void. A B., however, may be valid in part, or void in part, if such parts are separable. See MORTGAGE, BROCAKE BONDS TO PROCURE MARRIAGE, SPECIALTY DEBT.

**BOND CREDITOR**, in England, is the name sometimes given to a creditor whose debt is secured by a bond, and therefore privileged as a specialty. See preceding article.

**BONDAGER**, the term applied in Scotland to a rural labourer who rents a cottage from a farmer under an obligation to work for him at current wages at certain seasons. There are male and female bondagers, but the arrangement in each case is the same. The origin of the bondager system is the want of a sufficient rural population for the field-work of the neighbourhood. To induce the settlement of labourers, a landlord gives a certain

number of cottages along with each farm, and the tenant-farmer has the privilege of letting these, with a view to securing casual assistants, such as at turnip-hoeing and harvest. When wanted, they are obliged to turn out, though it may be at a sacrifice in point of wages or feeling. Such are bondagers, a class of cottagers over whom the landlord has no direct control; and as the farmer for the most part looks alone to their physical capacity, their moral and social condition is not generally creditable.

#### BONDED WAREHOUSE. See WAREHOUSING SYSTEM.

**BONDI, CLEMENTE**, a modern Italian poet, was born in 1742 at Mizzano, in Parma. He was educated by the Jesuits; and when still very young, appointed to deliver lectures in rhetoric, in the Royal Convent at Parma. Here he produced his first work, *Giornata Villereccia* (Parma, 1773), which is a not very lively picture of the rural pleasures of the brotherhood. Having celebrated in verse the abolition of the Jesuit order, he was subjected to a priestly persecution, and compelled to conceal himself in the mountains of the Tyrol; but ultimately he found a patron in the Austrian Archduke Ferdinand. He fixed his residence in Vienna, where he died in 1821. His poems are lyrical, descriptive, satirical, and elegiac. They please cultivated men, but more especially women of delicate sensibilities, by the light-flowing elegance of their versification, and the rare purity of their style. Among his larger works may be mentioned, *La Conversazione*, *La Felicità*, and *Il Governo Pacifico*. Italians consider B.'s translation of the *Aeneid* to possess remarkable excellence. His entire works were published at Vienna in 1808.

**BONDOW'**, or **BONDU**, a country of Senegambia, West Africa, lying between lat. 14°—16° N., and long. 11°—13° W. The population is estimated at 1,500,000, who are principally engaged in the cultivation of the soil, which is fertile, producing cotton, indigo, millet, maize, tobacco, &c. The weaving of cotton-cloth, which besides being made up into articles of dress, is used as currency, also forms part of the industry of the people. The surface of B. is level, with elevations in the north and central parts; the climate generally healthy, and vegetation luxuriant alike in field and forest. Iron is said to be plentiful, though not much worked, and gold is obtained in small quantity. Wild animals are numerous; and the principal river on the eastern border of the country, the Falemè, abounds with crocodiles. The inhabitants of B. profess Mohammedanism, but they trust greatly in sorcerers. The sovereign is absolute. B. exports cattle, corn, and gums; and has a transit trade in slaves, gold-dust, iron, salt, and butter. The capital, Bulibani, is situated in a plain bounded by rocky hills and forests, on the left bank of the Falemè. Its streets are unpaved and dirty, and its buildings mean and miserable; mud-walls surround it, and in its centre is the extensive but rude palace of the sovereign. Pop. about 2200, composed in great part of slaves, from the sale of which the ruler derives a considerable revenue.

**BONE, HENRY, R.A.**, a celebrated enamel-painter, was born at Truro, in Cornwall, in 1755. Appointed to a china-manufacturer in Bristol, he removed from thence to London in 1779, where he was employed in enamel-painting for lockets, brooches, &c. An enamel-portrait of his wife, exhibited at the Royal Academy in 1780, first attracted public attention; and he soon obtained a position which rendered it no longer necessary for him to continue his drudgery for the jewellers. In 1800, he was

appointed enamel-painter to the Prince of Wales, a position which he retained when the prince became king; and he also stood in a similar relationship to George III. and William IV. The Royal Academy made him an Associate in 1801, and a full Academician ten years later. Between this time and 1831, when advancing years compelled him to desist from his labours, he produced a large series of works remarkable alike for their beauty and dimensions; in the latter quality they were unapproached by any former or contemporary artist, and the principal of which are 'Bacchus and Ariadne,' after Titian, which was sold for 2200 guineas, and is now in the National Gallery; the 'Death of Dido'; 'Hope Nursing Love,' after Sir J. Reynolds; 'Venus,' &c. He also executed a large number of historical portraits of great merit; and altogether his name is one of the highest, if not the highest in his profession. He died December 1834.

**BONE** is the hard material of the skeletons or frameworks of mammalian animals, reptiles, and birds. In its earliest stages, it is termed temporary cartilage (q. v.), and consists of cells massed together, except in the flat bones, as those of the skull and shoulder-blade, of which the primary foundations are to a great extent of fibrous tissue. Points or centres of ossification form, the cells alter their form and arrangement, and a deposit of earthy materials, phosphate and carbonate of lime, takes place, rendering the former flexible substance rigid. By soaking a B. in a dilute mineral acid, we can dissolve these earthy matters, and render it again flexible; on the other hand, if we expose it to intense heat, the animal matter (gelatine) is got rid of, and

Transverse Section of Bone,  
shewing its microscopic structure.

though the bone retains at first its form, the slightest touch will cause its now unsupported earthy matter to crumble away. We see, in the ill-nourished children of large towns, too many examples of how necessary a proper relation of these two elements of B. to each other is; in the disease called rickets, the earthy matter is deficient, and the too flexible leg-bones bend under the weight of the trunk. In the aged person, again, the B. substance becomes more densely packed with earthy matter, and becomes brittle, rendering them peculiarly liable to fractures.

The bones of the skeleton are classified according to their shapes—viz., as long bones, e.g., the thigh-bone and arm-bone; flat bones, as the shoulder-blade and skull-bones; short and irregular bones, as those of the wrist or the vertebrae. The substance of bones is arranged differently in different parts—either hard and close, which is called the condensed substance, or loose and reticulated, called the cancellated structure. *Long Bones* have a shaft of hard substance terminating at each end

in soft or cancellated structure; in the latter situations, the B. is more expanded and rounded off to enter into the formation of a joint. *Irregular Bones* consist of a shell of condensed tissue, enclosing a mass of cancellated structure, and are smoothed off into surfaces adapted to those of the adjoining bones. *Flat Bones* consist of two layers of hard tissue, with an intermediate cancellated structure. Anatomists also talk of *mixed bones*, those which are both long and flat, as the ribs, the breast-bone, and the lower jaw.

The shaft of a long B. is hollow, and filled with an oily substance, the marrow (q. v.); the space in which the marrow lies is called the medullary canal. This fatty substance is also found in the cancellated structure of short and mixed, and in the diploë of flat bones, and even in the condensed tissue. Bones are covered externally by periosteum (q. v.), and on the surfaces of the cavities within by a fine membrane called internal periosteum or medullary membrane. B. is largely supplied with blood-vessels, which are continued into it from those of the periosteum; the largest are those which enter the cancellated ends of the long bones. The medullary membrane receives a special artery for the supply of the compact tissue next the canal. This vessel enters the bone generally rather above its middle, and divides into two branches, one of which runs up, the other downwards, both dividing into numerous branches, anastomosing with the vessels we have alluded to as entering the cancellated tissue. After the arteries enter the compact tissue of bone, they run in small capillary canals, invisible to the naked eye, which permeate the bone, and anastomose, leaving oblong loops or meches. The veins of B. are also contained in these canals, but are larger than the arteries, and possess at irregular intervals, where branches meet, dilatations or reservoirs for the blood.

These canals, named Haversian, after their discoverer, Clopton Havers, an old English anatomist, vary in diameter from  $\frac{1}{100}$  to  $\frac{1}{50}$  of an inch. They take a longitudinal direction, and if a transverse section is examined under the microscope, it appears pierced with holes, which are the Haversian canals cut across. Each canal is surrounded by its own layers of condensed structure, forming in the aggregate a hollow rod or pin, called the Haversian system, running through the plates of which the B. is composed, and securing their cohesion. In addition to these, there are to be seen a number of minute spaces or lacunæ, generally oval in man; from these pass numerous pores or canaliculi, which are directed to the nearest vessels: those in the periosteal, or outer lamella, pass into the B. from orifices on its surface, and the lacunæ face outwards. The pores of the internal layer open on the medullary canal, and its lacunæ face towards it, and the lacunæ in the layers around each Haversian canal face towards, and their pores open into it.

*Nerves* may be seen entering B., and the acute pain felt in some of its diseased conditions prove their existence, but they have not yet been actually demonstrated in the osseous tissue; neither have *absorbents*, though we suppose from analogy that bones are supplied with them.

The several bones composing the animal frame will be treated of under the head SKELTON. Any important peculiarities in the bones of different classes of animals, are noticed under the heads of these classes.

*Chemical Composition of Bone.*—The principal chemical ingredients present in B. are gelatine and phosphate of lime; and the following table represents the composition in 100 parts of B. of average quality:

## BONE-ASH—BONE-BLACK.

	Human Bones.	Ox Bones.
Gelatine,	83·30	83·30
Phosphate of Lime,	53·04	57·25
Carbonate of Lime,	11·30	2·85
Phosphate of Magnesia,	1·16	2·05
Soda and Chloride of Sodium (common salt),	1·20	3·45
	100·00	100·00

When a B. is digested in dilute hydrochloric acid at a summer heat, the earthy matters are gradually dissolved out, leaving the gelatine of the size and shape of the original B., but now soft, somewhat transparent, flexible, and even elastic. If this soft gelatinous residue of B. be boiled with water, it dissolves in great part therein, and yields a solution which sets or gelatinises on cooling. A more common way of extracting the gelatine from B. is to heat the bones covered with water in a digester to a temperature of 270°—290° F., when much of the gelatine dissolves out, and leaves the earthy salts with the remainder of the gelatine. Besides the marrow (q. v.), a little fat is generally found permeating the entire structure of the B., which can be extracted by throwing the bones into hot water, when the grease or fat exudes and floats to the surface. In some of the larger bones of man and other mammalia, there is a central cavity containing a considerable amount of fatty matter, popularly known as *marrow*. These cavities are not found in the bones of the young animal, but gradually form as the animal approaches maturity. In the sloth, cetacea, seals, and a few other animals, the cavities are not found. Occasionally, as in man, the elephant, giraffe, &c., the bones in the head have cavities filled with air instead of marrow. The uses to which a B. may be put are various. In the cooking of soups, bones form a constant ingredient, and become useful in supplying gelatine, which gives a body to the soup it would not otherwise possess. Where the soup is required of great lightness, for an invalid with weak digestive powers, the shavings of stag's horns may be employed, and these yield a *hardhorn jelly* free from oil, and which therefore sits lightly upon the stomach. How far gelatine is of itself nutritious, is a disputed question. See **GELATINE** and **NUTRITION**. Animals, however, like the dog, which masticate, devour, and digest the entire B., do derive benefit therefrom, in part from the gelatine, and in other part from the earthy substances; and the same remark applies to the use sometimes made of small fish, where, after being thoroughly browned, they are entirely eaten. In times of scarcity in Norway and Sweden, the poorer people even eat the bones of mackerel and other fish.

B. is largely used in making the handles of small brushes, the more common table-knives and forks, and penknives, and in the manufacture of the cheaper sorts of combs (q. v.). Our forefathers, before the metals were known, fashioned fish-hooks out of B., and used the spines in the tail and back-fin of certain fishes for pointing arrows. These uses of B., coupled with the employment of the serrated teeth of sharks as a war-weapon, are still practised by many uncivilised tribes. The fatty and other organic matters in B. allow of its being employed as a fuel where coal or wood cannot be obtained, as in the pampas of South America and the steppes of Tatar. In these regions, it is considered that the heat evolved during the combustion of the bones of an ox suffices to cook the flesh.

B. is likewise serviceable in the arts in yielding B.-ash (q. v.), B.-black (q. v.), B.-dust (q. v.), Dissolved Bones (see **BONES**, DISSOLVED), phosphorus (q. v.), superphosphates (q. v.), and certain oils and fats (see **DIFFEL'S ANIMAL OIL**),

which are employed in forming lampblack (q. v.), and in the manufacture of soap (q. v.). See also **BONES AS MANURE**.

**BONE-ASH**, or **BONE-EARTH**, is obtained by the complete combustion of bones in an open furnace, when the oxygen of the air burns away the organic matter or gelatine, and leaves the earthy constituents as a white friable mass, the size of the original bone, but readily reducible to the condition of coarse powder which is bone-ash. A very large quantity of B. is exported from South America to other countries, especially Britain. The used up bone-black of the sugar-refiner is also employed as a source of B., by being heated in a furnace exposed to the air. B. of good quality contains about 80 per cent. of phosphate of lime, and 20 per cent. of carbonate of lime, phosphate of magnesia, soda, and chloride of sodium (common salt); but it is occasionally found mixed with sand, especially that procured from South America. B. is employed to some extent as a source of phosphorus (q. v.), and in the making of cupels (q. v.) for the process of assaying (q. v.); but the most extensive use is in the manufacture of artificial manures, such as dissolved bones (q. v.) and superphosphates (q. v.).

**BONE-BLACK**, **ANIMAL CHARCOAL**, or **IVORY-BLACK**, is prepared from bones by heating them in close retorts till they undergo the process of destructive distillation, when combustible gases and water, together with the vapours of various salts of ammonia, and oil, are given off, and B. is left in the retort. It is generally reduced to coarse grains from about the size of small peas, down to large pinheads, and is extensively used in the arts for decolorising liquids, such as the sirup of sugar, and solutions of argol (impure cream of tartar) and of the alkaloids, as also in filters (q. v.), for separating chemical impurities from water. The general mode of using the B. is to allow the coloured liquid to percolate through a layer of the charcoal, when all colour is arrested, and the sirup or water runs clear and colourless from under the stratum of charcoal. This power of absorbing colouring matters is also observable in vegetable (peat or wood) charcoal, but not to such an extent as in bone-black. The application of heat to the liquids before filtration greatly facilitates the decolorisation, and where the volume of liquid to be operated upon is not great, the most expeditious method is to boil the liquid and B. together, and then strain through filtering-paper or cloth. The composition of B. in 100 parts is 10 of pure charcoal, associated with 90 of earthy salts—that is, in the proportion of 1 of pure charcoal in 10 of the commercial bone-black. The power of absorbing colour appears to be due to the porosity of the substance, and is not resident simply in the pure charcoal; indeed, the earthy matters (principally phosphate of lime and carbonate of lime) can be dissolved out of the B. by dilute hydrochloric acid, and the pure charcoal thus obtained only possesses about one-third the decolorising power of the total amount of B. it was obtained from. Thus, if 100 parts of ordinary B. have the power of arresting the colour from ten volumes of a given coloured liquid, then the 10 parts of pure charcoal which can be obtained from the 100 parts of B. will be found to decolorise only three volumes of the same coloured liquid; so that it is apparent the earthy matters in the B. influence and increase the absorption of the colouring matter, and thus render a given weight of the charcoal of greater commercial value. When sirup of sugar and other liquids have been run through B. for some time, the pores of the latter appear to get clogged with the colour, and the clarifying influence ceases, and

## BONE-DUST—BONES AS MANURE.

then the B. requires to undergo the process of *revivication*, which consists in reheating it carefully in ovens, or iron pipes enclosed in a furnace, when the absorbed colour is charred, and the B. can be of service once again as an arrester of colour. After several re-burnings, the B. becomes of very inferior absorptive quality, and is then disposed of for the manufacture of bone-ash and dissolved bones (q. v.). B. has likewise a great power of absorbing odours, especially those of a disagreeable nature, and can thus be employed to deodorise apartments, clothing, outhouses, &c., or wherever animal matter may be passing into a state of active putrefaction.

**BONE-DUST** is obtained by reducing bones to a fine state of division, either under heavy revolving wheels, or by passing them through toothed iron rollers. In order to facilitate the pulverisation of the bone, it is occasionally first subjected to the action of hot water and steam in a digester at a temperature of 270°—280° F., which dissolves out two-thirds of the gelatine, and leaves a very friable mass, which can be reduced to powder even when pressed between the fingers. B. is used in agriculture as a fertilising agent, either in its ordinary insoluble condition, when the beneficial effects on the land are prolonged over a series of years, or as dissolved bones (q. v.), when the fertilising force is exerted principally the first year. See **BONES AS MANURE**.

**BONE-GELATINE.** See **GELATINE**.

**BONER, ULRICH**, one of the oldest German fabulists, was a preaching friar of Bern, and is frequently mentioned in documents of the years 1324—1349. He flourished just when the minnesingers and poets of chivalry had passed away. His collection of 100 fables, or ‘examples,’ as they used to be called, was entitled *Der Edelstein* (The Precious Stone), and was first printed at Bamberg, 1461. It is marked by purity of style, and by clear and vivid delineation. This book is one of the greatest of all bibliographical rarities, for, at present, only one copy—that in the Wolfenbüttel Library—is known. It is decorated with wood-cuts. Bodmer and Breitinger published a complete edition of the work at Zurich in 1757.

**BONES, DISSOLVED**, a manure prepared by acting upon bone-dust by sulphuric acid of specific gravity 1600. About 15 cwt. of sulphuric acid (of specific gravity 1600) is added to every ton of bone-dust in a mixing vessel, where the whole can be thoroughly incorporated together. The resulting mass is allowed to lie in a heap for several months, during which time it dries up, and when sent into market, is a dark-coloured, coarse, soft powder. The original bone-dust contains a large percentage of insoluble or tribasic phosphate of lime ( $\text{CaO}_3\text{CaO}_2\text{CaO}_1\text{PO}_4$ ) ; and two equivalents of sulphuric acid ( $\text{HO}_2\text{SO}_4$ ) acting thereon, abstract two of the atoms of lime, and form two equivalents of sulphate of lime ( $\text{CaO}_1\text{SO}_4$ ), and one atom of the acid phosphate of lime ( $\text{HO}_2\text{HO}_1\text{CaO}_1\text{PO}_4$ ), which are soluble in water. As the gelatine of the B. hinders the sulphuric acid from acting fully on the earthy matter, it is customary to use a good proportion of bone-ash along with the bone-dust, and the absence of gelatine in the former admits of the acid doing its proper work. Very often, bone-ash is alone used in the preparation of Dissolved B., and then the manufactured material, containing no gelatine or animal matter, receives the name of *superphosphate of lime* or, simply, *superphosphate*. In place of bone-ash, much bony matter or phosphate of lime, in the form of **APATITE** (q. v.) and **COPROLITES** (q. v.), is now employed in part in the manufacture of some varieties of dissolved bones. The present value of

Dissolved B. ranges from £6 to £8 per ton, according to quality; and they contain from 20 to 35 per cent. of soluble phosphate of lime, and 15 to 3 per cent. of undissolved or insoluble phosphates. This material is very largely employed as a manure in Britain, and is eminently suitable for the cultivation of the root-crops, such as turnips, mangel-wurzel, &c.; and, associated with 12 to 20 per cent. of sulphate of ammonia (q. v.), or nitrate of soda, it rivals Peruvian guano in its fertilising effects on land where cereals—wheat, barley, oats, &c.—are growing.

**BONES AS MANURE.** The employment of bones as a manure is one of the greatest modern improvements in agriculture. They are applied either simply reduced to small fragments or a coarse powder called *Bone Dust* (q. v.), or, after undergoing chemical preparations of various kinds, as the basis of highly valuable artificial manures.—See **BONE-ASH**, and **BONES, DISSOLVED**.—All the substances which enter into the composition of bones are desirable additions to the soil, but particularly the phosphates. Phosphoric acid, usually found in combination with magnesia, and more particularly lime, enters into the structure of every plant and animal; it is a substance, therefore, which cannot be dispensed with either in the vegetable or animal economy. Being very sparingly diffused through most soils, it is often essential to add it artificially. The productiveness in many districts of Britain had become much impaired by the diminution of phosphoric acid in the soil, owing to the quantity taken off in corn, cheese, and the B. of animals, which were annually raised and exported. The fine red sandstone loams of Cheshire were comparatively sterile in the end of the last century, which was entirely owing to the deficiency of phosphoric acid in the soil, no doubt partly to be attributed to the quantity yearly abstracted by the dairy produce sent to market. So much was this the case, that a liberal dressing of common or calcined B. had the effect of at once doubling the value of the worn-out pastures. In other parts of Britain, however, such as the clay-soils of Suffolk—which at one time were under dairy-farms—the soil is rich in phosphates, and the application of B. as a manure is there attended with little effect. It becomes, therefore, of practical importance to ascertain when this substance should be added, and when it is not necessary to do so. It is important to observe, that although phosphoric acid is as essential to one crop as to another, yet some crops, such as turnips, require a far more liberal *artificial* supply of it than others, or wheat, which actually require as much to build up their structure. We will shortly state the principles which should regulate the practice of bone-manuring.

All perennial plants, such as grasses, are enabled to extract phosphoric acid from the soil more readily than annual plants, owing to their numerous and well-developed roots, which are ready, even at the beginning of the growing season, to draw supplies from a large mass of soil. Grasses, therefore, are only benefited by phosphoric manures when the soil is more than usually deficient in phosphates. If grass-lands are sterile, it is easy to ascertain if a deficiency of phosphoric acid is the cause, by adding calcined or crushed B., and watching their effect. An experiment of this sort is a much better guide than any analysis of the soil. In Cheshire, the quantity of B. applied to the pastures is from half a ton to a ton per acre; and this dressing will last from 16 to 25 years.

Wheat, also, from the long time it occupies the ground before it is ready to be reaped, and its slow growth during its early stages, can thrive with a small supply of phosphates. These substances

are, therefore, comparatively seldom applied directly as a manure for this crop. So, also, with early-sown oats or barley. When these latter crops, however, are late sown, and the rapidly growing conditions of heat and moisture exist, phosphates are often applied with great benefit.

It is as an application to the turnip that phosphoric acid is so marked in its effects, even when the soil already contains it in considerable quantity. The reason of this is not difficult to trace. The seed of the turnip is small, and it is sown at the warm season, when the growth is rapid. The seeds themselves have only a limited quantity of phosphates stored up for the benefit of the roots and leaves of the young plants. Unless the roots, therefore, while yet short, meet with a concentrated supply, the other elements of the food of the plant—carbonic acid, water, and ammonia—however abundantly they may be present, cannot be assimilated, and its growth is arrested. Besides, a liberal supply of phosphates has the effect of pushing on the turnip through its early stages, when it is so liable to injury from various insects.

The effects of B. as a manure for the turnip are greatly increased by dissolving them in sulphuric acid, and manufacturing the soluble superphosphate of lime. Liebig suggested such a use of sulphuric acid in 1839, and since then, hundreds of manufactories of this manure have arisen over the land. The utility of the discovery, however, is not at present so great as is sometimes represented, owing to the large supply of phosphatic guanos now in the market. In these the phosphate of lime is in a finely divided state, and is readily enough taken up by plants without being dissolved by acids. No doubt, as the scarcity of guano begins to be experienced, and its price rises, it will again become a much greater object than at present to manufacture superphosphate from mineral phosphates or bones. Three to four cwt.s of dissolved B. or of phosphatic guano is the quantity usually applied to an acre of turnips.

The value of B. as a manure has been long known in some parts of England, but their use was merely local, until more than two decades of the 19th c. had passed; and they were merely broken by a hammer, or rudely and imperfectly crushed by being laid in ruts where cart-wheels might pass over them. The first machines for bone-crushing were employed in Yorkshire and Lincolnshire in 1814 or 1815, and reduced them only to pieces about the size of a walnut, much larger than the coarsest or 'rough' bone-dust now in use. The employment of this manure did not become general in Scotland till about 1830, although it had been introduced in East Lothian some years before. Its use has now extended to different parts of the continent of Europe, and to North America.

BONET, JOHN PAUL, a Spaniard of the 17th c., one of the first instructors of deaf mutes. Only one person before him had been at all successful in the art, and about him, B. does not appear to have known anything, so that he is really entitled to the claim of originality in his method, which consisted in imparting instruction by the sight instead of by the ear—gestures, writing, a manual alphabet, and an artificial pronunciation, being the means employed. His plan is minutely detailed in a volume published by him at Madrid in 1620, entitled *Reducción de las Letras, y Arte para enseñar a hablar los Mudos*. The manual alphabet now in use at almost all deaf and dumb institutions in Europe and America, differs little from that introduced by Bonet.

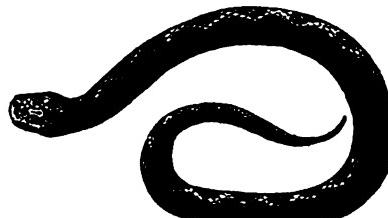

BONFIRE, a fire kindled for some purpose of

public rejoicing, usually in an open conspicuous place, as the top of a hill, or the centre of a village-green. The burning materials consist of tar-barrels, coal, and other combustibles. The practice of kindling fires of this kind is of so great antiquity in England, Ireland, and Scotland, as to be traced to pagan rites. See BELTEIN. It was customary to kindle one of these fires in token of rejoicing on Midsummer Eve—the evening before the 24th of June, which day was appropriated by the church for the feast of St John the Baptist. Reference is made to bonfires on this occasion by Googe in his translation of the poet Naogeorgus:

Then doth the joyfull feast of John the Baptist take his turne,  
When bonfires great, with loftie flame, in everie  
towne doe burne;  
And young men round about with maides doe dance  
in everie streete,  
With garlands wrought of motherwort, or else with  
vervain sweete, &c.

For much antiquarian lore on this subject, see Brand's *Popular Antiquities*, edited by Sir Henry Ellis, vol. i. The origin of the word B. has been very puzzling to etymologists. In Scotland, the popular term is *banefire* or *bainfire*, which Jamieson says is apparently a corruption of bailfire, which may be doubted. The most probable etymology is the Welsh *ban*, high, whence *ban-fagl*, a lofty blaze, a bonfire. The same hills that in English are called *Beacons*, are in Welsh called *Bans* or *Vans*. In Danish, also, *bavn*, is a beacon, and may be traced in such names as *Banbury*.

BONGAR (*Bungarus* or *Pseudoboa*), a genus of venomous serpents, allied to the genera *Elaps* and *Naja*, and distinguished by a much keeled back, which has a row of hexagonal scales larger than the rest. The head is broad and depressed,

Bongar, or Rock Snake.

with very strong bones. The species, which appear to be few—only two being certainly known—are natives of the East Indies. They are called Rock Snakes in India. *B. annularis*, which has the body surrounded with rings of black and yellow, attains a length of six or eight feet.

BONGARDIA, a genus of herbaceous plants of the natural order *Berberidaceae* (q. v.), natives of the East. One species (*B. Rauwolfii*) produces tubers, which are eaten, either boiled or roasted, in Persia; and the leaves of another (*B. chrysogonium*) have an acid taste, and are eaten as a salad.

BONGAY, an island of the East Indian Archipelago, to the east of Celebes. It gives name to a group of islets, which supplies the neighbourhood with slaves and wood.

BONHEUR, ROSALIE (more commonly called Rosa), a female French artist, born at Bordeaux on the 22d of March 1822. Her first master was her own father, Raymond Bonheur, an artist of merit, who died in 1853. In 1841, Mademoiselle B. contributed for the first time two small pictures to the

French Exhibition, 'Two Rabbits,' and 'Goats and Sheep,' which indicated the department in which she was to attain such eminence. During the ten years which followed, she was a constant contributor, almost all her pictures being devoted to animal or rural life. In 1853, her famous 'Horse Market' was the principal attraction of the Parisian exhibition; and in 1865 she sent to the Universal exhibition at Paris, a new landscape of large dimensions, 'The Haymaking Season in Auvergne.' Since 1849, Mademoiselle B. has directed the gratuitous School of Design for young girls. During the siege of Paris, 1870—1871, her studio and residence at Fontainebleau were spared and respected by special order of the Crown Prince of Prussia. A beautiful portrait of her was executed by Paul Delaroche.

BO'NI, or BO'NY, a powerful state of the south-west peninsula of the island of Celebes, in the South Pacific Ocean, between lat. 4° 20'—5° 20' S., and long. 119° 35'—120° 30' E. In the north part, the scenery is fine, and the soil fertile—rice, sago, and cassia being produced. In addition to agriculture, the industry of the inhabitants consists in the manufacture of cotton, and articles of gold and iron, in which they have a large trade. Their institutions, which are said to be very ancient, partake of the character of a constitutional monarchy. The British have twice attacked the Bonese for injuring their commerce, and selling the crews of British ships into slavery. In the second attack, in 1814, the Bonese king was killed. Pop. 200,000.—B., GULF OF, separates the south-east and south-west peninsulas of Celebes. It has a length of about 200 miles, with a breadth narrowing from 80 to 40 miles. Numerous shoals render its navigation difficult.

BONIFACE, St., 'the Apostle of Germany,' whose original name was Winfried, was born in Devonshire, England, about 680. He first entered a monastery in Exeter, at the age of 13, and afterwards removed to that of Nutcell, where he taught rhetoric, history, and theology, and became a priest at the age of 30. At that time, a movement, proceeding from England and Ireland, was going on for the conversion of the still heathen peoples of Europe; in 614, Gallus and Emmeran had been sent to Alemannia, Kilian (murdered 689) to Bavaria, Willibrord (died 696) to the country of the Franks, Swidvert to Friesland, and Siegfried to Sweden. Winfried also took the resolution (715) of preaching Christianity to the Frisians, among whom it had as yet found no entrance. But a war broke out between Charles Martel and the king of the Frisians, and Winfried returned from Utrecht to his convent, of which he became abbot. Still bent upon his design, he repaired to Rome in 718, and received the authorisation of Pope Gregory II. to preach the gospel to all the tribes of Germany. He went first to Thuringia and Bavaria, then laboured three years in Friesland, and travelled through Hesse and Saxony, everywhere baptising multitudes, and consecrating their idolatrous groves as churches. In 723, Gregory II. called him to Rome; made him bishop, with the name of Bonifacius; furnished him with new instructions or canons, and with letters to Charles Martel and all princes and bishops, requesting their aid in his pious work. Returning to Hesse (724), he destroyed the objects of heathen worship (among which are mentioned an oak near Geismar, sacred to Thor, and an idol named Stuffy, on a summit of the Harz, still called Stuftenberg), founded churches and convents, and called to his aid priests, monks, and nuns from England, whom he distributed through the various countries. In recognition of his eminent services, Gregory III. sent him (732) the pallium, and named him archbishop and primate

of all Germany, with power to establish bishoprics wherever he saw fit. B. now made a third journey to Rome (738), and was appointed papal legate for Germany. The bishoprics of Regensburg, Erfurt, Paderborn, Würzburg, Eichstätt, Salzburg, and several others, owe their establishment to St Boniface. The famous Abbey of Fulda is also one of his foundations. He was named Archbishop of Mainz by Pipin, whom he consecrated as king of the Franks at Soissons (752), and he presided in the council held at that place. In 754 he resumed anew his apostolical labours among the Frisians; and at Dokkum, about 18 miles north-east of Leeuwarden, in West Friesland, this venerable Christian hero was fallen upon by a mob of armed heathens, and killed, along with the congregation of converts that were with him (755). His remains were taken first to Utrecht, then to Mainz, and finally to Fulda. In the abbey, there are still shewn a copy of the gospels written by him, and a leaf stained with his blood. A collection of his letters, and the canons he promulgated for the discipline of the newly established churches, have been preserved, and are instructive as to the state of Germany at the time. The completest edition of the Letters (Epistole) is that of Würdtwein (Mainz, 1789). In 1811, a monument was erected to St B. on a hill near Altenberga, in the principality of Gotha, where, according to tradition, he had erected (724) the first Christian church in North Germany. A statue by Henschel of Cassel was also erected to him in Fulda in 1842. Ritterberg, *Kirchengeschichte Deutschlands* (vols. i. and ii., Gott. 1842).

BONIFACE, the name of nine popes, most of whom are of no historic note.—B. I. (418—422) was appointed, contrary to canonical rule, by the Emperor Theodosius II., upon account of prevailing party divisions. He was the first who assumed as Bishop of Rome the title of First Bishop of Christendom.—Boniface III., who was pope only for ten months in the year 607, was the first to whom the title of Universal Bishop of Christendom was conceded by the Greek Emperor (Phocas).—B. VIII., previously Benedict Cajetan, a native of Anagni, was elected pope on December 24, 1294. His inauguration was distinguished by great pomp: the kings of Hungary and Sicily held the reins of his horse as he proceeded to the Lateran, and with their crowns upon their heads, served him at table. He failed, however, in his attempts to assert a feudal superiority over Sicily, and to exercise his papal authority in the disputes between France and England. Philip the Fair of France, supported by his states and clergy, maintained the independence of the kingdom, disregarding many bulls and briefs, and even the sentence of excommunication to which the pope proceeded. Philip at last, with the aid of Italian enemies of B., made him prisoner at Anagni, to which he had fled; and although he was liberated by the people of Anagni after two days' imprisonment, he died within about a month (1303 A.D.), in consequence of having refused food during these two days, through fear of poison. He instituted the Roman jubilee in the year 1300. If the charges, however, which Philip the Fair brought against B. in self-defence—viz., heresy, simony, licentiousness, &c.—were well founded, and regarding the second there can be no doubt, Dante was quite justified in giving him a place in hell. Apart from the question of his personal character, B. was undoubtedly one of those dangerous ecclesiastics in whose downfall civilisation exults.—B. IX. (Peter Tomacelli), a native of Naples, succeeded Urban VI. as pope at Rome in 1389, whilst Clement VII. was pope at Avignon. He exceeded all his predecessors in the shameless sale of ecclesiastical offices and benefices, and of

dispensations and indulgences. He acquired, after a struggle, a most despotic power in Rome, which he kept in awe by fortresses; but to secure himself against external enemies, particularly Louis of Anjou, whose claim to the crown of Naples he had opposed, he was obliged to give away part of his territory in fiefs, as Ferrara to the House of Este. He died in 1404.

BONIFA'CIO, STRAIT or, the modern name of the strait between Corsica and Sardinia, the *Fretum Gallicum* of the Romans. At the narrowest part, it is only 7 miles wide. The navigation is difficult, owing to the great number of rocks, which, however, are favourable to the production of coral, and the coral and tunny fisheries are actively prosecuted. At the eastern entrance of the strait lie the Bucinario or Magdalen Islands, the *Insula Canicularis* of the ancients, principally inhabited by Corsicans, but mostly belonging to Sardinia. The strait receives its name from the small town of Bonifacio in Corsica, strongly situated upon a rocky promontory, with an excellent harbour and 3300 inhabitants. It was a place of much consequence to the Genoese for the security of their trade in these seas, and a number of very fine churches still attest its former greatness.

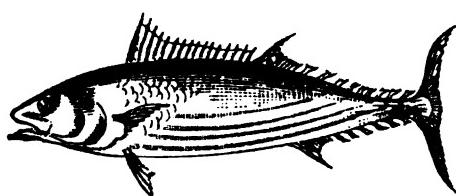

BON'IN, or ARCHBISHOP ISLANDS, in the Pacific, stretching in N. lat. between  $26^{\circ} 30'$ — $27^{\circ} 44'$ , and in E. long. between  $142^{\circ}$ — $143^{\circ}$ . They were discovered in 1827 by Captain Beechey of the *Blossom*, who took formal possession of them for England. They would appear to have been then uninhabited. In 1830, however, Peel Island, near the centre of the group, was settled, in connection with the whaling-business, by a motley colony—an Englishman, an Italian, a Dane, 2 Americans, and 15 Sandwich Islanders (5 men and 10 women)—under the auspices of a 'union-jack'. According to the latest accounts, the population had increased from 20 to 42. Besides pigs, goats, and fowls, Peel Island produces sweet potatoes, maize, onions, yams, pumpkins, melons, lemons, tobacco, and sugar-cane. Timber also is plentiful, though not of sufficient size for masts.

BONITO, a name common to several fishes of the mackerel family, or *Scomberidae* (q. v.). One of these, *Thynus pelamys*, sometimes called the Stripe-bellied Tunny, and of the same genus with the

and whitish below. Four dark lines extend along each side of the belly. The general form resembles that of the mackerel, but is less compressed.—The B. of the Mediterranean (*Pelamys Sarda*) is a fish very similar to this, but of an allied genus, distinguished by its comparatively large and strong teeth. It has dark transverse bars reaching from the ridge of the back to the lateral line. It is plentiful in the Black Sea.—The Plain B. (*Auxis vulgaris* or *A. Rocheanus*) may be distinguished at once from both of these by its more uniform blue colour, without stripes or bands, and by the widely separated dorsal fins. It has only one row of minute teeth in each jaw. It is found in the Mediterranean, and in some places seems to bear, in common with the last-mentioned species, the name bonito. Its flesh is little esteemed when fresh; it is generally used either salted or pickled. Like mackerel, it putrefies rapidly, unless means are used for its preservation. This fish has been occasionally caught on the coast of England, and one was taken in summer 1859, in a herring-net, off the coast of Banffshire.—Another species of *Auxis*, a native of the West Indian seas, equals the tunny in size.

BONN, a town of Rhenish Prussia, beautifully situated on the left bank of the Rhine, 15 miles above Cologne. Population (1871), inclusive of the military, 26,020. B. is connected with the right bank of the Rhine only by a ferry, and with Cologne by the railway as well as the river. The Cathedral Church is a fine specimen of the last period of the Romanesque style, and exhibits the transition to the Gothic already begun. B. has considerable manufactures of cotton goods, earthenware, vitriol, and soap. The neighbourhood is very romantic. B. is the seat of a number of learned associations and institutions. The Leopoldine Academy of Physical Science, founded at Vienna in 1652, was transferred to B. in 1818. It obtained a university in 1786, which, however, was suppressed during the sway of France; and the present university was founded in 1818, receiving from government the former electoral palace and other buildings, with an annual revenue of nearly £15,000 sterling. There are two theological faculties, the one Protestant, and the other Roman Catholic. The university has altogether more than 90 professors and lecturers, and fully 1000 students, and among its professors have been numbered some men of high distinction, as Niebuhr and A. W. Schlegel. Albert, the late Prince Consort, was a student here. Its clinical establishments are of unusual extent, and admirably arranged. It has a library of above 200,000 volumes, archaeological and other collections, a botanic-garden, an observatory, an agricultural school, a riding-school, &c. B. derives its origin from *Bonna*, one of the castles erected by the Romans in Germany. It was long the residence of the electors of Cologne; it was taken from the French in 1689, after a severe bombardment by the Elector Frederic III. of Brandenburg; and in 1703 it surrendered, after a siege, to the English and Dutch army under Marlborough. It returned again into the possession of the Elector of Cologne in 1715, and in 1717 its fortifications were razed. It was acquired by France in 1802, and assigned to Prussia in 1814. Beethoven was a native of Bonn.

BONNER, EDMUND, Bishop of London, was born of obscure and doubtful parentage, about the end of the 15th century. The reputation he gained at Oxford by his knowledge of the canon law, recommended him to the notice of Wolsey, who promoted him to several offices in the church. After the fall of Wolsey, B. took an active share in the work of reformation, and received due promotion from Henry VIII.

Bonito, or Stripe-bellied Tunny.

Tunny (q. v.), is well known to sailors as an inhabitant of tropical seas, and as one of the fishes most frequently seen pursuing the flying-fish. It is often taken by an imitation flying-fish made to skim along and touch the waves. Its flesh, although relished by those who have been previously confined to salt provisions, is dry. It is occasionally but rarely caught on the British coasts. It is a very beautiful fish, seldom exceeding thirty inches in length, of a beautiful steel-blue colour, darker on the back,

In 1533, he was deputed to appear before the pope at Marseille, to appeal for the excommunicated monarch to a general council. The violence of his threats on this occasion suggested to his holiness the fitness of having him burned alive, or thrown into a caldron of melted lead, so that B. judged it prudent to leave Marseille without notice. In 1540, he was made Bishop of London. The death of Henry cooled his Protestant zeal; and having given proofs of his lukewarmness in the cause of reformation, he was at length, in 1549, committed to the Marshalsea, and deprived of his bishopric. The accession of Queen Mary restored him to office, and gave him the opportunity of revenge, which he now took without delay or stint. As vicegerent and president of the convocation, he was the principal agent in that bloody persecution which has made the reign of Mary infamous. On the accession of Elizabeth in 1558, B. accompanied his episcopal brethren to salute her at Highgate, but was excepted from the honour of kissing her hand. In May 1559, he was summoned before the privy council, and refused, with a consistency worthy of due respect, to take the oath of supremacy. He was accordingly deposed from his bishopric, and shut up in the Marshalsea, where he died in 1569. While it is right to remember with detestation the multitude of B.'s cruelties, one also ought not to forget that he was strict in castigating the lax morality of his clergy; that after his return to popery, he remained steadfast to his principles; and that he bore his final misfortunes with manly resignation.

BO'NNET, in Fortification, is a small defence-work constructed at the salient angles of the glacis or larger works. It consists of two faces only, with a parapet 3 feet high by 10 or 12 broad. There is no ditch. A larger kind, with three salient angles, is called a priest's B., or *bonnet à prêtre*. The use of the B. is to check the besiegers when they are attempting to make a lodgment.

BONNET, CHARLES, an eminent naturalist and philosopher, born at Geneva, 13th March 1720. He was educated for the profession of the law, but devoted himself at a very early age to the study of natural history. A dissertation on aphides obtained for him, in 1740, the honour of being made a corresponding member of the Academy of Sciences in Paris. He was soon afterwards occupied in researches concerning polypi, the respiration of insects, the structure of the tapeworm, &c. He published his *Traité d'Insectologie* (2 vols., Par.) in 1745. His *Recherches sur l'Usage des Feuilles des Plantes*, published in 1754, contained the result of much observation on important points of vegetable physiology. A severe inflammation of the eyes, putting a stop for two years to his researches in natural history, gave another direction to his studies, and he published several works on psychology, in which materialistic views decidedly prevail: the body is represented as the original source of all the inclinations of the soul, and all ideas are referred to movements of the nervous fibres; but his religious convictions remained always strong and unshaken, and in his *Idées sur l'Etat Futur des Etres Vivants, ou Palingénésie Philosophique* (2 vols., Gen. 1769), he endeavoured to demonstrate the reasonableness of the Christian revelation. In this work he also maintained the future life of all living creatures, and the perfection of their faculties in a future state. Lavater translated the last part of it, and it helped to effect a change in the religious tendencies of Mendelssohn. His *Considérations sur les Corps Organisés* (2 vols., Gen. 1762) is very much devoted to an examination of the theories of generation. B. was for some years a member of the Great Council of

his native city. He died on 20th May 1793. In the latter part of his life, he superintended a collective edition of his own works (8 vols. and 18 vols., Neuch. 1779—1788).

BO'NNET, a covering for the head, of which there are many varieties. The French, from whom we have the word, apply it as we do to male as well as female head-dress. A kind of night-cap is called by them a B.; as, for example, the *bonnet rouge*, or infamous 'cap of liberty' of the revolutionary leaders. The English B. of former times was made of cloth, silk, or velvet, less or more ornamented, according to the means or taste of the wearer. This species of headgear was generally superseded by the hat, in the early part of the 16th c.; but in Scotland, bonnets were universally worn for a century to two centuries later, and they still remain to a certain extent a national characteristic. From the frequent notice of the blue B. in historical records and in song, it would seem that the Scotch were long identified with this kind of head-covering. The genuine old B. of the Lowland Scottish peasantry was of a broad, round, and flat shape, overshadowing the face and neck, and of a dark-blue colour, excepting a red tuft like a cherry on the top. The fabric was of thick milled woolen, without seam or lining, and so exceedingly durable that, with reasonable care, a single B. worth about 2s. would have served a man his whole life. No head-dress ever invented could stand so much rough usage. It might be folded up and put in the pocket, or laid flat and sat upon, with equal impunity; it might be exposed to a heavy drenching rain without the head being wetted, and when dried, it was as good as ever. Besides, it could be worn on the top of the head, or slouched in front, behind, or sideways, as a protective against a cold blast; and from its softness and elasticity, it very fairly saved the head from the effects of a blow. In short, there was no end to the adaptability of the old 'braid bonnet' as the Scotch termed it; and one almost feels a degree of regret that, in the progress of fashion, it should have gone so much out of use. From having been worn, till comparatively late times, by small rural proprietors—such as owners of a cottage and an acre or two of land—it gave to these local notabilities the distinctive appellation of *Bonnet Laird*. A lesser and not so broad a variety of the B. was worn by boys. The Highlanders have long worn bonnets of the same fabric, but these rise to a point in front, and are without any rim. Such is the cap now known as the *Glengarry Bonnet*. From time immemorial, these various kinds of Scots bonnets have been manufactured at Stewarton, a small town in Ayrshire. Formerly, the Stewarton B.-makers formed a corporation, which, like other old guilds, was governed by regulations conceived in a narrow and often amusingly absurd spirit; one of the rules of the fraternity, however, can be spoken of only with commendation, for it enforced a certain weight of material in each B., as well as durability in the colour. An account of this ancient corporation will be found in *Chamber's Journal*, first series, vol. v., p. 142. The bonnets used in the Highland regiments are made at Stewarton and Kilmarnock; they are usually distinguished by a chequered fillet, being the *fess-chequé* of the House of Stuart. Latterly, although hats and caps have, to a great extent, superseded bonnets of the old varieties, the bonnet manufactories of Stewarton have much increased, and are still increasing. Of the many and ever-shifting varieties of ladies' bonnets of straw, silk, and other materials, we need not attempt any account.

BO'NNET-PIECE, a gold coin of James V. of

BONNEVAL—BONUS.

Scotland, so called on account of the king's head being decorated with a bonnet instead of a crown, as was usual. We give a representation of the obverse side of this elegant coin, which shews the 'king's head regarding the right, with a cap or bonnet, having a circle of gems; round the neck

a collar of thistle-heads, and S S.' Inscription, 'JACOBVS 5. DNI G. R. SCOTORV. 1539.' Weight of the coin, 72 grains. Adam de Cardonnel, from whose work, *Numismata Scotiae* (Edin. 1786), we extract these particulars, observes, that James V. was the first Scottish sovereign who

placed dots on his money,

and was the first who dimin-

ished the size of the gold coins 'by increasing their thickness. The most remarkable are those com- monly called the bonnet-pieces, which were struck of native gold; in beauty and elegance of work- manship, they approach the nearest to the Roman coins, and very much surpass all the coinage at that period, or even since.' These bonnet-pieces are among the most valued curiosities of the antiquary.

**BO'NNEVAL, CLAUDE ALEXANDRE, COUNT DE**, also called Achmed Pasha, a French adventurer, whose history is very extraordinary. He was born of a noble family at Couassac, in Limousin, in 1675; proved unmanageable at the Jesuit College; and was placed in the Royal Marine Corps in his 13th year. He was transferred to the Guards; served with great distinction in Italy and the Netherlands; but having been refused promotion, upon account of some excesses of which he had been guilty, he behaved with great insolence to the minister at war, and was therefore condemned to death by a court-martial. Foreseeing this result, he fled to Germany, where, upon the recommendation of Prince Eugene, he obtained employment in the Austrian service. He now fought against his native country, distinguished himself by many daring exploits, was raised to the rank of lieutenant field-marshall, and bore a principal part under Prince Eugene in the war between Turkey and Austria. But when residing at Vienna, after the peace of Passarowitz, he made himself very disagreeable to the prince, and was therefore sent, in 1723, as master-general of ordnance, to the Netherlands, where he soon got into a scandalous quarrel with the governor, and was brought to trial, and condemned to death by a court-martial. The emperor commuted the sentence to one year's imprisonment; and upon condition of never again setting foot upon German soil, he was conveyed across the Tyrolese frontier. He went to Constantinople, was cordially welcomed, became a Mohammedan, took the name of Achmed, was made a pasha of three tails, was employed in organizing the Turkish artillery after the European manner, achieved successes as general of a division of 20,000 men, in the war of the Porte with Russia, and arrested the victorious career of the Persian usurper, Thamasp Kuli Khan. For this service, the sultan appointed him governor of Chios; but his own imprudence, and the envy of others, caused his removal from this office. He now thought of leaving Turkey, but died at Constantinople on 27th March 1747. The memoirs published as his are spurious.

**BONNYCASTLE, JOHN**, long Professor of Mathematics at the Royal Military Academy, Woolwich, is well known as the author of many excellent elementary works, chiefly mathematical. He was

born at Whitchurch, Buckinghamshire, and died at Woolwich in 1821. His *Elements of Algebra* (2 vols. 8vo, 1813) is selected by a capable critic, from among his other works, as specially deserving of commendation.

**BO'NNY RIVER**, a river of Guinea, West Africa, forming the eastern debouchure of the Niger, and falling into the Bight of Biafra, in about lat. 4° 30' N., and long. 7° 10' E. It is accessible at all times of the tide to vessels drawing as much as 18 feet of water, and safe anchorage at all seasons of the year is found within its bar. Its banks are low, swampy, and uncultivated. On the east side, near its mouth, is the town of B., long notorious as the rendezvous of slave-trading ships. It exports considerable quantities of palm-oil.

**BONPLAND, AIMÉ**, an eminent botanist, was born at La Rochelle, France, August 22, 1773. Having studied medicine and botany at Paris, he accompanied Alexander von Humboldt in 1799 to America, where they travelled nearly five years, mostly in Mexico and the Andes, during which time B. collected 6000 new species of plants. After his return, he was appointed, in 1804, director of the gardens at Navarre and Malmaison, and published several splendid and valuable botanical works, *Plantes Équinoxiales Recueillies au Mexique*, &c. (2 vols. Par. 1808—1816, with 140 copper-plates); *Monographie des Melastomées*, &c. (2 vols. Par. 1809—1816, with 120 copper-plates); and *Description des Plantes rares de Navarre et de la Malmaison* (11 numbers, Par. 1813—1817, with 64 copper-plates). He went to Buenos Ayres in 1816, with a collection of European plants and fruit-trees, was favourably received by the government, and named Professor of Natural History. After remaining at Buenos Ayres about five years, B. undertook an expedition of scientific discovery up the Parána, with the view of prosecuting his investigations to the Andes, across the Gran Chaco Desert; but Dr Francia, then dictator of Paraguay, instead of giving him permission to cross the country, arrested him, after killing some of his men, and kept him prisoner for about nine years, notwithstanding the efforts of the British government, at the instigation of Humboldt, to obtain his release. While detained by Dr Francia, he acted as physician of a garrison. On the 2d of February 1831, he obtained his liberty, and travelling southward, settled on the southern boundary of Brazil, near the eastern bank of the river Uruguay, and in the vicinity of the small town of San Borja. Here he resided until 1853, taking great interest in cultivating and promoting the cultivation of Paraguay tea, and with no desire to return to Europe. In 1853, he removed to a larger estate at Santa Anna, where he busied himself in cultivating orange-trees of his own planting. In 1857 he wrote to Humboldt that he was about to carry his collections and manuscripts to Paris, to deposit them in the Museum there, and that after a short stay in France, he intended to return to Santa Anna. That voyage, his death in 1858 prevented him from accomplishing. His remarks on the herbarium collected in his travels with Humboldt, have been given to the world by Kunth in his *Nova Genera et Species Plantarum* (12 vols. Par. 1815—1825, with 700 plates).

**BO'NUS**, a special allowance, or extra dividend, to the shareholders of a company. If the previous dividend has been 4 per cent. on the capital, and if the profits of the current year admit of 5 per cent., a formal dividend of that amount would commit the company to a like dividend in future; and to prevent such a precedent, 4 per cent. is declared, and a B. of 1 per cent.

Bonnet-piece.

## BONY PIKE—BOOK.

**BONY PIKE** (*Lepidosteus*), an interesting genus of fishes, being one of the few existing genera belonging to an order, *Ganoid Fishes* (q. v.), of which the fossil forms are extremely numerous, and the only existing genus, which, upon account of the number and arrangement of the bones of the head and other peculiarities of the skeleton exhibiting a resemblance to reptiles, is reckoned among *Sauroid Fishes* (q. v.). The body is covered with a case of dense bony square scales, so fitted together as to form a complete coat of mail. The vertebrates are articulated by ball and socket, and the head is capable of a degree of motion upon the trunk very remarkable among fishes, and compensating for the general stiffness of the mailed body, the skeleton of which is also bony, and not cartilaginous. The snout is elongated, and the edges of the jaws are furnished with long teeth, the breadth of the snout in some of the species giving it a resemblance to that of the pike. The tail is *heterocercal*, or unsymmetrical, the caudal rays being inserted not equally above and beneath the termination of the vertical column, but only at and beneath it, a character much more common in fishes of the old red sandstone than in those of the present period.—The species of this genus are pretty numerous, attain a large size, and are found in the rivers and lakes of the warm parts of America. They are much esteemed for the table.

**BONZES**, the Japanese priests of Fo or Buddha. The name is from the Japanese *Buso*. It was extended by the Portuguese to Buddhist priests in other countries, but particularly to the Chinese. See JAPAN and BUDDHISM.

**BOO'BY** (*Sula fuscicollis*), a species of Gannet (q. v.), which has received this name from its apparent stupidity in allowing itself to be knocked down with a stick or taken by the hand. Accounts differ very much, however, as to this character of the B., some representing it as singular in not taking alarm or becoming more wary even when it has had reason to apprehend danger from man; others, as Audubon, asserting in such a manner as apparently to place it beyond dispute, that it does learn to be upon its guard, and even becomes difficult to approach within reach of shot. The B. is not quite so large as its congener, the common gannet or solan-goose, and, like it, is a bird of powerful wing, and feeds on fish, which it takes by diving in the sea, observing its prey as it sweeps along in graceful and varying flight, sometimes at a

height of only a foot or two from the surface of the water, sometimes twenty yards above it, and plunging suddenly to seize it. It is sometimes taken, like the gannet, by means of a fish fastened to a board, through which it drives its bill, as it dashes at the bait. The B. is of a blackish-brown colour, whitish beneath; its colours are subject to some variation, and in young birds a general brown colour prevails; the sexes differ very little, except that the female is not quite so large as the male. It is found on almost all tropical and sub-tropical shores, and sometimes even 200 miles from land. On the east coast of North America, it reaches about as far north as Cape Hatteras, but is much more abundant further south, great numbers breeding on the low islands off the coast of Florida. The nest is often placed upon a low bush, and 'is large and flat, formed of a few dry sticks, covered and matted with sea-weeds in great quantity.' It contains only one egg or young one at a time. The expansibility of the gullet enables the B. to swallow fishes of considerable size. The bill, which is straight, conical, and longer than the head, opens beyond the eyes, as in the rest of this genus. The B. is much persecuted by the Frigate Bird (q. v.) and Man-of-war Bird (q. v.), more powerful birds and of swifter flight than itself, which often compel it to discharge for their use the prey which it has just swallowed. The flesh of the B., although sometimes eaten by sailors, is dark coloured, and not very agreeable. Bligh and his companions, in his long boat-voyage, found one or two which they captured a providential supply of food.

**BOOBY ISLAND**, a level rock in Torres Strait, in lat. 10° 36' S., and long. 141° 53' E., 3 feet in height, and  $\frac{1}{4}$  mile in diameter. Being, of course, highly dangerous to navigators, and destitute of resources of its own, it is said to be pretty regularly supplied with provisions and water by passing vessels, for the benefit of such as may be cast ashore on it.

**BOODROOM, BOUDROUM, or BODRUN**, a seaport town of Asiatic Turkey, in the pashalic of Anatolia, finely situated on the north shore of the Gulf of Kos, about 96 miles south of Smyrna, in lat. 37° 2' N., and long. 27° 25' E. It is an uninviting place, its streets being narrow and dirty, and its bazaars of the worst class; but as the site of the ancient *Halicarnassus*, the birthplace of Herodotus and Dionysius, it possesses great interest for the traveller. Many remains of the old city, which was 'the largest and strongest in all Caria,' bear witness to its former magnificence. A fortress, built by the Knights of Rhodes in 1402, occupies a projecting rock on the east side of the harbour, which is shallow but well sheltered, and resorted to by Turkish cruisers. Some ship-building is carried on. Pop. stated at about 11,000.

**BOOK**, a distinct literary production in one or more volumes; but the term book is also applied to a treatise, or group of chapters, forming a part of a volume, and traditionally it signifies a narrative, or record of some kind in the form of a roll: 'Lo, a roll of a book was therein; and he spread it before me; and it was written within and without.'—Ezek. ii. 9, 10. The term has a similar meaning in English law phraseology. 'In the Court of Exchequer, a roll was anciently denominated a book, and so continues in some instances till this day. An oath as old as the time of Edward I. runs in this form: "And you shall deliver into the Exchequer a book fairly written," &c., but the book delivered into the court in fulfilment of this oath has always been a roll of parchment.'—Godson and Burke *On the Law of Patents and Copyrights* (Lond. 1851, p. 323).

The word book is from the Angl.-Sax. *boc*, and, with some modifications of spelling, is common to

Booby.

height of only a foot or two from the surface of the water, sometimes twenty yards above it, and plunging suddenly to seize it. It is sometimes taken, like the gannet, by means of a

## BOOK.

all the Teutonic and Scandinavian languages (Ger. *buch*; Dutch, *boek*). It is believed to be derived from the same root as *beech* (Angl.-Sax. *beoc*; Ger. *buche*; Icel. *beikr*; Dutch, *beuk*), the earliest writing among those nations having been executed on the inner bark of the beech-tree, or perhaps carved on beech boards. The Greek word for a book, *biblos*, or more commonly, *biblion*, is derived from the Egyptian appellation for the plant *papyrus* (q. v.). The Latin word *liber*, a book, is derived from the name of the cellular tissue of the papyrus, instead of the plant itself. By the Greeks, a collection of books was called *biblioteca*, and by the Romans, *libraria*; hence the French term *bibliothèque*, and the English word *library*; hence, also, the *librarii*, or book-writers, and *bibliopoli*, booksellers, of the Romans. Properly prepared in long strips, the papyrus was wound round small cylinders, or rollers, which in Latin were styled *columina*; hence the English word *volume*. As the papyrus has also given the term paper to the moderns, it has played an important part in the naming of what concerns books. Besides papyrus, however,

Book Scroll.

the ancients used parchment and other materials for the fabrication of their books; and when, by the capture of Egypt by the Arabs in the 7th c., the papyrus plant could no longer be procured, parchment was the material generally employed.

By the Romans after the Augustan age, the art of fabricating books reached a degree of proficiency, along with the advancement in literature. The papyrus was carefully prepared; one side was reserved for the writing, and the other was coloured with saffron or cedar oil. The writing was effected by a pen made of a reed (*calamus*), of which the best kinds were supposed to be found in Egypt. The ink (*atramentum*) was very durable. In several rolls found at Herculaneum, the Roman ink, after being interred many centuries, is still in good preservation. When a Roman author wished to give his book to the world, a copy was put into the hands of transcribers (*librarii*), by whom a certain number of copies were produced. From these transcribers, who were equivalent to our modern printers, the copies passed to a class of artists (*librarioli*), who ornamented them with fanciful titles, margins, and terminations. The rolls were finished for use by the *bibliopoli*, or bookbinders; and last of all, they were offered for sale by the *bibliopoli*, or booksellers. A copy of one of the esteemed productions of a Roman author—as, for example, a copy of Virgil or Horace—was an elegantly done-up roll, about thirteen inches in depth, wound round a cylinder, the two ends of which were decorated with ivory or metal knobs. Outside, it bore various decorations along with the title, and for safety was put in a neat case of parchment or wood, which also bore sundry ornamental devices, including perhaps a portrait of the author. A bookseller's shop in ancient Rome would probably shew a collection of scrolls, less or more ornamented, not unlike in appearance to modern small maps mounted on rollers; and in this form books would be handed about and read. Prized for their rarity and costliness, these scroll-books were kept with great care in cases, or round-shaped boxes with lids, made of cedar; the odour of that wood being a preservative against moths and other destructive insects. Romans with a literary taste carried one of these boxes of scrolls with them as a portable library. A public library comprised a large variety of these boxes, and must have had the appearance of a

collection of round canisters. Yet the Romans did not invariably make their books in rolls; in some instances, they used leaves of lead, which had been beaten thin with a hammer, and also leaves of wood covered with wax; these loosely connected at the back with rings, may be viewed as the rude original of the modern book. At Herculaneum, books of this kind, called tablets, have been discovered in perfect preservation.

In producing books during the middle ages, the plan of rolls was dismissed, and that of leaves sewed together and enclosed in boards came generally into use. The material employed was still parchment, prepared from the skins of goats, sheep, deer, and other animals; for although the art of making paper was known in the 9th c., this new material came slowly into use. The fabricators of the books were for the most part different orders of monks, more particularly the Benedictines (q. v.), a learned and industrious body of men, whose peaceful establishments were long the great centres whence literature was dispersed in ages of intellectual darkness and social disorder. At the head of the book-manufacturing department in the monastery was the *armarius*, who besides taking charge of the library, gave out books to be copied, along with the pens, ink, and parchment required by the transcribers. Some of the monks were allowed to transcribe in the solitude of their cells, but the business of transcription was conducted chiefly in an apartment called the *scriptorium*, which was provided with ranges of desks and forms. There, the scribes or copyists, who were under strict regulations as to keeping silence, carried on their tedious but useful labours. The writing was effected in distinctly formed letters in an old character; regularity in the lines and pages being secured by previous ruling. There was an injunction that no one should on any account alter a single letter or word, without the sanction of the superior. With all the care that was bestowed, however, errors crept in, and were repeated from copy to copy, some of which mistakes have sorely puzzled the scholarly inquirers of later times. There was a division of labour in the monasteries. To some of the monks was assigned the duty of throwing in embellishments. With leaf-gold and brilliant water-colours, they adorned the devotional works, lives of saints, and copies of the Scriptures with pictorial illustrations and fancifully illuminated letters at the beginning of chapters. By another class of these monkish artists, the books were bound in styles suitable to the quality of the works. In many instances, the binding was superb. The boards of wood, covered with leather or velvet, were decorated with precious stones and devices in metal; and in front, the volume was held together with clasps of gold or silver-gilt. Skelton, the poet-laureate, in his *Garland of Laurel*, written about the year 1510, rapturously alludes to the splendid bindings of those old times:

With that of the boke losende were the claspis:  
The margent was illumynid all with golden railles  
And bye, empicturid with gressoppes and waspis,  
With butterfyis and freshae peacocke taylis,  
Enforde with flowris and slymy maylis;  
Envivid [enviduid] picturis well towched and quikly;  
It would haue made a man hole that had be right  
sekely,

To beholde how it was garnisshyd and bounde,  
Encouerde ouer with golde of tissew fyne;  
The claspis and bullyons were worth a thousandnes  
poundes;

With balassis\* and charbundles the borders did shyne;  
With curum musicum† every other lyne

Was wrytin: . . . .

\* Balassis—rabies.

† Curum musicum—moasic gold.

'A book, usually known by the name of *Textus Sanctus Culberti*, preserved in the Cottonian Library, is a fine specimen of Saxon caligraphy and decoration of the 7th c. It was written by Eadfrid, Bishop of Durham; and Ethelwold, his successor, executed the illuminations, the capitals, and other illustrations, with infinite labour and elegance. Bilfrid, a monk of Durham, covered the book, and adorned it with gold and silver plates set with precious stones. We find also that Dageus, a monk who flourished in Ireland in the early part of the 6th c., was a skilful calligraphist, and manufactured and ornamented binding in gold, silver, and precious stones.'—*Hannell's Inquiry into the Books of the Ancients* (Lond. 1843). Books of a common quality were plainly bound in parchment, and instead of clasps, they were tied in front with thongs. In order to enable monasteries to sustain the expense incurred by their book-fabricating establishments, they were occasionally endowed with lands by pious laymen, the bequests being expressly for 'the making and mending of books.' Among the works produced were copies of the Scriptures, in whole or in part; breviaries, or books of prayers used in the church-services; missals, psalters, books in philosophy, and copies of the Greek and Latin classics and fathers; also legends of the saints. Books of history, poetry, romance, &c., were less commonly transcribed; though, from the extent of some of the medieval libraries, these and various other subjects were not neglected. Indeed, but for the monks we should have possessed scarcely any chronicles of the middle ages; nor are we less indebted to them for the preservation of those classics which are now habitually used in our colleges and academies.

The method of dispersing the books was not less remarkable than that of their transcription. Some of the books were sold at exorbitant prices; some were executed to the order of kings, nobles, and church dignitaries; some were exchanged; and some found their way into the hands of the *stationarii*, or dealers in books, in the principal cities. It was customary to lend books for transcription, under an agreement to receive an additional copy on their return. In all cases of lending books, penalties were stipulated to be paid in the event of their not being restored. Latterly, there sprang up a practice among the *stationarii* of Paris, and some other cities, of lending out books, at certain rates, on the principle of a circulating library (q. v.), by which means the poorer class of students and others were accommodated. In these later times, also, as we approach the period when printing superseded transcription, the process of copying books began to be undertaken by lay scribes for a livelihood, of which there were examples in London. To the monks, however, and also to some orders of nuns, belongs the unspeakable merit of having not only supplied the religious orders with the books which were in daily use, but those which replenished the libraries of the learned and wealthy, until their ingenious craft was supplanted by that of the printer and bookseller. In the higher-class monasteries, there were libraries of from 500 to 1000 volumes; but many of the poorer conventional establishments could boast of no more than from 20 to 30 books. In the list of effects which belonged to a monastery in Scotland—St Serf, on an island in Loch Leven—there appear only 16 books; and yet, in this poorly provided insular establishment, the prior, Andrew Wintoun (1420), completed his *Orygynale Cronykil of Scotland*, a work in verse, which is not less valuable as a picture of ancient manners, than as a specimen of the attainments of the old monkish writers. But there are said to have been instances of a greater scarcity of books

than in St Serf's. Often, only two or three breviaries and missals, a psalter, and a copy of the Gospels, were all the books owned by a religious house. The possession of an entire copy of the Scriptures (the Latin version of St Jerome) gave immense importance to a monastery or church. Nor was this surprising, when the enormous labour of transcribing a Bible, letter by letter, is considered. Alcuin, a native of England, and one of the most industrious and ingenious monks of his time, occupied himself from about 778 to 800 A.D., a space of 22 years, in making a copy of the Bible for the Emperor Charlemagne. This ancient and extremely interesting monument of piety and labour is now in the British Museum, which became possessed of it for the sum of £750. The Museum is also enriched with a variety of missals and other works, executed by the monks. In the present day, it is scarcely possible to form a correct idea of the value put upon books, even of a common order, or of the prodigious care which was taken of them, during the middle ages. To preserve them from embezzlement, they

Chained Book.

were in some cases chained to shelves and reading-decks; and in the dwellings of nobles, a volume might be seen chained to a table in the hall, for the use of such members of the family as were able to read.

The establishment of universities in the 12th c. greatly stimulated the manufacture of books by transcription, more particularly those classics and philosophical treatises that were required by students in the colleges. The anxiety of the authorities in these schools of learning to insure accuracy in the text-books, as well as to prevent the use of books of an improper kind, led to the establishment of censorships and privileges which interfered with the preparation of, and traffic in, books, long after the invention of printing. Unfortunately, while this art was superseding the ancient process of transcription, the convulsions consequent on the Reformation caused an enormous destruction of books. In England, the libraries of monasteries, representing the labour of a thousand years, were mercilessly destroyed on the spot, or carried off and consumed in base purposes, without a thought as to their value. In Scotland, the monastic libraries which had escaped the ravages of Danish and other invaders, were similarly destroyed. The same fate overtook the ancient monastic libraries of France at the Revolution. See LIBRARIES.

In consequence of these deplorable events, as well as the perishableness of books, copies of works prior to the invention of printing exist only as rare and valuable curiosities. Even of the early printed books, there are comparatively few copies extant.

In England, books of improved typography and binding, adapted for ordinary libraries, date no further back than the reign of Queen Anne. In proportion as literature has been popularised, books have diminished in bulk and costliness. In the 16th and 17th centuries, the ordinary sizes of books were folio and quarto; and as works of these huge dimensions embraced light as well as much ponderous literature, a popular poet uses no metaphor, when he observes that ladies 'read the books they could not lift.' The dignified quarto survived in imaginative literature even till our own times; for it was in this costly form that the early editions of the poetry of Scott, Byron, and others made their appearance. Excepting for special purposes, all such large sizes are happily superseded by octavos and still lesser-sized books. Forms and prices are no longer for the few, but for 'the million.' And copies of the Bible, instead of being chained to shelves and desks, and being valued at hundreds of pounds, are now scattered in myriads at the easy charge of a shilling.

The dimensions of printed books are regulated by the size and form of the sheets of paper of which they are composed. A sheet, being folded in the middle, forms two leaves, or four pages; and a book of this size is called a folio. When the sheet is again folded, so as to make four leaves, or eight pages, it forms a quarto. The quarto, being folded across, so as to make eight leaves, or sixteen pages, forms an octavo. By folding the sheet into twelve leaves, or twenty-four pages, we make a duodecimo; and if into eighteen leaves, or thirty-six pages, we form an octodecimo. Below this there are small books of different denominations, and which are sometimes spoken of as pocket editions. Booksellers are accustomed, in speech, to Anglicise the terms for the sizes of books, with little regard to the proper terminations—as 4to, 8vo, 12mo, 18mo, 24mo, 32mo, 48mo, &c. For a long period, printing-paper was made chiefly of three sizes, respectively called royal, demy, and crown; and according as any one of these was employed, the size of the book was large or small. Demy, however, was the most commonly used, and the demy 8vo may be said to have become the established form of standard editions of books. As by means of the paper-making machine, paper is made in webs, and can be cut into every imaginable size of sheet, and as printing-machines can print very large surfaces, the sizes of books are now comparatively arbitrary; though, for convenience, the old names remain, with the difference, that instead of the 12mo, a not very dissimilar size, called the post-8vo, has come extensively into use. The size of the present work is large royal 8vo.

A thin kind of book, consisting of a few sheets sewed or stitched together, without boards, is called a pamphlet—a term supposed to be derived from the French words *par filer*, 'by a thread.' The French term *brochure* (from *brocher*, to stitch), signifying pamphlet, is coming into use; as also the French word *livraison*, signifying a portion of a book (group of volumes) published separately. For an account of the modern traffic in books, we refer to the article BOOK-TRADE.

w. c.

**BOOKBINDING**, the art of connecting together in a durable and convenient manner the several parts of a book. The craft of the bookbinder is older than that of the printer. As noticed in the preceding article, the Romans had their *bibliopagi* for doing up their books in rolls; and during the middle ages, the binding of books in a square form was executed by certain orders of monks. As the first style of typography was an imitation of the penmanship employed in Bibles and Missals, so was the binding of the first printed books only a copy of what

had been usual in doing up volumes of manuscript. But as printing greatly multiplied books, binding got out of the hands of the monks and other ingenious men who had hitherto carried it on, and assumed the character of a widely dispersed mechanical art, which, like other useful arts, has gone on improving till the present day. It says little for the taste or tact of the Germans, that they, the inventors of printing, should have long since been left behind, not alone as regards typography, but binding, and everything else connected with the preparation of books. The French have exerted their fine artistic taste in binding, and take the lead in this branch of art among continental nations. In the French language, the term *relieur*, used for bookbinder, has oddly enough the same root as *religion* (*religo*, to bind again). To the English belongs the merit of carrying the art to a high degree of perfection; for no bookbinding in the world excels that of London in solidity, elasticity, and elegance—the three great requisites of a well-bound book—which have been arrived at, not less from skill in manipulation, than the excellence of tools, and the prices which are ungrudgingly paid by wealthy book-fanciers. Reaching this advanced stage, bookbinding forms a regular craft, distinct from printing and bookselling, though in country towns it is sometimes united with these professions. Properly conducted, it is divided into the three departments of preparing, forwarding, and finishing; but in these there are many subdivisions of labour, a few of which may be referred to.

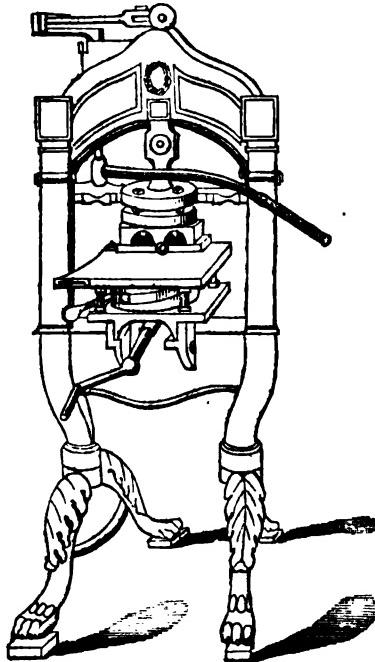

On coming from the press, sheets are first dried by being hung on poles for a length of time, and then smoothed by pressure, singly, between glazed mill-boards in a powerful hydraulic press. They are next collated or arranged in distinct books in quires, in which form they are delivered to the publisher. If, however, for immediate sale in 'cloth boards,' the sheets are transferred in masses from the printer to the binder, and treated as follows: The first operation is to fold the sheets, by means of a small instrument called a folder. The object is to fold down the different pages so as to fall on one another; and on the perfect accuracy with which this is performed depends the proper binding of the book. Attempts have been made to introduce machines for folding, but none has worked satisfactorily, and this operation is still performed by hand; usually the work is done by girls. After being folded, the sheets of the book are gathered and collated according to the 'signatures,' A, B, &c., which are printed at the bottom of the first page of each sheet. The books so made up and completed, are now pressed to a proper solidity, by being placed in quantities in a hydraulic press. The next process is to saw indentations in the back of the book, preparatory to sewing. If only a few volumes are to be sawed, the operation is executed with a tenon saw; when, however, there are large numbers, the books are placed on a machine with revolving saws, which instantaneously effect all the indentations. The books are next sewed on a frame, each sheet being less or more attached by a thread to cords across the back. The sewing, like the folding, is executed by girls. On being removed from the sewing-frame, the book receives its 'waste papers,' which are pasted to the back on each side. The book is now 'trimmed,' by being cut on the edges with a knife-apparatus. In some instances, this is effected by the plough-machine on the screw lying bench; in others, the books are piled on a machine, beneath a broad knife, which descends like a guillotine, and a large number are cut with amazing expedition. The books are next glued on the back, to impart a certain degree of firmness. After this, they are 'backed' by means of a machine of

225

recent invention, which imparts a certain roundness to the back, and at the same time gives a seat for the boards. The book, with a slip of canvas pasted on the back, is now ready for receiving the boards, which are previously cut in large quantities by a machine.

The preparing and attaching of the cover forms the final stage of the process. For the whole of the class of boarded books we have been describing, there is a method of making 'cases.' A case consists of cloth or paper pasted on two boards, the distance of the boards from each other being equal to the thickness of the book. The case being finished, receives the book, to which it is attached chiefly by pasting it to the canvas of the back and the blank or waste paper on each side. When the cases are in paper, they are at once applied in this manner, and the books may be said to be finished and ready for sale. Such is the mode of doing up that prodigious host of flashily covered volumes which forms a leading product of the cheap press. If the cases are in cloth, there are additional manipulations, in all of which machinery is employed.

Formerly, the ornamental and other work on the

Arming-Press.

outides of books was executed in a tedious and expensive way by hand. Now, the operation, at least as regards cloth boards, is done by two or three impressions in an arming press; perhaps not more than half a minute being employed to execute what in the olden time would have occupied a week. This improvement, the greatest in the art of book-binding, has been facilitated by an advance in the artistic skill of designers, by advancements in the art of die-sinking, and by corresponding adaptations of machinery—the whole unitedly working towards an end. When it is deemed necessary, for the sake of attractiveness, to stamp a peculiar device on the covers of a book, of which thousands are required, the design is referred to an artist, who, devoting himself to this branch of his profession, devises something appropriate and original. His design,

drawn on paper, is cut in brass or steel; and this, in the form of a metal block, gives the stamp at a blow by the arming-press. When the design is to be gilt, leaf-gold is previously applied. The block being heated, gives a firm and clear impression. Such is the expeditious method of titling and ornamenting with blank and gold tooling the cloth-covered books that are now generally in use.

Books bound in leather, of course, go through a more slow and careful process of forwarding and finishing. Formerly, the folded sheets were beaten with a broad-faced hammer on a stone, but now they are squeezed between steel rollers, to give them the required solidity. The sewing, gluing of the back, bucking singly with a hammer, and the other manipulations which follow, are all effected with great deliberation and nooty; and in this department of binding the highest class of operatives are employed. At one time, the titling of bound books was executed letter by letter, and comparatively few men had sufficient skill and steadiness of hand to produce good work. Now, lettering is sometimes done by means of metal types put together in a small case; though, when numbers are to be executed, the title is cut in block. It is usual also to apply stamps in block to the sides of bound books, and to leave only the finer and smaller tooling to be done by hand. Yet, although greatly assisted by new mechanical contrivances, the finisher must needs be a kind of artist. Coming to his hands flat and solid, and with its joints well formed, through the previous care of the forwarder, he delivers the book a perfect work of art. It opens easily, and lies flat out without any strain; its hinges are finely formed without crease; and on back, edges, and sides, the tooling claims mathematical precision.

A method of fixing together the leaves of a book by means of caoutchouc, or India rubber, instead of by sewing, has been invented. The sheets are cut into leaves, and the back edges, being laid evenly, receive a solution of this tenacious material. As each leaf is held merely by the caoutchouc which adheres to it, the book can be made to lie very flat; but this new kind of binding is only employed for maps, or books of plates, and does not seem likely to come into general use. Another novelty in binding is the substitution of wood for pasteboard boards, in imitation of books of ancient date. Applied only to some costly books of a fanciful kind, this must be considered to be but a passing caprice; for as wood is liable to warp, it can never serve so well as pasteboards.

In the present day, the binding-trade is pursued in various distinct branches. There are binders who devote themselves entirely to doing up books in cloth or paper; others execute general binding in leather; a third class bind only account-books; a fourth confine their workmanship to Bibles and Prayer-books; and a fifth are known as binders of books in a high style of art. A common defect in provincial binding is a want of taste. Strength is given without elegance; even in the finest kind of books, there is often a vulgarity as regards the colours of the end papers, and the marbling of the edges, as if the binders were unconscious of proper deficiency of effect. The same thing may almost be said of the best American binding.

Among celebrated English binders of a past age, the foremost place is usually assigned to Roger Payne, a clever but wayward being who carried on business in the west end of London about the year 1770, and who, from his unfortunate habits, died in great poverty. His reputation as a binder rests principally on his fine tooling and choice of ornaments, in which department he introduced many improvements. The greatest of Payne's successors

was Charles Lewis, a London binder (1786—1836), whose talent, according to Dr Dibdin, ‘consists in uniting the taste of Roger Payne with a freedom of forwarding and squareness of finishing peculiarly his own. His books appear to move on silken hinges; his joints are beautifully squared, and wrought upon with studded gold; and in his inside decorations he stands without a compeer.’ At present, there are several eminent binders in London, whose forwarding and finishing, as well as artistic decoration, have given them a deservedly high reputation. *w. c.*

**BOOK-CLUB**, or **BOOK-SOCIETY**, an association of individuals for purchasing and reading new books as they issue from the press, which, after being circulated among the members, are sold for the benefit of the concern. In some cases, the used books are disposed of by auction among the members. Book-clubs exist in many of the large towns and rural districts of Great Britain. Although new in name, and mostly composed of persons in the higher ranks of life, they are established on plans similar to the more humble class of reading societies which were common in different parts of the country in the latter part of the 18th century. In some places, the more fashionable book-clubs have been superseded by the late re-invigoration of the system of circulating libraries (*q. v.*). *w. c.*

**BOOK-KEEPING** is the method of recording business transactions in a set of blank-paper books kept for the purpose, by all classes of traders, as well as in various kinds of establishments. Viewed as an art, *B.* was first brought to comparative perfection by the merchants of Genoa and other cities in the north of Italy; and followed up by the merchants of the Netherlands, it has been brought to England, in which country, as also in the British colonial possessions and the United States, it is now carried on in the best manner by professional accountants and skilled clerks in counting-houses. The books employed are usually of a folio size, strongly bound. For security against loss, it is customary to remove them every night from the desk and ordinary shelves in the counting-house to a fire-proof safe.

Although reduced to an accurate system, the details of *B.* necessarily differ according to the extent and the nature of the transactions to be recorded. In all kinds of *B.*, however, there are or ought to be certain pervading principles, to which we shall in a brief way refer. The object is to keep an account of the goods a trader buys and sells, and the money he receives and pays away; also to shew, at short and periodical intervals, the exact state of his affairs—what are his *assets* (property and sums of money owing to him), and what are his *liabilities* (debts owing by him, and other pecuniary obligations). On the proper accomplishment of this object may be said to depend the stability and the reputation of the trader. Such is obviously the case, for, unless a person keep an accurate set of books to enable him to ascertain how his affairs stand, he must in a great measure be proceeding upon vague, and possibly erroneous conclusions; the result of which may be insolvency or bankruptcy, and loss of good name. In many instances, bankruptcy is traced to no other cause than the keeping of an insufficient set of books, and even keeping these badly. Viewed as credentials, a merchant’s books are invested with a certain sacredness of character. Such a set of them is to be kept as will at all times admit of a satisfactory statement of affairs being made up. On this account, they require to be kept with great neatness, accuracy, and perspicuity. As a rule, there should be no blotting, no scraping out of words or figures, and no tearing out of leaves—the records are to be beyond suspicion of falsification.

**SINGLE ENTRY.**—The simpler kind of accounting is called *B.* by Single Entry; the principal books used being the Day-book, Invoice-book, Cash-book, and Bill-book, which are employed for recording the transactions as they occur, and a Ledger, to which the entries are afterwards transferred, under the names of the parties concerned. The method is called Single Entry, for the reason that the items are entered only once in the accounts in the ledger.

**Day-book.**—The purpose of this book is to keep a daily account of all goods sold on credit—that is, goods not paid for at the time of being bought. The book is ruled with a date-line on the left-hand side of the page, and with double money-lines at the right-hand side. The entry of a transaction comprehends the name of the purchaser, and beneath it a note of the articles sold, with the prices extended to the first money-column. The gross amount added up is extended to the second money-column; so that the amount of all sales may easily be summed up. After the name of the purchaser, it is usual to put *Dr.*, and to articles in the entry is prefixed *To*—the meaning of these insertions being that the party named is *debtor* to the concern for the articles mentioned.

**Invoice-book.**—This book, which is similarly ruled, is sometimes called the *Credit Day-book*. It is used for keeping an account of all goods bought on credit. When the goods are bought, an invoice, or account of them, accompanied the package, or is received by post, and on being checked off, the items are copied into the book. After the name of the seller of the goods is inscribed the contraction *Or*, and to the items entered is prefixed the word *By*—the meaning of which is, that the party named is *creditor* by having sold the articles named. For the sake of brevity, some dealers merely enter the name of the creditor, the date, and the amount; and preserve the invoices, by docketing and tying them up in parcels, or by fastening them into a paper-book prepared for the purpose. In any case, the invoices should always be preserved.

**Cash-book.**—In this is kept an account of all cash received and paid, and of discount received and allowed. It is ruled for date and double money-columns on each page. Two pages, one opposite the other, are required for the entries; that on the left hand for entering cash received, and the discount allowed by the trader; that on the right hand for the cash he pays, and the discount allowed to him. The first money-column on each page is for the discount, and the second for the cash. For example, if a person settles his account, amounting to £5, less a discount of 5s., the sum of 5s. is entered in the first column, and £4, 15s. in the second; by which means a record is kept of accounts settled and the money actually received. A similar explanation applies to the ‘cash paid’ side. At the close of business for the day, the amounts on both sides are summed up and balanced.

**Bill-book.**—This contains an account of all ‘Bills Receivable’—that is, bills of which the trader is to receive payment; and ‘Bills Payable’—that is, bills which he has to pay. Sometimes, however, in the case of large concerns, these two classes of bills have each a distinct book. The books are ruled in a particular manner, to admit of an explicit statement of dates, amounts, length of term, and other particulars. See article **BILLS**.

**Ledger.**—This is the great book of the concern. It comprehends an abstract of the entries in the day-book, invoice-book, cash-book, and bill-book, the whole collected in a methodic form under the names of the various persons, whether standing in the relation of debtors or creditors to the trader;

and not only so, but an account of the trader's own private debit and credit. Two sets of columns are assigned to every person's account, one for *Dr.*, and the other for *Cr.* The copying of items from the day-book, &c., into these ledger accounts, is termed posting. According to the ordinary practice, books are posted after short and regular intervals—not longer than a month. Having books at all times well posted up is an acknowledged mark of a good man of business. By means of a well-posted ledger, and an inventory of stock and other assets, drawn up with a prudent regard to realizable value, the trader is able at the end of a year to make a *Balance Sheet*, or condensed statement of his affairs. A proper balance-sheet ought to shew the amount of capital invested in the form of money, stock, debts, &c.; also the amount of liabilities, the expenses at which the business has been conducted, the money drawn on private account, and the profit that is over, after all deductions have been made.

Some other books of a subsidiary kind are kept by large trading houses—as an *Order-book*, in which copies of all orders are entered: a *Memorandum Book*; an *Account Sales-book*, from which particulars are obtained for making out accounts of the sales of goods which may have been sent for disposal on commission; a *Stock-book*, in which an inventory is kept of the stock on hand; an *Account-book*, to contain a list of accounts; a *Warehouse-book*, to contain an account of the quantities of goods; a *Letter-book*, into which letters sent out by the firm are copied; with some others.

With such a set of books, and a few additional memoranda, a trader could doubtless strike a balance at the end of the year. He could see how much was owing to him, how much he was owing to others, how much he had spent, and how much would remain over, or how much would be deficient, after all accounts *pro* and *con* were settled. But by this elementary routine he could establish no satisfactory check on different departments of his business; and for large and complicated concerns, the system, if not absolutely valueless, would prove exceedingly imperfect. What the wholesale-trader wants is a process of checks—one book checking another—the whole thing reduced to such a rigorously methodised system of entries that every fraction is thoroughly accounted for. No doubt, to effect this elaborate and minute system of *B.*, a considerable expense is incurred for clerks; but in large establishments this is of small account in comparison with the advantages that are secured.

**DOUBLE ENTRY.**—The method of *B.* which has been so called is only an extension of that already noticed. The distinct peculiarity in double entry chiefly concerns the ledger. Its object is a system of checks, to be effected by entering transactions in the ledger twice—first to the *debtor* of one set of accounts, and then to the *creditor* of another set. In making the two entries, one is posted to an account under the name of the debtor or creditor, and the other is posted to an account under the head of the goods that have been bought or sold. Take, for instance, the article sugar. Say, the trader purchases a hoghead of the article from A. Brown & Co. He first enters it in the regular way to the *Cr* of A. Brown & Co., and then turning to the folio headed 'Sugar,' he enters it on the *Dr* side of the account as bought from A. Brown & Co. In the same way, when the hoghead is sold to E. Fraser & Co., it is entered first to the *Dr* of these parties, and then to the *Cr* side of sugar as sold to E. Fraser & Co. By this system of double entries, one the counterpart of the other, the one set of accounts constantly checks the other set; a trader can also ascertain how,

when, and at what prices his property has been disposed of.

In double entry, a book called a *Journal* is frequently used. The entries in the day-book, &c., are abstracted into the journal, and thence posted in a brief form into the ledger; the use of the journal, therefore, is only to save the ledger from being burdened with details.

Acknowledged to be the triumph of accountanship, *B.* by double entry, or by the Italian method, as it is sometimes called, is not an entire safeguard against frauds and fallacies in the conducting of commercial operations, which, independently of every technical aid, require to be sustained by constant integrity, vigilance, and discretion. Among the fallacies in the method of keeping books which are observed to sap the stability of the most gigantic concerns, are two so conspicuous as to demand our notice. The first consists in including bad or nearly worthless debts in the periodical lists of assets. The second is that of not estimating stock at its realisable value only. This last may be said to be a common error among traders, many of whom, without any evil intention, and simply from want of prudent consideration in making due allowance for depreciation of property, delusively and gradually slip into a condition of hopeless insolvency.

*B.* forms a department of school education in connection with penmanship and arithmetic. There are various useful treatises on the subject, with forms for day-book, ledger, and other books. Among the larger and more comprehensive of this class of works are, *A Complete System of Book-keeping*, by Benjamin Booth (Lond. 4to), Jones's *Science of Book-keeping Exemplified* (Lond. 4to); *Practical Book-keeping*, by F. H. Carter (Edin.). Among the lesser and more accessible treatises we may specify *Book-keeping by Single and Double Entry*, by W. Inglis (Edin.). It is proper, however, to add, that no method of school instruction can supersede the practical knowledge which is to be procured only in a busy and well-conducted counting-house. W. C.

#### BOOK-STALLS. See BOOK-TRADE

**BOOK-TRADE**, the business of dealing in books, in which are comprehended two classes of persons—Publishers, who prepare and dispose of books wholesale; and Booksellers, to whom the retailing of books more properly belongs. Although ordinarily distinct, the two professions may conveniently be treated together. While publishing, apart from bookselling, is of modern date, the selling of books is as old as the origin of literature. Copies of the works of authors in manuscript were sold in the cities of ancient Greece and Rome. Horace celebrates 'the brothers Sosii' as eminent booksellers (*bibliopoli*). With the foundation of several universities in the 12th c., the preparation and sale of books increased; but the trade of bookselling attained to importance only after the invention of printing. The first printers acted also as booksellers, and being mostly learned men, they were generally the editors, and, in some instances, the authors of the works which they produced. See PRINTING. Fust and Schaeffer, the partners of Gutenberg (q. v.), carried the productions of the Mainz press to the fair of Frankfurt-on-the-Main and to Paris. Some instances of division of the two branches, printing and bookselling, occurred in the 15th c. John Rymann of Augsburg (1497—1522) styled himself, at the conclusion of his publications, 'Archibibliopolis of Germany.' In consequence of the Reformation, the seats of learning were gradually removed from the southern to the northern states of Germany, and, of course, the booksellers followed their customers. Migrating from place to place, and also resorting

to the great continental fairs for customers, the early booksellers became known as *stationarii*, or stationers, from the practice of stationing themselves at stalls or booths in the streets, as is still customary with dealers in old books. The term stationer was long held to be synonymous with bookseller, but in modern times it is more commonly applied to dealers in paper and other writing materials.

Whether settled or migratory, the early publishers and sellers of books were subject to a number of restrictions, as is still the case in France and Russia. In England, the book-trade was trammelled by royal patents and proclamations, decrees and ordinances of the Star Chamber, licenses of universities, and charters granting monopolies in the sale of particular classes of works. In 1556, in the reign of Mary, the Stationers' Company of London was constituted by royal charter, the professed aim being the 'removal of great and detestable heresies.' The members of the Company were made literary constables to search for books, &c., and it was ordered 'that no man should exercise the mystery of printing, unless he was of the Stationers' Company, or had a license.' The charter, which was confirmed by Elizabeth in 1558, in effect empowered the company to make ordinances as to the printing and sale of books, and to exercise an arbitrary censorship of the press. The Crown, by an act 13 and 14 Car. II. c. 23, commonly called the 'Licensing Act,' assumed this species of control over the issue of books. The Licensing Act, and its renewals, ultimately expired in 1894. By the first Copyright Act, 8 Anne, c. 19, the legislature interposed to protect the rights of authors, and to relieve them, as well as publishers, from the thralldom of the Stationers' Company. But by the same act, the Archbishop of Canterbury, the Lord Chancellor, and certain judges in England, and the judges of the Court of Session in Scotland, were empowered, on the complaint of any person, to regulate the prices of books, and to fine those who sought higher prices than they enjoined. This provision was in force till 1738, when it was abolished by the act 12 Geo. II. c. 36. From this time the book-trade was free. How it spread and flourished may be best learned from the history of the literature with which it is identified. Subsequent to the reigns of Anne and George I., there was a succession of men of literary repute connected with the metropolitan book-trade; among whom may be mentioned Cave, the conductor and publisher of the *Gentleman's Magazine*, and early patron of Samuel Johnson; Dodley, a poet and dramatist, who reached the head of the bookselling profession; and three generations of the Nicholases. We might also include Richardson the novelist, a printer, who in 1754 became master of the Stationers' Company. The names of Baldwin, Rivington, Longman, Tonson, Miller, Cadell, Dilly, Lackington, and others, will also be as familiar as are the Knights, Bohns, and Murrays of later times.

Now, as formerly, the book-trade is centered in London, though carried on to a considerable extent in Edinburgh, and in a less degree in Oxford, Cambridge, Dublin, Glasgow, and a few other places. There are various reasons for London being the metropolis of English literature. As a centre of wealth, taste, and intellect, authors flock towards it as an agreeable and permanent home, and find in the Library of the British Museum the most ample materials for reference and study. By means of its system of railways, and its port, assorted parcels of books can be conveniently despatched to all parts of the United Kingdom, and of the world. It has numerous wholesale stationers, and abounds in printers, bookbinders, artists, and wood-engravers. Stationers' Hall, in which the rights to literary

property may be inscribed, is situated in London. Through its channels of literary intelligence and criticism, it possesses the most ample means of making new works known. Through favour of these circumstances, the metropolis becomes the centre of the British book-trade; almost every new work floats towards it, either for publication or to be issued wholesale on commission. In 1873, there were connected with the book-trade, within the bounds of the post-office district, 285 booksellers who were also publishers, and 504 booksellers alone. Of these, about 10 confined their business almost exclusively to the sale of foreign books, and 12 to the publication and sale of law-books. Among the booksellers are included commission-houses; and among the publishing establishments are several branches from Edinburgh and other places. The London book-trade is partly carried on in distinct departments; miscellaneous literature, law books, medical books, educational treatises, periodicals, &c., respectively engage the attention of publishers; and as regards religious books, each sect may be said to have publishers and booksellers of its own. The greater number of the publishing and commission houses are situated in Paternoster Row and the courts adjoining; so that this part of the city has become the great and acknowledged market for literature. In whatever part of the metropolis books are primarily issued, they may be found in one of the establishments in or about 'the Row,' by which means the collecting of books to meet country or foreign orders is effected at once on the spot. Every commission-house has 'collectors,' who, with bags, are seen hurrying about, picking up the works which are entered in their collecting-book. When not so found, books are said to be 'out of print.'

In Scotland, after struggling through an age of similar restrictions, the book-trade was developed about the middle of the 18th c. In Edinburgh, it was followed by Allan Ramsay, who published and sold his own songs, and his still more charming pastoral. Among his successors were Donaldson, Bell, Elliot, and Creech, each eminent in his way; more lately, the trade was ably sustained by Archibald Constable, the first publisher of the *Edinburgh Review* and *Waverley Novels*; and by William Blackwood, the originator of *Blackwood's Magazine*; still more recently the reputation of the Edinburgh book-trade has been maintained by Adam Black, publisher of the *Encyclopaedia Britannica*, and who, besides rising to the highest civic honours, became member of parliament for his native city, on the retirement of Mr. (afterwards Lord) Macaulay (1855).

Considering the many advantages possessed by London, it may appear surprising that the business of publishing should be attempted to any extent in Edinburgh—the only place out of the metropolis to which we need specially refer. Yet, the Scottish capital is not devoid of recommendations. Its general society is of a character to invite the residence of men of literary acquirements, and it is fortunate in possessing an extensive collection of books for reference in the Library of the Faculty of Advocates. Edinburgh publishers are able to conduct their enterprises with a degree of calmness and deliberation which can scarcely be realised in London; while, at the same time, they enjoy a certain advantage in comparatively cheap labour. Paper also may be obtained at a somewhat lower price from Scotch makers than from the wholesale stationers of London—this last circumstance being of first importance in producing large impressions of cheap books and periodicals. As Edinburgh books are mostly sent to London, the expense of carriage and loss by commission form a drawback on profits. Notwithstanding this and other disadvantages, the

book-trade of Edinburgh continues in a thriving condition. It comprehends upwards of thirty firms carrying on the united business of publishers and booksellers, and ninety who carry on business as booksellers alone. In this list are several leading publishing houses, which print the works that they issue, an economical and convenient union of professions which forms a peculiar feature of the Edinburgh book-trade. In the establishment whence the present work is issued, every department connected with the preparation and dispersion of books is included.

The publishers and booksellers of the United Kingdom possess no corporate privileges, nor do they associate for any professional object. No premiums are offered to stimulate improvements in typography, binding, or anything else—the trade being entirely free, and all being left to rise through individual exertion. All members of the profession, however, constitute what is, *par excellence*, 'the trade,' through which there is a pervading and strong feeling of fellowship.

In the infancy of the trade, authors frequently resorted to the plan of getting friends and patrons to subscribe for copies of their forthcoming works; the publisher in such cases acting only as commission-agent. Dryden's translation of Virgil's *Aeneid* was sold in this way. There were, in the case of that work, two classes of subscribers, one paying five, the other two, guineas for a copy. Those who paid the larger sum obtained the additional value by individually receiving a dedication plate with their arms underneath. There were 101 of the first class of subscribers, and 250 of the second. Pope made a fortune by his subscription books. He realized upwards of £5000 from his translation of Homer's *Iliad*, and £3000 from that of the *Odyssey*, both sold by subscription. Johnson, who lived in the transition state between the old and new way of disposing of literary works, perceived that the subscription system was essentially an unsound one, and that booksellers formed a proper and necessary medium between authors and the public. 'He that asks for subscriptions soon finds that he has enemies. All who do not encourage him defame him.' And again: 'Now learning is a trade; a man goes to a bookseller and gets what he can. We have done with patronage.' Literature has now risen above this degrading system. At present, (1) the author sells his work in manuscript to the publisher for a specified sum, giving him an assignment to the copyright, and leaving him to bring out the work according to his own fancy; or (2) the author retains the copyright, pays all expenses, undertakes all risks, and gets a publisher to bring out his work; or (3) the author, retaining the copyright, incurs no risk, and only allows the publisher to print and issue an edition of a certain number of copies for a sum agreed on; or (4) the author and publisher issue the work at their joint risk, and on such other terms as are mutually agreeable. In some instances, the publisher will not undertake to issue a work, unless the author gets it printed, and delivers copies ready for sale; in others, he will relieve the author of this trouble, and risking outlay, keep an account of charges and sales. Any plan by which an author retains a risk, is seldom satisfactory. Publishing is an exceedingly hazardous profession. Works of which the highest expectations are formed may not pay expenses; and books of a very frivolous and seemingly worthless kind may prove exceedingly remunerative. From a general misapprehension on this point, publishers have frequently been maligned as unjustly living on the brains of authors, who are ever represented as an unfortunate and ill-used race. A

knowledge of the hazardous nature of publishing, and of the heavy expenditure ordinarily incurred for making new books known, not to speak of the unreasonable expectations which are sometimes formed by literary men, would do much to dispel the common notions on the subject. For one book that is highly successful, there are numbers that become a dead stock in the warehouse, and barely pay expenses, of which melancholy fact too many authors who undertake the expenses and the risks of publication must be well aware, from dear-bought experience. But with writers of really popular and successful works, English publishers usually deal in a most liberal spirit; numerous instances, indeed, could be cited in which they have voluntarily and largely added to the remuneration stipulated to be given for copyright. For the celebrated sermon, *Religion in Common Life*, preached before the Queen by the Rev. John Caird (1855), though only a shilling pamphlet, the publishers, Messrs. Blackwood, of Edinburgh, gave £100; but the sale having gone far beyond expectations, they afterwards, of their own accord, presented the author with an additional sum of £400. Facts like this, while reflecting honour on the book-trade, shew the baselessness of the imputations so inconsiderately cast on publishers as a body.

In publishing new books, the following are the items of outlay which need to be taken into account: Copyright, paper, setting up the types, author's corrections, stereotyping, press-work or printing, embellishments, binding, advertising, presentation copies to editors for review, and to public institutions in terms of the Copyright Act. When the author retains the copyright, the publisher charges, besides the above items for printing &c., a commission on the sales of the work. New books are issued at a certain selling price to the public, and the publisher allows a percentage off the price to the retail bookseller. In a large proportion of cases, there is interposed the commission-agent. Several London publishers have commission-agents in the principal towns, to whom they consign quantities of each work, to be sold to the retail dealers; and in the same way, provincial publishers having agents in London, it happens that the book-trade is largely and necessarily carried on through middlemen. These individuals, of course, receive a commission adequate to remunerate them, after giving the ordinary publisher's allowance to the retailer.

It is usual, on issuing new books, for publishers or their agents to send out the work to be 'subscribed' among the trade. A copy of the new work is shewn by way of sample, and the subscription paper bears the selling price, and the price at which copies are offered. Besides making the trade acquainted with the day of publication of works which have been some time expected, this practice offers an opportunity for speculating. As an encouragement to do so, the work is offered at a somewhat lower rate than is afterwards allowed. By subscribing for books in this manner, and also by means of 'trade sales,' commission-houses in the Row ordinarily put themselves in possession of the works issued by publishers in other parts of London.

Trade sales, which are now less common than formerly, are conducted in the following manner. A publisher, wishing to dispose of his stock, issues a catalogue to the trade, stating the reduced price of each book, as well as the length of credit offered; and that the sale is to take place in a tavern specified, on a certain day, for which an invitation is given. At the appointed time and place, a handsome

dinner is on the table, and perhaps from eighty to one hundred and fifty guests are assembled. Nothing is said about business during dinner, but with the wine and glasses afterwards, and amidst no little good-humour, the sale begins. Each book being called over, every person has an opportunity of saying how many copies he will take. Occasionally, a toast is proposed, in order to maintain the hilarity of the meeting.

At these sales, it is not unusual to dispose of 'remainders of books,' that is, fag-ends of editions which are not moving off with sufficient alacrity in the ordinary course of trade. Remainders are either offered in small quantities at a very reduced price, or they are sold in the lump by auction. Purchased cheaply, these remainders are henceforth known as 'books with broken prices.' Many of the new-looking books ticketed at cheap booksellers are portions of these remainders. In some instances they are sent to the colonies, in the hope of finding a market. At these trade sales it is common to do business to the extent of from £5000 to £10,000; in the case of one publishing house, the amount is usually, at a half-yearly sale, from £12,000 to £15,000; and in another, being an annual sale, it is seldom less than £26,000. To avoid the seemingly useless outlay on a dinner, some publishers rely on the circulation of 'sale catalogues,' comprising offers at tempting prices, provided that orders are given within a certain day. Vast quantities of school-books of good reputation, and other works permanently in demand, are bought by London commission-houses in this manner annually.

Throughout the more respectable part of the trade, there is a constant effort to maintain unbroken prices; for when a book can be obtained by booksellers below trade-price, it is essentially ruined for all regular business. On the other hand, there has sprung up a practice amongst some retail booksellers of selling new books to the public at prices little above cost. This system of underselling has caused much disquietude in the trade. For a long time, resolute attempts were made by the heads of the profession to refuse to deal with undersellers; but these, appealing to the public, ultimately conquered; and now books of all kinds are disposed of at such prices as the bookseller pleases. In one sense, this underselling is unjust to the publisher, who has his wares sold cheap, without the esat and solid benefit which he might derive from fixing on them such low prices as would induce a large sale. Whether publishers will in time fall on the expedient of lowering nominal selling-prices, at the same time lessening allowances, or whether they will altogether drop the marking of prices, are questions on which we need not enter. Enough has been said to shew that, after making all ordinary deductions, to which losses, &c., may be added, publishers can reckon on receiving little more than half the price at which their books are nominally issued. To limit impressions as nearly as possible to the demand, is always a matter of serious consideration to the publisher; for, unlike most other kinds of goods left on hand, the overplus stocks of books are often nearly valueless. On this account, books are seldom sent out on sale or return except to commission-agents.

In one important respect the English publisher differs from the producer of almost every other class of goods. He has not only to manufacture the article, but to make it known to the public. While the retail draper takes upon himself the trouble and cost of advertising his novelties in order to attract customers, the retail bookseller is relieved from any such obligation, and has little

else to do than to hand across the counter the book for which a demand has been stimulated by the costly efforts of the publisher. The grand difficulty with the publisher is to excite general attention to his wares. Hence, the stupendous advertising system in newspapers and other channels of intelligence. Some publishers are reported to spend as much as £5000 per annum on advertisements, and an expenditure of from £1000 to £2000 is quite common. The monthly and quarterly periodicals being important advertising channels, it is of consequence for publishers to possess one of these, both for the sake of the revenue it may produce, and for keeping their own books before the public. A well-circulated periodical, therefore, is to be viewed as almost a necessity in the business of the publisher—the thing which gives spring and vitality to what might be otherwise an inert and difficult concern. So grave a matter is advertising to the publisher, that it is very generally the practice to employ one or more clerks to write, arrange, and distribute advertisements, and to conduct the multifarious correspondence connected with them. In consequence of these burdensome outlays, and other causes, including the liberal distribution of copies of books for review, the prices affixed to original works are necessarily higher than the actual amount of paper and print would seem to warrant. Books, as has been said, are subscribed for among the booksellers of the principal cities; but booksellers in the country towns either send for supplies by letter, or give their orders to travellers employed by the chief houses. Between the country booksellers and the leading publishers in London, Edinburgh, or Dublin, there is kept up a continual correspondence. In addition to his daily or weekly parcel, every provincial bookseller makes up a monthly order for magazines, periodicals, and books; and the collecting for monthly parcels forms one of the remarkable phenomena of the Row. The day of making up, called 'magazine day,' is the last, or last but one, of the month, when periodicals for the succeeding month are collected and despatched. In receiving and forwarding of enclosures by these monthly parcels, there prevails a spirit of mutual accommodation, which is exceedingly commendable, and without which, indeed, a large portion of the book-trade would be at a stand. By means of enclosures, booksellers in the most distant parts of the country are able to procure small supplies from different publishers at a trifling charge for carriage—with what result of convenience to the public need not be dwelt upon. The execution of foreign orders is, of course, comprehended in the business of the publisher. Publishers formerly took but little account of the demand likely to arise for their books from abroad, but now they frequently print an extra number of copies for export to the United States, Canada, and Australia. Previous to the internecine war in the United States, American publishers were in the constant habit of seizing upon popular English copyright books, and reprinting them in a cheap form suitable for their own market, which included Canada and several other British colonies. As nothing was paid to the author, books so printed were sold at prices against which the English publisher found it impossible to compete; he therefore withdrew in disgust, and left the colonial market to be supplied with 'pirated editions.' In consequence of the derangement of currency, the increased taxation, and the protective system indulged in since the conclusion of war, it has been found impossible to produce books so cheaply in America as in England; consequently large numbers of books are now printed here specially for the American market. The Canadians too, are exerting themselves, and are

making arrangements with English publishers for the supply of the Dominion ; so that, notwithstanding the absence of any international copyright treaty, it is probable that in the course of a few years most modern English books read in any part of America will be such as are either printed here, or are reprinted there by arrangement with the English publisher or author.

The plan of issuing neat cheap editions of popular works, was struck out a hundred years ago (1760—1770) by Alexander Donaldson, an Edinburgh bookseller above referred to,\* and was followed up by several publishers in London, one of whom, C. Cooke of Paternoster Row (1790—1800), issued an extensive series of cheap reprints, of a pocket-size, called *Cooke's Editions*, which for tastefulness of preparation have never been excelled. In the early years of the present century, Suttaby's, Sharpe's, Walker's, and Dove's pocket editions, were stock articles in the trade. About 1817—1818 some enterprising booksellers began to break through certain old usages of the trade, by issuing reprints of standard works, in a good style of typography, at considerably reduced prices. At the same time,

\* According to the act, 8 Anne, c. 19, the copyright of a book was for 14 years, with a second term of 14 years contingent on the author being alive at the expiration of the first term. While such was the law, publishers who bought a copyright were usually allowed, by courtesy of the trade, to continue to publish their works unmolested during the second term, even if the author was dead when the first term expired. Notwithstanding this act, there was long so little precision as to questions of literary property, that works issued by London publishers were freely reprinted in Edinburgh, while those belonging to Edinburgh publishers were similarly dealt with in London—for example, Ramsay's Poems, which were issued by the author at Edinburgh in 1725, were reprinted in London, and also in Dublin, in 1731. Alexander Donaldson, of Edinburgh, is said to have taken the lead in this kind of trade, though from any evidence on the subject, it does not appear that he went beyond the bounds of the law. In order to extend his sale of cheap reprints, he opened a shop in the Strand; a step which brought him into collision with certain publishers in London. It will be recollect that Boswell, in his Life of Johnson, under date 1763, alludes to this case of Donaldson, who is spoken of by Johnson as 'a fellow who takes advantage of the state of the law to injure his brethren'—one who, supposing he did reduce the price of books, 'is no better than Robin Hood, who robbed the rich in order to give to the poor.' To judge from the litigation which ensued, Donaldson scarcely merited these strictures. In 1771, certain parties in London procured an injunction from the Court of Chancery to restrain Alexander Donaldson from printing and selling Thomson's Seasons, on the ground that it was their property. Donaldson, appealing to the House of Lords, shewed that the work in question was first printed in 1729, that its author died in 1748, and that the copyright expired in 1757. The Lords decided in favour of Donaldson; thereby settling the point, that copyright depended entirely on the statute, and was not an inherent and interminable right of property, as many seem to have believed it to have been. Some details of this curious and important case will be found in the article COPYRIGHT. Donaldson, whose enterprises are spoken of approvingly by Boswell, left a fortune, which was greatly augmented by his son, a newspaper publisher in Edinburgh; and the total sum, amounting to nearly a quarter of a million sterling, was bequeathed to found an educational hospital for poor children. This building adorns the environs of Edinburgh, and is one of the most magnificent in Scotland. See DONALDSON'S HOSPITAL. This is not the only hospital for which the world is indebted to the book-trade. Thomas Guy, a bookseller in Cornhill, London, founded during his life the hospital which bears his name; he died in 1724. See GUY'S HOSPITAL.

numerous cheap periodicals made their appearance; but these, for the most part, were of so seditious, irreligious, and libellous a character, that the law interposed to check the growing evil, by the act 60 Geo. III., and 1 Geo. IV. c. 9. See NEWSPAPERS. Those cheap unstamped periodicals which appeared during the next ten years, were only tolerated when, eschewing news and politics, they confined themselves strictly to matters of instruction or amusement. The only one that attained to permanent success was the *Mirror*, an illustrated weekly sheet, 8vo size, projected by John Limbird in London, the first number of which appeared November 22, 1822. When, therefore, in 1827, the Society for Diffusing Useful Knowledge began to issue its low-priced scientific treatises—and when, in the same year, Archibald Constable commenced the cheap series of works in original literature, called *Constable's Miscellany*—the public were already in some measure familiar with a certain class of cheap books. Yet, viewing all previous enterprises of this kind as fitful and insufficient, as well as unsupported by any breadth of appreciation, we have to refer to this period (1827—1832) for the true origin of what is now designated the 'cheap press.' Constable's attempt to cheapen literature was happily coincident with a general awakening in the public mind, and proved eminently successful; imitations followed; a variety of serial works, in small volumes, for popular use made their appearance. A similar popularising of the price of periodicals was the next step in advance. Several cheap sheets of an entertaining nature were issued, similar to Limbird's *Mirror*, though more resembling a newspaper in shape, but for various reasons most of them soon disappeared. At this juncture, taking advantage of the growing demand for cheap literature, and desirous of guiding it in a right direction, William and Robert Chambers of Edinburgh began, on the 4th of February 1832, to issue *Chambers's Edinburgh Journal*, a weekly sheet at 1*d.*: on the 31st of March following appeared in London the *Penny Magazine* of the Society for the Diffusion of Useful Knowledge; and, July 7, this was followed by the *Saturday Magazine*, which was issued under the direction of a committee of the Society for Promoting Christian Knowledge. So many cheap publications of various kinds followed, that it would be impossible to particularise them in this brief sketch. The efforts to establish a cheap press were much facilitated by two great inventions—the paper-making machine, and the printing-machine, both of which had been introduced within the preceding twenty years. The continued issue of cheap reprints of popular works out of copyright has greatly changed the aspect of the trade; and although works at old prices are as numerous as ever, cheap books of an improving tendency are now placed within general reach. By the enterprise of certain publishers, new and copyright works are also now issued in a cheap form, in boards, with coloured paper covers—the prices of these neat and handy volumes being from 1*s.* to 2*s. 6d.* each. The trade in this class of books, and in cheap periodicals and newspapers, has been largely developed by railways. On the platforms of all the chief termini and stations, there are stalls for the sale of books, periodicals, and newspapers. These stalls, consisting of a counter and some shelving, which can be closed in with shutters at night, are rented from the railway companies by different booksellers, from whose head establishments supplies ceaselessly radiate. One firm, in August 1873, had 400 stalls. A London publisher announced, in the beginning of 1873, that in the twelve months preceding he had printed over five millions of books.

The sudden and successful rise of a cheap press

was not viewed with complacency by the fathers of the trade, and for a long time it was believed that, like many other novelties, it would have its day, and disappear. Looked at, therefore, as temporary and undignified, the cheap press was left to force its way in the hands of two or three ardent young publishers, who, extending their operations, at length assumed a position which could not fail to command respect, and to excite a spirit of emulation. Latterly, the old established firms have begun, though in a hesitating way, to issue a cheap class of publications, by reprinting and otherwise. At the same time, these firms, besides generally maintaining the old prices, unite to keep a few editions of standard works in print. These 'trade editions,' as they are termed, are printed and supplied in shares; each party concerned taking an interest in their sale, and being so far precluded from attempting the issue of rival editions. The names of all the proprietors of these joint-stock books are printed on the title-page; but as no new books are added, this once popular method of publication will soon become extinct.

As circulating libraries, by creating a taste for reading, led to the establishment of the cheap press, so, as might be expected, has the cheap press extended the sphere of literature, and given rise to public libraries and book-clubs; and even circulating libraries, which for a time suffered from the deluge of minor publications, have begun not only to revive, but to assume dimensions beyond precedent. Mr Mudie, in the year 1842, introduced a new system of subscription lending library, which in 1873 contained a million volumes, employing 80 clerks, and having no fewer than 18,000 subscribers to the London establishment alone. As many as 2000 copies of a single work at eighteen shillings or a guinea are sometimes added; so that in many cases what would formerly have been considered to be large editions are absorbed by one purchaser. After being used for several months, the overplus copies belonging to these libraries are disposed of at from a half to one quarter of the original price; and the readiness with which they find customers among the lesser libraries throughout the country is alone an evidence of the increasing demand for books. The largest of these circulating libraries is said to contain half a million volumes; and another, commenced in 1860 in connection with a system of railway, states 150,000.

The selling of second-hand books from open stalls, and from Booths (q. v.), is a practice so ancient as to be connected with the trade of the stationarii of the middle ages. Some men of considerable note in the book-trade began in the humble quality of stall-keepers. The most celebrated instance of this kind is perhaps that of James Lackington. He commenced his remarkable career by keeping a small stall of old books, which, while working as a shoemaker, he placed at his door in one of the obscure streets of the metropolis; and from his ultimate success, was able to inscribe the proud boast, *Sutor ultra crepidam feliciter ausus,* on his very entertaining memoirs. Though more common formerly than now, book-stalls are still seen in every large European city. They particularly abound in Paris—chiefly on the quays near the Pont-Neuf; and at all the great continental fairs, stalls of new and second-hand books are conspicuous. Booksellers at one time took their place among the stall-keepers on market-days in English provincial towns, nor have they altogether disappeared. Michael Johnson, bookseller in Lichfield, was in the habit of setting up a stall for the sale of his wares, every market-day, in Uttoxeter. On one occasion, confined to bed by indisposition, he requested his son Samuel to visit the market, and attend the stall

in his place, which he refused to do. How this act of criminal pride and filial disobedience preyed in after-years on the mind of the great lexicographer; and how, in his old age, to expiate this juvenile delinquency, he went to Uttoxeter on a market-day, and stood on the site of his father's stall for the space of an hour bareheaded in the rain, exposed to the jeers of the by-standers, are among the most characteristic circumstances narrated in the life of this extraordinary man (see Boswell, Croker's post 8vo edition, vol. x. p. 103). The flood of cheap publications forty years ago, which has been already referred to, greatly damaged the stall-trade in old books. Nevertheless, there remain in London a few book-stalls and booths, and in Edinburgh, though fallen from their high estate, book-stalls are still visible. In Paris the stall-trade still flourishes, and no book-hunter in that city loses the opportunity of a ramble along the Quais. It must be admitted, however, that the business is losing its picturesque character; it is getting into a regular shop-trade, and attaining to dimensions far beyond the notions of the old class of stall-keepers. London, of course, is the chief seat of the second-hand book-trade; but it is also conducted on a respectable scale in Edinburgh, Glasgow, Manchester, Liverpool, Oxford, Cambridge, Dublin, Bristol, and some other centres of wealth and intelligence. The dealers procure supplies chiefly at public auctions of the libraries of deceased clergymen, professors, and private gentlemen, of which sales there is a constant succession in London, Edinburgh, and elsewhere. At these auctions, good editions of standard books may usually be obtained at moderate prices; but rare and curious works, prized by the 'bibliomaniac,' frequently bring very high sums. See *BIBLIOMANIA*. Dealers in second-hand books send catalogues to their customers throughout the country; and from this source not a few gentlemen's libraries are mainly made up. During the past twenty years, there has been a growing scarcity of second-hand high-class works, in consequence of the purchase of large quantities for public libraries forming in the United States. From France, Italy, and Germany, there has been a similar export-trade in splendid old editions to North America.

At one period, it was usual to limit editions to from 500 to 1000, or 1250 copies, and impressions of 2000 were considered excessive. Now, large editions are more frequently the rule than the exception, particularly as regards the works of standard authors published in a cheap form. As the cost of composition (setting the types) is the same for a large as for a small edition, and as the charge for press-work is only a little more for a larger than a smaller impression, the profit on a book rises rapidly in proportion as the quantity put to press increases. In the case of cheap books, it is absolutely necessary that large impressions be sold, in order that they may realise any profit to the publisher. In preparing this class of books, therefore, to the extent of from 20,000 to 50,000 impressions, the element of composition dwindles into insignificance. The chief things taken into account are paper, machine-printing, and boarding. Paper, however, being the matter of most serious concern, the weight is rigorously computed beforehand by putting a sample volume into the scales. To avoid delay, and also to save outlay in preparing future impressions, it is customary to stereotype cheap books and periodicals. Although, like composition, stereotyping forms a minor charge, the accumulation of stereotype-plates at length becomes considerable, and, as in the case of overplus stock, forms a burden on the capital of the publisher.

The changes produced in the English book-trade

by the cheap press, are not more remarkable than that improvement in taste which has subdued the traffic in books of a politically objectionable, and of a demoralising character. Contrary to fears entertained on the subject, the cheapening of books, periodicals, and newspapers has in no perceptible degree deteriorated literature. The sale of books of a grossly demoralising tendency has been driven into obscurity, and in other ways circumscribed by a recent act of parliament (21 and 22 Vict. cap. 83); and it is demonstrable, as regards periodicals, that those of an objectionable kind form but a small proportion—not one hundredth part of the whole. Little dependence can be placed upon the statements given of the circulation of weekly and monthly magazines, as there is a general disinclination on the part of respectable publishers to state their actual sales; while the numbers mentioned by the less reputable members of the trade are almost without exception fictitious, and are generally mentioned for the sole purpose of attracting advertisements. Cases have been brought before our notice in which hundreds have been magnified into thousands, and in very rare instances indeed is the *bond-side* circulation honestly stated. The aggregate monthly circulation of periodicals of all descriptions, excluding newspapers, may be stated at about 10,000,000, of which not more than 90,000 are actually immoral or anti-religious. The circulation of some of the religious magazines is very large; of two published at sixpence monthly by the Religious Tract Society, one sells to the extent of 130,000, and the other 88,000. Including newspapers, the total number of separate weekly and monthly publications issued in London is nearly 700.

Obviously, the sale of such an enormous mass of cheap sheets would be overwhelming to the ordinary trade; in point of fact, the writing and publishing, and also the retailing, of the more widely circulated penny papers are conducted as a separate business. The sales are effected chiefly by means of small shops in back-streets, the purchasers being, besides domestic servants, all varieties of persons, old and young, who reside in these humble localities. The rise of these cheap periodical and newspaper shops, in adaptation to new social wants, is not the least remarkable of the 'signs of the times.' Nor can it be spoken of with regret. With other commodities the huckster dispenses the weekly pennyworth of literary amusement, which, enjoyed in the poorest family circle, enlivens the most dreary fate, and if not directly elevating in its tendency, may be presumed to do at least some good as a substitute for more exceptional means of excitement. On general grounds there is cause for congratulation. Considering the preponderantly large proportion of cheap periodicals of an unobjectionable, and not uninstructive kind, and looking also at the perfect freedom now enjoyed by every department of the press, we have a striking illustration of the vastly improved state of public feeling, with which cheap literature has steadily kept pace, since the reign of George IV. Not even in the most objectionable of the irreligious prints is there anything at all resembling the scurrilities which were at one time prevalent. The classes of books and periodicals which a number of years ago consisted of coarsely offensive attacks on the government, church, laws, &c., have entirely disappeared, and at no time in its whole history has the book-trade of Great Britain been on a more healthy footing than it is at present.

Limited by the generally imperfect state of education and inaptitude for reading, the ordinary book-trade is also obstructed on account of large sections of the people still speaking some form of

the Celtic language, and being unable to understand English. The Scottish Highlanders, Welsh, Manx, and aboriginal Irish, are less or more in this condition. In Wales, there exists a press specially devoted to those who, in remote parts of the Principality, still hold to the ancient vernacular; and the publishing of books and periodicals in the native tongue is conducted with remarkable activity. Some are translations from English works of a useful and popular kind, occasionally illustrated with wood-engravings; and the circumstance of there being a taste and demand for such productions, affords a favourable view of the intellectual advancement of the Principality. In Ireland, on the contrary, almost the only works printed in the ancient tongue are for the use of scholars, and not, as in Wales, for the poor. The Highlands and Western Islands of Scotland produce no literature, native or translated; and the Gaelic books in the hands of the people are extremely limited in variety and number.

Entirely separated from the general book-trade, there flourishes a system of publishing of a peculiar kind. We allude to the *Canvassing Trade*, which consists in the plan of disposing of books mostly in weekly and monthly numbers or parts. The business is conducted by only a few houses in London, Edinburgh, Glasgow, and one or two other places. Canvassers are employed to go from door to door, to procure subscribers; and the numbers are delivered periodically, till the work is completed. On account of the expense of canvassing and delivery, books sold in this manner are necessarily much dearer than if disposed of through the ordinary channels of trade. The method, however, of buying books in small portions at a time, accommodates certain classes of customers, and has been the means of disseminating an improving literature—Bibles, with notes and illustrations, and works of piety in particular—in quarters not reached by the operations of the bookseller. During the past ten years, the canvassing trade has largely been engaged in selling books, and especially Bibles, in the complete form. On giving an order, the book or Bible is left, and a small sum paid, and a similar sum weekly or monthly. It is said that but few bad debts are made amongst working-men, a fact that speaks well for their honesty.

Apart, likewise, from the general trade, the publication of small books, tracts, and periodicals is carried on to a large extent by associations for religious purposes, the funds for which are raised by voluntary subscriptions. As far as concerns the distribution of purely religious tracts among the unfortunate and less instructed members of the community, no fault is found with the operations of these societies. But when such associations address themselves to the publication of volumes and illustrated periodicals, differing in no material respect from the ordinary products of private enterprise, and intended not for gratuitous distribution but for sale, a certain injury is felt to be unbecomingly inflicted on the trade, which can no more be justified than the damage done to free competition by the giving of bounties on particular manufactures. Notice has been taken of two periodicals of the Religious Tract Society of London, the circulation of which must be allowed to be fostered in this manner, and other works could be pointed out as being so greatly cheapened by the same objectionable method as to be placed completely beyond the reach of fair commercial competition. See RELIGIOUS TRACT SOCIETY.

Another distinct kind of trade is that of printing and publishing authorised versions of the Bible, New Testament, and Book of Common Prayer. The preparation of these works has always been a preroga-

tive of the crown, which grants exclusive privileges or patent rights to certain parties for the purpose. From old usage, England, Ireland, and Scotland are treated separately. The last patent for England was granted by George IV. to Andrew Strahan, George Eyre, and Andrew Spottiswoode, for a term of thirty years; and having commenced on the 21st of January 1830, it expired on the 21st January 1860, and was then renewed during pleasure. The universities of Oxford and Cambridge have enjoyed the right of printing Bibles, &c., in common with the patentees; but in their case it is a simple affair of permission, they have no power to prohibit or prosecute. See PATENT.

In Ireland, George III., in 1766, granted a Bible patent to Boulton Grierson for forty years. He was succeeded by his son, George Grierson, who, in 1811, obtained a renewal. Trinity College, Dublin, had also a concurrent right; but the English patentees, and both Oxford and Cambridge, are permitted to import their Bibles into Ireland.

In Scotland, the last patent expired in 1839, and was not renewed in consequence of remonstrances from that country, to the effect that if its printing were left free, the Bible would be sold at a considerably lower price than it had hitherto been. Such has proved to be the case. The crown appoints a Board with authority to grant licenses to parties desirous to print editions of the Bible and other books falling within the royal prerogative, such as the Confession of Faith of the Church of Scotland, but the importation of English printed editions is not prohibited. (See *Abridgment of Specifications relating to Printing, &c., printed by order of the Commissioners of Patents*, London, 1859.)

The modification of the patent having tended to lower prices, the possibility of any further material reduction seems doubtful. One noticeable feature in the trade in Bibles is, that the publishers in England sell large numbers in sheets. They are bought by bookbinders, who do them up in various styles; some very neatly with gilt edges, which they sell to retailers at about 11d. per copy. Other copies, costing, perhaps, not more than 1s. or 1s. 6d. in sheets, are bound in velvet, morocco, tortoise-shell, or other ornamental bindings, and retailed as high as three guineas each. It is computed that in London alone, nearly 1000 persons are employed in binding Bibles, Prayer-books, and other books of devotion. From their cheapness, but more particularly from their accuracy, English-printed Bibles and New Testaments are purchased in large quantities by the United States. Other large purchasers are the British and Foreign Bible Society. The Society for Promoting Christian Knowledge makes large purchases of Prayer-books and Church Services in addition.

Although the printing of the authorised version of the Bible, the New Testament, and the Book of Common Prayer, with as well as without notes, seems to be reserved to the nominees of the crown, practically no objection is taken to the printing of these works by others, nor has any objection ever been raised to those printed with notes and comments. Many such editions are accordingly prepared and issued by publishers, often in a style of great elegance. Translations of the Bible, other than the authorised version, are also issued freely by Roman Catholic and other bodies; and at the present time a committee of learned divines is engaged upon a revised version of the English Bible, the copyright of which has been secured by the universities of Oxford and Cambridge, although the revision will not be completed for some years.

The universities of Oxford and Cambridge; also of Trinity College, Dublin; the four Scotch universities; and the colleges of Eton, Winchester, and

Westminster, were so much alarmed by the decision of the House of Lords in 1772, in favour of Donaldson's right to reprint works not protected by the copyright law of 8 Anne, c. 19, that they applied for and obtained an act of parliament 15 Geo. III. c. 53, giving them a perpetual copyright of all works belonging to them, or which might afterwards be bequeathed to or acquired by them. The only work in existence older than the present century, claimed by any of the above institutions, to which any value can be attached, is Clarendon's *History of the Rebellion*, with his life and continuation. The right to this and other works possessed by the university of Oxford, was confirmed by the last Copyright Act, 5 and 6 Vict. c. 45. It will therefore be understood that the printing and publishing of Lord Clarendon's *History of the Rebellion* remains an absolute and perpetual monopoly in the university of Oxford—a curious exemption from the ordinary and terminable claim of copyright, and singularly at variance with modern notions of free-trade. It should be added that the profits of the first edition were very great, and were applied by the university towards the erection of the 'Clarendon Press,' which was for a long time the university press; but, its business increasing, the 'Clarendon' has been superseded by the 'University Printing-house,' the former building, a very handsome one, being used for other purposes. (Besides Godson's *Law of Patents and Copyrights*, and Supplements, see Dr Ingram's *Memorials of Public Buildings of Oxford*, new edition, 1848, p. 11.)

Publishers are under the legal obligation to deliver, free, a copy of every book they issue (new editions without alterations excepted) to the five following public institutions: Library of the British Museum; Bodleian Library, Oxford; University Library, Cambridge; Trinity College Library, Dublin; and Library of Faculty of Advocates, Edinburgh. This obligation, imposed by a clause in the Copyright Act (see COPYRIGHT), is usually spoken of as an unjustifiable burden, and no doubt it is so; but it is chiefly from causing trouble that it becomes matter for complaint. In comparison with the immense benefits conferred on literature by the public libraries mentioned, the value of the books (with some exceptions) claimed by them is insignificant. In practice, not a hundredth part of the cheap books and sheets issued are given or claimed; which is perhaps unimportant, for if they were, no ordinary building could contain them.

The English book-trade has been lately much indebted to certain liberal Post-office arrangements. Manuscripts, proof-sheets, books, periodicals, and catalogues, if left open at the ends, may now be transmitted by post at an exceedingly small charge. See POST-OFFICE.

Unitedly, the whole trade of publishing and bookselling forms an important staple of national industry—inferior to some other manufactures and trades, yet great when viewed in relation to its past history, and to the still imperfect state of education among large masses of the people, and respectable from the number of men of high character who are connected with it. In reckoning the number of new works issued from the press annually, we may take the number of entries of distinct books, volumes, sheets, maps, &c., lodged by publishers at the British Museum, in terms of the Copyright Act. The following is an abstract of the return for 1872: Books—complete works, 8345; parts of volumes, works in progress, and periodicals, 17,796; single articles, including playbills, songs, broadsides, &c., 5871—total, 32,012. Music—complete works, volumes and pieces, 4272. Maps—245, in 1595 sheets; atlases, 33. Twenty years ago the number was only about half as great. In 1872, according

to the tables of the Board of Trade, the books imported into the United Kingdom were valued at £149,189. Of these the value from Germany was £38,565; France, £46,968; Holland, £18,590; the United States, £13,560; and Spain, £8150. The value of English printed books exported in 1870 was £883,914. The United States purchased to the amount of £307,684; Australia, £181,084; Canada, £81,590; British India, £43,648, in addition to its share of the £77,229 worth exported through Egypt. France, Germany, Holland, and Belgium unitedly took to the value of £95,918; our next largest customer being South Africa, for £28,748. In 1856, the total value of the books exported was £425,000. It is seen that the exports are sixfold more than the imports; also that we export to Australia alone more than we import from all countries, and to the United States double as much. A system of more free and untaxed import of foreign-printed English works would, in various ways, introduce changes into the book-trade, and have a tendency to alter some of its traditional usages.

In Germany, where printing originated, the book-trade became also first established, and the principal mart was Frankfurt, to the fairs of which the early booksellers and printers resorted. Leipzig, also, became a great mart for books as early as 1680; yet this ancient city is only one of many places of book preparation in Germany. Among them Stuttgart has taken a front rank, since about 1830, as an agency place for the South German book-trade, whilst Frankfurt has now entirely lost its ancient prestige. Throughout the different states of the German empire, more particularly Prussia and Saxony, printing and publishing are largely carried on; and from the various places of publication a great proportion of entire editions of works is transferred to Leipzig agents, who disperse the books throughout Germany, and all those countries for the book-trade of which the city of Leipzig forms the nucleus. Hence arises the important peculiarity of German literature, that literary, artistic, and scientific activity is not limited to, or monopolised by any single city, and that, consequently, authors do not need to resort to a metropolis for encouragement or any professional labour. Formerly, the booksellers from the various parts of Germany, and those countries which are dependent, in some measure, upon Germany, on account of affinity of language and identity of aspirations—such as Holland, Belgium, Denmark, Sweden, Norway, &c.—used to meet at Leipzig twice a year, at Easter and Michaelmas, with a view to exchange their respective publications, and arrange for settlement of mutual accounts. At present business is done at Leipzig through a system of agencies by commissioners there established. Every bookseller in Germany and the adjacent countries has his commissioner at Leipzig, and to him he forwards packages containing copies of his new publication or publications, on sale or return, for all the booksellers with whom he has an account. The commissioner then distributes the packages among the Leipzig commissioners, every one of whom is thus enabled, out of the many packages flowing in every week, to make up a case for each of his correspondents. At the end of the year, unsold books are returned to the various senders by means of the Leipzig agency. At Easter, during the fair, the balances are now mostly paid by commissioners to commissioner, the German publishers not resorting as much as formerly to the fair; the extension of railway communication, and other circumstances facilitating business, having somewhat changed the nature of the trade. The method of sending

parcels of new works, on sale or return, may not be satisfactory according to English notions, but the advantages of the plan are obvious in various points of view. There is no country in the world where literary and scientific novelties are so regularly made known and become noticed as in Germany. Let the book be what it may, within six weeks after its first publication it is known all over Germany, and through the personal vigilance of the retailers, is brought everywhere under the notice of those individuals to whom the subject treated of may be of interest. This method of publication has the merit of great simplicity, and secures an exemption from that frightful expenditure on advertisements to make books known, which presses on the English publisher. On this account, as well as from the cheapness of paper and printing, and the simple way that books are for the most part done up, the selling-prices of every variety of production are very moderate. The only drawback on the German publisher is, the liability to heavy returns of unsold books; but this he doubtless endeavours to avert by professional tact in his speculations, and a good knowledge of the market. It is, at all events, the belief of those who are well acquainted with the German book-trade, that the method pursued not only furnishes books cheaper, but is more productive to author and publisher than that in England; and that, in point of good management and prosperity, it exceeds, or at least equals, the book-trade in any other country. From the teeming press of Baron Bernhard Tauchnitz of Leipzig, has been issued a series of 1200 volumes of cheap reprints of English popular works in a pocket size, which are sold largely in Germany and all other continental countries. It is proper, however, to say that, as there is an international copyright law between Saxony and the United Kingdom, these *Tauchnitz Editions*, as they are termed, are issued in virtue of an honourable arrangement with English publishers and authors, and are accordingly not to be ranked with the piratical issues of the New York trade. Latterly, the sale of German books in England, France, and North America has rapidly increased.

In France, publishing is carried on chiefly in Paris, where there are now some extensive printing establishments, including the *Imprimerie Nationale*, provided with machinery equal, if not superior, to anything of the kind in London. As regards substantiality and elegance, French books occupy a place between those of Germany and England. They are, with few exceptions, done up simply in coloured paper covers, for temporary service; but the ink is generally better than that used in England; and works, when of a superior class, are executed with a high degree of taste—the excellence of pictorial embellishments being always conspicuous. Certain voluminous and most expensive works in French, and also in the classical languages, occasionally issue from the Parisian press, and command a large sale; orders of copies for university and public libraries all over the continent tending to promote these gigantic enterprises. Although confined mainly to Paris, the business of publishing, or at least of preparing books for the Parisian market, and for exportation, is carried on to a considerable extent in several provincial towns. Tours, in particular, is the seat of a large book-factory—that of Messrs Mame—in which printing, designing, engraving, and binding are all executed on the premises.

The French book-trade was virtually suspended during the war with Germany, 1870–1871, and the unsettled state of public affairs afterwards: it is but slowly recovering itself. The exports are to Italy, Germany, Russia, Holland, Belgium, North

America, and other countries, and a portion also comes to England. Between France and the United Kingdom there is now an international law of copyright, by which translations of works are, under certain limitations, protected in either country, when the title-page indicates that 'the right of translation is reserved.'

In the 17th c., various cities in the Dutch Netherlands bore a prominent place in the book-trade. At Amsterdam, some of the most beautiful editions of the classics, and large numbers of illustrated books, were executed; while from Leyden, and other seats of learning, exports of works in law, theology, &c., formed at one time a prosperous commerce. In this as in other trades, it has been the fate of Holland to lose its former reputation: it now produces few books in any other language than its own; but the demand for books in the Protestant parts of the country, and the number of booksellers, is perhaps larger than in any other part of the world. That part of the Netherlands now known as Belgium possesses a flourishing book-trade, mainly, we believe, on account of French being the language generally spoken. Brussels, as a kind of minor Paris, is the seat of some extensive printing and publishing concerns; and at Malines, missals, breviaries, and other religious works are produced in large numbers. According to a return of the minister of finances of Belgium, the following was the import and export trade in books for 1856: Value of imports, 284,557 francs, of which 80 per cent. was from France; value of exports, 2,446,578 francs, of which 47 per cent. was to England, and 53 to all other countries.

In Spain, bookselling is almost defunct; even in Madrid it can scarcely be said to have an existence. In Italy there are signs of revival, but the most active booksellers there are natives of Germany, who, during the last thirty years, have established bookselling houses in the principal cities, Rome, Naples, Turin, Milan, Bologna, Florence, Venice, and Verona, also Triest; and under their auspices, the trade may be expected to assume an organised form. Already these intelligent foreigners have done much to keep alive a knowledge of Italian literature.

The book-trade of the United States, which is daily assuming greater proportions, has sprung up from small beginnings within the present century. As in Germany, the business of publishing is monopolised by no particular city, but is carried on successfully in various towns throughout the Union. The chief centres are Boston, New York, and Philadelphia; but many books are published at Albany, Buffalo, Baltimore, Washington, New Orleans, Charleston, Cincinnati, Chicago, St Louis, and San Francisco; and a few in other places. The great distributing houses are located at New York and Philadelphia; and throughout the United States and Canada there are about 6200 booksellers, two-thirds of whom unite in an exceedingly miscellaneous collection of trades with that of bookselling. A few of the larger publishing houses in New York and Philadelphia, like some in Edinburgh and Glasgow, print, bind, and manufacture the books they sell. Harper's building in New York, and Lippincott's in Philadelphia, each cover nearly half an acre of ground, and cost above £50,000. The annual value of books produced in the United States is unknown. In 1856, upon very uncertain data, it was estimated at £3,200,000, this amount probably being the full selling-price of every volume printed. In consequence of the protectionist policy pursued since the war, the present state of the book-trade is far from satisfactory, and will probably remain so till wiser counsels prevail. English publishers and authors are naturally indignant at the

conduct of American publishers persisting in reprinting British copyright works, which is carried on to an enormous extent by the Harpers and the Appletons of New York, and others, in defiance of all remonstrances to the contrary, and even in disregard to the claims of those more scrupulous American publishers who pay for and import early sheets from England. The unauthorised reprint of the present work by the Appletons afforded an example of these practices.

American books are now executed with neatness and taste; their wood-cut embellishments sometimes surpass those of London; and in point of size and price, they are, for the most part, well adapted for general circulation. On account of the prevalence of education, and also the aspiring habits of the people, book-buyers of a humble position in life are greatly more numerous than they are in the United Kingdom. Few books are purchased by the Irish and other emigrants, but many of the liberated coloured people are said to be eager in their thirst for knowledge, and their children will no doubt be all taught to read. Looking on the American book-trade as, after all, still in its infancy, it may be expected, in the progress of events, to go on in a vastly accelerated ratio. Latterly, several English publishers have established branches of their business in New York; and there are now some extensive American commission-houses in London—from which intercommunion happy results may be anticipated. Books are sold wholesale by written orders, trade sales, auctions, and otherwise. Country dealers are in the habit of visiting the great book-dépôts of Boston, New York, and Philadelphia, and there personally making their selections. As previously stated, there is a large export of American books to Canada and other British possessions, in which, as yet, native literature is on a poor scale, but where there is a large and increasing number of readers.

In doing up books in cloth boards, the American binders invariably cut off the outer folds of the sheets, so as to smooth the edges of the leaves, as in English leather binding; by which process, the first readers of new books are spared the trouble of cutting open the leaves. Many persons have wished to see this improvement, for such it is, introduced into England. There are still, however, prejudices to be overcome on the subject. Strange as it may appear, numbers of purchasers like to cut up the leaves with a folder as they advance through a new book or periodical, from an idea that the repeated slight interruptions heighten the pleasure of perusal. In our experience, we have known gentlemen who would not sit down to read a cut-up new book. Besides, there is a notion among buyers in England, that books with smooth-cut leaves may be second-hand, and not worth the price of new. Undoubtedly, the Americans are ahead of Europeans generally in this particular.

Notice has been taken of the constant export from Europe to the United States of quantities of high-class books to stock the great public libraries that are everywhere springing into existence through the liberality of state legislatures, or the munificence of private individuals. There is, however, a traffic of a similar kind, more especially from England, in execution of orders for second-hand books from dealers who have establishments in the principal cities in the Union, and through whose agency persons of refined tastes are becoming acquainted with the aspect of our older literary treasures. One of these second-hand book-stores in Philadelphia, which we visited in 1853, was on as extensive a scale as anything of the kind in London or Edinburgh, while the choice which it presented

would have come quite up to the delicate perceptions of the bibliomaniac.

For a variety of particulars bearing on the book-trade in general, we refer to the articles, **BIBLIOGRAPHY**, **BOOK**, **BOOKBINDING**, **CENSORSHIP**, **CIRCULATING LIBRARY**, **COPYRIGHT**, **NEWSPAPERS**, **PAPER**, **PERIODICALS**, **PRESS**, **PRINTING**, **STATIONER**, **STEREOTYPING**, **WOOD-ENGRAVING**. W. C.

**BOOLAK**, or **BOULA'C**, a town of Egypt, on the right bank of the Nile, two or three miles north of Cairo, of which it forms the port. Destroyed by the French in 1799, it was rebuilt by Mehemet Ali, who established cotton, silk, and weaving factories; a government printing-house, from which a newspaper in Arabic is issued weekly; and a school of engineering. It is connected by railways with Alexandria and Suez. Pop. 20,000.

**BOOLUNDSHU'HUR**, a British district in the lieut.-governorship of the North-west Provinces of India. With an area of 1910 sq. miles, it contained, in 1872, 936,593 inhabitants. It lies in N. lat., between 28° 3'—28° 43', and in E. long., between 77° 28'—78° 32', being bounded to the N. and W. respectively by the districts of Meerut and Delhi. Its chief town of the same name, otherwise called Uchuganj, is on the route between Bareilly and Delhi, being 40 miles to the south-east of the latter. Its population amounts to 12,049; and its distance from Calcutta is 780 miles, its elevation above the level of the sea being almost precisely the same number of feet.

**BOOM**, in a ship, is a general name for the long poles which jut out from certain supports or uprights, to stretch or extend the bottoms of sails. Some taper regularly from the middle towards both ends; while others have the thickest part at about one-third of the length from one end. According to their particular modes and places of application, they receive the names of *jib-B.*, *flying jib-B.*, *studding-sail B.*, *tower studding-sail B.*, *main B.*, *square-sail B.*, *driver-B.*, *spanker-B.*, *ring-tail B.*, *main-topmast B.*, *fore-topmast B.*, *fire-B.*, &c. In the old 110-gun ships of Nelson's days, these booms varied from 57 to 32 feet in length, and from 15 to 6 inches in thickness. The war-steamer of the present day require a somewhat different equipment of booms. The immense spread of canvas in some of the clipper merchant-ships now built requires the use of booms of very considerable length. A seaman speaks of 'booming' when he applies a B. to a sail; he employs *B.-iron*, shaped like the figure 8, to connect booms and other spars together end to end.

Besides the booms on board ship, the same name is also given to a strong iron chain employed in barring the passage of the mouth of a harbour or river, or to cut off the retreat of an enemy if he has actually entered. Such a B. should be protected by a battery or batteries. The chains are moored, and are floated by logs. There should be two such chains, one to afford resistance if the enemy has penetrated the other; they need not extend all across the passage, seeing that shallow spots are self-defended. A modern war-steamer would cut through a chain-B., unless made of very thick and strong iron. Sometimes hampen cable booms are used to resist small-craft. The Russians effectually boomed the harbour of Sebastopol in September 1854, thereby preventing the entrance of English and French ships; this was done partly by sinking some of their own ships, and partly by the laying of booms.

**BOOM**, a town of Belgium, in the province of Antwerp, about 10 miles south of the city of that name. Its situation at the junction of the Brussels Canal with the river Rupel makes it a place of

considerable trade. It has numerous and extensive brick and tile works, breweries, tanneries, rope-walks, sail-cloth manufactures, salt-works, &c. Pop. 7464.

**BOOMERANG**, a missile instrument for war, sport, or the chase, in use by the aborigines of Australia. It is of hard wood, of a bent form; the shape is parabolic, as represented in the adjoining

Boomerang.

cut. It is about two and a half inches broad, a third of an inch thick, and two feet long, the extremities being rounded. One side is flat, the other rounded; and it is brought to a bluntness edge. The method of using this remarkable weapon consists in throwing it in a particular manner. It is taken by one end, with the bulged side downwards, and the convex edge forward, and thrown directly onward, as if to hit some one thirty yards in advance. Instead of going directly forward, as might be expected, and there falling to the ground, it slowly ascends in the air, whirling round and round, and describing a curved line of progress till it reaches a considerable height, when it begins to retrograde, and finally it sweeps over the head of the projector, and falls behind him. This surprising motion is produced by the bulged side of the missile. The air impinging thereon, lifts the instrument in the air, exactly as by hitting the oblique bars in a windmill, it forces it to go round. The ingenuity of the contrivance, which is worthy of the highest scientific calculation, is very extraordinary as coming from almost the lowest race of mankind. The B. is one of the ancient instruments of war of the natives of Australia. They are said to be very dexterous in hitting birds with it, the animals being of course behind them, and perhaps not aware that they are objects of attack. This curiosity, as it must be called, was first made known by being brought before the Royal Irish Academy by Professor McCullagh in May 1837.

**BOONE**, DANIEL, a famous backwoodsman and trapper, was born in Virginia, United States. At an early period of his life, he emigrated to North Carolina; but his love of the wilderness not being sufficiently gratified there, he planned an expedition into Kentucky, then almost unknown. On the 7th of June 1769, along with five companions, he reached the Red River, north of the Kentucky. B., however, was captured by the Indians, but escaped, and accidentally falling in with his brother, who had pursued his track, they lived together in a cabin during the whole winter. In May 1770, B.'s brother went home, and B. himself was left alone in the perilous forest. In July, his brother returned, and after exploring a considerable portion of country, they returned in 1771 to Carolina, determined to emigrate with their families to Kentucky; but the attempt proved unsuccessful. Shortly after, B. was engaged as the agent of a Carolina company, in purchasing the lands on the south side of the Kentucky river, where, in 1775, he built a fort on the site now occupied by the town of Boonesborough. In 1777, the place was twice attacked by a swarm of Indians, who, however, failed to capture it. On the 8th of August 1778, a third attempt was made by 450 savages, officered by Canadian Frenchmen. In spite of repeated assaults, the little garrison of fifty men set at defiance its

enemies, who were at length obliged to retire, and never afterwards ventured to besiege the place. After many skirmishes and encounters with the Indians, B. removed in 1798 to Upper Louisiana, where the Spanish authorities gave him a grant of 2000 acres of land. He settled with his children and followers at Charette, on the Missouri River, beyond the inhabited limits of the country, where he followed his favourite occupation of hunting and trapping bears till his death, which occurred in 1822. B. was one of the most adventurous of all those 'pioneers of civilization' to whose courage, endurance, and skill America owes so much.

**BOONESBOROUGH**, one of at least thirty localities in the United States, which take their name from the first pioneer of the great valley of the Mississippi. It stands on the Kentucky, about 18 miles to the south-east of Lexington. Though now an insignificant village, yet it deserves a prominent place in the history of the mighty west. It was founded in 1775 by Daniel Boone (q. v.), as his first fort; and within three or four years thereafter, it was the seat of the first legislature beyond the Alleghanies.

**BOORGHA'S.** See BURGAS.

**BOORO**, an island of the Malay Archipelago, about 60 miles to the west-north-west of Amboyna, extending between S. lat. 3° and 4°, and between E. long. 126° and 127°. With an estimated area of 2000 square miles, it is said to contain 18,000 inhabitants. Though it is mountainous, having Mount Dome and Tomahoo, respectively 10,400 feet high and 6528; yet it is, on the whole, very fertile, its productions being rice, sago, fruits, dye-woods, and cajeput oil. At the east end of the island, the Dutch have a station named Fort Defence; but the best anchorage is on the north side in Cajeli Bay.

**BOOROJIRD**, or **BOOROOGIRD**, a town in the province of Irak-Ajemi Persia, situated in a fertile valley about 190 miles north-west of Ispahan. Lat. 33° 43' N., long. 48° 45' E. It has a castle and several mosques. Pop. about 12,000, who are chiefly engaged in agricultural pursuits.

**BOOSA.** See BOUSA.

**BOOT**, **BOOTS**, or **BOOTIKIN**, an instrument of judicial torture, formerly used in Scotland to force confessions from persons accused of crimes, or answers from unwilling or suspected witnesses. Bishop Burnet in the *History of his Own Time*, and Sir Walter Scott in his *Old Mortality*, speak of the B. as made of iron; but the Rev. Thomas Morer in his *Short Account of Scotland*, written from personal observation of the country at a time when the B. was still in use, describes it as 'made of four pieces of narrow boards nailed together, of a competent length for the leg, not unlike those short cases we use to guard young trees from the rabbits.' One or both legs of the person to be tortured having been placed in this case, wedges were inserted between the limb and the sides of the case, and these wedges were driven down by the executioner with a maul or hammer, questions being at intervals put to the sufferer, until either he gave the desired information, or fainted away, or shewed such endurance as satisfied the judges that no answer could be extorted from him. The wedges were commonly placed against the calf of the leg, but Bishop Burnet says he had heard that they were sometimes placed against the shin-bone. In one case—that of a lad in Orkney, in 1596—it is recorded that they were struck home as many as fifty-seven times. In another—that of John Fian, schoolmaster at Prestonpans, burned for sorcery in 1591—it is said that the victim 'did abide so many blows, that his legs were crushed and

beaten together as small as might be, and the bones and flesh so bruised that the blood and marrow spouted forth in great abundance, whereby they were made unserviceable for ever.' 'Still,' it is added, 'he would not confess; and, indeed, it is remarkable in how many cases we are told that the torture, agonizing as it was, failed in its purpose, even where the sufferer 'shrieked for pain in terrible manner, so as to have moved a heart of stone.' A writer of 1591, after speaking of the 'pilniewinks,' 'pilliwinks,' thumb-screws, or thumbkins (q. v.) as 'a grievous torture,' and of compression of the skull by a twisted cord as 'a most cruel torment also,' describes the B. as 'the most severe and cruel pain in the world.' Yet there are instances in which it was not thought enough. When the boots were first used in Scotland is not known. In a case where a deed of conveyance of land was challenged as a forgery, in 1579, two witnesses, a clergyman and a notary, both of Forfarshire, were ordered to be 'put in the boots, gins, or any other torments, to urge them to declare the truth.' In a letter, still preserved in the State Paper Office at London, Sir Francis Walsingham writes to the English ambassador at Edinburgh, in 1583, that Queen Elizabeth desires that Father William Holt, an English Jesuit then in Scotland, may be 'put to the boots.' The B. was subject of allusion on the English stage in 1604; in Marston's *Malcontent*, printed in that year, one of the characters is made to say: 'All your empirics could never do the like cure upon the gout the rack did in England, or your Scotch boots.' A young gentlewoman of Aberdeenshire was tortured by the B. in 1630. Soon afterwards, it is said to have fallen into desuetude for about thirty years. It was revived after the insurrection of the westland Covenanters in 1666, and continued to be used throughout the reigns of King Charles II., and King James II., and during the first years of King William III. 'The genius of our nation,' writes Sir J. Lauder of Fountainhall in 1681, 'looks upon the torture of the boots as a barbarous remedy, and yet of late it hath been frequently used among us.' The Claim of Right brought forward by the Scottish Convention in 1689, denounced 'the use of torture, without evidence, and in ordinary crimes, as contrary to law.' Notwithstanding this declaration, the B. was used at least once again. In 1690, Neville Payne, an English gentleman who was supposed to have entered Scotland on a treasonable mission, was put to the torture under a warrant superscribed by King William, and still shewn in the Register House at Edinburgh. The B. was applied to one leg, the thumb-screws to both hands, but without any effect, although, in the words of one of the privy-councillors, the torture, which lasted for two hours, was inflicted 'with all the severity that was consistent with humanity, even unto that pitch that we could not preserve life and have gone further.' This is believed to be the last time that the B. was used. But it was not until Scotland had ceased to be an independent kingdom, that the British parliament enacted—by the statute 7 Anne c. 21—that in future 'no person accused of any crime in Scotland shall be subject or liable to any torture.' Torture is believed not to have been used in England after 1640. It was abolished in France in 1789, and in Russia in 1801.

**BOOTAN.** See BHOTAN.

**BOÖTÉS**, in ancient mythology, the son of Cares and of Iasion, who, being plundered of all his possessions by his brother Pluto, invented the plough, to which he yoked two oxen, and cultivated the soil to procure subsistence for himself. As a reward for

this discovery, he was translated to heaven by his mother with the plough and yoke of oxen, under the name of B., i.e., the Ox-driver, which is borne by one of the constellations. According to others, B. was the son of Lycaon and Callisto, whom his father slew, and set before Jupiter for a repast, to try his omniscience. Jupiter restored him to life, and placed him amongst the stars.

**BOOTH.** Throughout all Europe, in early times, trade was carried on chiefly by fairs, as indeed is still the case in some parts of it, and in many parts of Asia. The tents, huts, or other temporary or movable structures in which the traders exposed their goods for sale, had in this country the name of *booths*—a word of uncertain origin, traced by some to the Gaelic *both* or *bothag*, a bothy or hut; by others, with more probability, to the Greek *apotheke*, the Latin *apotheca*, the Italian *boteca* and *pothecca*, and the French *boutique*—all signifying an office, place of business, shop, store-house, or tavern. From this, its primary sense, in which it is still in use, B. gradually came to mean a fixed shop or warehouse. As towns sprang up, the yearly fair was more or less supplanted by the weekly market. The slight B. which was set up in the same spot every week, had an irresistible tendency to become substantial and permanent; and the records of the 12th and some following centuries are full of unavailing complaints against the encroachments which were in this way made upon the market-places and streets. Thus, Joceline of Brakelond chronicles the ineffectual efforts of his great and wealthy abbey, in 1192, to dislodge the burgesses of Bury St Edmunds from the shops, sheds, and stalls which they had erected on the market-place without leave of the monks. So in the Winton *Domesday Book*, compiled in 1148, notice is taken of ‘houses’ in Winchester which had been ‘stalls.’ So, also, Stow relates that the houses

MERCHANTS' BOOTHES:  
From an illuminated MS. representing Venice in the  
14th century.

in Old Fish Street, in London, ‘were at the first but movable boards set out on market-days to shew their fish there to be sold; but procuring licence to set up sheds, they grew to shops, and by little and little, to tall houses.’ So, again, the same chronicler tells us that ‘in Cheapside, from the great conduit west, were many fair and large houses, which houses in former times were but sheds or shops, with solars (that is, lofts or upper chambers) over them.’ So in Edinburgh the range called at first ‘the Boothraw,’ and afterwards ‘the Luckenbooths,’ arose in the very centre of the High Street. So, likewise, in Edinburgh and elsewhere, the trader who for years had spread his stall under the shelter of the same

buttress of the church or town-hall, began to rest a fixed wooden B. against it, gradually transforming the timber beams into lath and plaster, or even into brick or stone, until at length the basement of the stately cathedral, or *hôtel de ville*, was incrusted all over with unseemly little booths (or *krames*, as they were called in Scotland), like limpets on a rock. The B. which thus arose had often but one apartment, which opened on the street by a narrow door, and a broad unglazed window, closed at night by a wooden shutter, dividing in the middle, and hinged at top and bottom, so that the upper half formed a sort of awning, while the lower half served as a table for the display of the trader’s wares. It was at this window that business was conducted, the trader standing within, the buyer without. Occasionally a flight of steps led down to a cellar under the B., which served as a store-room. In other cases, a chamber behind was the warehouse of the merchant’s B., or the workshop of the craftsman’s B., or the sleeping-place of either. As civilisation advanced, a ‘solar’ or chamber was raised above the B. for the dwelling-house of the trader, occasionally with a store-room in the roof, to which goods were hoisted by a crane. There is mention of a goldsmith’s B., with a ‘solar’ above it, at Perth, about 1220. Traces of the middle-age B. still remain in France, some of them believed to be of the 12th century.

**BOOTH, UNLICENSED**, are, by the law of England, public nuisances, and may, upon indictment, be suppressed, and the keepers of them fined. But by the 6 and 7 Vict. c. 68, s. 23, theatrical representations in booths or shows at fairs, feasts, or customary meetings of the like kind, when allowed by the justice of the peace of the district, or other local authorities, are lawful. See THEATRES, LAWS AS TO.

**BOOTH, BARTON**, a celebrated actor of the 18th c., was born in 1681, his father being nearly related to Henry Booth, Earl of Warrington. Having received a good education at Westminster, he was sent at the age of 17 to Cambridge University, from which he ran away to join a company of strolling-players, who were shortly after dispersed by the law. B. next performed at Bartholomew Fair with such success that Betterton would have engaged him for Drury Lane had he not been afraid of offending his family by doing so. After a successful engagement in Dublin, he returned to London, and was now engaged at Drury Lane, where he appeared in 1701, and made a great ‘sensation.’ He became quite the rage among the nobility, who vied with each other in placing their carriages at his disposal; and he frequently stayed overnight at Windsor, where the court was then held. His greatest character was the ghost in *Hamlet*, in which he is said never to have had an equal; and his Othello, according to Cibber, was also a very masterly performance. He died May 10, 1733.

**BOOTHAU'K**, a fortified pass of Afghanistan, 12 miles to the east of Cabul. It runs for 5 miles between cliffs 500 feet high, and is in some places only 50 yards wide.

**BOOTHIA FELIX**, a peninsula forming the most northerly part of the American continent. Towards the south, it is terminated by an isthmus, while, to the north, it is bounded by Bellot Strait (q.v.). It was discovered by Sir John Ross during the most famous of his voyages, and named after his friend Sir Felix Booth, being supposed at the time to reach as far north as Barrow Strait.

**BOOTHIA GULF** separates Boothia Felix on the west from Cockburn Island on the east, and

is, in fact, a continuation of Prince Regent's Inlet towards the south.

BOOTON, an island of the Malay Archipelago, separated by a strait of the same name from the south-east end of Celebes. It is in lat. 5° S., and long. 123° E. In size, character, and productions, it generally resembles Booro (q. v.). It is frequented by the Dutch, who used at one time to send an officer to destroy the clove-trees, as interfering with their monopoly in cloves.

BOOTS, which are only a lengthened variety of shoes, are among the most ancient articles of attire. Shoes, extended a certain height up the leg, laced, ornamented, and of fanciful colours, were in use by the ancient Egyptians, Greeks, and Romans, as is seen by existing relics and drawings. Leaving an account of these and other varieties of shoes, as well as an account of the trade and manufacture of shoes and boots generally, to the article SHOE-TRADE, we here confine attention to a few historical particulars respecting what are properly called B., meaning by the term leather coverings for the legs and feet. Different kinds of half-boots were worn by the Anglo-Saxons and Anglo-Normans; and in the reign of Edward IV., if not earlier, the boot-proper, with tops and spurs, was established as an article of knightly dress. (See *Book of the Feet*, by J. Sparkes Hall, London.)

In the reign of Charles I., a species of boot, exceedingly wide at the top, made of Spanish leather, came into use; and with Charles II. the highly decorated French boot was introduced as an article of gay courtly attire. Meanwhile, the jack-boot, as it is called (see JACK), had become indispensable in the costume of cavalry soldiers and horsemen generally; and by William III. and his followers it was regularly naturalised in England. Strongly made, the jack-boot extended in length above the knee, was capacious at top, had a very high heel, and round the ankle it had a flat leather band bearing a powerful spur. In the adjoining cut is offered a representation of this highly characteristic boot, which we readily associate with the civil and foreign wars that distracted the 17th century. This huge species of boot remained in use in British cavalry regiments until comparatively recent times, and was dismissed as being too cumbersome in the case of men being dismounted. It is, nevertheless, in a somewhat polished and improved form, still worn by the Horse-guards, with whose stalwart appearance, doing duty in their tall B. at Whitehall, most people are familiar.

As an improved jack, the Horse-guards boot bears a remarkably close resemblance to the boot of the French postilion, well known to the older class of continental tourists. French postilion B., however, it is proper to understand, are made of that capacity that will suit any ordinary foot and leg. Kept economically as part of the equipment of a posting-house, they are ready for all legs, with or without stockings, as the case may be; and looking at the strength of their materials, they may very fairly be supposed to accommodate all the post-boys of an establishment during half a century.

The jack-boot is almost entitled to be called the parent of the top and some other varieties. B. with tops of a yellow colour were so commonly worn by gentlemen in the 18th c., as to become a peculiarity in the national costume of the English. When Philip, Duke of Orleans, and other revolutionists of note, affected to imitate the sentiments and manners of the English, they ostentatiously wore top-boots. In the early years of the present century, a number

of members of the House of Commons, among whom may be specified the late Sir Francis Burdett, habitually wore top-boots; nor have they yet entirely disappeared. By jockeys and riders generally, they are likely to remain in permanent use. What perhaps contributed to break up the general use of top-boots, was the introduction of the Hessian boot as an article of walking-dress. Worn over tight pantaloons, the Hessian boot was a handsome piece of attire, giving, undoubtedly, an elegant appearance to the nether costume. A representation of a Hessian boot, with its tassel, is annexed. B. of this shape, as is seen by engravings, were worn by English general officers in the early part of the French war, and somewhat later. At length they were superseded by the well-known Wellington boot, which, as its name imports, was introduced by the great Duke, as a simplification, under the loose military trouser. This species of boot has, in its turn, been almost entirely abandoned in England, in consequence of the universal use of short ankle B.; but it is still generally used by some classes of persons in the United States, though in an odd fashion, with the trousers stuffed loosely in at the top.

Hessian Boot.

BOOTY is the victors' share in property captured from the vanquished. It is generally a military term, the word *prize* being more frequently used in the navy. The regulations concerning B. in the British army were collected and consolidated in 1831, and have only been slightly altered since. All military B. is apportioned as the sovereign from time to time may direct. Deserters, and those who do not claim their share within six years, receive none. The officers appoint two B. or prize agents, by letters of attorney; the field-officers naming one, and the subordinate officers another. The officer commanding the successful expedition sends to the military authorities a list of the persons entitled to booty. The agents collect the property, convert it into money at the best advantage, and hand over the proceeds to the authorities, receiving a small percentage for their trouble. A scale of distribution is then made out, and the money is paid after a certain interval. When an army and a fleet join in a capture, the Admiralty calculates the army share, and sends the amount to the military authorities. Prize and B. originally belonged to the sovereign, and are only distributed to the captors as an act of grace; for, if the sovereign pleases, the property can be given back again to the enemy. See further, under PRIZE.

BOPP, FRANZ, Ordinary Professor of Oriental Languages at Berlin, was born at Mainz, on the 14th September 1791. Devoting himself exclusively to the study of oriental literature, he spent some years in Paris, where he was encouraged in his labours by Chezy, Silvestre de Sacy, and August Wilhelm Schlegel, and afterwards visited London, to prosecute his favourite studies more thoroughly, being partly supported by a small pension from the king of Bavaria. His first publication was on the Sanscrit verb; he afterwards produced a Sanscrit grammar, a *Glossarium Sanscritum*, and editions of several fragments of the great Indian epic, the *Mahabharata*, in the original text, with a translation. He helped much to facilitate the study of Sanscrit in Europe. But his most important labours centred in the analysis of the grammatical forms of the different languages of the Indo-Germanic family, by which he may be said to have founded a new science of Comparative

Grammar. His great work in this department is a Comparative Grammar of the Sanscrit, Zend, Greek, Latin, Lithuanian, Old Slavonian, Gothic, and German (*Vergleichende Grammatik*, &c., Berl. 1833, &c.; a second edition, entirely recast, was published in 1857). An English translation by Lieutenant Eastwick, and conducted through the press by Mr Wilson, Boden professor of Sanscrit in Oxford University, was published in 3 vols. 1845—1850. In recognition of his splendid services to philology, he was, in 1842, made a knight of the newly erected French *Ordre du Mérite*, and in 1857, foreign associate of the French Institute. He died in 1867.

**BOPPARD**, or **BOPPART** (ancient *Baudobriga*), a walled town of Rhineish Prussia, situated on the left bank of the Rhine, about 9 miles south of Coblenz. B. is a busy manufacturing place, with dirty, narrow streets, and its houses are chiefly of wood. Its appearance, however, is picturesque, and it has several buildings, architecturally remarkable. The church of the Carmelites contains some fine specimens of 16th c. sculpture. During the middle ages, B. was an imperial city, and many councils were held in it. Remains of the Roman fortress built by Drusus still exist in the centre of the town. Pop. about 4500.

**BORA**, KATHARINA VON, or CATHARINE DE BORA, the wife of Luther, was born, it is supposed, at Löben, near Schweinitz, in Saxony, on 29th January 1499. At a very early age, she entered the Cistercian convent of Nimptschen, near Grimma. Becoming acquainted with Luther's doctrines, she found herself very unhappy in her monastic life; and finally, along with eight other nuns, whose relatives, like her own, refused to listen to them, she applied for assistance to Luther. Luther obtained the services of Leonhard Koppe, a citizen of Torgau, and by him and a few associates the nine nuns were liberated from the convent in April 1523. They were brought to Wittenberg, where Luther had suitably provided for their reception. Catharine became an inmate in the house of the burgomaster Reichenbach. Luther, through his friend, Nicholas von Amsdorf, minister in Wittenberg, offered her the hand of Doctor Kaspar Glaz, who became pastor in Orlamünde. She declined this proposal, but declared herself ready to marry Von Amsdorf, or Luther himself, who had already laid aside his monastic dress. Her marriage with Luther took place on 13th June 1525, and was made the occasion of much unjust reproach by his enemies, which has not ceased to be repeated to this day. In his will, he left her all that he had, so long as she should remain a widow, because, as he says, she had always been an affectionate and true wife to him. After Luther's death, the Elector of Saxony and Christian III. of Denmark contributed from time to time to her support. She died at Torgau on 20th December 1552.

**BORA'CIC ACID** is found native (1) in the steam or vapour which rises from certain volcanic rocks in Tuscany, and (2) as a saline incrustation in the crater of a mountain in the island Volcano, which is situated 12 miles north of Sicily. This crater is about 700 feet deep, the sides lined with a crust of B. A. about half an inch thick, and is sufficient to yield an annual supply of 2000 tons. B. A. also occurs in combination in Borax (q. v.), Datholite (q. v.), Boracite, and other minerals, and to a very minute extent in trap rocks generally. The Tuscan supply of B. A. may be regarded as the most important, and its collection takes place over an area of about 30 miles. The plan pursued is to form a series of caldrons—100 to 1000 feet in diameter, and 7 to 20 feet deep—partly by excavation, and partly

by building, in the side of the volcanic mountain where the steam and B. A. vapours are issuing from fissures, and divert the course of a mountain stream, so that at pleasure the caldrons, or *lagoons*, may be supplied with water. As the volcanic vapours—called *suffioni*—gurgle through the water contained in the lagoons, the B. A. is arrested by the water, which becomes impregnated with it. The liquid is passed from one lagoon to another, then on to settling vats and flat-bottomed evaporating pans, till it becomes so concentrated that on cooling, impure crystals of B. A. separate. In this condition it is sent to England and other countries. The appearance of the surface of the ground, from which thousands of jets of steam are constantly issuing, is very striking; and the name given to one of the principal mountains, *Monte Cerboli* (*Mons Cerberi*), denotes the feeling of awe with which the peasantry regarded the district as the entrance to the lower regions. Native B. A. is employed as a source of borax (q. v.), and contains about three-fourths of its weight of true B. A., accompanied by one-fourth of water and impurities. In a pure condition, B. A. may be prepared by dissolving 40 parts of borax ( $\text{Na}_2\text{BO}_3$ ) in 100 of water, and acting thereon by 25 parts of hydrochloric acid ( $\text{HCl}$ ), which removes the soda, forming chloride of sodium ( $\text{NaCl}$ ) and water ( $\text{HO}$ ), and on cooling the mixture, the B. A. ( $\text{BO}_3$ ) crystallises out. On re-solution in water and re-crystallisation, it is obtained in pure white feathery crystals. B. A. is used in the arts as a flux, as an ingredient in the glaze employed in pottery; and the wicks of stearine and composite candles are treated with it, so that when the candle is burning, the end of the wick when it gets long, may fuse and fall to the side, where it can be burned away. The exportation of B. A. from the Tuscan lagoons exceeds 3,000,000 lbs. annually.

**BORAGE** (*Bordgo*), a genus of plants of the

Borage (*B. officinalis*):  
a, flowering branch; b, the cone of stamens, &c.

natural order *Boraginæ* (q. v.), having a wheel-shaped corolla, the mouth of which is closed with five teeth, and forked filaments, of which the inner arm bears the anther, the anthers connivent around

the style, in the form of a cone. The species are few, chiefly natives of the countries around the Mediterranean Sea. The COMMON BORAGE (*B. officinalis*) is found in waste places in many parts of Europe, and is pretty frequent—perhaps naturalised—in Britain. It is a plant of rather coarse appearance, with a stout erect herbaceous stem, 1—2 feet high, somewhat branched; the lower leaves elliptical, obtuse, tapering to the base; the stem, leaves, flower-stalks, and calyx rough with hairs. The flowers are more than half an inch broad, of a beautiful blue colour. *B.* was formerly much cultivated and highly esteemed, being reckoned amongst the *cordial* flowers, and supposed to possess exhilarating qualities, for which it no longer receives credit. The belief in its virtues was at one time extremely prevalent in England, and its use accordingly universal. The flowers were put into salads, Gerard tells us (1697), ‘to make the mind glad;’ and he adds: ‘There be also many things made of them, used everywhere for the comfort of the heart, for the driving away of sorrow, and increasing the joy of the mind.’ Like some other plants of the same order, *B.* contains nitrate of potash (nitre), and is slightly febrifuge. It is mucilaginous and emollient, and has been used in pectoral affections: its leaves impart a coolness to beverages in which they are steeped; and with wine, water, lemon, and sugar, enter into the composition of an English drink called a *cold tankard*. The young leaves and tender tops are pickled, and occasionally boiled for the table.

BORAGINÆ, or BORAGINÆCEÆ, a natural order of dicotyledonous plants, consisting chiefly of herbaceous plants, but also containing shrubs and even trees, the leaves generally rough with hairs which proceed from a thick hard base, and the whole plant mucilaginous and emollient. The leaves are alternate and without stipules. The flowers are in spikes, racemes, or panicles which are almost always coiled up, and gradually uncoil and elongate themselves, the flowers expanding in succession. The calyx is 4—5-partite, and remains till the fruit is ripe; the corolla is generally regular, 4—5-cleft, imbricated in bud; the stamens rise from the corolla, and are equal in number to its divisions—generally five—and alternate with them. The ovary is 4-partite, 4-celled; the style simple, arising from the base of the lobes of the ovary. The fruit consists of 4—or sometimes of 2—distinct achenia. See ACHENIUM.—The order *Ehretiaceæ* of some botanists differs chiefly in the fruit, which in the more typical species is a succulent drupe; and in the *Heliotropes* consists of four dry achenia more or less consolidated.—There are about 600 known species of the proper *Boragineæ*, and about 300 of *Ehretiaceæ*. The former are natives principally of temperate climates, and are particularly abundant in the south of Europe and in the temperate parts of Asia; the latter are more tropical, but not exclusively so. BORAGE (q. v.), ALKANET (q. v.), CONFREY (q. v.), and FORGET-ME-NOT (q. v.), are familiar examples of the former; the exquisitely fragrant HELIOTROPE (q. v.) is the best known of the latter. The drupes of some species of *Ehretiæ* are eatable.

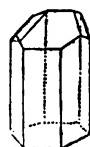

BORA'SSUS. See PALMYRA PALM.

BORAX, or BIBORATE OF SODA, is found native as a saline incrustation on the shores of certain lakes in Persia and Tibet. It also occurs in India, China, Ceylon, Saxony, and South America. When collected on the banks of the lakes, it is impure, and goes by the name of *tincal*. The latter is purified by acting upon it with a solution of caustic soda, which removes the fatty matter that the

crystals are coated with, to prevent evaporation of the water they contain, and thereafter dissolving in hot water and recrystallising. *B.* is likewise prepared from boracic acid ( $\text{BO}_3$ ), (q. v.), by solution in boiling water, and the addition of a boiling solution of ordinary carbonate of soda ( $\text{NaOCCO}_3$ ), when  $\text{B}(\text{NaO}_2\text{BO}_3)$  is formed, and carbonic acid ( $\text{CO}_2$ ) is disengaged, and on cooling in wooden tanks lined with lead, the crystals of *B.* separate. The common crystalline variety of *B.* contains 10 equivalents of water ( $\text{NaO}_2\text{BO}_3 + 10\text{H}_2\text{O}$ ); but if a stronger than ordinary solution be allowed to cool, crystals begin to separate at a higher temperature than usual, which contain only 5 atoms of water ( $\text{NaO}_2\text{BO}_3 + 5\text{H}_2\text{O}$ ). *B.* is soluble in water to the extent of one part of the salt in two parts of hot water, and in twelve of cold, yielding a clear solution with a sweetish taste. It is readily reduced to powder, and is then known as *powdered borax*. It is of great use in the chemical arts. As an assistant agent in experimenting with the blow-pipe (q. v.), *B.* is of great service, from the readiness with which it forms coloured glasses with the various metallic oxides. It is also employed in the manufacture of enamel, and for glazing or coating vessels in English pottery, as also in the formation of the paste for artificial gems. To the metallurgist, it is an aid in the readiness with which it promotes the fusion of metallic mixtures, and the separation of the metals; and to the solderer of all metals it is of service in forming a thin glassy coating over the edges of the metals, which prevents their oxidation at the time they are being joined together. *B.* is also used in dyeing.

BORDA, JEAN CHARLES, an eminent practical mathematician and astronomer, was born on 4th May 1733 at Dax, in the department of the Landes, in France. In 1771, he was associated with Verdun and Pingré in proving the accuracy of chronometers. He also devoted much attention to the subject of ship-building, and suggested great improvements in the form of vessels. In 1787 he took an active part in bringing the observatories of Paris and Greenwich into closer relations with one another. Along with Delambre and Méchain, he was a leading member of the French commission intrusted with the measurement of a meridian arc. He rendered essential service in the commission on the new system of weights and measures. He invented a new instrument for measuring the inclination of the magnetic needle; and his corrections of the seconds pendulum are still in use. But his reputation depends most of all on his improvement of the reflecting circle, on which instrument he published a work in two volumes (Par. 1787). He died at Paris on the 20th February 1799.

BORDEAUX, an important seaport town of France, chief town in the province of Gironde, beautifully situated in a plain on the left bank of the Garonne, about 60 miles from its mouth in the Atlantic. Ships of more than 1000 tons burthen can easily ascend the river at high-water to *B.*, which is accessible at all times to vessels of 600 tons. Its harbour is very capacious; and, by the Garonne, its commerce very extensive. The river is crossed by a noble bridge of 17 arches and 532 yards in length, erected by the elder Deschamps in 1811—1821. The old town, consisting partly of high wooden houses of the 15th c., has narrow crooked streets; but the newer parts of the city and the suburbs have wide streets, fine squares, and pleasant promenades lined with trees. The cathedral, which was consecrated in 1096, is remarkable for its beautiful towers. The church

Crystal of Borax.

## BORDELAIS—BORDER.

of St Croix is a building of the 10th c.; that of St Seurin is also very old, and has rare Gothic ornaments. The former archiepiscopal palace is now the town-hall. The Great Theatre is one of the largest and finest buildings of its kind in France. B. has many other fine public buildings, and learned associations, and educational and benevolent institutions, with a public library of upwards of 120,000 volumes. The university, founded by Pope Eugenius IV. in 1441, has been, since 1839, an *Académie Universitaire*, with fifteen professorships. Pop. in 1872, 182,727.

Among the principal branches of industry are the production or preparation of sugar, brandy, liqueurs, vinegar, nitric acid, printed calicoes, woollen goods, carpets, hats, paper, earthenware, glass bottles, metallic wires, madder, and resinous articles. The rope-works, cooperages, and dock-yards are extensive and full of activity. The Canal du Midi, connecting B. with the Mediterranean, enables it to supply the whole south of France with the colonial produce which it imports; and also with English tin, lead, copper, coal, dye-stuffs, herrings, &c. Wine, brandy, vinegar, dried fruits, hams, turpentine, and glass bottles are among its principal exports.

Except the wines of Champagne, no French wines are so much exported to foreign countries as those grown in the district of B., and known as *BORDEAUX WINES*. Some of them are red (known in England as *Claret*), others white. Of the red wines, the Medoc is one of the best known. The red wines produced by the vineyards of Lafitte, Latour, Chateau-Margaux, and Haut-Brou, are particularly celebrated for their quality. The white wines of Graves, and those of Sauternes, Barsac, Preignac, and Langon are in highest repute.

In former times, B. was called *Burdigala*, and was the capital of the *Bituriges Vivisci*. It was a very prosperous town in the times of the Romans, was made by Hadrian the capital of Aquitania Secunda, and was both the principal emporium of the south-west of Gaul, and the seat of its best educational institutions. It was taken by Charles Martel in 735; but was again spoiled by Norman plunderers in the 9th century. It became the capital of the duchy of Guienne; and in 1152 passed, by the marriage of Eleanor of Guienne with Henry of Normandy (afterwards Henry II. of England), under the dominion of England. B. was for a considerable time the seat of the splendid court of Edward the Black Prince. During the Revolution, B. was the principal seat of the Girondists, and suffered fearfully at the hands of the Terrorists. Its inhabitants, disaffected to Napoleon's government, were the first to declare for the Bourbons in 1814. During the Franco-Prussian war, a delegation of the Government of National Defence, retreating before the advancing German army, stationed itself, December 1870, at B.; and the first sittings of the National Assembly in 1871 were held there. Since the restoration of peace, the export-trade of B. has increased greatly. In wine, there was an increase, between 1859 and 1871, of 124 per cent. in the quantity, and 73 per cent. in the value—arising from the amount of cheap wine shipped from the port during the two previous years. About one-sixth of the total export of this article goes to the British dominions.

**BORDELAIS**, a district of France, once forming part of the old province of Guienne, and having Bordeaux for its capital, but now included in the departments of Gironde and Landes.

**BORDER**, THE, is a term employed in historical as well as popular phraseology to signify the

common frontier of England and Scotland. At present, the dividing boundary of the two countries consists partly of natural and partly of imaginary outlines. It is customary to speak of Scotland as a country 'north of the Tweed,' but the Tweed is the boundary only in a small part of its course, on the east, and large portions of several Scottish counties lie to the south of that river. Even at its mouth, the Tweed is not the division; for north of the river at its estuary lies the ancient town of Berwick, with the district known as its 'bounds,' which belong to England. The Tweed forms the division only for about 16 to 18 miles. Leaving the river at Carham Burn, a few miles above Coldstream, the line proceeds towards the Cheviot mountains, the ridge of which is the boundary for about 25 miles; descending thence, the line strikes on Kerhope Water, a tributary of the Esk. That river is the boundary for a number of miles to a point above Longtown. The line now quits the Esk abruptly in a northern direction, and taking into England part of what was known as the 'Debatable Land' (q. v.), strikes on the small river Sark, which is the boundary to the Solway Firth, the great natural division on the west. Such, in general terms, is the entire boundary, extending from sea to sea for about 100 miles, in which length the Tweed obviously plays an inferior part. The counties lying on the English side of the border are Northumberland and Cumberland; on the Scottish side, Berwickshire, Roxburghshire, and Dumfries-shire. Readers of history are aware that the division here indicated is comparatively modern; in former times, the frontier shifted according to the surging tide of war or diplomacy. For several ages prior to the 11th c., the kingdom of Northumbria, forming a part of what we now call England, included all that portion of Scotland south of the Firth of Forth as far west as Stirling. As a result of some warlike operations, this district was ceded by the Earl of Northumberland to Malcolm II., king of Scots, 1018, and ever since the Tweed, in its lower part, has been the boundary. What, however, was gained by Scotland on the east was lost on the west; for William the Conqueror wrenched Cumberland from the northern sovereign; and with little intermission the boundary in this quarter was settled according to its present limits.

It may be said that from the 11th till the end of the 17th c., there was almost constant disturbance on the border. Ruthless wars on a great scale between English and Scots sometimes caused the most frightful devastation, and became the source of lasting ill-will on both sides. History abounds in events of this kind, and the feuds and forays of clans and families are commemorated in a series of ballads, for ever embalmed in the *Minstrelsy of the Scottish Border*, by Sir Walter Scott. The most notable of these forays from the Scottish side is narrated in the ballad of the *Battle of Otterburne*, or, as it is sometimes called, *Chevy Chase*. The event referred to occurred in 1388. Among the latest of the regular invasions from England was that in 1543, in the reign of Henry VIII., conducted by the Earl of Hertford. The invasion was by the eastern marches, and in their devastating course, the English army set fire to and destroyed all the towns, villages, monasteries, and numerous castles within a wide range of country. At an early date, wardens and commissioners had been appointed to repress petty insurrections, and punish the moss-troopers who made cattle-lifting from their neighbours on the opposite side of the border a kind of profession. For these measures of police, the border was divided into three parts—the east, middle, and western marches. Such

## BORDER—BORDER-WARRANT.

was the lawlessness in the early part of the 16th c., that in 1511, Sir Robert Kerr, warden of the eastern marches, was slain at a border meeting by three Englishmen. The principal murderer escaped as far as York, and for a time tried to conceal himself; but he was sought out by two of Sir Robert's followers, who brought his head to their new master, by whom, in memorial of their vengeance, it was exposed at the cross of Edinburgh (Scott's *Essay on Border Antiquities*). Sometimes the Scottish borderers met ostensibly to amuse themselves with the ancient sport of football, but in reality to plan and execute daring military exploits. During the reigns of Elizabeth and James VI, strenuous efforts were made to preserve peace on the border, and this was attained only by extraordinary severities. Many of the more audacious reivers were hanged, and great numbers were banished. Some account of the measures adopted at this period to suppress border outrages will be found in the *Memoirs of Sir Robert Cary*, who long acted as English warden on the marches; also in the *Domestic Annals of Scotland*, by R. Chambers, vol. i. After the accession of James to the English throne, a sweeping clearance of the Scottish border was effected. The laird of Buccleuch collected under his banners the most desperate of the border marauders, whom he formed into a legion for the service of the states of Holland. At the same time, the Debatable Land was cleared of the Græmes, a daring sept of freebooters, who were transported to Ireland, and their return prohibited under pain of death. The legislative union of 1707, and the firm administration of justice, along with a general improvement in manners, finally terminated the long course of misrule.

In the present day, there is nothing to distinguish the border from other districts of the country, unless it be the prevalence of picturesque ruins of old castles, generally roofless, but, from the vast thickness and strength of the walls, still in a good state of preservation. The border strengths were of three kinds—regular fortresses, large baronial castles, and the lesser kind of towers. On the east, the English owned the fortified town of Berwick, and at no great distance Newcastle-on-Tyne; and on the west, Carlisle. The chief Scottish border fortresses were the royal castles of Roxburgh, Jedburgh, and Lochmaben; and we might almost include Edinburgh Castle, for it is only 60 miles distant. Among the baronial castles on the English side were numbered Norham, Alnwick, Bamborough, Naworth, Brougham, Penrith, and Cockermouth. Among the Scottish fortlets of the baronial class may be mentioned Newark, Hermitage, and Caerlaverock. The smaller kind of towers on both sides of the frontier appear to have been exceedingly numerous, and it is their remains that form the more conspicuous memorials of old border strife. These buildings consist of a single square tower, usually of three floors; the lower vaulted, for the reception of cattle; while the two upper, consisting of but one small apartment each, with narrow slit-hole windows, comprised the accommodation for the family. It is conjectured, however, that retainers lived in thatched huts outside, which are now obliterated, and were brought into the tower, along with the cattle, only in the case of an anticipated attack. These towers, known as bastel-houses or peels, once the residences of a warlike yeomanry, are thickly studded over the south of Scotland, more particularly along the vale of the Tweed; and by the lighting of beacons on their summits, the whole country between the border and the Forth could be speedily summoned to arms. On the English side, there are similar towers, such as those of Thirlwall, Fenwick,

and Widdrington. The English border castles of every kind appear to have been of greater splendour and strength than those on the Scottish side. 'Raby Castle, still inhabited, attests the magnificence of the great Nevilles, Earls of Westmoreland; and the lowering strength of Naworth shews the power of the Dacres' (Scott). On the English side, however, there is nothing which can be compared to the ruins of that remarkable group of Scottish border abbeys—Melrose, Dryburgh, Kelso, and Jedburgh, not to speak of the remains of various other religious houses. For an account of these and other architectural remains on the border, we must refer to the *Border Antiquities of England and Scotland*, by Sir Walter Scott, 2 vols. folio, illustrated with plates; also to Billings's *Baronial and Ecclesiastical Antiquities of Scotland*, 4 vols. 4to, illustrated with plates.

Assimilated in habits to the rest of the population, the old Scottish border families are still distinguishable by their surnames—as, for example, the Maxwells, Johnstons, and Jardines on the west, and the Elliots, Armstrongs, Scotts, and Kerrs on the middle and eastern marches. The principal Scottish border families of rank are the Scotts, Dukes of Buccleuch, descendants of a famed border chief, Sir Walter Scott of Buccleuch; and the Kerrs, Dukes of Roxburgh, who are sprung from an equally celebrated borderer, Sir Robert Kerr of Cessford. The possessions of both families are extensive, particularly those of Buccleuch (q. v.), which spread through several counties. The family of corresponding rank within the English border is that of the Percies, Dukes of Northumberland. Local intercourse across the border is considerably obstructed by the long range of hills and the moors which generally lie on the line of boundary; and the circumstance of the peculiar civil and ecclesiastical institutions of the two kingdoms shedding off here towards different centres, still further tends to lessen community of feeling. At no distant day, certain exciseable articles were charged with a less duty in Scotland than England, and the consequence was an active contraband trade on the border, chiefly by the mountain-passes and the Solway. Now, these duties are assimilated, and this demoralising kind of traffic has disappeared. The great channels of communication across the border are two lines of railway, one by way of Berwick, and the other by Carlisle. There are also good roads in various directions for those who wish to explore this interesting district of country. Besides the books relative to the border already referred to, there are some works of local note, among which the most comprehensive is Richardson's *Borderer's Table-book*, 8 vols. royal 8vo (Newcastle-on-Tyne); we may also refer to Jeffrey's *History and Antiquities of Roxburghshire*, 3 vols.; and Ridpath's *Border History*, 1 vol. 4to. W.C.

**BORDER-WARRANT**, in the law of Scotland, is a warrant issued by the judge ordinary—that is, by the sheriff or county court judge, or by magistrates of royal burghs within the royalty, or by justices of the peace—on the borders between Scotland and England, on the petition of a creditor who desired to arrest the person or effects of a debtor residing on the English side, and to detain him until he finds bail for his appearance in, and abiding the result of, any action which may be brought for the debt within six months. The creditor must swear to the truth of the debt, and before resorting to imprisonment of the debtor, it is proper to examine him as to his domicile, or usual residence, and occupation. These warrants are in use in the counties of Dumfries, Roxburgh, and Berwick. They are more used in the country districts than

in the burghs, though not frequently even in the country districts. In Dumfriesshire and Berwickshire, border-warrants are granted exclusively for arresting the persons of alleged debtors. In Roxburghshire—with the exception of the courts of the justices of the peace in Kelso and Melrose districts, which follow the practice of the two first-named counties—the warrants are granted for the purpose of arresting both the debtor's person and goods. In the stewartry of Kirkcudbright, and in Wigtonshire, they are unknown.

In English practice, the warrant to arrest an absconding debtor, which includes any foreigner who may be in England on business or pleasure, is very similar. See ARRESTMENT FOR FOUNDING JURISDICTION; DEBTORS, ABSCONDING; FOREIGN ATTACHMENT; JURISDICTION.

BORDURE, or BORDER, in Heraldry. Coats of arms are frequently surrounded with a B., the object of which is generally to shew that the bearer is a cadet of the house whose arms he carries. The character of the B. often has reference to the profession of the bearer: thus, a B. embattled, is granted to a soldier; and a B. ermine, to a lawyer.

BORE is a tidal phenomenon at the estuaries of certain rivers. When a river expands gradually towards a very wide mouth, and is subject to high tides, the spring flood-tide drives an immense volume of water from the sea into the river; the water accumulates in the estuary more rapidly than it can flow up into the river; and thus there is gradually formed a kind of watery ridge stretching across the estuary, and rushing up towards the river with great violence. In some cases, this ridge, or B., is many feet in height, and contends against the descending stream with frightful noise. This phenomenon is observable in several British rivers, as the Severn, Trent, Wye, and Solway. The most celebrated bores are those of the Ganges, Brahmaputra, and Indus: in the Hoogly branch of the Ganges, the B. travels 70 miles in 4 hours, and sometimes appears suddenly as a liquid wall 5 feet in height.

BORE is a name for the internal cavity of a cannon, mortar, howitzer, rifle, musket, fowling-piece, pistol, or other kind of firearm. It is in most cases cylindrical; but in the Lancaster gun the B. is oval; in the Whitworth gun, it is hexagonal; while in the Armstrong, and many other kinds of gun, it is furrowed by spiral grooves. Technically, the B. of a gun often means simply the diameter of the cavity, as when we speak of a gun 'of 8-inch bore,' and in that case its meaning is equivalent to 'calibre.'

The BORING of a cannon is a process which may best be described in connection with CANNON FOUNDING. It is desirable to mention in the present place, however, that there is an operation called 'boring-up' conducted at Woolwich Arsenal, for enlarging the bore of a gun. It has been found in recent years that many of the old cannon are thicker and heavier than needful for the size of shot propelled, and that they could be fitted for the discharge of larger shot without danger. A change was begun in the armament of the British fleet in 1839 by substituting heavier broadsides; and as one part of the process, many of the old 24-pounders were 'bored-up' to 32s; even some of the 18-pounders were found to be thick and strong enough to undergo this process. More than 2000 iron naval guns were thus treated at Woolwich preparatory to the change in 1839; and many others have since been similarly bored-up. About 1860, important experiments were carried on at Woolwich, to determine whether the old smooth-

bore iron guns could not only be bored-up, but rifled at the same time. There were 15,000 of such guns belonging to the British government, and it was suggested that they ought to be improved, instead of being cast aside as useless in the event of the success of the Armstrong and Whitworth guns. The process has not proved altogether satisfactory.

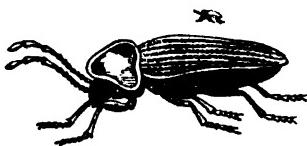

BO'REAS, the Greek name of the north-east wind, blowing towards Hellas from the Thracian mountains, and personified in mythology as the son of Astraeus and of Eos or Aurora, and the brother of Notus, Zephyrus, and Hesperus. B. was said to dwell in a cave of the Thracian Haemus, to which he carried Oreithyia, the daughter of the Athenian king Erechtheus, who bore him Zetes and Calais—employed as the symbols of swiftness—and Cleopatra, the wife of Phineus. According to Homeric fable, he begat, with the mares of Erichthonius, twelve horses of extraordinary fleetness. The rape of Oreithyia was represented on the ark of Cypelos, where B. instead of feet has the tails of serpents. He had a temple in Athens, because he destroyed the ships of the Persians under Xerxes; and at Megalopolis, a yearly festival was celebrated in his honour, because upon one occasion he helped the Megalopolitans against the Spartans.

BO'RECOLE. See KALE.

BORELLI, GIOVANNI ALFONSO, a distinguished mathematician and astronomer, and the founder of the iastro-mathematical school, born at Naples in 1608, was educated at Florence, and became professor of mathematics at Pisa, and afterwards at Messina. Having taken part in a revolt, he was obliged to leave Messina, and spent the remainder of his life at Rome, where he enjoyed the patronage of Queen Christina of Sweden, and where he died in 1679. He carefully observed the motions of the satellites of Jupiter, then little known, and seems to have been the first to discover the parabolic paths of comets. He made many valuable observations on a malignant fever in Sicily, and wrote a treatise on the causes of such fevers. He wrote also an account of an eruption of Etna, and a number of works on subjects of applied mathematics, of which the most celebrated is that *De Motu Animalium* (Rome, 1680—1681). In this work, he applies the laws of mechanics to the motions of animals, regarding the bones as levers, in which the power acts between the weight and the fulcrum, and endeavouring to calculate the power of muscles from a consideration of their fibrous structure, and the manner in which they are united to the tendons. All more recent authors on the same subject have been much indebted to Borelli.

BORER, a name common to many insects of the Linnean genus *Ptinus*, the tribe *Ptiniores* of Latreille, coleopterous (q. v.) insects of small size, the larva of which—small, white, soft, worm-like creatures, with six minute feet—are furnished with strong cutting jaws (*maxilla*), by means of which they eat their way in old wood, and similar substances, boring little holes as round as if made with a fine drill. Every one is familiar with the appearance of these holes, and with the injury done by these insects to furniture, &c. The holes are filled up, as the insect works its way onward, with a fine powder, formed from the wood which it has eaten; and finally it constructs for itself a little silky cocoon, and having passed through the pupa state in the bottom of its hole, comes forth a winged insect—a small beetle, in the widest popular sense of that term. One of the most common British species is *Anobium striatum*, a dark-brown insect, not much above one line in length. The thorax, as in the whole tribe, is proportionately very large,

and has a swollen hood-like appearance, the head being, as it were, received within it. This insect has long been noted for the pertinacity with which it

Borer (*Anobium striatum*),  
Natural size, and magnified.

simulates death. This instinct appears to be common to the whole tribe, as it is also to many other insects.—Another species of the same genus, *Anobium tessellatum*, has become an object of interest as one of the insects which, being sometimes heard to make a peculiar ticking noise, are connected with superstitious fancies and fears, and receive the name of Death-watch (q. v.).

**BORGHESE**, a family of great distinction in the republic of Siena, and afterwards at Rome. **CAMILLO** B. ascended the papal throne in 1605 as Paul V., and by him other members of the family were advanced to high positions. A marriage with the heiress of the family of Aldobrandini brought the B. family into the possession of great wealth. **CAMILLO FILIPPO LUDOVICO** B., Prince B., born at Rome in 1775, joined the French army when it invaded Italy; and in 1803 married Pauline, the sister of Napoleon Bonaparte, and widow of General Leclerc. His wife subsequently received the principality of Guastalla, and he was created Duke of Guastalla, and under the French Empire he was for some time governor-general of the provinces beyond the Alps. He held his court at Turin, and was very popular among the Piedmontese. He sold the B. collection of artistic treasures to Napoleon for 13,000,000 francs, receiving in part-payment the Piedmontese national domains; but when these were reclaimed by the king of Sardinia in 1815, he received back some of the works of ancient art. After the overthrow of Napoleon, he separated from his wife, and broke off all connection with the Bonaparte family. He lost Guastalla, but retained the principalities of Sulmona and Rossano, his hereditary possessions. He died in 1832.—The *Borghese Palace* is one of the most magnificent at Rome. The noble portico of the inner court is composed of 96 granite columns; the collection of paintings is remarkably fine.

**BORGHESI**, **BARTOLOMMEO**, COUNT, a distinguished antiquarian, born at Savignano, Central Italy, on the 11th July 1781. His father, Pietro Borghezi, who was one of the most accomplished scholars of his time, trained him to an early delight in learned pursuits. He studied at Bologna, and afterwards devoted himself to archaeological researches. He arranged the numismatic collection in Milan, and that of the Vatican, of which he drew up a catalogue. In reward for this work, he obtained from the pope exemption for himself and family from the observance of fasts. In 1821 he fixed his residence in the republic of San Marino. His principal work yet published is his *Nuovi Frammenti Dei Fasti Consolari Capitolini Illustrati* (2 vols., Milan, 1818–1820). His contributions to Forcellini's Latin Lexicon are very highly prized.

**BORGIA**, a family originally Spanish, but which acquired great eminence in Italy after the elevation of Alfonso Borgia to the popedom, as Calixtus III., in 1455. He had previously been a privy-councillor

of the king of Aragon. He died in 1458.—Rodrigo B. ascended the papal throne in August 1492, under the name of Alexander VI. (q. v.). Before his elevation to the popedom, he had a number of children by a Roman woman named Vanozza (Giulia Farnese), of whom two, Cesare and Lucrezia, share their father's extraordinary historic infamy.—**CESARE** or **CEZAR** B., was one of the greatest monsters of a time of depravity, when the court of Rome was the scene of all the worst forms of crime. He unscrupulously made use of the most sacred things as means to the most iniquitous ends. He had early received high ecclesiastical preferment, and his father, soon after becoming pope, invested him with the purple. But his father conferring upon his brother Giovanni the Duchy of Benevento, with the counties of Terracina and Pontecorvo, Caesar, as was believed, moved with envy, caused his brother to be assassinated. He obtained the duchy and counties for himself, and was permitted by his father to resign the purple and to devote himself to the profession of arms. He was sent in 1498 to France, to convey to Louis XII. a bull of divorce and dispensation from his marriage with Anne of Brittany. Louis rewarded him for the pope's complaisance with the Duchy of Valentinois, a body-guard of 100 men, 20,000 livres of yearly revenue, and a promise of support in his schemes of ambition. In 1499, Caesar married a daughter of the king of Navarre; and accompanied Louis XII. to Italy, where he undertook the conquest of the Romagna for the Holy See. The rightful lords of that country, who fell into his hands, were murdered, notwithstanding that their lives had been guaranteed by his oath. In 1501 he was named by his father, Duke of Romagna. In the same year, he wrested the principality of Piombino from Jacopo D'Appiano, but failed in an attempt to acquire Bologna and Florence. He took Camerino, and caused Giulio Di Varano, the lord of that town, to be strangled along with his two sons. By treachery as much as by violence he made himself master of the Duchy of Urbino. A league of Italian princes was formed to resist him, but he kept them in awe by a body of Swiss troops, till he succeeded in winning some of them over by advantageous offers, employed them against the others, and then treacherously murdered them on the day of the victory, 31st December 1502, at Sinigaglia. He now seized their possessions, and saw no obstacle in the way of his being made king of Romagna, of the March, and of Umbria, when, on 17th August 1503, his father died, probably of poison which he had prepared for twelve cardinals. Caesar, also, who was a party to the design (and who, like his father, had long been familiar with that mode of despatching those who stood in the way of his ambition, or whose wealth he desired to obtain), had himself partaken of the poison, and the consequence was a severe illness, exactly at a time when the utmost activity and presence of mind were requisite for his affairs. Enemies rose against him on all hands, and one of the most inveterate of them ascended the papal throne as Julius II. Caesar was arrested and conveyed to the Castle of Medina Del Campo, in Spain, where he lay imprisoned for two years. At length he contrived to make his escape to the king of Navarre, whom he accompanied in the war against Castile, and was killed on the 12th March 1507 by a missile from the Castle of Biano. With all his baseness and cruelty, B. was temperate and sober. He loved and patronised learning, and possessed in a remarkable degree a ready and persuasive eloquence. Macchiavelli has delineated his character in his *Principe*.—**LUCREZIA** B. was a woman of great beauty. She was married first to Giovanni Sforza, Lord of Pesaro, but forsook him, and lived in incestuous intercourse

with her two brothers and with her own father. She then married, in 1498, Alfonso, Duke of Biscaglia, a natural son of Alfonso II. of Naples; but he was assassinated by her brother Caesar in 1501. In September of the same year, she married Alfonso of Este, who afterwards inherited the Duchy of Ferrara. She died in 1520. Like her brother Caesar, she shrank from no crime; but she also was a patroness of art and learning, and upon this account homage was paid to her by Pietro Bembo and other poets of that time.

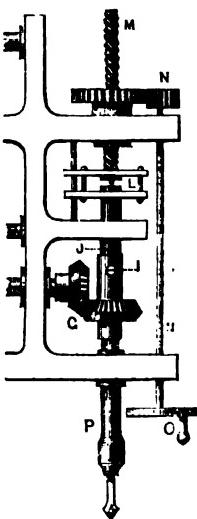

**BO'RGO**, a name given to a number of towns and villages in Italy and the Southern Tyrol, and indicating the growth of the town or village around a castle or castellated rock, the original Borgo. See **BOROUGH**. Thus, *B. di val Sugana* is a place of 3500 inhabitants, with a castellated hill, in the Tyrol; *B. Lavezzano* is an Italian town in the province of Novara, with about 3000 inhabitants; *B. San Donino*, in the province of Parma, with 10,000 inhabitants; *B. San Sepolcro*, in the province of Arezzo, with 8000 inhabitants, &c.

**BORING**, as a process in carpentry and in the working of metals, is performed in a variety of ways. For boring holes in wood the carpenter makes use of *awls*, which simply displace a portion of the wood, and of *gimlets*, *augers*, and bits of various kinds, these last being applied by means of the crank-shaped instrument called a *brace*. All these are too familiar to need description. The boring of holes in metal plates for making attachments, is effected by means of *drills* driven by machinery. The annexed figure shews the essential parts of such a boring machine. The drill is inserted in the end of a vertical spindle, P, which revolves in a fixed frame, and is driven by the bevel-wheels, G. The metal to be bored is placed on a table or other support below the drill; and the up and down motion, or

end-pressure and off-action, of the drill is effected by the hand-gear, O, N, turning the screw M; which being coupled to the top of the spindle at L, presses it down or raises it, according to the way it is turned. The spindle slides vertically in the collar forming the axis of the bevel wheel, but is carried round with it by means of the pin I, which projects into a groove seen at J.

The Boring of Cannon and of Cylinders for steam-engines is most conveniently described under **CANNON-FOUNDING**; see also **LATHE**.

**BORING**, applied to the earth and to rocks, has two chief uses. 1. *For Draining*.—In some districts, owing to the existence, near the surface, of a bed of clay impervious to water, the surface-water is retained in hollows, of greater or less extent. The expense of deep draining has been so great as to induce proprietors to neglect such land, but this expense has lately been avoided by leading drains to the lowest portion of the hollow, and then opening a bore through the clay to the pervious strata of sand or gravel beneath. This is done by a simple instrument, an auger of  $2\frac{1}{4}$  or  $3\frac{1}{4}$  inches in diameter, wrought by means of a cross-bar by one or two men.

Boring Machine.

2. *For Artesian wells, and for the discovery of the mineral contents of the earth*.—As the borings for these purposes are performed in the same manner, it is unnecessary to give them separate notices. The object in boring for Artesian wells is to open a passage for the escape of water from water-logged strata. See **ARTESIAN WELLS**. In the search for minerals, B. is had recourse to as a cheap method of discovering the mineral wealth of a district, and whether the quantity and quality of the contained minerals are such as to make the working remunerative. It should, however, never be undertaken without a previous geological survey of the locality; the neglect of this has caused an immense loss of time and money in futile searches for minerals, as in the innumerable cases of bores driven into Silurian and Old Red Sandstone strata, in search for coal. B. is also of use even after the presence of coal has been ascertained, to determine the most advantageous position for sinking the shaft by which the coal is to be drawn up. The general method of operating is as follows: The boring instrument consists of an iron shank, having a cross-bar at the top and a hollow screw at the bottom; to this all the successive B. instruments are fastened. A simple chisel is first attached to the screw, and one or two men press upon the cross-bar, and at the same time force it round like an auger; while another workman, by means of a lever erected overhead, with a chain descending from it to the cross-bar, gives an up and down motion to the instrument. When the chisel becomes clogged, from the accumulation of material which it has loosened, it is exchanged for a cylindrical auger, provided with a valve, which scoops out the separated material; and thus by alternate chopping and scooping the work is carried on. The nature of the strata is determined with considerable facility and certainty by examining the fragments brought up by the auger. As the work advances, successive lengths of rod are screwed on at the upper end. Three poles are erected over the well, for the purpose of elevating the rods, to permit the change of the tools.

The cost of B. varies with the material through which the operation is carried on. In strata of moderate hardness, the cost is about 10*s.* a fathom for the first 10 fathoms, and an additional 6*s.* for each 5 fathoms beyond.

A simple method of B. has been long in use among the Chinese, by which the great loss of time, arising from the screwing and unscrewing the rods, at each elevation of the chisel or auger, is saved. The chisel and scooping instrument are fastened to a rope, which is alternately elevated and allowed to descend by the simple force of gravity; the instrument thus forces its way through the ground. In the softer rocks of the newer formations this method has been successfully employed in boring for Artesian wells.

A still greater saving in time and money has been obtained by a process invented by M. Fauville, and described by him before the British Association in 1846. His apparatus consists of a hollow boring-rod, formed of wrought-iron tubes screwed end to end, armed at the lower end with a hollow perforating tool. The upper end of the hollow rod is connected with a force-pump by a flexible tube. By means of the force-pump a current of water is sent down the rod into the bore hole as it is sunk, and the water coming up again brings with it all the drilled particles, so that, except for the renewal of the perforating tool, the rods do not require to be elevated. M. Fauville found, by experience, that when he was passing through gravel, or required to bring up considerable masses of broken-off rock, it was better to inject the water by the bore-hole and

let it rise through the hollow tube. In this way he has succeeded in raising stones  $2\frac{1}{2}$  inches long by  $1\frac{1}{2}$  inch thick.

**BORLASE**, REV. WILLIAM, an English antiquarian, was born at Pendine, Cornwall, February 2, 1696. Ordained a priest in the English Church in 1720, he was, in 1732, presented to the vicarage of his native parish of St Just. Devoting himself to a study of the natural history and antiquities of Cornwall, he in 1763 published, at the Oxford press, a volume, entitled *Observations on the Antiquities, Historical and Monumental, of the County of Cornwall*. This was followed, in 1758, by the *Natural History of Cornwall*, printed at the same press. B. paraphrased the book of Job, and wrote several pieces of a religious nature, was active in the supervision of his parish, and took an especial interest in the improvement of its highways. But that which makes his name most interesting now, is the fact that he was one of Pope's correspondents, and furnished to the poet most of the curious fossils of which the Twickenham grotto was composed. He died August 31, 1772.

**BORNEENE, FLUID BORNEO CAMPHOR, or OIL OF CAMPHOR**, is a thin liquid, lighter than water, with a fragrant odour (somewhat resembling turpentine), obtained by distilling native oil of Borneo camphor, or oil of Valerian. The B. is employed in perfumery.

**BO'RNEO** (called by the natives *Pulo Kalaman* or *Klementin*, which in the name of an indigenous fruit), next to Australia and Papua, the largest island in the world, is situated in the Indian Archipelago, in  $7^{\circ}$  N.— $4^{\circ} 20'$  S. lat., and  $106^{\circ} 40'$ — $116^{\circ} 46'$  E. long. It is bounded on the E. by the Sea of Celebes and the Macassar Strait, S. by the Sea of Java, W. and N. by the Gulf of Siam and the China Sea. Its length is about 800 miles, with a breadth of 700, and an area of about 300,000 square miles. The population is under 2,000,000. The largest part, ruled by the Dutch, had, in 1870, 519 Europeans and 1,156,115 natives; the independent kingdom of Borneo or Brunei, in the north, between Sambas and Maludu, 225,000; Sarawak, 50,000; and the unexplored regions of the interior are sparsely peopled. The coasts of B., which are often low and marshy, and rendered dangerous to navigation by numerous islets and rocks, present no deep indentations, though they are pierced by numerous small bays and creeks. Two chains of mountains run through the island in a nearly parallel direction from south-west to north-east; the one rising in Sarawak (q. v.), gradually increases in elevation until it attains, in its termination in Mount Kini Balu, on the north-east coast, a height of 13,698 feet; a cross chain, branching off in about lat.  $2^{\circ}$  N., extends in a south-east direction through Banjermassin (q. v.). The other range, which is much lower, intersects the equator in long.  $113^{\circ}$  E. Between are well-watered plains. B. has fine rivers, especially on the north and west coasts. About their upper courses, however, little is known. The principal are: on the north, the Brunei or Borneo, the Redjang, Baram, Bintulu, Sirabas, Batang-Lupar, and Sarawak; on the east, the Kutei or Mahakkam, Bulungan and Kuran, or Beru. The Barito, or river of Banjermassin, Kahaijan, Kapuas-Murung, Mendawai, Sampit, and other smaller streams, flow through the south-east part; while the Pontianak, or Kapuas-Bohang, Sambas, Simpang, Succadana, and Pawan, are the most important on the west. All the rivers of B. have banks at their mouths, which render them unfit for large ships; the Brunei, however, is navigable 15 miles for vessels of considerable tonnage. There are numerous lakes, abounding in fish, the largest being

Kini Balu, south-east of the mountain of the same name, 100 miles in circumference, beautified with islands, and having many Dyak villages on its bank. The climate, in the low grounds, is humid, hot, and unhealthy for Europeans; but in the higher parts towards the north, the temperature is generally moderate, the thermometer at noon varying from  $81^{\circ}$  to  $91^{\circ}$  F. During the rainy season, from November to May, heavy storms of wind and loud thunder are experienced on the west coast. Vegetation is extremely luxuriant. The forests produce iron-wood, teak, gutta-percha, ebony, sandal-wood, ratans, dye-woods, benzoin, wax, dragon's blood, sago, various resins, vegetable oils, and gums. The camphor is the best in Asia, of which 4500 pounds are exported annually. The Mohor tree, well adapted for making native boats, attains a height of 80 feet, and the Kaladang, suited for large masts, to 200. Nutmegs, cloves, cinnamon, pepper, betel, ginger, rice, millet, sweet potatoes, yams, cotton, sugar-cane, indigo, tobacco, coffee, melons, citrons, pineapples, bananas, coco-nuts, &c., are largely grown. The mountains and forests contain many monkeys, among which is the orang-outang. Tapis, tigers, bears, swine, wild oxen, and various kinds of deer abound. The elephant is only found on the north coast, and the rhinoceros on the north-west. The few domesticated animals are buffaloes, sheep, goats, dogs, and cats. A few horses are seen in Banjermassin. The birds are remarkable for their plumage. The principal are eagles, vultures, Argus-pheasants, peacocks, flamingoes, pigeons, parrots, and the swallows (*Collocalia esculenta*) which construct the edible nests prized by the Chinese for making soup. The rivers, lakes, and lagoons swarm with crocodiles, and many kinds of snakes, frogs, lizards, and leeches. Fish is plentiful, and the coasts are rich in tortoises, pearl-mussels, oysters, and bêche-de-mer, or trepang. Brilliant butterflies and moths are in great variety, and silk-worms are found. Among the mineral products are coal, gold, antimony, iron, tin, platina, nickel, diamonds, precious stones, rock-crystals, porcelain-clay, petroleum, and sulphur. The diamond mines are chiefly in Landak and Pontianak (q. v.); Sambas produces the greatest quantity of gold; the kingdom of Brunei, Kutei, and Banjermassin, the largest amount of coal.

The population consists of three classes: the Dyaks, who are the aboriginal inhabitants, and almost all heathen; the Mohammedans or Malays, Buginese, Javans, and Arabs; and the Chinese. The Dyaks live chiefly in the interior, and employ themselves with land culture, collecting gutta-percha, resin, gums, ratans, gold dust, and wax. They are divided into numerous tribes. The Malays dwell on the coasts, are traders, and bold sailors. They are more civilised than the Dyaks, cultivate the grounds around their houses, lay out gardens, keep cattle, and live partly by fishing. The Chinese, chiefly from Canton, have penetrated far into the interior. They engage in trade and mining, are unwearied in their efforts to make money, and then return to their native country. They number about 75,000, and have always endeavoured to live as an independent republic, under chiefs chosen by themselves, and according to Chinese laws. In 1857, the Chinese living in Sarawak (q. v.) rebelled against Sir James Brooke (q. v.), and were nearly exterminated. In the last years, the Dutch were also compelled to put them down by force of arms, and have imposed a poll-tax.

The women of B., except the Dyak, weave cotton fabrics, make earthenware, baskets, and mats of beautiful designs and colours. In the district of Banjermassin are factories of weapons. The principal exports are gold, gold-dust, diamonds, coal, ratana,

## BORNHOLM—BORO BUDDOR.

gutta-percha, edible nests, cotton, wax, timber, dye-woods, mats, resins, sandal-wood, camphor, &c.; the imports—earthenware, iron, steel, and copper work, piece goods, yarns, woollen and silk fabrics, medicines, provisions, wines, spirits, rice, sugar, tea, tobacco, opium, trepang, gambir, vegetable oils, gunpowder, &c. The Dutch imports amount to about £190,000 annually, and the exports to £130,000.

By far the largest part of the island is ruled directly or indirectly by the Dutch, who have divided it into the residency of the western division of B., and that of the southern and eastern, the former having Pontianak (q. v.) as the seat of government; the latter, Banjermassin. The smaller portion towards the north and north-east contains Sarawak and the territories of the sultan of B. proper. Besides a number of small dependencies, the western division contains the important kingdoms of Landak, Mampawa, and Sambas, with the mining district of Montrado, in the north. The chief towns are Sambas (10,000), Pontianak (9000), Banjermassin (30,000), Borneo or Brunei (30,000), and Sarawak (25,000).

The Portuguese effected a settlement in 1690 at Banjermassin; from whence they were, however, soon expelled. The Dutch succeeded in concluding a treaty of commerce with the princes of Banjermassin; and in 1643 erected a fort and factory, a second in 1778 at Pontianak, and others since. The British made unsuccessful attempts in 1702 and 1774 to effect a settlement in B.; but have, within the last twenty years, acquired a preponderating influence on the north-western coast. This has been in a great measure owing to the enterprise of Sir James Brooke (q. v.) and his vigorous government as rajah of Sarawak, and in part also to the occupation of Labuan (q. v.) as a colony and naval station. The British government has, however, recently refused, upon Sir James Brooke's retirement from Sarawak, to annex it to the British empire. The piracy carried on by the inhabitants of B. has often demanded severe chastisement, and piratical flotillas have been destroyed by the British.

BO'RNLHM, an island in the Baltic Sea, belonging to Denmark, and situated about 90 miles east from Seeland, and half-way between the island of Rügen and the Swedish coast, lat.  $54^{\circ} 59'$ — $55^{\circ} 18'$  N., long.  $14^{\circ} 42'$ — $15^{\circ} 10'$  E. Area, including three small islands in its vicinity, about 230 square miles, with a population above 29,000. It is rocky, and traversed from north to south by a high mountain-ridge, the slope of which is in great part a waste heath, but elsewhere it is not unfertile, and agriculture and cattle husbandry are successfully prosecuted. High cliffs, sand-banks, and breakers, make the coast dangerous. The most notable product of the island is porcelain clay, with which the porcelain manufacture of Copenhagen is carried on. The capital of the island is Rönne, or Rottum, on the western coast, a place of 4500 inhabitants.

BO'NING-PIECE (Fr. borner, to bound), a common and very simple implement, used by gardeners in laying out grounds, to make the surface either level or of perfectly regular slope. It consists of two slips of board, one about 18 inches long, and the other about 4 feet, the shorter fastened by the middle to one end of the longer, and at right angles to it. One B. being placed at one end of a line drawn in the piece of ground which is being laid out, with the edge of the shorter slip of board along the line, and the longer slip erect, others of the same size are similarly placed at the other end and in other parts of the line; and the requisite uniformity of surface is obtained by filling up with earth, or removing it, until on looking along their

summits it appears that they are all in the same plane. The name is perhaps derived from the frequent application of the implement to borders or edgings.

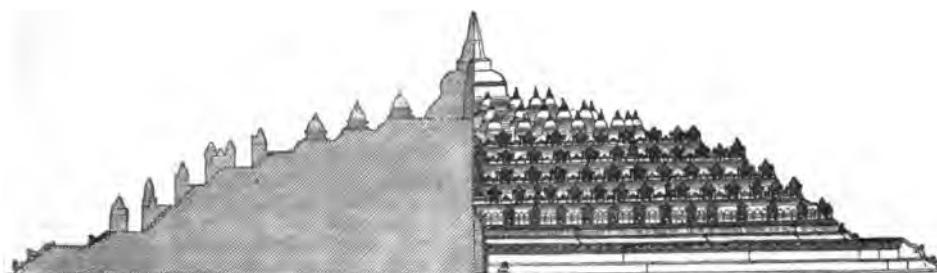

BO'RNU, a powerful state of Central Africa, extending between lat.  $10^{\circ}$  and  $15^{\circ}$  N., and long.  $12^{\circ}$  and  $18^{\circ}$  E., and bounded on the E. by Lake Tsad, S. by Mandara, W. by Hausa, and N. by Kanem and the Sahara. The greater part of the country is perfectly level, and much of it is liable to be overflowed in the rainy season, which lasts from October to April, when fevers and other diseases consequently prevail. The heat from March to June is excessive, ranging from  $104^{\circ}$  to  $107^{\circ}$  F. The two principal rivers are the Shary and the Yeou or Yo, both of which fall into Lake Tsad. The soil is fertile, and although the cultivation is very imperfect, produces plentiful crops of maize, millet, barley, rice, various kinds of pulse, cotton, and indigo. The inhabitants possess elephants, horses, buffaloes, oxen, sheep, &c. Wild beasts, as lions, panthers, &c., are very numerous, having their chief haunts in the forests which occur only in the vicinity of the rivers, and which abound also in birds of many kinds, snakes, crocodiles, &c. Wild bees are extremely plentiful. The country produces no iron, that which is used being brought from Mandara. Much care is bestowed upon the manufacture of coats-of-mail, both for horses and their riders. The only other manufacture carried to any considerable extent is that of cotton cloth, which is dyed with beautiful blue stripes by means of indigo, and much exported to Fezzan. The population, which is estimated at from eight to nine millions, are mostly of Negro race, and called Kanowry. The ruling race, called Shouas, are of Arab descent, and bigoted Mohammedans; but many traces of Fetishism remain among the masses. Whatever they have of civilisation is derived from the Arabs. The slave-trade is eagerly prosecuted, and gives occasion to many warlike expeditions. B. appears to have existed as a state for many centuries, but in the beginning of the present century it was conquered by the Feillatahs, whose yoke, however, was soon shaken off, under the leadership of a fanatic faki, named Mohammed el Amin, whose services were called in by the sultan. The Bornuese afterwards transferred their allegiance from the sultan to Mohammed, whose descendant now rules in Bornu.

BORO BUDDOR (the Great Buddha), the ruin of a splendid Buddhist temple in Java, residency Kadu, regency Magelang, and district Minoreh, near the junction of the Ello and Progo, is the most elaborate monument of the Buddhist style of architecture anywhere existing. Buddhism (q. v.) was early introduced into Java, and Javanese chronicles place the building of B. B. in the beginning of the 7th century. The figure (copied from Ferguson's *Handbook of Architecture*) represents a section through one half, and an elevation of the other half of the building. It is a pyramid of a square form, each side at the base measuring 600 feet, and consists of seven walls, which are built like the steps of a stair up a hill. Between the walls are narrow terraces running round the building. The walls are richly ornamented with statuary. Outside are niches, each of which is occupied by a statue of Buddha, larger than life, seated in the usual attitude, with his legs crossed under the body. The number of these figures is about 400. Between each of these are bas-reliefs, representing the god in the same attitude, besides architectural ornaments and carvings of all sorts. Below the niches, on the lower story, is an immense bas-relief running round the whole building, repre-

## BORODINO—BOROUGH.

senting scenes from the life of Buddha, and religious subjects. The inner faces of the building are also profusely ornamented with bas-reliefs, seated figures, and architectural ornaments, carried to an extent

unrivalled by any other building in the world. The art of sculpture appears in Java to have early attained the highest point of excellence. 'Above and within the upper square terrace are three

Elevation and Section of Temple of Boro Buddor.

circular ones, the outer ornamented with 32, the next with 24, and the upper with 16 small domes, each containing a seated statue of Buddha, which can be seen through the open work of their roofs. The whole is surmounted by what must be considered as the Pagoda (q. v.) itself, which is now empty, its centre being occupied only by a sunken chamber 10 feet deep, meant originally, no doubt, to contain the relic for which this splendid temple was erected.' Mr Fergusson considers that the five lower terraces are copied from and represent a Buddhist vihara or monastery; and that the niches containing the cross-legged figures were, in the originals, cells, each occupied by a shaven priest. The structure is thus a compound of a Tope (q. v.) with a copy, in durable architecture, of the frail cells of a vihara.

**BORODINO**, a village of Russia, in the government of Moekwa, and about 70 miles west from the city of that name. It is situated on the Kalouga, an affluent of the Moekwa, and gave name to the great battle fought between the French army under Napoleon, and the Russian under Kutusow, Barclay de Tolly, and Bagration, 7th September 1812. The battle of B. was one of the most obstinately disputed in history, and the loss on both sides was almost equally great. Out of 240,000 men engaged, between 70,000 and 80,000 were killed and wounded. The Russians retreated on the following day, but it was in the most perfect order, and without the enemy venturing to attack them. The Russians, therefore, have always held this battle as a victory, and in 1839 raised a fine mausoleum on the battle-field. To the French, however, certainly belongs the honour, as they not only remained on the field of battle, but in seven days after, they had pushed on to Moscow. The French name it the battle of the Moekwa, from the river of that name, and it gave Marshal Ney his title of Prince of Moekwa.

**BORON** is a non-metallic element present in Boracic Acid (q. v.) and Borax (q. v.). It was discovered in 1808 by Gay Lussac and Thenard in France, and Davy in England. The process followed in procuring B. till lately, was to mix pure and dry boracic acid ( $BO_3$ ) with thin slices of the metal potassium (K), and heat them in a tube, when three atoms of the potassium abstracted the oxygen, forming potash (KO), and set free the boron (B). On cooling and washing the mixture with cold water, the potash dissolved out, and left the B. as a dark greenish-brown powder, which, when heated, burned with a green flame, and was re-formed into boracic acid, by combining with

the oxygen of the air. Recently, however, Wöhler and Deville have obtained B. by heating in a crucible at a high temperature a mixture of pure dry boracic acid and the metal aluminium, when the latter takes the oxygen forming alumina ( $Al_2O_3$ ), and leaves the B. as minute crystals interspersed through the earth alumina. These crystals possess great interest from their similarity in properties to pure crystallised carbon, or the diamond, and they are now known among scientific chemists as *B. diamonds*. They are remarkably transparent, are tinged yellow or red (though the colour may be accidental), and rival the ordinary diamond in their lustre and refractive power. B. diamonds not only scratch glass, but also the corundum and the sapphire; and a real diamond, with which a few B. diamonds were crushed, had its edges worn away. It is apparent, therefore, that the B. crystals possess in a high degree the characters of the ordinary diamond; and though they have as yet only been obtained in minute specks, yet it is not too much to expect that the size will be increased, and the artificial B. diamond come into market as an article of ornament, to rival the *natural* carbon diamond in its mysterious power of flashing back the rays of light. Indeed, so like are these two kinds of diamonds, that they can scarcely be distinguished by outward characters or signs; and it has been gravely suggested that some of the diamonds which now adorn the brow, the neck, or the arm, may be natural B. diamonds. They are very indestructible, requiring a high temperature to destroy them; and, like the true diamond, heat ultimately forms them into a coke.

**BOROUGH** (Ang. Sax. *byrig*, *burg*, *burh*; It. *borgo*; Fr. *bouvr*; Scot. *burgh*). The original meaning of this word, by which we now designate a corporate township, seems to have been a hill, rising-ground, or heap of earth; and it was probably from the elevated positions on which places of defence were erected, that it afterwards came to signify a fortification or castle, and latterly the aggregate of houses, churches, and other structures, which, in unsettled times, usually gathered under the walls of a castle; together with their inhabitants, and the arrangements which were made for their government. The questions whether we owe our municipal corporations to Roman, or to Saxon and other Teutonic influences, or to both; and if to both, then to what extent they have severally contributed to their formation, have been keenly discussed by constitutional historians. In so far as etymology goes, its authority is pretty equally divided, the term *municipal*, from the Latin *municipalis*, and *city*,

## BOROUGHBRIDGE—BOROUGH RATE.

from *civitas*, favouring the Roman view; whilst B. from the root above indicated, and *town*, from the Saxon *tun* or *dun*, a fortified hill, support the Teutonic. But the discussion forms a branch of a very wide subject, which has divided recent writers into two opposite schools, and of which we can here only indicate the existence. On the Roman side, Sir Francis Palgrave is the most uncompromising, and Mr Allen, as it seems to us, the more judicious champion. The Teutonic side is espoused by most of the Anglo-Saxon scholars of England, and in general by German writers. But from whatever source derived, that the boroughs of England existed, not as aggregates of houses merely, but as corporate bodies, in the Saxon time, is now generally admitted. The B. system of Scotland is also of great antiquity. 'A *Hanse*, or confederation of boroughs for mutual defence and the protection of trade, existed in Scotland, and was known by this name in the reign of David I., about a century before the formation of the Hanseatic League of the continental cities; and the famous burgh laws date from about the same period. This code of Scotch burghal regulation,' in Mr Innes's opinion, 'though collected in the reign of David, and sanctioned by him, was the result of the experience of the towns of England and Scotland;' and he goes on to shew the very close resemblance between these laws and the burghal usages of Newcastle, and even of Winchester, which seems to suggest their common Saxon origin. Mr Innes speaks favourably of the B. life of our ancestors; and he considers the burgh domestic architecture, of which monuments remain sufficient to shew that 'the burgess of the Reformation period lived in greater decency and comfort than the laird, though without the numerous following, which no doubt gave dignity if it diminished food. I am not sure that this class has gone on progressively, either in outward signs of comfort, or in education and accomplishment, equal to their neighbours. The reason, I suppose, is obvious. The Scotch burgher, when successful, does not set himself to better his condition and his family within the sphere of his success, but leaves it, and seeks what he deems a higher.' In confirmation of this view, Mr Innes elsewhere mentions that 'many of the old citizen-merchants of Edinburgh had studied at the university, and appear in the list of graduates.'

Borough, in England, is properly a city or other town that sends burgesses to parliament—a privilege, the nature and extent of which will be explained under PARLIAMENT (q. v.); and in this sense it is also called a *parliamentary borough*. But in the interpretation clause of the Municipal Reform Act, 5 and 6 Will. c. 76, s. 142, the word *borough* is declared, for the purposes of the act, to mean a city, borough, port, cinque port, or town corporate, and whether sending representatives to parliament or not. See MUNICIPALITY.

BOROUGHBRIDGE, a town in West Riding, Yorkshire, on the right bank of the Ure, here navigable for small-craft, 17 miles north-west of York. It arose simultaneously with the decline of Aldborough,  $1\frac{1}{2}$  mile to the east, soon after the Conquest, when the great north road was diverted from Aldborough to this place. Its chief trade is in agricultural produce and hardware. Pop. (1871) 2508. Edward II., in 1321, defeated the Earl of Lancaster here. Near B. are three immense Druid stones, called the 'Devil's Arrows,' 16 to 22 feet high.

BOROUGH ENGLISH is a custom that prevails in some ancient boroughs in England, according to which the youngest son inherits the property within borough in preference to his elder brothers. The

reason assigned for it is, that the youngest son, on account of his tender age, is not so capable as his elder brothers to maintain himself. A posthumous son is entitled to this privilege, and dispossesses his elder brother. The right of representation also exists with reference to it, for should the youngest son die in his father's lifetime leaving a daughter, she will inherit the property. This custom obtains in the manor of Lambeth, Surrey, in the manors of Hackney, St John of Jerusalem in Islington, Heston, and Edmonton in Middlesex, and in other counties. See CUSTOM, GAVELKIND, INHERITANCE.

BOROUGH FUND. This is a fund which is expressly defined by the Municipal Corporations Act, 5 and 6 Will. IV. c. 76, by which it is declared that the rents and profits of all hereditaments, and the interest, dividends, and annual proceeds of all moneys, dues, chattels, and valuable securities belonging or payable to any body corporate named in conjunction with a borough in the schedules, or to any member or officer thereof, in his corporate capacity, and every fine or penalty for every offence against this act (the application of which has not been already provided for), shall be paid to the treasurer of such borough; and all the moneys which he shall so receive shall be carried by him to the account of a fund to be called 'The Borough Fund'; and such fund, subject to certain payments and deductions, shall be applied towards the payment of the salary of the mayor, and of the recorder, police magistrate, town-clerk, treasurer, and other officers. Corporations may now, under certain checks, maintain parliamentary and legal proceedings at the expense of the borough fund, 35 and 36 Vict. c. 91. But existing gas and water companies authorised by statute are not to be compelled with in this way.

The Court of Chancery exercises jurisdiction over the property of corporations in boroughs, which, since the Municipal Corporations Act, are considered to hold their property in trust for charitable uses; and the trusts are applicable as well to the personal as to the real estate. See Grant on Corporations, 1850; and see FUND.

BOROUGH JUSTICES were first created in the time of Charles I. Under the Municipal Corporations Act, 5 and 6 Will. IV. c. 76, these justices consist of the mayor during his year of office, and for one year after it determines; the recorder *ex officio*; and such persons as the crown may appoint by commission. Their duties cannot be delegated; and before acting, they must make the same declaration, and take the same oaths as the recorder does on entering his office. See JUSTICES.

BOROUGH LAWS, in Scottish legal history, was the name given to a collection of ancient laws relative to boroughs or *burghs*, which have long ceased to have any force, but serve to throw light on the ancient manners and customs of the country. The authenticity of these B. L. is beyond question; they are universally allowed to have been enacted in the reign of King David in the 12th century. See REGIA MAJESTATEM.

BOROUGH RATE is a rate raised and levied within borough by order of the council of the same; and it has been decided by the Court of Exchequer that such rate is valid, though not made *in public*. By the 92d section of the Municipal Corporations Act, 5 and 6 Will. IV. c. 76, where there is a deficiency of the *borough fund* (q. v.), the borough council is authorised and required from time to time to order a B. R. in the nature of a *county rate* (q. v.) to be made within their borough, for which purpose the council shall have all the

powers of county justices. As to boroughs not within the Municipal Corporations Act, the levying and application of borough rates in them is regulated by the 17 and 18 Vict. c. 71, by the first section of which it is enacted that the justices of the peace may make a B. R. in the nature of a county rate, for all the purposes for which a B. R. may be levied, such borough justices also having the same powers as county justices. The council of a borough cannot make a retrospective rate; and the provision of the 7 Will. IV. and 1 Vict. c. 81, s. 2, which declared lawful all such retrospective rates as might be made within six calendar months after the passing of the act, was merely for a temporary purpose. The Municipal Corporations Act directs that all sums levied in pursuance of a B. R. shall be paid over to account of the borough fund; and there is a provision as to *Watch Rates* (q. v.).

Where parties consider themselves aggrieved by a B. R., they may appeal to the recorder at the next quarter-sessions for the borough in which such rate has been made; or if there be no recorder, to the next county quarter-sessions.

**BOROVSK**, or **BOROFSK**, a town of Russia, in the government of Kalouga, and 49 miles north-east of the town of that name. Conjointly with Kalouga it gives title to a bishop. It has extensive manufactures of sail-cloth, and a trade in leather, flax, and hemp. Its onions and garlic are celebrated. In its vicinity is a convent, founded in 1444, one of the richest in the empire. Pop. (1867) 8826.

**BORROMEAN ISLANDS**, a group of small islands in the Lago Maggiore, Northern Italy. They are situated in the western arm of the lake, called the Bay of Toss, and are named after the family of Borromeo, which for centuries has been in possession of the richest estates in the neighbourhood. They are sometimes also called *Isole dei Conigli*, on account of the number of rabbits found on them. They were little more than naked rocks, till Vitaliano, Count Borromeo, master-general of ordnance to the king of Spain, about 1671, caused soil to be carried to them, built terraces, and converted them into gardens, the beauty of which and of their situation has won for them the name of the *Enchanted Islands*. The two most celebrated are *Isola Bella* and *Isola Madre*. On the west side of *Isola Bella* stands a palace of the Borromeo family, containing many admirable paintings and other works of art. The *Salle terrene*, a series of grottos, inlaid with stones of various colours and adorned with fountains, connect the palace with the gardens, the terraced style of which gives to the whole island the appearance of a truncated pyramid; a colossal winged unicorn, the armorial device of the Borromeo family, crowning the whole. *Isola Madre* is laid out in the same terraced style, and is crowned by a castle. The odours of flowers from the islands, upon which grow many plants of tropical climates, are wafted far over the lake. The *Isola de' Pescatori* now contains a village of about 400 inhabitants, who derive their subsistence from fishing and smuggling.

**BORROMEO**, CARLO, COUNT, a saint of the Church of Rome, was born on the 2d October 1538, at the Castle of Arona, on the Lago Maggiore, the family seat of his ancestors. He studied law at Pavia, and took the degree of doctor in 1559. His uncle, Pope Pius IV., on being raised to the pontificate in 1560, appointed him, notwithstanding his youth, to a number of high offices, and made him a cardinal and archbishop of Milan. B. displayed great faithfulness and ability in governing Ancona, Bologna, and other parts of the States of the Church

as legate, and in discharging the duties of offices connected with ecclesiastical administration at Rome. Surrounded as he was with magnificence and luxury, he was always grave, pious, and rigid in his life, studious, and a patron of letters. His uncle, the pope, made him his grand penitentiary, and did nothing considerable without his co-operation. It was in a great measure by his influence that the re-opening of the Council of Trent was accomplished, and that its deliberations were brought to a conclusion so favourable to the papal throne. He committed its decrees to memory, had the principal part in drawing up the *Catechismus Romanus* for exposition of them, and proceeded to give all possible effect to them in his archiepiscopal province. B.'s exertions, not only for the improvement of ecclesiastical discipline, but also for the reformation of morals in the archbishopric of Milan, drew upon him the hostility of the monastic orders, and also to some extent that of the Spanish authorities in Milan, who were jealous of the extension of his jurisdiction. An attempt was even made upon his life in 1569. He spent great part of his income in beautifying the cathedral and other churches. With a view to provide well-qualified priests, he founded, in 1570, the Helvetic College at Milan. He brought about an alliance of the seven Catholic cantons, known as the *Golden Borromean League*, for the united defence of their faith. In the famine of 1570, and during the plague in Milan in 1576, he displayed equal energy, benevolence, and devotedness, saving the lives of multitudes by the prompt arrangements which he made for necessary relief. Exhausted by his labours and his austerities, he died on 3d November 1584. Many supposed miracles at his tomb led to his being canonised in 1616. His theological works were published at Milan in 1747, in 5 vols. folio. On the western bank of the Lago Maggiore, in the neighbourhood of his birthplace, is a colossal brazen statue of him.—His brother's son, Count Frederico Borromeo, born 1563, was also a cardinal, and from 1595 to 1631 archbishop of Milan, and was the founder of the Ambrosian Library (q. v.).

**BORROW**, GEORGE, an English author, born at Norfolk in 1803. He displayed from his earliest years an extraordinary talent for languages, and a strong inclination for adventure. In his youth he lived for some time among gypsies, by this means acquiring an exact knowledge of their language, manners, and customs. His travels, as agent for the British and Foreign Bible Society, through almost all countries of Europe and a part of Africa, made him familiar with many modern languages, even to their dialectic peculiarities. Whatever was little known had peculiar charms for him, and he shrank neither from toil nor danger. True to his youthful predilection, he made the gypsies scattered over every part of Europe one of the principal subjects of his study. His first work, *The Zincali, or an Account of the Gypsies in Spain* (2 vols., Lond. 1841), made a favourable impression by its lively and dramatic style. It was followed by *The Bible in Spain* (2 vols., Lond. 1843), a book to which its author is chiefly indebted for his celebrity, and which consists of a narrative of personal adventures as various as it is interesting. The graphic power of the style amply compensates for the rather unmethodical arrangement of the book. After a long interval, B. published a work long before announced, *Lavengro, the Scholar, the Gipsy, and the Priest* (3 vols., Lond. 1851), which was generally regarded as an autobiography, with a spice of fancy mingling with fact. The principal character is depicted with extravagant exaggeration; and the somewhat bizarre originality which gave a peculiar zest

## BORROWING—BORY DE SAINT VINCENT.

to the author's earlier works here appears as mannerism. The book left the hero in the midst of his adventures, which were not continued until 1857, when B. published *The Romany Rye*, a sequel to *Lavengro*, which was a more unsatisfactory work than any of its predecessors. He published *Wild Wales* in 1862.

BORROWING has, in the case of *money*, several legal applications of a general nature, in which the law with regard to *bonds*, *mortgages*, and other similar *securities*, has to be considered. See the articles on these subjects. More strictly, borrowing may be described as a contract under the law of *bailments* (see CONTRACT), and may be briefly and simply defined as asking or taking a loan. The essentials of this contract are, that there must be a certain specific thing lent, such as a book, an article of furniture, a horse, or it may be a house, land, or even an incorporeal right. But in the law of England the contract is confined to goods and chattels or personal property, and does not extend to real estate. Lord Chief-Judge Holt's definition described it as a borrowing of a thing *lent*, in contradistinction to a thing deposited, or sold, or intrusted to another for the sole benefit or purposes of the owner. Again, the borrowing must be gratuitous and for the borrower's use, which use must be the principal object, and not a mere accessory. Such use, too, may be for a limited time or for an indefinite period. The contract must also be of a legal nature, for if it is immoral, or against law, it is utterly void; this, however, is a necessary qualification of all contracts. Lastly, the property which is the subject of the contract must be borrowed or lent to be specifically returned to the lender at the determination of the agreement, in which respect it differs from a loan for consumption.

The persons who may borrow and lend are all those who can legally make a contract; a capacity, therefore, which excludes married women, unless they act with the consent of their husbands, when it binds the latter and not the wives.

It is not necessary that the lender should be absolute proprietor of the thing lent or borrowed; it is sufficient if he have either a qualified or a special property therein, or a lawful possession thereof. As to the borrower, he has the right to use the thing during the time and for the purpose intended, whether such intention is expressed or implied; but beyond this he cannot go. The following quotation from Mr Justice Story's celebrated work on *bailments* (to which reference is generally made), is useful for popular information: 'A gratuitous loan is to be considered as strictly personal, unless, from other circumstances, a different intention may fairly be presumed. Thus, if A lends B her jewels to wear, this will not authorise B to lend them to C to wear. So, if C lends D his horse to ride to Boston, this will not authorise D to allow E to ride the horse to Boston. But if a man lends his horses and carriage for a month to a friend for his use, there, a use by any of his family, or for family purposes, may be fairly presumed; although not a use for the benefit of mere strangers.' During the period of the loan, the borrower has no property in the thing, but a mere right of possession and use of it. But, notwithstanding, if the thing lent and borrowed be injured by a stranger, it would appear that the borrower may maintain an action for the recovery of damages; the mere possession of property without title being sufficient against a wrong-doer. See CONTRACT, LOAN, HIRE, besides the subjects above referred to.

BORROWING DAYS. The last three days of

March are so called in Scotland and some parts of England. The popular notion is, that these days are borrowed or taken from April, and may be expected to consist of cold or stormy weather. Although this notion dates from a period before the change of the style, a few days of broken and unpleasant weather about the end of March still afford a sanction for old notions concerning the borrowing days. The origin of the term B. D. is lost in the mists of antiquity, though we are inclined to hazard the conjecture that it has no higher source than the popular rhyme in which it is introduced as a poetic fiction. The most dramatic form of this rhyme in Scotland is as follows:

March said to April:  
 'I see three hoggs on yonder hill;  
 And if you'll lend me days three,  
 I'll find a way to gar [make] them die!  
 The first o' them was wind and weet,  
 The second o' them was snow and sleet,  
 The third o' them was sic a freeze,  
 It frosed the birds' feet to the trees.  
 But when the borrowed days were gane,  
 The three silly hoggs came hirplin [limping] hame.'

The superstition, if we may so call it, respecting the B. D., though now little else than a jocular fancy, was so strong in Scotland in the 17th c., that when the Covenanting army, under Montrose, marched into Aberdeen on the 30th March 1639, and was favoured by good weather, a minister pointed it out in his sermon as a miraculous dispensation of Providence in behalf of the good cause. See Gordon of Rothiemay's *History of Scots Affairs from 1637 to 1641*. For further notice of the B. D. we refer to Brand's *Popular Antiquities*.

BORROWSTOUNNESS, or BONESS, a sea-port in Linlithgowshire, on a low peninsula on the Firth of Forth, 17 miles west-north-west of Edinburgh. It has coal-mines extending under the bed of the Firth; and manufactures of salt, soap, malt, vitriol, and earthenware, and a trade in grain. Ironstone, limestone, and freestone also exist in the parish. Graham's Dike, a part of the Roman wall of Antoninus, traverses the parish. Dugald Stewart lived near Borrowstounness. Pop. (1871) 4986. In 1871, the tonnage inwards was 21,899; and outwards, 41,168. The coasting trade was, inwards, 3462; and outwards, 12,409—the total tonnage for that year being thus 78,938.

BORY DE SAINT VINCENT, JEAN BAPTISTE GEORGE MARIE, a French traveller and naturalist, was born in 1780 at Agen, now in the department of Lot-et-Garonne. In 1798, he proceeded, along with Captain Baudin, in a scientific mission to New Holland, but separated from him before they reached their destination. Among the fruits of his travels were his *Essai sur les Iles Fortunées de l'antique Atlante, ou Précis de l'Histoire Générale de l'Archipel des Canaries* (Par. 1803), and his *Voyage dans les quatre principales Iles des Mers d'Afrique* (3 vols., Par. 1804). Having returned to his native country, he became a captain in the army, served at Ulm and Austerlitz, went to Spain, and became military intendant in the staff of Marshal Soult. In 1815, he served as a colonel, and after the battle of Waterloo made an eloquent but fruitless appeal to his colleagues in the Chamber against submitting to the Bourbons, and was compelled to go into exile. At Brussels he edited, along with Van Mons, the *Annales des Sciences Physiques* (8 vols.). He also produced an admirable work on the subterranean quarries in the limestone hills near Maestricht (Par. 1821). He returned to France in 1820, wrote for liberal journals, and for Courcier's *Encyclopédie*, &c. In 1827, appeared his *L'Homme, Essai Zoologique*

*sur le Genre humain*. He wrote what relates to cryptogamic plants in Duperrey's *Voyage autour du Monde* (Par. 1828). He rendered an important service to science by editing the *Dictionnaire Classique de l'Histoire Naturelle*. When, in 1829, the French government sent a scientific expedition to the Morea and the Cyclades, the first place in it was assigned to B. de S. V.; and the results of his researches were given to the world in the *Expédition Scientifique de Morée* (Par. and Strasb. 1832, &c.), and in the *Nouvelle Flore du Péloponnèse et des Cyclades* (Par. 1838). In 1839, he undertook the principal charge of the scientific commission which the French government sent to Algeria. He died 22d December 1846.

BOS. See BOVIDÆ AND OX.

BOS, LAMBERT, a Dutch philologist, was born at Workum, in Friesland, 23d November 1670, and studied at the university of Franeker, where, by the advice of Vitringa, he devoted himself especially to the Greek language. In 1704, he was appointed Greek professor in that university. He died 6th January 1717. All his works are characterised by thorough scholarship and remarkable acuteness, and notwithstanding the advances of classical criticism since his day, some of them are still consulted, such as his *Vetus Testamentum ex Versione Septuaginta Interpretum* (Franeker, 1709; new edit., Oxford, 1805), his *Ellipses Graecæ* (Franeker, 1702), and more particularly his *Antiquitatum Græcarum præcipue Atticarum Descriptio Brevis* (Franeker, 1714).

BOSA, a town of the island of Sardinia, in the province of Cagliari, near the mouth of the Termo. Lat. 40° 17' N., long. 8° 27' E. Notwithstanding its fine situation, partly on the side of a hill, and partly on a plain, it is an unhealthy place. It is surrounded by decaying walls; has an old castle, a cathedral, several monasteries and churches; and a trade in wine, oil, grain, and cheese. Its port admits only vessels of small size. Pop. 6500.

BOSCAN-ALMOGAVER, JUAN, a Spanish poet, born in the year 1500 at Barcelona, of an ancient noble family. He received from his parents a careful education, and came to Granada, to the court of Charles V. The education of the celebrated Duke of Alva was afterwards intrusted to him. He spent the latter part of his life at Barcelona, and was employed in editing his own works and those of his friend Garcilasso de la Vega, when he died some time prior to 1544. He was the first to make use of Italian measures in Spanish verse, and thus became the creator of the Spanish sonnet. By the introduction of various Italian forms, he made an epoch in Spanish poetry. His poems are still esteemed, but his other literary productions are forgotten. The best edition is that of Leon, 1549.

BOSCAWEN, EDWARD, an eminent English admiral, second son of Viscount Falmouth, was born in 1711, and highly distinguished himself at the taking of Puerto-Bello, and at the siege of Cartagena in 1740. In April 1744, he captured the French ship *Medée*, with 800 prisoners. He had an important share in the victory off Cape Finisterre (May 3, 1747), and six months after received the command of the East Indian expedition; he displayed high military skill in conducting the retreat from Pondicherry. He returned in 1750, and in the following year became a lord of the Admiralty. In 1755, he was again afloat, and intercepted the French fleet off Newfoundland, capturing two 64-gun ships and 1500 men, including the French commander, Hoquart, whom he had twice before

taken prisoner. Next year, now admiral of the blue, he was appointed commander-in-chief of the powerful expedition against Cape Breton, as the fruit of which that island and St John's were taken after some hard fighting. B. crowned his career by his signal victory over the French Toulon fleet, in the Bay of Lagos, August 18, 1759. On his return home, he received the thanks of parliament, a pension of £3000 a year, a seat in the privy council, and the command of the marines. In the following summer, while his fleet lay idle in the Bay of Quiberon, ravaged by scurvy, B. and some of his men employed themselves in cultivating a garden on a small island, in order to supply the sick with vegetables. He died in the following year. Lord Chatham is said to have testified that when he proposed expeditions to other commanders he heard only of difficulties, but when he applied to B., he found him ready with suggestions and expedients.

BOSCH, HIRONYMUS DE, born at Amsterdam 23d March 1740, died there 1st June 1811, was unquestionably the most distinguished Latin poet of recent times, and a philologist of varied acquirements. His *Poemata* first appeared at Leyden in 1803 (2d ed., Utr. 1808). He rendered an important service to classical literature by his edition of the *Anthologia Graeca*, with a metrical translation by Hugo Grotius never before published (4 vols., Utr. 1795–1810, to which Van Lenne� added a fifth volume, Utr. 1822). His Discourses and Treatises on subjects of literature, which are mostly composed in the Dutch language, display profound learning, excellent judgment, and refined taste.

BOSCOBEL, an extra-parochial liberty of England, in the county of Shropshire, about 6 miles east-north-east of Shifnal. The population of B. is only about 20, but the place is interesting in connection with the escape of Charles II. after his defeat at Worcester in 1651. After the battle, Boscobel House being proposed as a secure retreat, thitherwards Charles turned his steps. At White-Ladies, a seat of the Giffard family, which was reached in the early morning, the king had his long hair cut, his hands and face smeared with soot; and for his royal dress he substituted the green and greasy suit of a countryman, and a leather doublet. Thus disguised, Charles passed through a secret door into a neighbouring wood, in the thickest part of which he sat shivering in the rain until dusk, when he stole out, and along with a guide endeavoured to reach Wales, where it was now thought he would be safer than at Boscobel. They reached a royalist's house at Madeley, on the banks of the Severn, at midnight, and it was then found that they could not escape to Wales, on account of the vigilance of the Puritans; and once more, after a day's rest in a stable loft, the king started for Boscobel wood, where he arrived about five o'clock in the morning. He immediately, along with Major Carlis, who had led the forlorn-hope at Worcester, ascended a thick pollard oak, from which they could watch at intervals during the day the Roundheads in search of them passing by unaware of their near presence. In the evening, they descended from their elevated hiding-place, and made their way to the manor-house, where the king remained hidden for two days. After other adventures, Charles contrived to escape from England on the 17th October.—The title of *BOSCOBEL TRACTS* has been given to certain contemporaneous writings, first published in 1662, giving a graphic description of this passage of the monarch's life. The authorship is generally attributed to Thomas Blount, a loyal gentleman of Worcestershire; but Nash, his grandson, in his history of Worcestershire, denies that they were his, on the authority of Blount

## BOSCO TRE-CASE—BOSNIA.

himself. But the author, whoever he was, was manifestly a staunch royalist, and his narrative bears evidence that he had good opportunity for ascertaining the truth of all the statements in it.

BO'SCO TRE-CA'SÉ, a town of Italy, situated at the southern base of Mount Vesuvius. It has several churches and convents, and a royal manufactory of arms and gunpowder. Wine and silk are raised in the district. Pop. 8500.

BO'SCOVICH, ROGER JOSEPH, a celebrated mathematician and astronomer, born at Ragusa 18th May 1711. He entered at an early age into the order of the Jesuits, and spent his life in scientific pursuits and important public labours. Before the completion of his course of studies in Rome, he was appointed teacher of mathematics and philosophy in the *Collegium Romanum* there. The pope gave him a commission to measure a degree of the meridian in the States of the Church, which he accomplished in the years 1750—1753. In 1764 he was appointed to a professorship in Pavia, but after some time retired from this office. He was subsequently appointed professor of astronomy and optics in the Palatine schools at Milan, and superintended the erection of the observatory in the Brera College, upon which he spent money of his own. After the dissolution of his order, he went to Paris in 1774, and received a pension from the king. B. afterwards went to Bassano, to superintend an edition of his works, on the completion of which he returned to Milan, but fell into a depression of spirits, which at last grew into complete insanity, and he died 12th February 1787. His works include dissertations on a great variety of important questions in mathematical and physical science, and were published collectively under the title *Opera Pertinentia ad Opticam et Astronomiam* (5 vols., Bassano, 1785). His name is connected with a theory of physics, first published in his *Philosophia Naturalis Theoria, Redacta ad Unicam Legem Virium in Natura Existentium* (Vienna, 1758). He was also a poet, and his Latin poem, *De Solis ac Lunæ Defectibus* (Lond. 1764), has been much admired.

BOSIO, FRANC. JOS., BARON, an eminent sculptor, was born 1769 at Monaco, in Sardinia; studied at Paris; and when only 19, returned to Italy, where he executed a multitude of commissions even at that early age. His reputation was greatly increased by the figures which, at the request of Napoleon, he executed for the column in the Place Vendôme. Louis XVIII. and Charles X. also patronised B., the former appointing him royal sculptor, the latter elevating him to the rank of baron. He also enjoyed several professional honours, being director of the Academy of Fine Arts in Paris, and member of the Berlin Academy of Arts. He died July 23, 1845. B.'s principal works are—the 'Hercules' in the garden of the Tuilleries; the incomparably beautiful 'Hyacinth' in the Luxembourg; the 'Nymph Salmacis,' a figure displaying wonderful grace and purity of outline; an allegorical figure of France, 7 feet high, surrounded by the Muse of History and a group of Genii; the statue in memory of the Duc d'Enghien; the equestrian statue in the Place des Victoires, and the monument of Count Demidov, 30 feet high, composed of six figures, with bas-reliefs, &c. Besides these, B. executed a great multitude of busts of distinguished persons, such as the Emperor Napoleon, the Empress, Queen Hortensia, the king and queen of Westphalia, Louis XVIII., Charles X., &c. B.'s works are all marked by grace of form, harmony of design, and elegance of finish. His style generally reminds one of Canova.

256

BO'SJESMAN'S COUNTRY, a region in Africa to the north of the Cape Colony. The inhabitants, a

Bosjesman.

variety of the Hottentot (q. v.) race, are remarkably diminutive in stature, and thoroughly savage in condition.

BOSNA-SERAI, SERA'I, or SARAJEWO (Ital. Seraglio), capital of the province of Bosnia, European Turkey, is beautifully situated in the midst of gardens on both sides of the Migliazza, an affluent of the Bosna, about 122 miles southwest of Belgrade. Its population is estimated at from 40,000 to 60,000, two-thirds of whom are Turks, the rest Greeks and Jews. Four handsome stone bridges cross the river at different points of the city, which is adorned with 150 mosques and churches, whose gilded domes and whitened minarets and spires give it quite an oriental appearance. B. has a palace built by Mohammed II., and an old castle on a height, erected in 1263 by the Hungarian general Cotromon; its old walls are decayed, but it is defended by a citadel, well provided with cannon, and has manufactures of cutlery, jewellery, leather, and woollen goods. Its position makes it the entrepôt for the commerce of South Germany, Croatia, Dalmatia, and Turkey, and it is consequently a busy place. It has important iron mines and mineral baths in its vicinity.

BO'SNIA, the most north-westerly province of European Turkey, forming an eyalet, governed by a pasha, and including, besides Bosnia proper, the Turkish parts of Croatia and Dalmatia, and the district of Herzegovina (q. v.). It extends between lat. 42° 30' and 45° 15' N., and long. 17° 40' and 21° E. It is bounded N. by the Save and Unna; E. by the Vrina, the mountain-chain of Jublanik, and a branch of the Argentarie Alps; S. by the Scardagh Mountains; and on the W. by the mountains of Cozman, Timor, and Steriza. At a few points in the south it reaches to the Adriatic Sea. It has an extent estimated at 18,800 square miles, with a population of about a million. With the exception of the northern tract, extending along the Save, it is everywhere a mountainous country, and is traversed by more or less elevated ranges of the Dinaric Alps, whose highest peaks rise to a height of from 5000 to 7700 feet above the sea, and are covered with snow from September to June. The mountain slopes are for the most part thickly covered with forests of oak, beech, lime, chestnut, &c., of magnificent growth, and only here and there

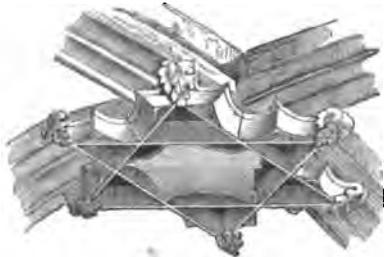

exhibit meadows, pastures, and cultivated spots. The principal river of the country is the Save, on the northern border, into which flow the Unna, the Verbas, the Bosna, and the Drin. The Narenta and the Boyana fall into the Adriatic Sea. The air is salubrious, the climate temperate and mild. It is only in the plain that agriculture is carried on to a considerable extent; grain, maize, hemp, vegetables, fruits, and grapes are produced in great abundance; and their cultivation would be much more extensively and actively prosecuted, but for the heavy impositions laid upon this branch of industry by the Turkish government. Game and fish abound, as well as wild animals, such as bears, wolves, lynxes, &c. The country is celebrated for the breeding of sheep, swine, goats, and poultry; and bees, both wild and tame, are very numerous. The gipsies and Morlacks dig for lead, quicksilver, coal, and iron; but beyond this, mining, owing to repressive government, is entirely neglected, although the country is rich in metallic ores. Commerce and manufactures—chiefly limited to the fabrication of firearms, sabre-blades, and knives—are entirely confined to the towns. The position of B. gives it the transit trade between Austria and Turkey. There are almost no good roads in the country. The population consists of Bosniacs, Croats, Morlacks, Montenegrines, Turks, Germans, Illyrians, Dalmatians, &c., the much greater part being of the Slavonian race. The Bosniacs, or Bosniaks, who form about a third of the inhabitants, are partly Mohammedans and partly of the Greek and Roman Catholic Churches. They are brave, hardy, rapacious, and cruel; rude and repulsive towards strangers, yet among themselves they are peaceful and honest; they are also industrious, simple in their habits, and temperate. The Moslem women in B. are less secluded than in the other Turkish provinces, and have long enjoyed the liberty of appearing in public more or less veiled. The Croats, who form about a sixth of the population, belong partly to the Greek and partly to the Roman Catholic Church; only a few are Mohammedans. They are principally engaged in agriculture, the feeding of cattle, and the barter trade. The Morlacks, who number about 150,000, dwell mostly in the district of Herzegovina, are courteous, clever in business, and extremely ready in adapting themselves to anything. They are inveterate enemies of the Turks. Three-fourths of them are Greek Christians, and the rest Roman Catholics. The Turks form more than a fourth of the inhabitants, the number of Greeks and Jews is between 20,000 and 30,000. B., being a frontier province, is important as a line of defence, and has consequently a great number of fortifications. B., in ancient times, was included in Pannonia; and previous to the 7th c., was governed by princes of its own, called Bans or Waiwodes, who became dependent on Hungary. Being conquered by the Turks, it was finally annexed to the Ottoman empire, in 1522, by Solyman the Magnificent. Since the introduction of reforms, denuding the former hereditary chiefs of their highest prerogatives, and a great part of their revenues, B. has been the seat of almost perpetual disturbance, and several campaigns have had to be undertaken against it by the Turkish government. A most dangerous rebellion broke out in 1851, which was not quelled by Omar Pasha until he had inflicted several defeats on the rebels, and stormed some of their fortresses. Since that time the country has been more quiet.

BOSPORUS, the ancient name of the channel now known also as the Strait of Constantinople, which separates Europe from Asia, and connects the Black Sea with the Sea of Marmora. The name,

which signifies Ox-ford or Cow-ford, was given to it because here, according to the legend, Io, transformed into a cow, swam across; or, as is very generally supposed, because it is so narrow that an ox might swim across. Afterwards, as the same name was bestowed upon other straits, this was designated the *Thracian Bosphorus*. Its south and north entrances have two light-houses each. Its shores are elevated, and throughout its length the strait has 7 bays or gulfs, with corresponding promontories on the opposite side. One of these gulfs forms the harbour of Constantinople, or, as it is often called, the Golden Horn. The length of the Thracian B. is about 17 miles, with a breadth of from little more than a third of a mile to two miles. At the middle of this strait, where it is about 2800 feet in breadth, Darius made his bridge of boats when he marched against the Scythians.—The name of Cimmerian Bosphorus was given by the ancients to the Strait of Kaffa (q. v.), also called the Strait of Yenikale or of Theodosia. The country on both sides of the Cimmerian B. formed, in ancient times, the kingdom of Bosphorus, which was founded by the Archæanactidæ, 502 b. c. They reigned till 480. A new dynasty began with King Spartocles, 480—438 b. c. Under Satyrus I., who died in 393, the kingdom was extended along the Asiatic coast; and under Leucon I., after whom his descendants were called Leuconides, Theodosia was united with it in 360. King Leucanor became tributary to the Scythians in 290; and this tribute afterwards became so oppressive, that Parisades, the last of the Leuconides, preferred to become subject to Mithridates, king of Pontus, who in the year 116 b. c. vanquished the Scythians, and set his son, Machares, on the throne of Bosphorus. He having taken his own life, and Mithridates having followed him to the grave, the Romans gave the country, in 63 b. c., to Pharnaces, the second son of Mithridates, and after his assassination, to several princes who gave themselves out for descendants of Mithridates. When at last the family became entirely extinct, in 259 a. d., the Sarmatians made themselves masters of the kingdom, from whom the inhabitants of the Chersonesus took it in 344. Along with Tauric Chersonesus, it afterwards formed a part of the Eastern Roman Empire, until the Chazars, and afterwards the Tatars, under Mongolian princes, made themselves masters of it. See TAURIDA.

BOSQUET, PIERRE FRANÇOIS JOSEPH, a distinguished French marshal, born 8th November 1810 at Mont de Marsan, in the department of Landes, entered, in 1829, the Polytechnic School at Paris, and in 1833 joined the artillery as sub-lieutenant. In June 1834, he proceeded with his regiment to Algeria, where he became conspicuous for his military tact, energy, and valour. In 1847, he had attained the rank of colonel, and the following year he was named general of brigade by the republican government. In the end of 1853, he returned to France, and in 1854 was appointed by the emperor general of division. He had the command of the second division of the French army in the Crimea, and at the battle of the Alma, 25th September, his successful manoeuvres against the Russian left wing were mentioned in Marshal St Arnaud's dispatch to the emperor as deciding the fate of the day. At Inkermann, 25th November, he contributed greatly to the defeat of the Russians. His conduct on this occasion was noticed with praise by Lord Raglan in his dispatch, and the British parliament voted its thanks to him in a special resolution. He also took a leading part in the capture of the Malakoff, 8th September 1855; but a wound he received from the bursting of a shell obliged him to retire to France. In 1856 he was made field-marshall. He died in 1861.

**BOSS**, in Architecture, a raised ornament, covering the intersections of the ribs of ceilings. They are more frequently seen in vaulted roofs, as in the

Boss.—From Notredame la Riche, Tours.

aisles of a church, but occur also where the ceiling is flat. In early Norman work there are generally no bosses, and they become richer and more frequent as we advance towards the decorated and perpendicular styles. In the decorated style the B. usually consists of foliage, sometimes combined with animals, heads, and the like. Coats-of-arms, charged with armorial bearings, came then also to be used for this purpose, though they were more frequent in the perpendicular. —The B. of a bit is the ornament with which a bridle-bit terminates at each end. It was borne in the arms of the corporation of Lorimers.

Boss, on  
Norman shield.  
See LORIMER.

**BOSSI**, LUIGI, an Italian archaeologist and historian, was born at Milan in February 1785; studied at Pavia, and became a canon of the cathedral of Milan; but when the French entered Italy, he took the side of the invaders, and was appointed by Bonaparte agent of the French government at Turin, and afterwards prefect of the archives of the kingdom of Italy. He died at Milan 10th April 1835. He was an extremely prolific author, and produced more than 80 works, great and small, including theological and religious works, dissertations on antiquarian subjects, historic works, works on subjects connected with the fine arts, tragedies, comedies, &c. That his works have afforded many opportunities for unfavourable criticism, is only what might be supposed, from their number and variety. His *Introduzione allo Studio dell' Arti del Disegno*, is instructive and much esteemed. His most important historic works are a much enriched translation of Roscoe's *Life of Leo X.* (12 vols., Milan, 1816—1817); *Researches concerning Christopher Columbus* (Milan, 1818); and a *History of Italy* (19 vols., Milan, 1819—1823).

**BOSSUET, JACQUES BÉNIGNE**, a distinguished French pulpit orator, was born, 27th September 1627, at Dijon; received his earlier education in the Jesuit college there; and then came to Paris to the College of Navarre, where he studied the Sacred Scriptures, the works of classical antiquity, and the Cartesian philosophy. In 1652, he was made a doctor of the Sorbonne, and a canon in Metz. Here he was called by the bishop to reply to the Catechism of the Protestant minister, Paul Ferri, and this he did in a way that commanded the admiration even of Protestants. He soon attained great distinction as a pulpit orator, and in 1661 he was made preacher to the court. His discourse on the occasion of Marshal Turenne's conversion to the Catholic

286

church obtained for him the bishopric of Cordan. The king having, in 1670, intrusted to him the education of the Dauphin, he resigned his bishopric in 1671, because he believed that he would be unfaithful to his duty if he retained it during a continued absence from his diocese. He was now made a member of the Academy. The care with which he attended to the education of the Dauphin was rewarded, in 1680, by his nomination as first almoner of the Dauphin, and in 1681 by his appointment to the bishopric of Meaux. He was the author of the four articles, which secured the freedom of the Gallican Church, and the rights of the king in regard to it, against the aggressions of the pope; and his eloquence in the Assembly of the French clergy, in the year 1682, obtained their adoption of these articles. In 1697, he became a member of the Council of State, and in the following year first almoner to the Duchess of Burgundy. He spent the last year of his life in his diocese, where he died 12th April 1704. He was alike strict in morals and in religious doctrine: his strictness in the latter he shewed particularly in his controversy with Fénelon, whom he reproached as a heretic for his defence of Quietism (q.v.). His style is vigorous and artistic. His orations at the funerals of the Duchess of Orleans and the great Condé are particularly noted as master-pieces of this kind of eloquence. All his writings attracted much attention. For the defence of those dogmas of the Catholic Church which are rejected by Protestants, he wrote his *Exposition de la Doctrine de l'Eglise Catholique sur les Matières de Controverse* (Par. 1671). His greatest controversial work is his celebrated *Histoire des Variations des Eglises Protestantes* (2 vols., Par. 1688), in which he founds his argument chiefly upon the doctrinal diversities of the churches of the Reformation. To the defence of the four articles of the Gallican Church he devoted his *Defensio declarationis celebrissima, quam de Potestate Ecclesiae sancti cleris Gallicus a. 1682* (2 vols., Luxemb. 1730). With a view to the instruction of the Dauphin, he wrote his *Discours sur l'Histoire Universelle jusqu'à l'Empire de Charlemagne* (Par. 1681), a work particularly deserving of notice, as the first attempt at a philosophical treatment of history. The continuation of it to the year 1661 (Par. 1805) is entirely derived from materials which he left behind him, but to which the last touch of his own hand was wanting. Another fruit of his political and historical studies, was the *Politique tirée de l'Ecriture Sainte* (Par. 1709). The most complete edition of his works is that published under the care of the Benedictines (46 vols., Versailles, 1815—1819).—His nephew, JACQUES BOSSUET, died bishop of Troyes, 12th July 1743. His very extensive correspondence, chiefly devoted to the elucidation and investigation of the views of Fénelon, is included in the above-mentioned edition of the works of his uncle.

**BOSSUT, CHARLES**, a French mathematician and natural philosopher, born 11th August 1730, at Tartaras, near Lyon. So early as the year 1752, he became professor of mathematics in Paris, and in 1768 was received into the Academy of Sciences. The revolution deprived him of his situation and his income, and he lived in the greatest seclusion, and in almost misanthropical discontentment, till under the Empire he was appointed a professor in the Polytechnic School. He died 14th January 1814. His works are very numerous. The following may be mentioned as particularly valuable: *Recherches sur la Construction la plus avantageuse des Dugues* (Par. 1764); *Recherches sur les Aléas que la résistance de l'éther peut produire dans le Mouvement des Planètes* (Par. 1776); *Nouvelle*

*Expériences sur la Résistance des Fluides, par d'Alembert, Condorcet, et Bossut* (Par. 1777); *Traité élémentaire de Mécanique et de Dynamique* (Charleville 1763); *Cours Complet des Mathématiques* (7 vols., Par. 1795—1801); *Cours de Mathématique à l'Usage des écoles Militaires* (2 vols., Par. 1782); *Essai sur l'Histoire Générale des Mathématiques* (2 vols.; 2d ed., Par. 1810), one of the best works on the history of mathematics; and *Traité du Calcul Différentiel et Intégral*. All his works are distinguished by methodical arrangement and great clearness. He was a great admirer of Pascal, and edited his works (16 vols., Par. 1779), to which he prefixed an introductory *Discours sur la Vie et les Ouvrages de Pascal*, in 5 vols.

BOSTAN (El), a town of Asiatic Turkey, in the pashalic of Marash, situated in a plain on the Sihum, on the north side of Mount Taurus. Lat. 39° N., long. 36° 23' E. B. can be surrounded with water on the approach of an enemy; it has several mosques, and a considerable trade in wheat. It occupies the site of the Cappadocian Comana, which had a celebrated temple dedicated to a deity which is 'supposed to have been called Ma in the language of the country, and to be the moon-goddess.' Pop. between 8000 and 9000.

BOSTANJI, a class of men in Turkey who, originally the sultan's gardeners (the name being derived from *bostan*, a garden), now perform, in addition to their garden labour, a variety of duties, such as mounting guard at the seraglio, rowing the sultan's barge, and attending on the officers of the imperial household. They are under a chief called Bostanji Bashi, who holds the rank of a pasha, and is governor of the sultan's residences, and steersman of his barge. He also holds the inspector-generalship of the woods and forests in the vicinity of the capital, has the jurisdiction of the shores of the Bosphorus and Sea of Marmora, and is, altogether, so important a functionary that only personal favourites of the sultan can hope to fill the office. The financial reforms of Sultan Mahmoud, however, have greatly lessened the emoluments of the post. The B. at one time amounted to 5000, and were divided into companies like the janissaries, with whom they were united in military duty. In wartime, their strength was 12,000. A scarlet bonnet, of excessive dimensions, formed the distinctive part of their costume. Their number now does not amount to more than 600.

BOSTON, an ancient English borough and seaport in Lincolnshire, on both sides of the Witham, 28 miles south-east of Lincoln. It is supposed to be identical with the Icanhoe, where St Botolph founded an abbey in 654, destroyed in 870 by the Danes. Under the Normans, B. became a place of importance, and in 1204 it paid the largest dues (£780) of any English port except London (£836). In the reign of Edward III., many foreign traders settled, and the merchants of the Hanseatic League established a guild in Boston. After their departure, the town declined, and the suppression of the monasteries by Henry VIII. further injured it; but his grant of a charter of incorporation, and Mary's subsequent grant of extensive lands, partly compensated for this. The modern town consists chiefly of two good streets, one on each side of the river. The parish church of St Botolph (1309), 245 by 98 feet, is one of the largest without cross aisles in England, and has a fine tower 300 feet high, surmounted by a lantern visible 40 miles out at sea. The clearing of the river of silt and the closing of the adjacent fens have greatly promoted the trade of Boston. Vessels of 300 tons can reach the heart of the town. The chief export is corn. Pop.

of municipal borough (1871), 14,526; of parliamentary, which returns two members to parliament, 18,279. B. is a great market for cattle and sheep, and has manufactures of canvas, iron, brass, ropes, leather, bricks, whitling, and hats. In 1866, 139 vessels, of the aggregate burden of 7350 tons, and 1 steam-vessel, of 15 tons, were registered as belonging to B. Fox, the martyrologist, was born there.

BOSTON, capital of Massachusetts, United States, is situated in lat. 42° 21' N., and long. 71° 4' W. It stands at the west end of Massachusetts Bay, on an inlet, which, whether for defence or trade, forms one of the best havens in the world. This inlet, known as Boston harbour, the primary source of the city's growth and prosperity, has a seaward barrier of two headlands, the interval of 4 miles being so subdivided by an insular breastwork as to leave only three practicable entrances, the main one barely wide enough for two vessels to pass one another; while the enclosed space of about 75 square miles—at least half of it affording depth for the largest ships—greatly augments, with its islands and its peninsulas, both its military and commercial capabilities. On an oblong peninsula, of about 700 acres, running to the north-east, B. was founded in 1630, its original owner, John Blackstone, selling out his right and title, five years thereafter, for £30. With so well chosen a site, and, doubtless, also through the industry and enterprise of its Puritan occupiers, the new town increased so steadily in wealth and population, that in less than a century and a half it became the foremost champion of colonial independence. Since then it has overleaped its natural limits, swarming off, as it were, into an island towards the north-east and into the mainland on the south-east, and consists of Old, East, and South Boston; Boston Highlands, formerly Roxbury, annexed in 1868; and Dorchester, annexed in 1870; which are connected together by bridges, while the united whole has been joined to the inner shore of the harbour by an immense dam called the Western Avenue. All the divisions of the city are of an uneven surface. Undulation, in fact, is a characteristic of the entire neighbourhood—continent, islands, and peninsulas alike. From this irregularity, so different from the straight and formal lines of street in American cities, and also from being built of a very neat kind of brick, B. has much the appearance of a substantial English provincial town; the resemblance being perhaps heightened by the dress, manners, and feelings of the inhabitants, who are essentially of the old British type, as befits the descendants of the 'Pilgrim Fathers.' On a peninsula, to the north of East B., rises Bunker's Hill, so famous in the War of Independence; while the Dorchester heights, only less famous, occupy the centre of South B.; and, lastly, the peninsula of Old B. seems to have originally taken the name of Tremont, from its three mounts or hillocks. Between 1840 and 1850 the population had swelled from 93,383 to 136,881. In 1860, it was 200,000; and in 1870, 250,526. Among the public buildings, the principal are the State House, City Hall, Faneuil Hall, Faneuil-hall market, Massachusetts hospital, custom-house, county jail, houses of industry and correction, 2 theatres, an athenaeum, an odeon, a library, a music hall—said to be one of the finest concert rooms in the world—and 129 churches. Among other objects worthy of note are the Common, a beautiful park of 50 acres, on the peninsula; the wharfs and quays; and the bridges, seven in number, which unite together the three portions of Boston. The water-works demand more special mention. To say nothing of an earlier enterprise of the kind on a

smaller scale, Long Pond, distant 20 miles, and capable of yielding 10 millions of gallons a day, has, since 1845, been conveyed by a brick conduit into the grand reservoir of Brookline, at the further end of the Western Avenue, and thence been carried into the subordinate reservoirs respectively of the three sections of the city. B. as the centre—social, political, and commercial—of the best educated and most intelligent state in the Union, is pre-eminent throughout the republic in literature and science. Its trade, likewise, is marvellous: it is, in fact, more marvellous, in proportion to physical facilities, than even that of New York, for while the latter city, with the lakes on the one side and the ocean on the other, and with the Hudson as a link between them, drains regions of vast extent and singular fertility, B., to say nothing of rugged soil and ungenial climate, is cut off from the interior, such as it is, by the entire want of inland waters. But what New York has so largely inherited from nature, B. has in some measure created for itself. By eight great systems of railway it reaches, besides the coasts to the north and south, the St Lawrence and the Lakes, the Hudson and the Mississippi; while, as the Transatlantic terminus of the Cunard line, it virtually connects those channels of communication with Great Britain and its net-work of iron roads. In several departments of maritime traffic, such as the coasting intercourse and the trade with Russia, India, and China, B. is understood to possess far more than its share; and as the port of the manufacturing districts of the Union, it may be said to monopolise the carrying alike of raw material and of finished goods. The chief exports are beef, pork, lard, fish, ice, woollens, cottons, paper, boots and shoes, cordage, hardware, and furniture; while the imports, wafted from all corners of the world, comprise nearly every article that has a name in commerce. The total number of vessels that entered the port in 1869 was 4,831, of 1,885,862 tons. The total value of the imports in the same year was 44,628,395 dollars; and of the exports, 14,301,878 dollars. To specify a few details: the chief articles of import, by land and sea, in that year were cotton, to the value of 31,000,000 dollars; flour, 13,000,000; leather, 21,500,000; and wool, 23,250,000. The principal exports were provisions, lard, &c., to the value of 1,550,000 dollars; cotton, petroleum, and tobacco were exported, each to about the same value—1,000,000 dollars; fish and spirits also were estimated to amount each to about 500,000 dollars. There were in the city, in 1870, 70 banks, with an aggregate capital of 48,600,000 dollars; and there are issued 100 periodicals, nine of which are dailies. In 1822, B., previously ruled like an ordinary township by select men, adopted a municipal organisation, with a mayor, 8 aldermen, and 48 councillors—the councillors forming one board, and the aldermen and mayor another.

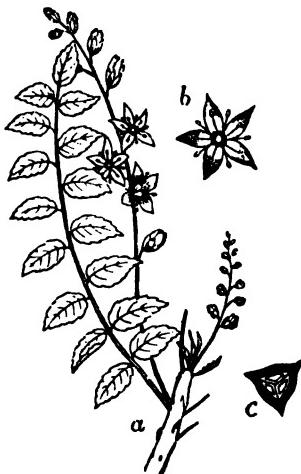

BO'STON, THOMAS, a Scottish divine, once extensively popular, was born of poor parents at Dunse, Berwickshire, March 7, 1676. As early as his 12th year he was concerned about the state of his soul, and while only a boy at the grammar-school, he formed a society of three for religious conference and social prayer. After a hard struggle, he succeeded in entering Edinburgh University in 1691. He received licence as a preacher in 1697, and was greatly appreciated by the serious portion of the community; but his uncompromising character prevented him from receiving a clerical charge for two years. He was then ordained minister of Simprin, and in 1707 was translated to Ettrick, where he died on the 20th May 1732. Of his voluminous works the best known, but not the most agreeable, is the *Fourfold State*, published in 1720. It discourses of

man's paradisaical integrity, his ruin by the fall, his begun regeneration on earth, and consummate bliss or woe hereafter. An excellent little treatise of B.'s is entitled *The Crook in the Lot*. As a pastor, B. was eminently laborious, and deservedly popular. In the ecclesiastical courts he distinguished himself by his zeal in defence of the church's independence, and in the controversy regarding the *Marrow of Modern Divinity* (which was objected to as being too free in its offers of salvation), he was one of the ten ministers who declared their approval of that work. See MARROW CONTROVERSY. As a theologian, B. is perhaps the most 'Representative Man' in the whole list of Scottish divines. His language, sentiments, and peculiar modes of expressing the peculiarities of Calvinistic psychology, have coloured the style of Scottish preaching more than any other writer of the same school has done. Although often displaying what we should now call narrowness and ignorance, B. exhibits also flashes of insight and beauty, quaint felicities of diction—as, for instance, when in *The Crook in the Lot*, he warns the prodigate against the possibility of a 'leap out of Delilah's lap into Abraham's bosom'—and an occasional shrewdness of thought, which are even yet worth studying. B.'s autobiography used to be a great favourite with the Scottish peasantry.

BOSWELL, JAMES, Esq., of Auchinleck, in Ayrshire, celebrated as the friend and biographer of Dr Samuel Johnson, was born October 29, 1740, at Edinburgh, where his father was one of the judges of the Court of Session, and as such was styled Lord Auchinleck. He was intended by his father for the profession of an advocate, and studied first at Glasgow, and afterwards at the then famous university of Utrecht, to which he went in 1763. When in London in that year he made the acquaintance of Johnson, an event of decisive importance for his whole subsequent life. The acquaintance was earnestly sought by himself, and originated in his strong literary tastes and his ardent admiration of Johnson's writings. He spent one winter at Utrecht, and then proceeded on a tour through Germany, Switzerland, and Italy, and visited Corsica with a letter of introduction from Rousseau to Paoli, with whom he contracted a warm and lasting friendship. He enthusiastically adopted the cause of Corsican independence; and after his return to Scotland, published an *Account of Corsica, with Memoirs of General Pasquale Di Paoli* (Glasg. 1768; 3d ed., Lond. 1769), which was speedily translated into several languages. B. became a member of the Faculty of Advocates in 1766, but never devoted himself with earnestness to the business of law. In 1773, he was admitted into the Literary Club instituted by Johnson, and of which Burke, Goldsmith, Reynolds, and Garrick were members. From this time he made it his principal business to note down the sayings and doings of Johnson, with whom he associated on most intimate terms, and whom he accompanied on his tour in Scotland and the Hebrides in 1773. Boswell was married in 1769 to a lady named Montgomery, by whom he had several children. Led by his taste for London society, he removed thither at a mature period of life, and entered at the English bar, but without attaining to any success in the profession. After Johnson's death in 1784, he employed himself in arranging the materials which he had collected, and preparing his long-contemplated biography. His *Journal of a Tour to the Hebrides* appeared in 1785, his *Life of Samuel Johnson*, in 2 vols., in 1791. Both have gone through many editions. Boswell has been emphatically styled by Macaulay 'the first of biographers.' His work is indeed full of details, but

they are such as exhibit character, and are arranged in the most interesting manner. He neither conceals his own faults, nor those of Johnson, but presents a picture of which the truthfulness is too evident to be questioned; and Johnson is perhaps already better known by the pages of B. than by any of his own writings. B. died in London, June 19, 1795. Besides the works already mentioned, he was the author of one or two minor productions of temporary interest. In December 1856, there was published a posthumous volume of *Letters of James Boswell, addressed to the Rev. W. J. Temple, from the Original MSS.*, in which the gay, insouciant character of the man very strongly appears. His eldest son, Sir ALEXANDER Boswell, Baronet of Auchinleck, born 1775, was the author of a number of Scottish songs, full of humour, which he collected into a volume, entitled, *Songs, chiefly in the Scottish Dialect* (Edin. 1803), and some of which attained considerable popularity. He also wrote *Edinburgh, or the Ancient Royalty*, a picture of Scottish manners in the dialogue form, and edited many of the older productions of Scottish literature. A duel with Mr Stuart of Dunearn, occasioned by personal allusions in a publication connected with a parliamentary election, resulted in his death on March 26, 1822.

BOSWELLIA, a genus of trees of the natural order *Amyridaceæ* (q. v.), having flowers with a small five-toothed calyx, five petals, and a crenulated glandular disk; a triangular capsule with three valves, three cells, and one seed in each cell; the seeds winged on one side; their cotyledons intricately folded, and cut into many segments. Two or three species only are known, of which the most interesting is *B. serrata* (or *B. thurifera*), the tree which

Boswellia serrata:

a, part of a branchlet, with leaf and raceme of flowers; b, a single flower; c, a capsule, cross section.

yields OLIBANUM (q. v.), now very generally believed to have been the FRANKINCENSE (q. v.) of the ancients. It is a large timber-tree, with pinnate leaves, which have about ten pairs of hairy serrated oblong leaflets, and an odd one, each leaflet about 1– $\frac{1}{4}$  inch in length. The flowers are small and numerous, in axillary racemes, and of a pale pink colour. When the bark is wounded, the olibanum flows out, of a delightful fragrance, and hardens by exposure to the atmosphere. The tree is found in the mountainous parts of Coromandel, and is

supposed to be also a native of other parts of India, and of Persia, Arabia, and perhaps Abyssinia. *B. glabra*, a very similar species, a native of India, also yields a resin, comparatively coarse, which is sometimes used for incense, and is boiled with oil as a substitute for pitch.

BO'SWORTH, or MARKET BO'SWORTH, a market-town in Leicestershire, on an eminence in a very fertile district, 12 miles west of Leicester. Pop. in 1871, 13,746, many of whom are employed in knitting worsted stockings. On a moor in the vicinity was fought, 1485, the battle in which Richard III. was slain, and which terminated the Wars of the Roses. On an elevation, called Crownhill, Lord Stanley placed the crown on the head of the Earl of Richmond, Henry VII. Here Simpson the mathematician was born; Dr Johnson was an usher in the Free Grammar School, in which Salt the Abyssinian traveller, and Richard Dawes the Greek critic, were educated.

BO'SWORTH, JOSEPH, D.D., a distinguished philologist, is a native of Derbyshire, where he was born in 1788. He graduated first at Aberdeen, and afterwards at Leyden; he also took the degrees of B.D. and D.D. at Cambridge and Oxford. He obtained a curacy in the English Church in 1815, and two years afterwards the vicarage of Horwood Parva, Buckinghamshire. He now devoted such time as an active discharge of his parochial duties left at his disposal to literature, and especially to researches in Anglo-Saxon and its cognate dialects. The result of his labours appeared in 1823 in a work, entitled *Elements of Anglo-Saxon Grammar*. Fifteen years afterwards, he published the work by which his name is best known, *A Dictionary of the Anglo-Saxon Language* (Lond. 1838), which is considered alike remarkable for its ripe scholarship, enlarged views, copiousness, and accuracy; containing, as the *Edinburgh Review* remarked, 'within a moderate compass, a complete apparatus for the study of Anglo-Saxon.' An abridged edition has since been issued by the author, who has also published some other works of a philological character. B. resided in Holland eleven years, from 1829 to 1840, first as British chaplain at Amsterdam, and subsequently at Rotterdam. He returned to England in 1840, and was presented to the vicarage of Waite, in Lincolnshire. In 1865, he published the Gospels in Gothic of 360 A.D., and the Anglo-Saxon of 995 A.D., in parallel columns with Wycliffe's Version of the year 1389, and Tyndale's of 1526.

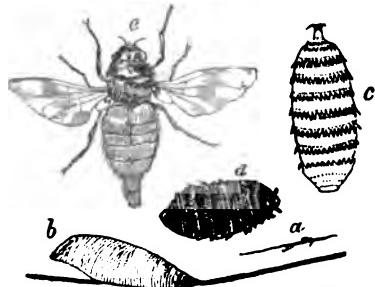

BÖSZÖRME NY, the name of two towns in Hungary, one in the county of Bihar, about 12 miles west-north-west of Grosswardein, with a population (1869) of 3265; the other a free town of the county of Szabolcs, 12 miles north-north-west of Debreczin, with a population of 3200.

BOT, BOT-FLY, and GAD-FLY, names common to many insects of the family *Oestridæ* (q. v.) or *Oestracidae*, the genus *Oestrus* of Linnaeus. The name bot is sometimes restricted to the larvae, which appear to have been its original use, the other names being given to the perfect insects; the name gad-fly often to insects of the genus *Tabanus* (q. v.), to which some try to restrict it. The insects of this family are now supposed not to be those which were called *Oestrus* by the ancients, although, like them, extremely troublesome to cattle. They are Dipteron (two-winged) (q. v.) insects, nearly allied to the *Muscidae* (House-fly, Flesh-fly, Blow-fly, &c.), with small 3-jointed antennæ, and mouth destitute of a proboscis.—The Horse-bot, or Gad-fly of the Horse (*Gasterophilus*, or *Gastrus*, or *Oestrus Equi*), sometimes also called the *Breeze* and

BOT.

*Horse-bee*, is much less common in Britain than in some parts of the continent of Europe, and occurs chiefly in elevated heathy districts. It is not quite half an inch in length, woolly, with yellowish gray head, rusty thorax, abdomen, and the wings whitish, with brownish-gray spots. The abdomen of the female terminates in a blackish horny tube. In the latter part of summer, the female hovers about horses, and deposits her eggs on their hairs, where they remain attached by a glutinous substance until they, or the larvae just emerging from them, are licked off by the tongue of the horse, their destined place being its stomach. It is believed that the fly deposits her eggs only on those parts which are accessible to the horse's tongue, seeming to prefer the back of the knee-joint, where they may sometimes be found in hundreds. The larva is yellowish, without feet, short, thick, soft, composed of rings which have a double row of short teeth surrounding them; it is somewhat acuminate at one end—the head; and the mouth is furnished with two hooks, one on each side, for taking hold of the inner coat of the horse's stomach, to which the B. attaches itself, and from

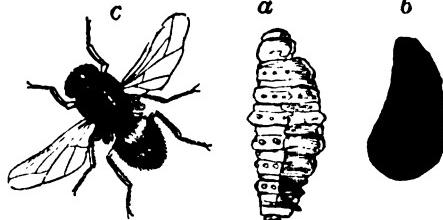

female has an ovipositor—a remarkable organ, formed of a horny substance, and consisting of four tubes

Horse Bot-fly:

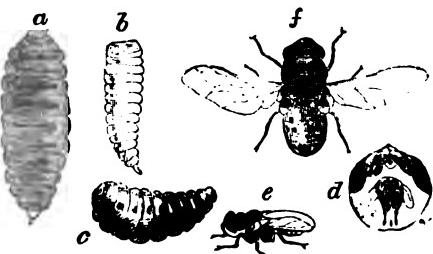

a, a horse-hair with eggs of bot-fly; b, one egg magnified; c, larva; d, pupa; e, perfect insect, a little larger than life.

which it derives its subsistence, hanging in clusters sometimes of three or four, sometimes of more than one hundred. Here it spends the winter, and in the following summer, when it is about an inch long, it disengages itself, and being carried through the horse's intestines, burrows in the ground; and changes into an oval black pupa with spiny rings, from which, in a few weeks, the perfect insect comes forth. Multitudes, of course, become the prey of birds, before they can accomplish their burrowing.—It has been disputed whether or not bots are very injurious to horses; and some have even maintained that, when not excessively numerous, their presence is rather beneficial, an opinion which is certainly not recommended by its apparent probability, whilst it seems to be universally admitted, that in great numbers they are hurtful.—The Red-tailed Horse-bot (*G. or C. haemorrhoidalis*), also a British species, deposits its eggs upon the lips of the horse, distressing it very much by the annoyance which it gives in so doing. The larvae attach themselves chiefly to the surface of the intestine, about the anus of the horse, and sometimes cause an annoying irritation. Linseed-oil is used for their removal.—The Ox-bot, or Ox Gad-fly (*Oestrus* or *Hypoderma Bovis*) is more troublesome than any species of horse-bot. It is a beautiful insect, not quite half an inch long, and thicker in proportion than the horse-bots; it has brown unspotted wings; the face whitish, the crown of the head brown, the thorax black, the abdomen whitish, with a broad black band around the middle, and yellow hairs at the extremity, where also the

a, larva, full grown, natural size; b, pupa; c, perfect insect, a little larger than life.

retractile within one another, like the pieces of a telescope; and the last of them terminating in five points, three of which are longer than the others, and hooked. By means of this organ, a small round hole is pierced in the hide of an ox's back, in which an egg is deposited. The fly is very quick in depositing her egg, not remaining upon the back of the animal more than a few seconds. Cattle exhibit great alarm and excitement at the presence of the gad-fly, and rush wildly about, with head stretched forward, and tail stuck out, to escape from their tormentor. The further injury done by this insect is not, however, usually great; the larva—a little pearl-white maggot (*warble* or *worm*)—feeding upon the juices beneath the skin, causes a swelling, called a *warble*, forming a sort of sac, within which it lives and grows, amidst a kind of purulent matter suited to its appetite; and from which it finally emerges, leaving a small sore, and like the horse-bot, undergoes its further transformations in the ground. By pressure on the warbles, bots may be destroyed, and when they are numerous, assiduous oiling of the back of the ox is resorted to for the same purpose.—The SHEEP-BOT (*Cephalemyia* or *Oestrus Ovis*) is a much more serious pest than any other British species, and is not unfrequently very destructive to flocks. The insect is smaller than either the ox-bot or horse-bot; it is of grayish colour, with a large head and yellow face, and is most abundant in damp situations and

woody districts. It is to be seen chiefly in the months of June and July. Sheep exhibit great alarm when it approaches them, and seem to seek, by keeping their noses close to the ground, and by incessant motion of their feet, to keep it from

## BOT—BOTANIC GARDEN.

entering their nostrils. It is in the nostrils of the sheep that this fly deposits its eggs, and the larvae, when hatched, make their way into the maxillary and frontal sinusses, feeding upon the juices there, until they are ready to change into the pupa state, in April or May of the following year, when they find their way again through the nostrils to the ground. They seem to cause great irritation in their progress up the nostrils of the sheep, and the poor animals run hither and thither, snorting and in great excitement. ‘The common saying, that a whimsical person is *maggoty*, or has got *maggots in his head*, perhaps arose from the freaks the sheep have been observed to exhibit when infested by their bots.’ The bots cause considerable irritation in the cavities, where they usually fix themselves, and sometimes get into the brain, and cause death.—These larvae move with considerable quickness, holding on by the hooks with which their mouth is furnished, and contracting and elongating the body. It is said that flocks fed where broom is in flower are never infested with them; and when many cases arise in a flock, it is found particularly advantageous to remove it to a dry soil.—Goats, deer, and other quadrupeds are also liable to be assailed by different kinds of gad-fly. The eggs of one of the species which attacks the fallow-deer, are deposited in the nostrils, and the larvae make their way in large numbers to a cavity near the pharynx. Rein-deer are excessively tormented by these insects, one kind depositing its eggs in their nostrils, and another in their skin; and it is no infrequent thing for a large part of a flock to be destroyed by them. When feeding where bot-flies are numerous, they keep such watch against them, that they neglect to eat, become emaciated, and often actually perish in consequence.—Even human beings have sometimes been afflicted by insects of this family. Humboldt saw Indians in South America having the abdomen covered with tumours produced by their larvae.

BOTANIC GARDEN, a garden devoted to the promotion of botany, and in which plants are collected and cultivated in order to scientific study. The various economical applications of botany, however, in agriculture, manufactures, medicine, &c., are almost always kept particularly in view; and one great object of a B. G. is to bring to a country useful foreign plants, to determine the question of their suitableness to its climate, and to introduce those which may be cultivated with advantage. B. gardens are now deemed indispensable to universities; they are reckoned among the public institutions of great cities, and even of nations, and are established in new colonies, not only for the sake of science, but as one of the means of promoting their prosperity. They were utterly unknown to the ancients, although some of the secondary objects in which they are found most useful engaged the attention both of Greeks and Romans. The first approach to a B. G. appears to have been made about 1309 A. D., in the garden of Matthaeus Sylvaticus, at Salerno; botanical science, however, being merely subservient to medicine. Of a similar character was the medical garden established at Venice, by the republic, in 1333. The example of Venice was followed by other Italian cities, and plants from different parts of the world began to be collected. At length, about contemporaneously with the revival of botanical science in modern times, the first true B. G. was formed in 1533 at Padua, by Musa Brassavola, for Gaspar de Gabrieli, a wealthy Tuscan noble; which was soon followed by those of Pisa, Florence, Bologna, and Rome. The first public B. G. was that of Pisa. A public B. G. was established at Padua in 1545, by a decree

of the republic of Venice, at the request of the professors and students of medicine. The republic of Venice greatly encouraged the study of botany by sending persons to the Levant, to Egypt, and even to India, to procure plants for this garden.—The B. G. of Leyden was begun in 1577; it enjoyed in its infancy the care of Clusius, and was brought to great perfection by Boerhaave, who was professor of botany there.—The first public B. G. in Germany was established by the Elector of Saxony at Leipzig in 1580, and was soon followed by others.—France had no B. G. till Louis XIII. established the *Jardin des Plantes* at Paris, which was begun in 1610, but not completed till 1634.—Nor was there any public B. G. in England till 1632, when that of Oxford was founded by the Earl of Danby. Private B. gardens, however, had existed in England for the greater part of a century before.—The B. G. of Edinburgh, the first in Scotland, was founded about the year 1680, as a private B. G., by Dr. afterwards Sir Andrew Balfour, a zealous naturalist, who had inherited a collection of plants formed by a pupil of his own, Patrick Murray of Livingston, at his country seat, and transferred them to Edinburgh; and the city of Edinburgh afterwards allotted to it a piece of ground, and allowed an annual sum for its support out of the revenues of the university.

The B. G. at Kew occupies a high place among British national institutions: it possesses one of the richest collections of plants in the world, and has been greatly improved under the care of Sir William Jackson Hooker, who was director of it from 1841 to 1865. The *Hortus Kewensis* of Mr Aiton, to whom the garden owed much of its prosperity in the 18th c., illustrates the greatness which it had even then attained. One of its chief glories is now its immense palm-house, finished in 1848, which is 362 feet in length, and the central part of it 100 feet wide, and 66 feet high.—A new palm-house has, in like manner, greatly added to the attractions and value of the B. G. of Edinburgh. It is 100 feet long by 60 feet wide, and 70 $\frac{1}{2}$  feet high. These houses permit something of the stateliness and magnificence of the palms of the tropics to be seen in Britain.

Of B. gardens on the continent of Europe, the *Jardin des Plantes* may be regarded as holding the first place, both with reference to the strictly scientific study of botany, and to the care bestowed upon the introduction and diffusion of useful or beautiful plants from all parts of the world. There exists in France what may be called a system of B. gardens—one at least in every department—to which plants are sent from the *Jardin des Plantes*, and from which, as they continue to be multiplied by propagation, they soon find their way into the hands of nurserymen and private cultivators. The B. G. connected with the imperial palace at Schönbrunn, in Austria, and that of Berlin, are the greatest in Germany. The former, which was begun in 1763 by the Emperor Francis I., was supplied with West Indian plants at enormous expense, the celebrated Jacquin being sent to procure them. The B. G. of New York is perhaps the most worthy of notice among the numerous botanic gardens of America; and that of Calcutta deserves to be mentioned, as an important connecting-link between the B. gardens of Europe and the botany of India. It has enjoyed the care of a succession of eminent botanists, and has been very useful both in transmitting Indian plants to other parts of the world, and in introducing valuable productions of other countries into India.

In the laying out and arranging of B. gardens, different methods are adopted, mere convenience and beauty being in some cases primarily regarded, and these in other cases being sacrificed to the

supposed interests of science in an attempted scientific arrangement. A perfect adherence to a botanical system is, for obvious reasons, impossible; but a scientific arrangement of the plants in natural groups, in so far as it can be conveniently accomplished, greatly increases the usefulness of a B. G., and facilitates the study of botany. Sometimes houses are devoted to particular orders of plants, as palms, heaths, or orchids; sometimes to plants of particular habit, as aquatic plants; and sometimes portions of the garden are advantageously devoted to the exhibition, at one view, of plants valuable for particular uses, as cereals or corn-plants, plants yielding fibre, &c.

BOTANO'MANCY, divination by means of planta. See DIVINATION.

BOTANY (Gr. *botane*, an herb), the science which has for its subject the Vegetable Kingdom (q. v.). Everything that relates to plants is included in this science; there are, therefore, several great branches of it, in many respects very different from each other. Of these branches of the science, some, relating to plants in general, rather than to particular kinds or species, are sometimes included under the designation of *General B.* (sometimes called *Phytomony*; Gr. *phyton*, a plant, and *nomos*, a law); whilst those which relate to particular species, their distinctive characters, distribution, &c., are, in like manner, comprehended under the term *Special Botany*.—In the former of these departments, the first place must be assigned to *Structural B.*, also called *Organology*, or *Organography*, which has for its subject the structure of plants, the textures of which they are composed, and their various organs. Subordinate to this are the study of the elementary tissues of plants, sometimes called *Vegetable Histology* (see *Histology*), and that of the anatomy of plants, sometimes called *Phytotomy* (Gr. *phyton*, a plant, and *tome*, a cutting); both of which have recently been prosecuted with great assiduity. In both, the microscope is an indispensable instrument, and by means of it all the important discoveries of modern times have been made. Intimately connected with these is *Morphology* (Gr. *morphe*, a form, and *logos*, a discourse), that branch of botanical science which relates to what has been called the *Metamorphosis of Organs*, or, in other words, the gradual transmutation of leaves by the processes of vegetable life into the various organs with which a plant is provided, and their consequent assumption of new forms and adaptation to new uses. This branch of B., entirely of recent origin, has been described as being in the vegetable what comparative anatomy is in the animal kingdom, and has now become the exposition of an admitted great general law, almost equally important in reference to structural B. and to vegetable physiology. *Vegetable Physiology* or *Physiological B.* treats of the various kinds of organic activity which are displayed in the life of plants. It is based upon *Structural B.*, an intimate acquaintance with which is indispensable to the study of it. The arguments or illustrations of natural theology, derived from B., are chiefly taken from structural B. and vegetable physiology considered together, the wisdom of the Creator appearing in his works equally in their structure and in the adaptation of all their organs to their respective wonderful functions. In connection with vegetable physiology, another branch of science claims attention—*VEGETABLE CHEMISTRY*; of which there are two parts—an examination of the products of the living processes in plants, which, with all its well-known difficulty, is still comparatively easy; and an inquiry into these processes themselves, with respect to the chemical

changes effected in them—an investigation of the secrets of that chemistry of nature which so far excels all that has yet been accomplished in laboratories. This is, however, a branch of the science of chemistry rather than of B.; but it so far belongs to the latter, that although only subsidiary, it is useful and indispensable. Even mathematics and natural philosophy, however, have been called to the assistance of the philosophical botanist in his attempts to explain the phenomena of his own science.

*Special B.* has been rendered subservient to the study of general B., and errors in the former are also guarded against by dependence, to a certain extent, on the well-ascertained principles of the latter. A comprehensive view of the vegetable kingdom is indeed impossible without an inquiry into the number and peculiarities of the different species which it contains; but the attempt to classify and arrange these can only be successful when it is founded upon a knowledge of general laws relating to all vegetable organisms. That the discoveries of a botanist may be made known, the description of species is necessary; and works devoted to this are sometimes called works of *Descriptive B.* or of *Phytography* (*phyton*, a plant, and *graphe*, a writing). But in the description of plants, a multitude of terms must be employed, which almost exclusively belong to botanical science itself, whilst even those which are common to it with other departments of natural history, must be employed in senses modified by the peculiarities of the vegetable kingdom. Many of the terms used are such as belong to structural B. and vegetable physiology; but many also—for example, adjectives which designate the particular forms of leaves, &c.—become familiar only when an acquaintance with them is sought in order to descriptive B., and a knowledge of the different species of plants. Great precision is necessary in the use of these terms, and from the want of it, the descriptions of the ancients and of travellers unacquainted with B. often leave it impossible to determine the particular species intended. This gives rise to what is sometimes called in botanical works *Terminology*—an explanation of botanical terms, which, however, has no right to be regarded as a separate branch of science, or worthy of a distinct name; and the name which it has received is barbarous. When structural B. was little heeded, and little more was commonly supposed necessary for a botanist than a knowledge of species and the ability to distinguish them, ‘terminology’ was often separately taught, and the student was required to commit long tables of terms and their meanings to memory—a difficulty placed in his way at the outset which was both formidable and repulsive, like that which the student of the Chinese language must expect to encounter in its alphabet.

The necessity of classification and systematic arrangement in B. will be very obvious, if the multitude of different kinds of plants is considered, fully 120,000 species being already known and described, whilst great regions of the earth are still unexplored. The systematic arrangement of plants is sometimes called *Systematic B.*, sometimes *Taxological B.* (Gr. *taxis*, order, and *logos*, a discourse), sometimes, less properly, *Taxology* or *Taxonomy*. The history and progress of the science have been marked by the different systems which have been proposed, and have prevailed at different times. These have, however, been of two very distinct kinds, founded upon very different principles, and particularly adapted to very different objects, and are respectively designated *artificial* and *natural* or *physiological* systems. Artificial

systems are based upon some single class of characters, in the external parts of plants, without reference to the importance of these characters in what concerns the life of a plant, or the purpose for which it exists, and are chiefly adapted to the convenience of the student desirous of readily distinguishing species among the multitudes with which he has to deal. A work of descriptive B., arranged according to an artificial system, has been aptly likened to a dictionary in which the words are alphabetically arranged.

An artificial system cannot, however, serve the highest purposes of the science. But in framing a natural system, great difficulties are to be encountered, and imperfection of the system is necessarily to a certain extent involved in imperfection of the science. Based not upon one mere set of characters arbitrarily selected, but upon a consideration as far as possible of all characters which plants present, and not merely upon external forms viewed in themselves, but upon these and internal organisation considered in their physiological relations, a natural system aims at exhibiting the real affinities which subsist in the vegetable kingdom; and evidently must be at all times liable to modification, and capable of improvement, as botanical science advances, either through the discovery of new plants or through phytotomical and physiological research: it also evidently requires the greatest scientific attainments and the highest powers of a philosophic mind. Nor is it one of the least of the practical difficulties, that the affinities of plants are not such as to constitute a simple lineal series, but that they may be viewed as a multitude of groups arranged around centres, and connected with each other upon different sides and by a great variety of ties.

Yet the rudiments of a natural system have always been sought after, and in some measure attained, when B. has been studied as a science—whenever it has become anything more than a mere acquaintance with a few plants and their names. The genera into which species are grouped by all botanists are natural, and are the basis upon which all classification proceeds in its further generalisations. So sensible was Linnaeus of the importance of maintaining this character of the genera, that when a rigid adherence to his artificial system would have caused the division of a genus into parts, and the consequent separation of species very nearly allied, he kept the genus unbroken, and maintained the usefulness of his artificial system, to the student desirous of finding the names of plants, by referring from one of its classes or orders to another for species exceptional among those of their genus as to the number of their stamens or pistils, or their *diaecious*, *monoeious*, or *hermaphrodite* flowers.—The classification of species, however, in genera and larger natural groups, being a subject as much connected with other branches of natural history as with B., will more properly be treated in the article NATURAL HISTORY; and to that article also, and to the article SPECIES, we refer for all that our limits allow concerning some of the most interesting and difficult questions of science, the limits of species, the distribution of species, &c.

An important branch of botanical science is that which is called *Geographical B.*, or the *Geography of Plants*, and sometimes *Phylogeography*. It must be regarded as yet in its infancy, although a multitude of observations have been recorded in works of descriptive B., and by botanical travellers. It is the object of *Geographical B.* to connect with the occurrence or prevalence of plants in particular countries a great variety of facts as to climate, altitude, geology, &c., and even facts of history. It aims at the establishment of great general laws, which, however,

it has not yet been able to establish. Some account of the progress which has been made in this branch of B., and of the imperfect generalisations which have been reached, will be found in the article GEOGRAPHY OF PLANTS.

Another branch of botanical science which has recently sprung up, and has acquired great magnitude and importance, is PALEONTOLOGICAL B., or FOSSIL BOTANY. The petrified fruits and wood, the beautiful impressions of ferns and palms, and other traces and remains of former vegetation, which appear in vast numbers and great variety in different strata of the earth's crust, present a most interesting field of scientific research. The study of the different kinds of fossil plants, and the comparison of them with existing species, belong strictly to the science of B.; the study of their relations to particular strata or formations, and so to particular periods in the physical history of the globe, belongs to geology. The study of fossil plants has proved exceedingly useful in guiding to just and philosophic views of the mutual relations even of species and groups still existing. See PALEONTOLOGY.

The subject of the DISEASES OF PLANTS must be regarded as falling within the province of Botany. It has scarcely yet been treated or studied as a distinct branch of science, although it has not been overlooked in its relation to Vegetable Physiology, with which its intimate connection is obvious, and it has received no little attention in its bearings on agriculture and other arts by which plants are made to supply the wants or minister to the comforts of man.

ECONOMIC B. includes all that relates to plants, considered with reference to these arts and to these uses. That part of it which relates to medicinal plants has been often separately and elaborately treated under the name of MEDICAL BOTANY. In the botanical articles of this work, will be found notices of the more important plants affording food to man, and therefore cultivated in fields or gardens, in warm or in cold climates, and of those valuable for their timber, their fibre, or the dye-stuff or medicines which they yield.

Having thus endeavoured to sketch an outline of the science of B., we must refer to the articles PLANT, VEGETABLE PHYSIOLOGY, instead of attempting here to fill up a part of that outline by exhibiting the first principles of the science. It remains for us, in the present article, to give a very brief account of the history of B., and outlines of the systems of classification most deserving of attention.

We are informed that Solomon 'spoke of trees, from the cedar in Lebanon even to the hyssop that springeth out of the wall.' There is reason also to believe that Zoroaster devoted some attention to plants, and that this study early engaged some of the philosophers of Greece. The oldest botanical work which has come down to us is that of Theophrastus (q. v.), a pupil of Aristotle, who flourished in the 4th c. B. C. His descriptions of plants are very unsatisfactory, but his knowledge of their organs and of vegetable physiology may well be deemed wonderful, when we consider the low state of this branch of science throughout many centuries after his time. It was not, indeed, till after the revival of letters in Western Europe, that it was ever again studied as it had been by him. About four hundred years after Theophrastus, in the first c. of the Christian era, Dioscorides of Anazarbus, in Asia Minor—a herballist, however, rather than a botanist—described more than 600 plants in a work which continued in great repute throughout the middle ages, a sure proof how destitute that period must have been of any botanical science of its own. About the same time, the elder Pliny devoted a

## BOTANY.

share of his attention to B., and his writings contain some account of more than 1000 species, but compiled from various sources, without much discrimination, and mingled with many errors. Centuries elapsed without producing another name worthy to be mentioned in a history of botany. It was among the Arabians that the science next began to be cultivated, about the close of the 8th century. The greatest name of this period is Avicenna. Centuries again elapsed, a longer interval than before, during which it made no progress whatever. It was not till the beginning of the 16th c. that B. resumed its place as a science. The first to revive it was Otto Brunfels, a German, who published in 1530 his *Historia Plantarum Argentorati*, or History of the Plants of Strasburg, in 2 vols., folio, illustrated with cuts. He was speedily followed by Bock or Tragus, Fuchs or Fuchsius, and other Germans; by Matthiolus and Cœsalpinus in Italy; Dodens or Dodonæus in the Low Countries; De L'Obel or Lobelius, a Dutch physician at the court of England; Gesner in Switzerland; Dalechamps and Moulins, or Molinæus, in France, and by many others, for B. now began to be prosecuted wherever learning flourished, and with great zeal and success. Chairs of B. were founded in universities, botanic gardens (q. v.) were established in many places, and travellers began to explore even remote parts of the world. One of the greatest names of the latter part of the 16th c. is that of L'Ecluse, or Clusius, who travelled through many countries, encountering great perils and hardships in pursuit of his favourite science, and was finally professor of B. at Leyden. The name of Dr Turner, 'the Father of English B.', belongs more to the 17th c. than to the 16th. The number of species known and described had increased, in the beginning of the 17th c., to more than 5000, but the study of them was much impeded by confusion of synonyms and by want of classification, whilst classification was rendered extremely difficult by imperfect knowledge of the structure and organs of plants. The foundations of a natural system of classification may be said to have been laid, in the latter half of the 17th c., by Dr Robert Morison, a native of Aberdeen and professor of B. at Oxford, followed towards the close of the century by the celebrated Ray, one of the greatest naturalists that England has produced.

The application of the microscope in B. inaugurated a new epoch of the science, about the middle of the 17th century. Henshaw and Hook, both Englishmen, were among the first to employ this instrument to good purpose in the examination of the organs and structure of plants; but the greatest eminence belongs to the name of Grew, also an Englishman, a physician at Coventry, and to that of Malpighi, an Italian, perhaps still more celebrated for his anatomical than for his botanical discoveries. Vegetable physiology now began to be recognised as the highest department of botanical science.

In the latter half of the century, perhaps the most eminent name after Ray is that of Joseph Pitton de Tournefort, a French gentleman, who devoted his whole life to the pursuit of botanical science, and who must be particularly noticed in a sketch of the history of B., on account of a system which he proposed, and which was more generally received and employed than any other till the time of Linnaeus. Another botanist of the same period, Rivinus, professor at Leipsic, gave to the world a botanical system which was received to some extent in Germany. Tournefort's system was partly natural and partly artificial; that of Rivinus was perhaps the most perfectly artificial that was ever proposed.

The science of B. made rapid progress during the 17th and 18th centuries, both by the extension of

botanical research in different parts of the world, and the careful study of particular groups or families of plants. Its progress was promoted by the publication of many valuable descriptive works. Important discoveries were also made in vegetable physiology.

About the middle of the 18th c., the wonderful genius of Linnaeus effected a great change in B., as well as in zoology. His name marks an epoch in the history of the science; not chiefly, however, in consequence of the new system which he introduced, nor even because of the discoveries which he made, but rather because he was able very thoroughly to make himself master of all that had been ascertained by his predecessors, and to exhibit it in lucid order. He gave also a great impulse to botanical studies, by the enthusiasm with which he inspired his pupils. And among the benefits which he conferred on B., in common with zoology, not the least considerable was the introduction of trivial or specific names to be used along with the name of the genus as the designations of particular species.

From the time of Linnaeus, the progress of B. during the remainder of the 18th c. became more rapid; and since the commencement of the 19th c., it has advanced with gigantic strides. A large space would be occupied by a mere enumeration of the names of those who have promoted it by their labours and discoveries. Some notion of what botanical literature has become, may be formed from the fact, that Pritzel, in his *Thesaurus Litteraturæ Botanicae* (Leip. 1847—1851), enumerates about 15,000 publications.

Von Haller, an anatomist and philosopher, as well as a botanist, was, of all the contemporaries of Linnaeus, the only one who could be regarded as his rival. Of all the botanists of the latter half of the 18th c., the most deserving to be mentioned in the history of the science along with the great Swede, are Bernard de Jussieu, and his nephew, Antoine Laurent de Jussieu, who applied themselves with great earnestness to the study of the natural affinities of plants and the formation of a natural system, a work which Linnaeus himself attempted, and of the importance of which he was so sensible, that whilst acknowledging the imperfect success of his endeavours, he declared his resolution to persevere in them to the end of his life. The Jussieus traced the outlines of a system which the greatest botanists since their time have not so much sought to change as to complete. Among those who have laboured with greatest success in this work, must be mentioned De Candolle, Fries, Endlicher, Brongniart, Meisner, Von Martius, Lindley, and Brown. The botanist last named acquired by his work on the plants of New Holland, published in 1810, a high eminence, not on account of new plants which he described, but on account of the light which he threw upon the most difficult questions connected with the structure of plants and vegetable physiology. Many remarkable discoveries in vegetable physiology have recently been made by Link, Meyen, Schleiden, Von Mohl, Lindley, and others, some of them affecting what may be called the most fundamental principles of botanical science.

Since the days of Linnaeus, great progress has been made in the examination of the B. of particular countries and districts, of which perhaps the least important result has been the discovery of very many plants unknown before. But our limits prevent us from noticing particular works in this department of botanical science, or those of botanical travellers, or of botanists who have devoted themselves to the study of particular groups of plants. And we can merely allude to the scientific associations, continually increasing in number and resources,

by which the interests of this science are promoted, and to the magazines and other periodical publications devoted to it.—However, we cannot but refer also to what may be deemed by some—but unjustly—matters of comparative insignificance, the introduction of B. into schools, and the publication of many works intended for the use of persons not very scientific. By the introduction of this or any similar branch of science into schools, not only may important educational purposes be served, but the young may be led to form a taste for the science which will impel them to its subsequent prosecution. There are few branches of science so easily made popular as B.; but they very much mistake its nature who suppose it to consist in a mere knowledge of the names of plants, or in a familiarity with the classes of an artificial system. What B. really is, and to what the true study of it tends, is better perceived if we consider that ‘there is not a flower that blows but has some beauty only unveiled to the minute inquirer, some peculiarity in structure fitting it to its destined place and purpose, and yet not patent to a casual glance.’ There is perhaps no branch of science which demands more than B. the application of the highest mental powers; and like every other, to him who truly prosecutes it—whether little or much—it brings in due measure an immediate reward in his own improvement and delight.

We proceed to exhibit an outline of the Linnaean system, the only artificial system which it appears necessary further to notice, and of the natural system by which it has been to a great extent superseded. The Linnaean system, however, is not entirely artificial. Its foundation may be said to be laid in the perfectly natural distinction between Phanerogamous and Cryptogamous plants—the former of which Linnaeus divided into 23 classes; whilst he constituted the latter, corresponding to the Acotyledonous plants of Jussieu, into his 24th and last class, *Cryptogamia*. In the other classes, he took the characters from the parts of fructification: this he defined as having no stamens or pistils distinctly visible, and gave it a name, *Cryptogamia* (Gr. *kryptos*, concealed, and *gamy*, marriage), in accordance with this definition, modestly refraining from a confident assertion of the absence of stamens and pistils. Of the 23 classes of phanerogamous or phanerogamous plants (Gr. *phaneros*, manifest, and *phaino*, to shew), the characters of all are taken from the stamens; and those of Classes I.—XI., simply from the number of them; these classes, however, not including plants exhibiting the peculiarities with reference to which the remaining classes are constituted. Thus Class I., *Monandria* (Gr. *monos*, one, *aner*, a male), consists of plants the flowers of which have only one stamen; Class II., *Dianandra* (Gr. *dies*, twice), of those with two stamens; Class III., *Triandria* (Gr. *treis*, three), of those with three stamens, and so on; Class IV., *Tetrandria* (Gr. *tetras*, four times); Class V., *Pentandria* (Gr. *pente*, five); Class VI., *Hexandria* (Gr. *hex*, six); Class VII., *Heptandria* (Gr. *hepta*, seven); Class VIII., *Ocandria* (Gr. *octo*, eight); Class IX., *Enneandria* (Gr. *ennea*, nine); Class X., *Decandria* (Gr. *deka*, ten)—until, in Class XI., *Dodecandria* (Gr. *dodeka*, twelve), the number of the stamens is less definitely fixed, and plants are included in it having more than ten, and fewer than twenty stamens. Then follow two classes—Class XII., *Icosandria* (Gr. *eikosi*, twenty), and Class XIII., *Polyandria* (Gr. *polys*, many)—which have numerous stamens, but differ in their being inserted on the calyx in the former class, and on the receptacle in the latter, characters essentially natural, as are those also of most of the remaining classes. Classes XIV., *Didynamia*, and XV., *Tetra-*

*dynamia* (Gr. *dynamis*, power), are distinguished by having the stamens of different lengths—the former having two long and two short stamens, the latter, four long and two short. Class XV. agrees with the great natural order *Crucifera*. Class XVI., *Monadelphia* (Gr. *adelphos*, a brother), has the stamens united by the filaments in one bundle; Class XVII., *Diadelphia*, has the filaments united in two bundles, or one free and the rest united; Class XVIII., *Polyadelphia*, has them united in more than two bundles. In Class XIX., *Syngenesia* (Gr. *syn*, together, and *genesia*, generation), the stamens are also united, but by the anthers instead of the filaments. This class nearly agrees with the great natural order *Composita*, and consists chiefly of plants having compound flowers. Class XX., *Gynandria* (Gr. *gyne*, a female), consists of plants in which the stamens grow out of, or are united with the pistil. Class XXI., *Monacia* (Gr. *oikos*, a house), consists of plants having the stamens and pistils in different flowers on the same plant; Class XXII., *Dioica*, of those which have the male and female flowers on different plants; Class XXIII., *Polygamia* (Gr. *polys*, many, *gamos*, marriage), of those having the stamens and pistils in the same or in different flowers on the same or on different plants.—The classes are divided into *ordines*, which are constituted on various grounds. The orders of the first 13 classes are strictly artificial, their characters being found simply in the number of the pistils, according to which they are named *Monogynia* (Gr. *monos*, one, *gyna*, a female), *Digynia*, *Trigynia*, &c.; *Dodecagynia*, including all with 12—19 pistils, and *Polygynia*, all with 20 and upwards. The orders of Class XIV. are constituted on entirely different grounds, and are two in number, *Gymnosperma* (Gr. *gymnos*, naked, *sperma*, a seed), and *Angiosperma* (Gr. *angeion*, a vessel)—the former ‘having naked seeds’ (or rather the fruit formed of 4 *achenes*), the latter having the seeds in a capsule. The orders of Class XV. are in like manner founded upon the fruit; those of Classes XVI., XVII., and XVIII., upon the number of the stamens; as are also those of Classes XX., XXI., and XXII.; those of Class XIX., chiefly upon characters taken from the florets of compound flowers; those of Class XXIII., upon the circumstance of the hermaphrodite, male and female flowers being found on one, two, or three plants; whilst the orders of Class XXIV. are strictly natural—*Filices* (or Ferns), *Mueci* (or Mooses), *Algae*, and *Fungi*.

The student may acquire a pretty complete knowledge of the Linnaean artificial system, without knowing much in reality of B.; but, even in beginning to learn the natural system, he must learn some of the first principles of the science. Jussieu followed Ray in dividing plants into three great primary divisions—*Acotyledones* (q. v.), *Monocotyledones* (q. v.), and *Dicotyledones* (q. v.); having respectively no cotyledon or seed-lobe, one cotyledon, and two cotyledons. And, however the names may be changed, or characters assumed from other parts of the plant, these great divisions of the vegetable kingdom still subsist; the *Acotyledonous* plants being also, according to characters taken from the stem, *Acrogenous* (q. v.); the *Monocotyledonous* plants, *Endogenous* (q. v.); and the *Dicotyledonous* plants, *Exogenous* (q. v.). Endlicher is the only botanist of great note who has attempted to make primary divisions of the vegetable kingdom essentially different from those indicated by Ray, and his attempt has not commended itself to general approval. De Candolle gave expression to an important truth in botanical science, when he united the two divisions of monocotyledonous and dicotyledonous plants under the common title of *Vascular*

## BOTANY BAY—BOTHNIA.

plants, in opposition to *Acotyledonous* or *Cellular* plants; the vascular plants being the *phanerogamous*, and the cellular the *cryptogamous*. Lindley has endeavoured to modify the natural system by dividing the *asexual* or *flowerless* (*cryptogamous*) plants into the two classes of *Thallogens*—with the stem and leaves undistinguishable—and *Acrogens*, with the stem and leaves distinguishable, thus limiting the term acrogens to those which have a distinct stem; and in like manner dividing the *sexual* or *flowering* (*phanerogamous*) plants into five classes, viz., *Rhizogens*, with fructification springing from a thallus; *Endogens* and *Dictyogens*, with fructification springing from a stem, the wood of which is youngest in the centre, and the seed with a single cotyledon—the former having parallel-veined permanent leaves, and the wood of the stem always confused; the latter having net-veined deciduous leaves, and the wood of the stem when perennial arranged in a circle around a central pith; *Gymnogens* and *Exogens*, having the wood of the stem youngest at the circumference, and always concentric, the seed with two or more cotyledons; the former having the seeds quite naked, the latter having them enclosed in seed-vessels. But others generally prefer the simpler division of phanerogamous or vascular plants into monocotyledonous or endogenous, and dicotyledonous or exogenous, the former including Lindley's endogens and dictyogens, the latter his exogens, gymnogens, and rhizogens; although the latter have only a provisional place assigned them, in the absence of well ascertained views of their structure.

One of the great advantages of the natural system is, that the plants which it brings together are very generally found to agree in their properties, as well as in their structural characters. There are, indeed, species which, in respect of their properties, are anomalous or exceptional in the genera or orders to which they belong; but these exceptions do not invalidate the general rule, according to which we expect the most deadly poisons in the order *Loganiaceæ*, bland mucilage and useful fibre in *Malvaceæ*, wholesome succulent herbage along with a certain amount of acridity or pungency in *Cruciferae*, &c., &c. The knowledge of the properties of genera and orders is of great use in guiding inquiry, and it is thus that modern science attains in rapid succession to discoveries important in their practical relations.

In the determination of the intermediate subdivisions of the natural system, botanists have not yet been so successful as with regard to these primary divisions, and the ascertainment of the characters and limits of lowest subdivisions—orders, tribes, and genera. Great difficulty has been found in arranging the orders in natural groups, although the attempt, very necessary to a complete system and a just exhibition of nature, has been very assiduously and perseveringly made by Meisner, Endlicher, Lindley, and others of the greatest botanists of the present age.

BOTANY BAY, a haven of New South Wales, in lat. 34° S., and long. 151° 15' E., discovered by Cook, on his first voyage, in 1770, and named by him from the great number of new plants in its vicinity—a characteristic, however, rather of Australia in general than of this particular locality. In 1787, it received England's first penal colony in the east; and though it was supplanted the very next year by Port Jackson, a vastly superior harbour immediately to the north of it, yet it long continued to be the popular designation, not merely of this convict settlement, but of the Australian convict settlements generally. On the shore of B. B. there was erected, in 1825, a column to the memory

of that eminent French navigator, the unfortunate La Perouse.

BOTH, JOHN and ANDREW, two celebrated painters, who, being united in their works like Beaumont and Fletcher, are, like them, usually spoken of together, were born at Utrecht, where their father was a painter on glass—John in 1610; the date of Andrew's birth is not known. After studying under Abraham Bloemaert, the brothers went to Italy, where they soon won for themselves a high reputation. John painted landscapes, adopting Claude for his model, while Andrew filled in the figures after the style of Bamboccio, and in so careful a manner that the pictures looked like the work of one hand. John's landscapes are characterised by delicious warmth of sky, softness of distance, and general truthfulness to nature; even the different hours of the day may be distinguished in some of his best pictures, so careful are his tints. The works of the brothers are still in great repute, and bring high prices whenever they are offered for sale. One of the brothers was accidentally drowned in a canal in Venice in 1650; the other brother then settled in Utrecht, where he died six years afterwards.

BOTHIE (from the Gaelic *bothag*) signified originally a humble cottage or hut but for a considerable number of years the term has been more popularly applied to a barely furnished, generally uncomfortable habitation for farm-servants. Though bothies are principally confined to the eastern and north-eastern counties of Scotland, a few have spread over a much wider area. The bothie, strictly speaking, of modern times is situated either under the same roof as the stable, or, oftener, at a short distance from the steading. While the cubic contents are invariably disproportionate to the number of inmates, the furnishings are of an uninviting, sometimes actually repulsive character. One long, roughly manufactured table, a few long stools, a chair or two, a number of virtual bunks, a few wooden caps or bowls, and a pot or two, constitute the bulk of the fittings. The inhabitants are generally unmarried men, who frequently have their own food to prepare. Some of the larger farmers afford a woman for cooking and cleaning the bothie. Huddled together in this unnatural way, without the refining influence of the heads of families or the female sex, it is not surprising that the inhabitants of the bothie often acquire boorish, and sometimes immoral habits. Public moralists decry the bothie vehemently. The men themselves do not raise their voice loudly, if at all, against it; and some influential farmers, among others Mr M'Combie, M.P., seem to regard it, if an evil, a necessary one, in present circumstances. The bands of Irish and Highland females living together in the East Lothian cottages, may be ranked as bothieites, and do not strengthen the argument for the general system. Though the bothie system is only one of several foul blots on the agricultural escutcheon affecting the labourers, it is diminishing, as farm cottages increase, and must soon, under the pressure of public opinion and the growing desire for social elevation, be reduced to a minimum, if not entirely abolished.

BOTHNIA, the name formerly given to a country of Northern Europe, extending along the east and west shores of the Gulf of Bothnia (q. v.), the eastern portion now being comprised in Finland (q. v.), and the western forming the Swedish governments of Piteå and Umeå.

BOTHNIA, GULF OF, the part of the Baltic Sea which lies to the north of the isle of Åland, having on its eastern shore Finland, on the western,

## BOTHRIOCEPHALUS—BOTRYCHIUM.

Sweden and Lapland, with Tornea for its northern limit. It extends from lat. 60° to 66° N., and long. 17° to 25° 36' E., its greatest length being about 400 miles, and its average breadth 100 miles. Its depth varies from 20 to 50 fathoms, but both along its shores, and in the middle, are many small islands, sand-banks, rocks, and cliffs, called *stærs*, which render the navigation difficult; though on the whole it is less dangerous than other parts of the Baltic, and has many good harbours. The rivers which fall into this gulf, both from Sweden and Finland, are numerous; and the waters of the gulf itself are but slightly salt. In winter, it is usually so hard frozen that it can be crossed by sledges.

**BOTHRIOCEPHALUS** (Gr. *bothrion*, a little pit, and *cephale*, a head), a genus of intestinal worms, belonging to the order of *Cestode Worms* (q. v.), and included, until recently, in the genus *Tenia* (tape-worm, q. v.). The head in this genus is not furnished with four sucking disks, as in the true tape-worms, but with two lateral longitudinal hollows, which seem to serve only for adhesion by means of a partial vacuum, and to have nothing to do with nutrition. Nourishment is indeed supposed to be obtained entirely by the imbibing of fluids through the entire length of the worm; and whilst this process of imbibing takes place, there is also an exudation—as *excremose* accompanies *endosmose* (q. v.) in the roots of plants—of peculiar oleaginous drops, which may probably be in part the cause of the injurious effects produced by these worms upon the health of the animals infested by them. The species of *B.* are very abundant in predaceous fishes, and occur more sparingly in fish-eating birds; the immature and sexless young being found in fishes and inferior aquatic animals, either in peculiar cysts, or in the intestinal canal. Sticklebacks are often seen distended to an unusual size by a species of *B.* which lies free in the cavity of the abdomen; but in the stickleback its joints and sexual organs always remain undeveloped; it is only when the stickleback has been digested in a bird's stomach, that the

A few Segments of  
Bothrioccephalus latus.  
of  
Another species of tape-worm, under the name

of Broad Tape-worm. The segments are much broader than they are long, and each contains organs of reproduction. The worm is strictly androgynous. It is scarcely known in Britain, but is of frequent occurrence in some parts of Europe, and sometimes attains a length of fifteen feet or upwards; and a coil of these worms is not unfrequently expelled at once from a patient. The *B.* is, however, much more easily expelled than the true tape-worms. The same means are employed. The geographical distribution of this worm, which is most frequent in low marshy countries, has led to the conjecture, that its youngest brood may inhabit some of the smallest aquatic animals, and that it may find its way into human beings by their eating salads, fruit which grows near the ground, or the like.

**BOTHWELL**, a small village in Bothwell parish, in Lanarkshire, on the right bank of the Clyde, 8 miles east-south-east of Glasgow. The river is here crossed by the celebrated bridge, the place of the bloody encounter between the Covenanters and Monmouth in 1679, when the former were

defeated. Near the village are the magnificent Norman ruins of Bothwell Castle, at the foot of which the Clyde washes the fine scenery of 'Bothwell Bank,' celebrated in Scottish song. Pop. (1871) 1209.

**BOTHWELL, JAMES HEPBURN**, fourth EARL OF, was born about 1526. On his father's death in 1556, he succeeded to the great inheritance which made the Earl of Bothwell the most powerful noble in the south of Scotland. At first, he opposed the Reformation party, but on their accession to power he easily changed his politics; and, in 1561, formed one of the deputation of lords sent to convey the youthful Queen of Scotland to her kingdom. He was shortly after made a privy-councillor; but his violence and misconduct soon became intolerable, and he was ordered to quit Edinburgh. In March 1562, he and the Earl of Arran were committed to the castle for conspiring to seize the queen's person. B. made his escape, was recaptured at Holy Island, again got free, and sailed to France. He speedily returned, but finding Moray close on his trail, embarked for the continent. Not appearing at his trial, he was outlawed. In 1566, after the queen's marriage with Darnley, he reappeared, and having strongly espoused her cause against Moray and his party, was suddenly restored to favour, and even high influence. In October 1566, while performing a judicial tour in Liddesdale, he was attacked and wounded, and the queen manifested her interest in his danger by riding twenty miles and back to see him, a journey which brought on a dangerous fever. At Craigmillar, some time after, B. attempted, unsuccessfully, to overrule her objections to a divorce from Darnley. A more thoroughgoing method was open to him, and on the night of 9th February 1567, Darnley was blown up at the Kirk of Field. The public voice loudly charged B. with the murder, but he was not formally indicted till the 28th March. He came to the trial attended by 4000 followers, and received an easy acquittal. Two days after, he carried the sword of state before the queen at the opening of parliament, and at its close, all his lands and offices were confirmed to him, in consideration of his 'gret and manifold gude service done and performit not only to her hienes' honour, weil, and estimatioun, but also to the comone weil of the realme and leiges thairof.' At a supper on the following night, the leading nobles signed a bond approving of Bothwell's acquittal, and commending him as a fit husband to the queen, pledging themselves to stand by him. On the 26th April, B., accompanied by a strong force, carried off the queen to Dunbar Castle; on the 6th May he was divorced from his wife; and on the 15th his marriage with Mary was solemnised at Holyrood. He had previously been created Duke of Orkney. His guilty triumph was very short; the wrath of the nation was roused; at the end of one month, Mary was a prisoner in Edinburgh, and B., pursued in his voyage to the Orkneys, fled to Denmark. There he was seized, imprisoned, and died in 1576, leaving no heirs. His titles and estates were forfeited to the crown.

**BOTONÉ, or BOTONNY.** In Heraldry, a cross botoné is a cross of which the ends are in the form of buds or buttons.

**BOTRYCHIUM**, a genus of Ferns, of the division *Ophioglossaceæ*, having the *spore-cases* (or seed-vessels) distinct, sub-globose, clustered at the margin, and on one side of a pinnated *rachis* (an altered frond), 2-valved, without any trace of an elastic ring, and opening transversely. The only British species is *B. Lunaria*, Moonwort, a little plant, pretty frequent in dry mountain pastures, but not

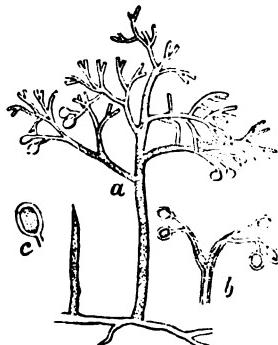

## BOTRYTIS—BOTTA.

applied to any particular use. A species more worthy of notice is *B. Virginicum*, of which the geographical distribution is very remarkable. It abounds in many parts of the southern states of America, the mountains of Mexico, &c.; in Australia, in some parts of Asia, as the Himalaya Mountains; and is found also in Norway, although in no other part of Europe. It is large and succulent, and is boiled and eaten in the Himalaya, in New Zealand, &c. It is called RATTLESNAKE FERN in some parts of America, from its growing in places where rattlesnakes are found.

Moonwort Fern  
(*Botrychium Lunaria*)

rising up from them, and bearing the fructification at their extremity. Some of them attack the fibres of vegetable fabrics, such as linen and cotton, in damp places, the decayed stems of plants, decaying fruit, &c. Some are found on living animal tissues, whether always previously diseased or not, is a question still unsettled, although the probability appears to be that they make their appearance only where there is already disease, which, however, they modify or entirely change. A remarkable species of this section of the genus is the MUSCARDINE (q. v.), or SILKWORM ROT.—A section of the genus, in many respects of particular interest, and which some botanists have endeavoured to separate into a distinct genus, consists of species which grow among living vegetable tissues. The threads of the mycelium creep among the loose cells of the under side of the leaves, and send up their fertile shoots through the stomata (see LEAF and STOMATA).

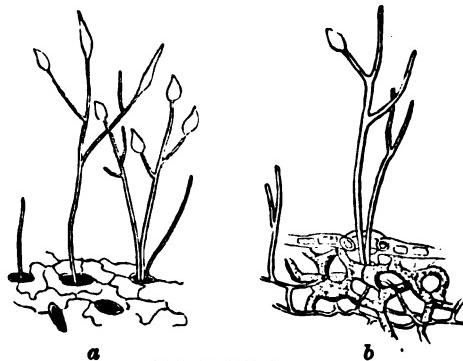

Botrytis parasitica :

a, plant, with mycelium, magnified; b, extremity of branch, with fructification; c, fructification, more highly magnified.

Many of the species are extremely destructive to particular plants, as *B. parasitica* to turnips. But *B. infestans* is, of all the species, the subject of greatest interest, the potato disease being confidently ascribed to it by some observers, among whom is

sometimes named Mr Berkeley, and the opinion of no living botanist is entitled to greater respect upon a point connected with this branch of the science; but Mr Berkeley himself states his opinion very guardedly. ‘The decay of the leaves and haulm in the potato murrain,’ he says, ‘is certainly due

*Botrytis infestans* :

a, Young plants proceeding from stoma.  
b, Section of potato-leaf, shewing the mode in which the mycelium creeps among the loose tissue of the leaf.

to *Botrytis infestans*; and its appearance in the diseased tissues of the tubers, when exposed to the air, makes it at least probable that it has a close connection with that destructive murrain, which, in many instances, does not appear alone, but accompanied by other diseases. The mould may be traced spreading round the edges of the brown spots on the leaves, and soon destroying the tissue on which it was developed.’ (Art. *Botrytis* in Morton’s *Cyclopaedia of Agriculture*.) This destruction results not only from the fungus feeding upon the juices of the plant, but from its obstructing the elaboration of the sap and all the processes which in a healthy state take place at the surface of the leaf.—The whole subject of the propagation of fungi of this kind is involved in great obscurity. They are indeed seen to produce seeds (or spores) in great abundance, but the doubtful question is, how these reach the place where they are to grow, whether from the surface of the leaf, to which it is objected that the stomata are too small to admit them, or, as Mr Berkeley thinks, from within the plant. See POTATO DISEASE.

**BOTTA**, CARLO GIUSEPPE GUGLIELMO, an Italian poet and historian, born in 1766 at S. Giorgio del Canavese, in Piedmont. He studied medicine in Turin. In 1794, he became a physician to the French army, and in 1799, he, Carlo Aurelio de Bossi, and Carlo Giulio, were appointed the provisional government of Piedmont. They were known as *Il triumvirato de tre' Carli*. After the battle of Marengo, he became a member of the Piedmontese Consulta. In the *Corps Legislatif*, he gave offence to Napoleon, by designating his government as despotic. In 1830, he was allowed to return to his native town, and was pensioned by Charles Albert. He died in Paris 10th August 1837. Of his works of earlier date, the following may be mentioned, in which his admirable historic style is gradually developed: *Description de l'Ile de Corfu* (2 vols., Par. 1799); *Souvenirs d'un Voyage en Dalmatie* (Tur. 1802); *Précis Historique de la Maison de Savoie* (Par. 1803); *Histoire de l'Amérique* (Par. 1809). His epic poem in twelve books, *Il Camillo o Vejo Conquistata* (Par. 1816), was also favourably received. But his most important works are his *Storia d'Italia dal 1789 al 1814* (Par. 1824), which has gone

through many editions, and for which he received the quinquennial prize of 1000 Tuscan dollars, founded by the Grand Duke Ferdinand II. in 1814, in the *Accademia della Crusca* at Florence; his *Histoire des Peuples d'Italie* (3 vols., Par. 1825), in which he denies to the Christian religion and to philosophy the credit of having civilised Europe, and ascribes it to the restoration of learning; and the *Storia d'Italia dal 1490 al 1814* (20 vols., Par. 1832), which consists of Guicciardini's work (1490—1534), Botta's continuation of it (1535—1789), and the above-mentioned *Storia d'Italia*.

BOTTA, PAUL EMILE, a distinguished French archaeologist and traveller, the son of the preceding, was born about 1800. While yet young, he undertook a voyage round the world, and remained long about the western coasts of America, where he zealously collected treasures of natural history. In the year 1830 he went to Egypt, where he entered into the service of Mehemet Ali as a physician, and in this capacity accompanied the Egyptian expedition to Sennaar. Here he formed a very considerable zoological collection, with which he returned to Cairo in 1833. The French government now appointed him consul in Alexandria, from which he undertook a journey to Arabia, the results of which he gave to the world in a work, entitled *Relation d'un Voyage dans l'Yémen, entrepris 1837, pour le Muséum d'Histoire Naturelle de Paris* (Par. 1844). From Alexandria the government sent him as consular agent to Mosul, and at this place, at the instigation of the German orientalist Julius Mohl, he commenced a series of discoveries which form an epoch in archaeological science. Early in the spring of 1843, B. began his diggings in the heaps of ruins near the Tigris, for monuments of Assyrian antiquity, and the *Journal Asiatique* soon contained accounts of the success with which his enterprise and perseverance were rewarded, and also disquisitions on the extremely difficult subject of the cuneiform writing of the Assyrians, which afterwards appeared as a separate publication under the title, *Mémoires de l'Ecriture Cunéiforme Assyrienne* (Par. 1848). The French government took up the matter warmly; a practised draughtsman was sent out for the purpose of making sketches upon the spot of the sculptures on alabaster, so apt to fall to pieces; and a commission of learned men was appointed, for the purpose of conducting the publication of a magnificent archaeological work, which shortly afterwards appeared under the special superintendence of B. himself, with the title, *Monument de Ninive, découvert et décrit par Botta, mesuré et dessiné par Flandin* (Par. 1849—1850). It consists of five great folio volumes. In 1848, he published the *Inscriptions découvertes à Khor-sabad*. Although in abundance of results B. was far exceeded by Layard (q. v.), yet he certainly deserved the praise of having laid the foundation of Assyrian archaeology, the extent and importance of which are even yet imperfectly perceived. See **ASSYRIA**.

BOTTARI, GIOVANNI, a learned Italian prelate, was born at Florence, January 15, 1689. He studied ancient literature and eloquence under Biscioni, and subsequently applied himself to mathematics, philosophy, and theology. He soon obtained a great reputation for the delicacy and purity of his style. The Della Crusca Academy intrusted him with the care of a new impression of its famous dictionary. This extensive work occupied B. and his collaborateurs several years, and proved of extreme service to the Italian language. In 1730, he went to Rome, where he was made professor of ecclesiastical history and of controversy in the College of

La Sapienza. He also took part in the labours of the geometer Manfredi, when the latter was engaged in determining the level of the Tiber. Clement XII. appointed him librarian of the Vatican, and Benedict XIV. canon of Santa Maria Transteverine. He died at Rome, 3d June 1775. The works of which B. was either the author or editor are very numerous; the principal are—his edition of *Virgil* from the Vatican MS.; his elaborate treatises on the catacombs of Rome and on the Vatican; his *Del Museo Capitolino*; and his dissertations on Dante, Boccaccio, and Livy.

BÖTTGER, or BÖTTCHER, or BÖTTIGER, JOH. FRIEDA, by whom the art of porcelain manufacture was very much improved in Germany in the beginning of last century, was born in 1681 or 1682 at Schleiz, in the territory of Reusa. His father was master of the mint at Magdeburg and at Schleiz. He was apprenticed to an apothecary in Berlin, but became an enthusiast in the search for the philosopher's stone, for which he neglected everything else, thereby involving himself in many difficulties, and incurring the displeasure of the authorities, so that he was obliged to flee from Berlin, to escape the risk of being punished as an adept. He found protectors and patrons at the court of Saxony, and received large sums to enable him to prosecute his experiments in alchemy. Disappointment ensuing, as he did not succeed in making gold, he was called upon to reveal his secret in writing, and handed in a manuscript full of mystical nonsense, but in which he expressed himself with the air of one completely master of his subject. The king, however, was dissatisfied with this production, of which he appreciated the worthlessness, and readily consented to a request of the Count of Tschirnhausen, who desired to avail himself of the skill which he believed B. really to possess, for experiments upon clays, with a view to the manufacture of porcelain. B. was compelled, accordingly, to enter upon these experiments, of which the celebrated Meissen (q. v.) Porcelain was the result. See **POTTERY**. But as a security against the revelation of the art of making it, he and his assistants were treated as prisoners; and when Saxony was invaded by Charles XII. of Sweden in 1706, they were secretly removed from Dresden to Königstein. His success was, however, rewarded with large presents, which he soon squandered. He died on 13th March 1719.

BÖTTIGER, KARL AUGUST, one of the most erudite and thoughtful archaeologists of Germany, was born 8th June 1760, at Reichenbach, in Saxony. He studied at Leipzig. In 1791, chiefly through the influence of Herder, he was appointed director of the Gymnasium, and conistorial councillor at Weimar. Here he enjoyed the stimulating society of Schiller, Herder, Wieland, Goethe, and others. His literary activity at this period was prodigious. He edited several journals, and wrote multitudes of reviews, biographical notices, &c., for the *Allgemeine Zeitung*. In 1804, B. was called to Dresden, where he began to deliver lectures on special branches of classical antiquities and art. The result of these was: *Discourses on Archaeology* (Dresden, 1807); *On Museums and Collections of Antiques* (Leip. 1808); *The Aldobrandinian Marriage Festival* (a mythico-allegorical interpretation of a picture discovered by a member of the Florentine family of Aldobrandini, representing a Roman marriage (Dresden, 1810); *Thoughts on the Archaeology of Painting* (Dresden, 1811); and the *Mythology of Art* (Dresden, 1811). In 1814, appeared his *Lectures on the Dresden Gallery of Antiques* (Dresden); in 1821—1825, his *Amalthea, or Museum of*

## BOTTLE—BOTTLEHEAD.

*Mythological Art, &c.* (Leip.); and in 1826, his *Thoughts on Mythological Art* (Dresden and Leipsic). In 1832, B. was elected a member of the French Institute. He died 17th November 1835. His works, both in Latin and German, have been collected and edited by Sillig.

**BOTTLE** (Fr. *bouteille*, which is the dim. of *bottle* or *boute* [allied to Eng. *butl*], a vessel), a vessel, generally of a round shape, with a narrow neck, for holding liquids. Bottles are now usually made of glass or earthenware; but the first bottles were made of the skins of animals, mostly goats—of this kind were the bottles spoken of in Scripture. Skin bottles are still used in Southern Europe for the transport of wine, and by tribes of Africa and Asia for carrying water. The ancient Egyptians made bottles of most elegant form and exquisite workmanship of alabaster, stone, gold, ivory, and other substances. The Italian peasants carry, slung round their necks, bottles made of the rind of the gourd, which, when dry, is as hard as wood. Bottles made of glass will be treated of under **GLASS**.

**BOTTLE-CHART** is the name given to a marine chart which purports to shew the track of sealed bottles thrown from ships into the sea. It is a well-known practice to throw sealed bottles containing some intelligence into the sea during long voyages, in the hope that these fragile messengers may be picked up, and their intelligence reach its proper destination. The frequency of these instances at length led to the inference, that by such means the determination of currents might be illustrated. Captain Beecher, an English naval officer, has the merit of having constructed charts of bottle-voyages in the Atlantic, his facts being drawn from the numerous cases that had occurred. The time which elapses between the launching of the bottle from the ship and the finding it on shore, has varied from a few days to sixteen years; while the straight-line distance between the two points has varied from a few miles to 5000 miles. Of the actual length of the curved line followed by the bottle, little or nothing is known, for the intermediate history of the voyage is a blank. The subject is now in course of being further investigated by this ingenious officer and others; and perhaps, in time, bottle-charts, as determining ocean currents, may be found practically useful to the hydrographer. Here, only glancing at this novel subject, we refer for current information respecting it to the *Nautical Magazine*.

**BOTTLE-GLASS.** See **GLASS**.

**BOTTLE-GOURD** (*Lagenaria*, from Lat. *lagena*, a bottle), a genus of plants of the natural order *Cucurbitaceæ* (q. v.), nearly allied to the Gourd (q. v.) genus (*Cucurbita*), in which it was until recently included. One of the most marked distinctions between them is the very tumid border of the seeds of the Bottle-gourds, which have also all the anthers separate, and have white flowers, whilst those of the Gourds proper are yellow. The Common B., or False Calabash (*Lagenaria vulgaris*), is a native of India, but is now common almost everywhere in warm climates. It is a climbing musky-scented annual, clothed with soft down, having its flowers in clusters, and a large fruit, from 1 to even 6 feet in length, which is usually shaped like a bottle, an urn, or a club. The fruit has a hard rind, and when the pulp is removed, and the rind dried, it is used in many countries for holding water, and is generally called a *calabash* (q. v.). The B., in its wild state, is very bitter and poisonous, and even in cultivation, some of its varieties exhibit not a little of the bitterness and purgative properties of colocynth (q. v.). Other varieties, however, have a cooling edible pulp. This is most perfectly the case, in general,

with those which attain the greatest luxuriance. The B. appears to have been introduced into Europe about the close of the 16th c., but it requires for its advantageous cultivation a warmer climate than that of any part of Britain, where, although it succeeds well enough on a hotbed, it is chiefly known as an object of curiosity. It is, however, much cultivated in warmer countries as an esculent, and is an important article of food to the poorer Arabs, who boil it with vinegar, or make a pudding of it in its own rind with rice and meat.

Another species, *L. idolatrica*, is a sacred plant of the Hindus, much employed in their religious ceremonies.

**BOTTLEHEAD** (synon. *Bottlenose*, *Bottle-headed Whale*, *Bottle-nosed Whale*, or *Beaked Whale*), a cetaceous animal occasionally but rarely met with on the British coasts, and on those of the continent of Europe. It was until recently placed in the genus *Delphinus* by naturalists, and is still ranked among the *Delphinidae* or *Dolphin* (q. v.) family;

Bottlehead.

but some of its characters appear to make it a connecting-link between them and the *Balaenidae*, or true whales. A new genus, *Hyperodon* (the name of which is derived from the Greek, and refers to the peculiarities of the dentition), has been erected for it; but unfortunately several specific names have been adopted by different authors—as *H. Butzkopf*, *H. bidens*, and *H. Honfloreensis*—to the increase of difficulty and obscurity; whilst it appears that there is only one species to which they equally belong. The B. has the snout produced into a beak, as in the dolphins; the beak is short and strong; the forehead rises suddenly from the beak, and is remarkably elevated, a peculiarity which is owing to large bony crests rising over the bones of the upper jaw. The teeth are only two in number, and are situated in the fore-part of the lower jaw,

Skull of Bottlehead.

pointed, but much enveloped by the soft parts, and sometimes completely hidden among them: the palate and upper jaw are furnished with little hard points or tubercles, not  $\frac{1}{16}$ th of an inch in height, which, however, have been doubtfully regarded as a kind of false teeth, and by Cuvier as rudimentary vestiges of whalebone. There is a dorsal fin, rather small in proportion to the size of the animal, and placed further back than in the common dolphin. The blowhole is crescent-shaped, the points of the crescent directed backwards. The skin is smooth and glossy, of a blackish lead colour on the back, gradually becoming lighter on the sides, and whitish on the belly. The animal attains a length of about 25 feet.

The B. has occasionally been caught in consequence of its having entered harbours or the mouths

of rivers. One was caught above London Bridge, and figured and described by Hunter in the *Philosophical Transactions* for 1787. It is impossible that too great attention can be paid to specimens of the rarer cetacei caught or driven ashore on any part of the coast, and it is to be hoped that the obscurity and confusion still so much prevailing in this branch of natural history may soon be removed. Photography seems to afford new facilities for an exact comparison of specimens, of which advantage ought to be taken; and everything capable of being preserved should be so carefully, for the study of naturalists. There is a splendid skeleton of the B. in the Museum of the Royal College of Surgeons, London.

The name BOTTLE-NOSED WHALE has been also given to a species of dolphin (q. v.), *Delphinus Tursio*, which is occasionally met with on the British coasts.

BOTTOM, in naval language, is either the whole ship itself, or that part of it which is under water when laden. Commodities are often said to be imported 'in foreign bottoms,' or in 'British bottoms:' in which cases, the phrase is applied to the whole ship. A 'full ship,' or a 'full B.' denotes such a form given to the lower half of the hull as to allow the stowage of a large amount of merchandise. A 'sharp ship,' or a 'sharp B.,' implies a capacity for speed.

The word B. is also applied in an obvious way to the bed of the sea, which is characterised as rocky, stony, sandy, coral, muddy, oozy, &c., bottomed.

BOTTOMRY, BOND OR CONTRACT OF, is a security by which a ship itself is expressly mortgaged and pledged by the owner or master, or hypothecated for repairs to the ship, or for money advanced for its outfit, or otherwise with relation to it. It is called a security by B., because the bottom or keel of the ship is figuratively used to express the whole of it. The loan or debt is repayable only in the event of the ship's safe arrival at the port or destination; and in consideration of this risk, the lender or creditor exacts a premium, the amount of which depends on the nature of the adventure. If the ship be totally lost, the lender loses his money; but if she returns safely, he recovers his principal, together with interest at the rate agreed upon. These contracts are not treated as ordinary mortgages, and preferred according to the order of date; but inversely, the latest is preferred to the preceding, because it is presumed that the last loan saved the ship, and in all cases necessity alone is the condition of the contract.

Such, generally, is the law of Great Britain; but the French law appears to be different. By that system, a ship, as movable property, cannot be hypothecated, but remains subject to the debts of the seller until it has made a voyage at sea, under the name and at the risk of the new purchaser, unless it has been sold under a decree; and it is a rule that the sale of a ship at sea shall never prejudice the creditors of the seller. See RESPONSIBILITY, SHIPPING, and HYPOTHECATION.

BOTZEN, an important trading town of the Austrian Tyrol, about 32 miles north-north-east of Trent. B. is a well-built town, with good streets and arcades; and streams of pure water are conducted through the principal thoroughfares, in little canals. It is protected from the inundations of a mountain-torrent in the vicinity by a strong wall about two miles in length. Its situation, at the junction of the roads from Germany, Italy, and Switzerland, makes B. the entrepot of the trade of these three countries. It has manufactures of silk, linen, hosiery, leather, &c.; and four extensive

annual fairs. Wine and fruits in abundance are produced in the environs. Pop. (1869) 9357.

BOUCHAIN, a fortified town of France, in the department of Nord, 12 miles south-east of Douai, intersected by the Scheldt, and possessing the means of laying the adjacent country under water, in the event of an attack. It was taken by the Duke of Marlborough in 1711, and recaptured by the French in the following year, to whom it was finally ceded by the treaty of Utrecht. Pop. (1872) 1039, who are chiefly engaged in extracting sugar from beet-root, and in refining salt.

BOUCHER, FRANCIS, a French painter of great note in his day, was born at Paris in 1704, and after studying there under Francis le Moine, he went to Rome to prosecute his art. After a short residence there, he returned to Paris, and on the death of Vanloo, was appointed principal painter to Louis XV. B. was an artist of much ability, and equally facile in the production of figure or landscape pictures—a facility, however, which was very fatal to the claims his genius might otherwise have had on posterity. In many of his paintings, picturesque effect is the only thing sought, no matter at what cost to truth. He has been called the Anacreon of painting, on account of the amorous character of many of his works: mythological and pastoral subjects were also great favourites with him. At his death in 1770, he was director of the French Academy.

BOUCHES-DU-RHONE, a department in the south-east of France, formerly a part of Provence, is situated at the mouths of the Rhone, in lat. 43° 10'—43° 56' N., and long. 4° 13'—5° 40' E. It has an area of 1971 square miles, and a population, in 1872, of 554,911. It is divided into three arrondissements—Marseille, Aix, and Arles—which are subdivided into 27 cantons and 108 communes. Through the northern and eastern districts, the Maritime Alps, which send out some calcareous ridges southward, slope gently down to the basin of the Rhone. Towards the sea-shore, there are several plains of considerable extent. About one-half of the department is under cultivation: heaths, wood, wastes, and water occupy the other half. The Rhone—which between Arles and the sea separates into several branches, forming a delta, called *Île de la Camargue*—and its affluent, the Durance, are the principal rivers. The department is intersected by several canals of importance, and the aqueduct to convey the water from the Durance to Marseille, is one of the most extensive works of the kind in existence, being no less than 51 miles long, including 15 miles of tunnelling. The *Île de la Camargue* produces corn and rice, and affords pasture for large numbers of sheep and cattle. The vine, olive, and mulberry also thrive here, and timber is plentiful. The soil in some parts, however, is strongly impregnated with salt. The great plain of Crou, which extends along the eastern branch of the Rhone, is stony and arid, except in a few spots, where the vine and olive are successfully cultivated. Besides the Etang de Berre (q. v.), there are numerous salt-lakes, communicating with the sea by natural or artificial channels. Marble, limestone, and gypsum are found in the Bouches-du-Rhone. Cloth leather, hats, perfumes, soap, olive-oil, vinegar, and chemical products are manufactured; there are extensive brandy-distilleries, sugar-refineries, and salt-works, and the produce of wine is large. B. has an active commerce with the Levant, Africa, Spain, and the West Indies.

BOUDOIR (Fr. *boudoir*, to pout—hence a retired corner), a lady's small private apartment, in

## BOUFLERS—BOUGIES.

which she receives only her most intimate friends. Boudoirs became particularly fashionable in France during the reign of Louis XIV., and so continued during the following reign. The example having been set by Madame Pompadour, Madame Dubarry, and other royal mistresses, it became indispensable for every lady of fashion to have her B., which was adorned with the most fantastic luxurianess.

**BOUFLERS**, LOUIS FRANÇAIS, DUKE OF, peer and marshal of France, one of the most distinguished generals of his time, was born in 1644, and was descended from one of the most ancient and noble families of Picardy. He began his military career as a lieutenant, and rose very rapidly from one rank to another. Under the great Condé, Turenne, Crequi, Luxembourg, and Catina, he fought with distinction in Germany and the Netherlands. His defences of Namur in 1695, and of Lille in 1708, are famous. The siege of the former place, conducted by King William III of England, cost the allies more than 20,000 men; and although Louis XIV. sent to B. an order written by his own hand for the surrender of the place, yet he did not surrender it until all the means of defence were exhausted. After the defeat of Malplaquet, he led the French army so admirably, that the retreat seemed rather a triumph than the consequence of a lost battle. He was a man of highly honourable and upright character. He died at Fontainbleau in 1711.—His son, Joseph Marie, Duke of Bouflers, and also a marshal of France, born in 1706, died at Genoa in 1747.

**BOUFLERS**, STANISLAS, MARQUIS DE, commonly styled the Chevalier de Bouflers, was born at Lunéville in 1737. He was the son of the Marquis Boufflers-Rémencourt, who was captain of the guard to Stanislas, king of Poland, and his mother was long one of the brightest ornaments of the Polish court. He himself was esteemed one of the most clever and agreeable men of his time. He entered the French military service, and was very soon made governor of Senegal, in which capacity he had the merit of introducing many regulations very useful to the colony. After his return, he devoted himself to the light literature for which the time of Louis XV. was distinguished. He was chosen a member of the National Assembly in 1789, in which he displayed great moderation, and made some most judicious proposals; but after the 10th of August 1792, he forsook France. He was hospitably received at the court of Prussia, and received the gift of a large estate in Poland, in order to establish upon it a colony of French exiles. Having returned to France, he again devoted himself, after the year 1800, entirely to literature. In 1804, he entered as an old academician into the Institute reorganised by Napoleon. He died 18th January 1815. The monument on his grave bears the following inscription, dictated by himself: *Mes amis, croyez que je dors* (My friends, believe that I sleep). A collection of his works was published after his death (8 vols. Par. 1815). His letters from Switzerland deserve to be particularly mentioned; and from this work an idea may be formed of the amiable character and intellectual liveliness of its author.

**BOUGAINVILLE** a bay, island, and strait, so called from the French navigator of the name (q. v.), a contemporary of Cook.—1. Bay, in Patagonia, on the north side of the Strait of Magellan, being in lat. 53° 25' S., and long. 70° 13' W.—2. Island, one of the Solomons, in the west section of Polynesia, sometimes distinguished from the east section as Melanesia. It is between lat. 5° 30' and 7° 2' S., and in long. 155° E., being mountainous, well

wooded, and populous.—3. Strait, in the New Hebrides, having Mallicollo to the south-east, and, to the north-west, Espiritu Santo, an islet of 63 miles by 20, which now appropriates the appellation that so long drifted about the ocean in search of a southern continent.

**BOUGAINVILLE**, LOUIS ANTOINE DE, one of the most famous navigators of France, was the son of a notary, and was born at Paris, 11th November 1729, studied there, and attained great proficiency both in languages and science. In 1754, he went as secretary of the French embassy to London. In 1766, he acted as aide-de-camp to the Marquis of Montcalm, to whom the defence of Canada was intrusted. At the head of a select detachment, he burned an English flotilla; and through his advice and example, a corps of 5000 French, in June 1758, successfully withstood an English army of 24,000 men. In the campaign of 1761 in Germany, he served with distinction. After the peace, he entered the naval service, in which he soon signalised himself. After having been obliged to give up a project which he had formed of founding a settlement on the Falkland Islands, he undertook a voyage round the world (15th Dec. 1766, to 18th March 1769) with a frigate and a St Malo transport, the first voyage round the world which the French ever accomplished. He gave an account of it in his *Description d'un Voyage autour du Monde* (2 vols. Par. 1771—1772). Geography and other branches of science were enriched by it with many discoveries. In the North American war, B. commanded several ships of the line, and in 1779, was made *chef d'escadre*; in the following year, he was made a field-marshal in the army. After the outbreak of the Revolution, he retired from public service, devoted himself entirely to scientific pursuits, and died 31st August 1811.

**BOUGHT AND SOLD NOTES** are notes of sale signed by a broker employed to sell goods, and by which the bargain through him is completed. The following is the form of the bought and sold note:

'Sold for A. B., to C. D., 250 firkins butter, at 100c. Shipped in the month of July, and payable by bill at two months.'

These notes are, in fact, transcripts from books, in which it is the practice of brokers to enter or register their transactions. The bought notes and the sold notes are respectively delivered to the principal parties; and as they contain the essential parts of the bargain, they will suffice, in the absence of a corresponding entry in the broker's books; but if they describe the particulars differently or incorrectly, as one species of goods for another, or erroneously state the terms no contract arises, and a variation of this nature cannot be corrected by a reference to the broker's book.

In Scotland, there is no necessity for any such signed note, but the contract may be proved by any kind of evidence, verbal (see PAROLE EVIDENCE) as well as written, the only exceptions to this general rule being those contained in acts of parliament relative to ships, literary property, patents, and goods bonded in the Queen's warehouses. See BROKER, SALE.

**BOUGIES** are rods of metal or other substances, used for distending contracted mucous canals, as the gullet, bowels, or urethra. See STRICTURE. For the urethra, they are frequently of German silver, or pewter, and vary from 125 to 25 inch in diameter. Still larger sizes are used by many surgeons. The following directions for making common non-metallic B. are taken from South's translation of Chelin's

*Surgery*: ‘A piece of fine linen, which has been already used, nine inches long, and half an inch in width, according to the thickness of the bougie to be made, is to be dipped into melting plaster, and, when a little cooled, spread flat and even with a spatula; it is then to be rolled together between the fingers, and afterwards between two plates of marble, till it is quite firm and smooth. The bougie must be equally thick throughout its whole length to about one inch from its point. Bougies are also made by dipping cotton threads into melted wax till they have acquired sufficient size, after which they are rolled between marble plates. Bougies are also made of a material termed “gum elastic;” and for very narrow strictures, catgut is often used.’

**BOUGUER, PIERRE**, one of the most eminent French mathematicians and natural philosophers of his time, was born at Croisic, in Bretagne, 18th February 1698, and studied in the Jesuit College at Vannes. In 1713, he succeeded his father as Professor of Hydrography in Croisic, from which he was removed to a similar office at Havre in 1730. In 1729, he published his *Essai d'Optique sur la Gradation de la Lumière*. His researches on other subjects of natural philosophy and astronomy continued to add to his fame; and in 1731, he was made Associate Geometer of the Academy of Sciences, and promoted to the office of pensioned astronomer in 1735. In that year, also, he was chosen to proceed, along with Godin and De la Condamine, to South America, in order to the measurement of a degree of the meridian at the equator. B. and his companions had to contend with many difficulties, and were more than seven years away from home, during which time B. made valuable observations on the length of the seconds' pendulum at great elevations, the deviation of the plumb-line from a vertical position through the attraction of a neighbouring mountain, the limit of perpetual snow, the obliquity of the ecliptic, &c. He published an account of his labours and those of his colleagues in a magnificent work, entitled *La Figure de la Terre déterminée par M.M. Bouguer et De la Condamine* (Par. 1749), which, however, involved him in an unpleasant controversy with De la Condamine concerning their respective shares of merit in the researches in which they had been jointly engaged. B.'s investigations concerning the intensity of light laid the foundation of photometry; and their results, which had been partly exhibited in the optical work already noticed, were more fully embodied in his *Traité d'Optique sur la Gradation de la Lumière*, which was edited after his death by Lacaille (Par. 1760). He invented the heliometer in 1748, which has of late been brought to greater perfection by Fraunhofer. He also published an excellent work on navigation (Par. 1753). He died in 1758.

**BOUILLET, FRANÇOIS CLAUDE AMOUR, MARQUIS DE**, a distinguished French general, was born in 1739 at the castle of Cluzel, in Auvergne, entered the army at the age of 14, and served with distinction in Germany during the Seven Years' War. In 1768 he was appointed governor of the island of Guadeloupe, and on the seeming approach of war with Britain, he was made governor-general of Martinique and St Lucia, and commander-in-chief of all the French forces in the West Indies. When the war really broke out in 1778, he took the island of Dominica from the British, the whole garrison falling into his hands. In conjunction with Admiral De Grasse, he took Tobago in 1781; and after De Grasse's departure, the British islands of St Eustatius, Saba, and St Martin. The humanity and generosity which he displayed were equal to his valour and skill. In

1782, B. captured the islands of St Christopher's and Nevis. For this he was rewarded with the rank of lieutenant-general. In 1784, he visited England, and was received with extraordinary respect. Louis XVI. nominated him a member of the Assembly of Notables in 1787—1788; in 1790, he was made commander-in-chief of the army of the Meuse, the Saar, and the Mosella. His decision of character prevented the dissolution of the army and the outbreak of civil war; he also quelled the insurrection of the garrison of Metz and of the three regiments at Nancy. For this he received the thanks of the National Assembly and of the king. For his share in the attempted escape of Louis XVI. he had to flee from France. He repaired to Coblenz to the king's brothers, and in 1791 attended the conference at Pilnitz. In the same year he entered into the service of Gustavus III. of Sweden, and after the assassination of that monarch, he served in the corps of the Prince of Condé. He rejected a proposal which the French princes made to him in 1793, that he should take the chief command in La Vendée; and went to England, where his advice in West Indian affairs was useful to the government, and where he wrote his *Mémoires sur la Révolution Française*—a truthful and useful work, throwing much light on the transactions of that time. He died in London in 1800.

**BOUILLON**, a duchy, originally German, in the Belgian part of the grand duchy of Luxemburg, consisting of a woody and hilly district in the Ardennes, about 157 square miles in extent, and with a population of 21,000. This duchy was the possession of the famous crusader, Godfrey (q. v.) of Bouillon, who, in order to raise money for his crusade, pledged it, in 1095, to the Bishop of Liège. It was conquered by France in the war of 1672, and bestowed by Louis XIV., in 1678, upon his grand chamberlain, Latour d'Auvergne. By the peace of 1814, the greater part of it was included in the grand duchy of Luxemburg; and the sovereignty of it passed to the king of the Netherlands, who, in 1821, purchased the proprietary rights from the heir. By the revolution of 1830, B., along with Luxemburg, was separated from the Netherlands, and in 1837 united to Belgium.—The principal town is Bouillon, situated between steep hills on the Semoy, with a strong castle on a rock, formerly the residence of the Dukes of Bouillon. Pop. 2800.

**BOUILLON, GODFREY**. See GODFREY OF BOUILLON.

**BOUILLY, JEAN NICOLAS**, one of the most prolific of French dramatic authors, was born at Boudray, near Tours, in 1763, and at first studied law, but afterwards devoted himself to belles-lettres. At the commencement of the Revolution, he attached himself to Mirabeau and Barnave, and in 1790 produced a drama called *Pierre le Grand* (Peter the Great), in which he displayed very revolutionary sentiments. He afterwards filled important public offices in Tours during times of the most dangerous excitement, and conducted himself with great prudence and moderation. He took an active part in the introduction of the system of elementary schools in France. The greater number of his dramatic works were produced in the first decade of the 19th century. Many of them have been translated into other languages. He wrote also tales and other works for young persons, some of which acquired great popularity. He died at Paris, 24th April 1842.

**BOULAC**, or **BOOLAK**, the name of the port of Cairo, is situated on the Nile, about one mile distant from that city, and is supposed to be the site of the ancient Litopolis. It is a crowded

## BOULAINVILLIERS—BOULDER-CLAY.

town, extremely dirty, with very narrow and irregular unpaved streets. It contains the custom-house and warehouses of Cairo, and has some good baths which are supplied by the Nile. There is in B. a weekly newspaper. Pop. about 14,000.

**BOULAINVILLIERS, HENRY, COUNT,** an eminent French author, descended from an ancient family in Picardy, was born 11th October 1658 at St Saire, in Normandy. After studying at the College of Juilly, he embraced the military profession, but afterwards resigned it, and devoted himself to the investigation of the genealogy of the ancient families of France. He regarded the feudal system as the most perfect creation of human genius and wisdom, and his writings are pervaded by the most extreme aristocratic sentiments. They were only circulated in manuscript during his life, and first published after his death, which took place on 23d January 1722. The most valuable of them are his *Histoire de l'Ancien Gouvernement de France* (3 vols. Hague, 1727), his *Histoire de la Pairie de France et du Parlement de Paris* (2 vols. Lond. 1753), and his *Abrégi Chronologique de l'Histoire de France* (3 vols. Hague, 1733). His philosophical writings have long ceased to have any interest, and the prejudices which appear in his historic works may afford amusement to his readers; but he deserves to be remembered as one of the first laborious investigators of the facts of history.

**BOULAY DE LA MEURTHE, ANTOINE JACQUES CLAUDE JOSEPH, COUNT,** a statesman of the French Empire, was born in 1761 at Chaumousey, a village in the Vosges. He espoused the cause of the Revolution, but held moderate principles. In 1797, he was elected to the Council of Five Hundred, in which he became the declared opponent both of Jacobinism and of the despotism of the Directory. He supported the *coup d'état* of the 18th Brumaire. Under the Empire, he accepted the post of president of the legislative section of the Council of State, in which capacity he had an important part in the preparation of the *Code Civil*. He afterwards laboured with extraordinary zeal and energy in the administration of the national domains, which he regarded as affording the basis for a regeneration of France. He adhered to the cause of Napoleon with remarkable fidelity. After the second Restoration, he was conveyed by the Russians into Germany. He received permission to return to France in 1819, and lived in complete retirement till his death, which took place at Paris, 2d February 1840. Napoleon had elevated him to the rank of a count of the Empire. In 1799, he published an *Essay on the Causes which led to the Establishment of the Commonwealth in England* in 1849, a work which had an extraordinary circulation, and did much to prepare men's minds for the revolution of the 18th Brumaire. He prosecuted the same general subject in his Political Picture of the Reigns of Charles II. and James II. (*Tableau Politique, &c.*, 2 vols. Brussels, 1818). He wrote also Bourrienne and his Errors, Voluntary and Involuntary (*Bourrienne et ses Erreurs, &c.*, 2 vols. Par. 1830), a work not without value in reference to the history of Napoleon.

His son, **HENRY BOULAY DE LA MEURTHE**, was born at Paris in 1797. He took an active part in the revolution of 1830, but became an opponent also of the government of Louis Philippe. He devoted great attention to questions of social economy, contributing much to promote the establishment of houses of refuge (*salles d'asile*), the extension of elementary education, and many improvements in the condition of the labouring-classes. In the National Assembly of 1848, he associated himself

with the moderate republicans, and in January 1849 was elected vice-president of the republic. Nevertheless, he tacitly acquiesced in the *coup d'état* of December 1851, and became a member of the imperial senate. He died at Paris, 24th November 1858.

**BOULDER-CLAY, DILUVIUM, DRIFT, or TILL,** is a post-pliocene bed of a remarkable character, and as yet somewhat mysterious history. It usually occurs as the lowest or first of that group of beds which geologists recognise as the post-tertiary, post-pliocene, pleistocene, or superficial formation. The only exception is when a bed of sand intervenes—as is rarely the case—over the surface of the subjacent rocks. It consists of a compact clay, blue or red, according to the prevalent character of the subjacent rocks, having boulders diffused throughout its mass, and with here and there thin lenticular beds of gravel and sand interspersed. In some places in Scotland it is not less than 70 feet thick. In America, it extends to about the 38th parallel; in Britain, it terminates a little to the north of London. The boulders, which are the most striking feature of this bed, differ in size from a small pebble to masses many tons in weight. They are portions of rocks of all ages, more or less worn. The older rocks, when from a distance, are rounded, while those that have been broken from rocks in the district are more angular. These masses are scattered without order in the clay, the heaviest blocks occurring frequently in the upper portion of the bed. Nor is there any indication of their having sunk in the clay from gravity—the clay seems to have been so viscous when the materials assumed their present position, as to have successfully resisted the immense pressure of these enormous blocks. The boulders have not that rounded appearance produced by the action of water in a river-course or on the shore between high and low water marks. They have a greater or less number of rubbed faces, produced evidently by being forced, while held in one position, over the solid rocks beneath. The rubbed and scratched surfaces exhibited on these rocks, when the superincumbent clay is removed, plainly testify to their origin. Several interesting examples of such rubbed surfaces exist in the neighbourhood of Edinburgh. They have been carefully examined and described by Fleming, Chambers, Milne-Home, and other local geologists. A careful observer can determine from the scratchings the direction of the current which bore with it the rubbing boulders. In the district to which we have alluded, these indicate a current from the west. The general direction, however, in America, in Britain, and in Scandinavia, seems to have been from the poles towards the warmer regions of the earth.

The B. contains no fossils strictly its own. Organisms exist in the boulders obtained from the older fossiliferous rocks, but no indications have hitherto been observed of a fauna or flora belonging to the period of the deposition of this bed. In the brick clays and gravels overlying it in Scotland, there are shells of arctic character.

The origin and structure of this remarkable bed have been a puzzle to geologists. That it was produced by the Noachian deluge, as was universally believed not many years ago, finds now no supporters. The present approved explanation assigns it as the product of a glacial ocean, in which the materials were borne violently along, pressing hard upon the sea-bottom, so as to wear and scratch it. But, while there is little room to doubt that such was the general fact, it remains to be shewn how a merely ice-charged ocean could carry along such vast masses of clay and blocks, allowing them all the time to press so hard upon the sea-bottom as

## BOULDERS—BOULOGNE-SUR-MER.

to mould its whole figure—for such appears to have been its work.

**BOULDERS, ERRATIC**, are large masses of rock found at a distance from the formations to which they belong. The term is generally applied when they are found lying detached on the surface; in which case they may either have been washed out of the boulder-clay (q. v.), or have been carried separately by icebergs, and dropped in their present situations. Large blocks of Scandinavian rocks are scattered over the plains of Denmark, Prussia, and Northern Germany. From their magnitude and number, they frequently form a striking feature in the landscape. They abound on the shores of the Firth of Forth—a large one, locally known as the ‘Penny Bap,’ is the most prominent object on the beach a little to the east of Leith. The pedestal of the statue of Peter the Great, in St Petersburg, was hewn out of a large erratic boulder, 1500 tons in weight, that lay on a marshy plain near that

from B. to St Cloud. Pop. in 1872, 18,687. The Bois de Boulogne is traversed by many walks, through the broadest of which the fashionable world of Paris travels in Easter-week to the Abbey of Longchamp. At the entrance of the wood lies Auteuil (q. v.). During the Revolution, the trees of the older walks were mostly cut down. But when Napoleon chose St Cloud, in the immediate neighbourhood, for his summer residence, new walks were planted and laid off, and the enclosing walls were restored. This wood, which from ancient times to the present day has been a place of enjoyment and recreation to the Parisians, was again much injured during the siege of 1870—1871.

**BOULOGNE-SUR-MER**, a fortified seaport in the department of Pas-de-Calais, France, situated at the mouth of the Lianne, in the English Channel, about 19 miles south-west of Calais, and 139 north-north-west of Paris. Lat. 50° 45' N., long. 1° 36' E. The town consists of two parts—Upper and Lower Boulogne. The upper town was, in former times, strongly fortified; but its citadel was demolished in 1690, and its ramparts have been converted into beautiful promenades, with fine views, and from which, in clear weather, the spire of Dover can be seen. The upper town contains the Hôtel-de-Ville, and the Cathedral, a modern edifice with a conspicuous dome. The lower town, which is more properly the seaport, is newer, finer, more populous, and more lively, inhabited chiefly by merchants, mariners, and fishermen. It contains the barracks, the great hospital, the theatre, the museum, and gallery of art. Latterly, the streets of B. have been much improved by means of side pavement, and many new and elegant buildings have been erected. B. has numerous churches and educational institutions; is the seat of various associations; has extensive and excellent salt-water baths; and, on account of its fine sands, is much resorted to for sea-bathing. Pop. in 1872, 38,514, who are actively engaged in the boiling of sugar, in the manufacture of linen and sail-cloth, cordage, &c., and in fishing, the coast being productive in oysters, herring, cod, and mackerel. B. has an active coasting trade, and ranks with Calais as one of the nearest and most frequented places of passage between France and England, steamers plying daily to London, which they reach in from 9 to 10 hours, and twice a day to Folkestone, which they reach in 1½ to 2 hours. B. is much resorted to by the English, who form a large section of the population, and for whose accommodation there are numerous hotels and boarding-houses. Paris is reached by railway from B. in six hours. The harbour of B. is too shallow for large ships of war, which can only reach the wide and safe roads of St Jean; it was, however, considerably enlarged and improved by Napoleon I., and also more recently—so that at high-water large merchant-vessels can, without danger, pass out or in. The long pier forms a fine promenade. B. was anciently called *Gesoriacum*, in the country of the Morini; after the time of Constantine the Great, it was called *Bononia*, and after that of the Carlovingians, *Bolonia*. In 1435, B. came into the possession of the Duke of Burgundy, and was united with the crown of France by Louis XI. in 1477. B. was besieged by Henry VII. of England in 1492, taken by Henry VIII. in 1544, and restored to the French by Edward VI. in 1550. From this point Napoleon contemplated the invasion of England; and here he encamped 180,000 men and collected 2400 transports, ready at any favourable moment to swoop down on the shores of Britain; but after months' watching, the war with Austria created other employment for them. As a memorial of this great camp, a tall marble

Erratic Boulder.

city. We give a drawing of a large one that forms a rocking-stone at Fall River, Massachusetts, United States.

**BOULEVARD, or BOULEVART** (Ital. *Boulevard*), identical with Eng. *bulwark* (q. v.), the name given in France to the old fortifications, ramparts, &c., with which towns, or portions of them, were or still are surrounded. In France and Germany, these ancient works have generally been levelled, the ditches filled up, and the space thus obtained employed for the formation of parks, promenades, and streets lined with trees. These, however, in France, still bear the name of Boulevard. The boulevards of Paris are celebrated, and are of great service as open spaces promoting the circulation of air amidst the dense mass of habitations. Some parts of them present a very dazzling spectacle; and as a whole, they afford a striking exhibition of the life and character of the French capital in all the different classes of society. The *Boulevard des Italiens* is particularly known as the rendezvous of the fashionable, and the *Boulevard du Temple* as the place where the small theatres were to be found which are frequented by the common people and the inhabitants of the suburbs, for which reason the expression *Théâtre de Boulevard* is often employed to denote a theatre for the common people, or one of an inferior kind.

**BOULOGNE**, a town of France, in the department of the Seine, on the right bank of the river of that name, about 5 miles west of Paris, from which it is separated by the Bois de Boulogne. A fine stone bridge of twelve arches crosses the Seine

## BOULTON—BOUNTY.

column was commenced on the higher grounds; but being incomplete at the restoration of the Bourbons, it was finished and inaugurated in honour of Louis XVIII. It has since been restored to its original object, and surmounted by a colossal statue of Napoleon. The poets Campbell and Churchill died at B.; and the house, or rather, the house occupying the site of that in which Le Sage, the author of *Gé Blas*, is said to have died, is shewn to the visitor. Altogether, B. is to be described as a thriving and agreeable place of residence; and from its accessibility to English tourists, and rapid railway transit to Paris, it has greatly superseded Calais as a place of embarkation.

**BOULTON**, MATTHEW, a celebrated English mechanician, was born in 1728 at Birmingham, where his father, who had a steel manufactory, had acquired a considerable fortune. When still very young, he undertook, at his father's death, the business of the manufactory, which he carried on with great energy, and extended, in 1762, by the purchase of a piece of land, then a barren heath, at Soho, near his native town. One of his first inventions was a new mode of inlaying steel. He entered into partnership with James Watt (q. v.), who had obtained a patent for the great improvements in the steam-engine which have immortalised his name, and they established a manufactory of steam-engines in 1769. They jointly contributed also to the improvement of coining machinery, and so to the perfection of the coinage itself. B. died at Soho, 17th August 1809. His long life was devoted to the promotion of the useful arts and of the commercial interests of his native country. He was a man of extremely pleasing conversation, and of a most generous disposition.

**BOUND**, or **BOUNDARY**, the utmost limits of land by which the same is known and can be described; being in this sense synonymous with *abutments*, which means the buttings and boundings of lands, east, west, north, and south, with respect to the places by which they are limited and bounded. The sides of the land are properly said to be *adjoining*, and the ends *abutting*, to the thing contiguous. For other applications of this term, see the articles that follow.

**BOUNDARIES OF BOROUGHS, CITIES, AND TOWNS** in England, are settled by the 5 and 6 Will. IV. c. 76, ss. 7 and 8, which refers to and adopts, for the purpose of such boundary, the regulations of the 2 and 3 Will. IV. c. 64—amended, however, by the 5 and 6 Will. IV. c. 103. These boundaries are generally the same as the parliamentary limits. The corresponding Scotch law on this subject is contained in the 3 and 4 Will. IV. c. 76, which adopts the limits prescribed in the 2 and 3 Will. IV. c. 65.

By the 7 Geo. IV. c. 64, it is enacted that where, in England, any felony or misdemeanour shall be committed on the boundary or boundaries of two or more counties, or within the distance of 500 yards of any such boundary or boundaries, or shall be begun in one county, and completed in another—every such felony and misdemeanour shall be dealt with and tried in any of the counties.

**BOUNDARIES OF PARISHES** are determined by ancient and immemorial usage, as to which, see **PARTH**, and see **BATING THE BOUNDS**. It may also be observed that by numerous acts of parliament lately passed, for extending church accommodation, and making more effectual provision for the cure of souls, it is generally provided that any part or parts of any parish may be constituted a separate district for spiritual purposes, or *parish quasi sacra*, as it is called in Scotland; and that any parish may also be divided into two or more

distinct and separate parishes for all ecclesiastical purposes, though for other purposes the old limits remain. The Church Building and Inclosure Acts contain many provisions as to boundaries.

**BOUNDARY SURVEY OF IRELAND**. This important subject is provided for and regulated by these acts of parliament—the 6 Geo. IV. c. 99, 17 Vict. c. 17, 20 and 21 Vict. c. 45, and the 22 and 23 Vict. c. 8, which are all to be read as one act. The boundary surveyor may alter the names of lands erroneously named in the ordinance map of any county, on the application of the owners of such land, who are to state the ground on which such application is made. And the same surveyor may define the boundaries of parishes divided under certain acts of parliament. The publication in the *Dublin Gazette* of the surveyor's report, referred to in the order of the lord-lieutenant in council, is to be discontinued, on the ground of its being unnecessary and expensive; and in lieu thereof, any person desirous of seeing the report and ordinance plans, may see them at the council office, in Dublin, at all reasonable hours, without fee or reward. See **ORDNANCE SURVEY** and **SURVEY**; and see **IRELAND**.

**BOUND-BAILIFF**, in England, is an officer of the sheriff whose duty is to discover and arrest debtors. As the sheriff is responsible for the misconduct of these bailiffs, they are annually bound in an obligation, with sureties, for the due execution of their office, and are, in consequence, called *bound-bailiffs*, a name which Blackstone is at pains to inform us ‘the common people have corrupted into a much more homely appellation’—*bum-bailiff*. See **BAILIFF**.

**BOUNDING CHARTER**, in the Scotch law, is an instrument of title which describes the lands thereby conveyed by their boundaries or limits. It gives right to everything within the bounds, and, on the other hand, it excludes what lies beyond these. If the boundary be the sea or the sea-shore, the right is extended or limited as the sea recedes or advances. If, again, it be a stream or river, the property may be subject to alteration, either extended by *allusion* (q. v.), or by the gradual and imperceptible variation of the channel; or the stream may cease to be the boundary, in consequence of some violent change. But if the property described in the charter is bounded by walls, the walls, as a general rule, will not be held as included in the grant; and where it is intended that a wall is to be mutual, this must be expressed. When the grant is described both by boundaries and by measurement, the boundaries determine its extent, although containing a larger quantity of ground than the measurement. The lands, however, may be described simply by reference to a plan, and this is a conveyance which makes a valid bounding charter. By statute also a reference to a leading name in a prior deed is a sufficient description. The following articles should be consulted in connection with this subject—**CHARTER**; **CONVEYANCE**; **LAND**, **TITLES TO**; and **GRANT**.

**BOUNTY** is a sum of money given to encourage men to enter the army or navy. In time of peace, when there is little or no need to augment the forces, the B. sinks to a minimum; but in cases of exigency, it is raised according to the difficulty and urgency of the circumstances. In the British army, no B. was paid to recruits until about half a century ago; the temptations offered to them, if any, were of some other character. The highest B. ever paid during the great wars against Napoleon was in 1812, when it amounted to £18, 12s. 6d. for limited service, and £23, 17s. 6d. for life; but these sums were in great part nominal, being subject to

## BOUNTY—BOUQUETIN.

many unfair and absurd deductions. Even so late as 1849, when the B. to an infantry recruit was nominally £4, he received little more than one-eighth of this amount, all the rest being swallowed up in fees and drawbacks of various kinds. The only B. which now (1874) exists is a free kit—no other being allowed. The young men who used to enter the British army were supposed, for the most part, to have been tempted by immediate B. rather than by prospective pay and pensions; and thus it arose that the rate of B. varied frequently, while those of pay and pensions underwent very little change. In 1855, it was £7 per head (for line infantry); in 1856, only £2; in 1858, £3; and it afterwards underwent further changes. It was always higher to the cavalry and artillery than to the infantry; and in the latter it was higher to the Highland than to the other regiments, on account of matters connected with dress and personal ornaments. The relation which the B. bore to the other emoluments of the soldier are explained under ENLISTMENT, RECRUITING. In reference to seamen, the subject will receive elucidation under MANNING THE NAVY.—The term B. is also used in the navy to signify the payment and distribution of money to which the officers and crews of her Majesty's ships and vessels of war may, on particular occasions of active service, be entitled. See PRIZE, SALVAGE, BOOTY.

**BOUNTY**, a term applied to any sum granted by the legislature towards creating or encouraging some kind of undertaking believed to be of national importance. At one time there was no end to the giving of bounties in this way from the public purse—there were bounties on exporting corn, with a view to encouraging agriculture; there were bounties on the tonnage of vessels employed in the herring and whale fisheries; on the importation of materials of manufactures; on the importation of indigo from the colonies; on the exportation of Irish linen, &c. The fallacy of this costly and factitious process for fostering commerce, manufactures, and agriculture was amply demonstrated by Adam Smith in his *Wealth of Nations*; one of his more striking facts being, that every barrel of herrings which sold for 20s. cost the government about 2s. The notion that bounties may properly be given as an encouragement in the infancy of undertakings, has been happily exploded. It is ascertained that, besides taxing the general community in order to reward or encourage individuals, bounties do no real good to the parties so favoured; for by such inducements they engage in businesses for which they have no special vocation, or which, in existing circumstances, it would be preferable to let alone. Misdirection of capital, talent, and industry are, in short, the inevitable result of bounties, as of all measures alleged to be for the special protection of trade. The only kind of bounties which can in recent times be spoken of as remaining in Great Britain are the large parliamentary grants to sustain certain steam-boat companies which performed the mail-service; as, for example, the Cunard Company. But on the subject of these grants there are differences of opinion. By some, they are defended as payment for a service which would not otherwise be so well performed; while by others it is asserted that they defeat competition, and are so much money thrown away.

**BOUNTY OF QUEEN ANNE.** See QUEEN ANNE'S BOUNTY.

**BOUQUET OF WINE** is the peculiar flavour yielded by the better class of wines, and which is due principally to the presence of cinnamathic ether. See WINE.

**BOUQUETIN**, or **IBEX** of the Alps (*Capra Ibex*), a species of goat, which inhabits the highest regions of the Alps, even higher and wilder than those inhabited by the chamois, up to the limits of perpetual snow. It is the *Ibex* of the ancients. See IRKX. In German Switzerland, its name is *Steinbock*. It was at one time found on all the higher Alps, but has disappeared from most of them, and exists chiefly on those between the Valais and Piedmont, where it is carefully protected by the Sardinian government. It is larger and more powerful than the common goat, and has a small head and great horns (those of the male 1½—2 feet long), which curve backwards, are directed a little outwards, and have prominent transverse knots or bands on the front. The horns of the females are only about six inches long. The hoofs are large, rough on the sole, and capable of being spread widely apart, to give greater security of footing. The general colour is brown. The body is covered with two kinds of hair, the longer hair being mixed, at least in winter, with thick soft wool. There is no beard, except a few hairs in winter, although the animal has been often incorrectly figured as having one.

The B. feeds on the herbage and small shrubs which are found on the last confines of vegetation, and descends by night to browse in the highest forests, the lichens and branches of which supply much of its winter food. It is capable of enduring

Bouquetin.

great cold, and will remain, with seeming indifference, for hours on the summit of a rock, motionless, during the most severe storm. It possesses an extraordinary power of bounding from crag to crag, and of ascending or descending almost perpendicular precipices. Even the projections of a wall of rough masonry have been seen to suffice for the feet of a tame one to take hold of. One has also been known frequently to spring from the ground, without a race, and plant itself on a man's head. Tschudi rejects as a fable the statement which has been repeated by one naturalist after another, from the days of Gesner, that the B. throws itself down precipices, so as to fall upon its horns, their elasticity preserving it from injury.

When taken young, the B. is easily tamed. It readily associates with common goats, and breeds

## BOURBON.

with them, and the hybrids produce young, of which, however, it does not appear that in any case both parents have been ascertained to be hybrids.

Whether this animal might not be made useful to the inhabitants of such countries as Iceland and Greenland, no one seems to have thought of trying.

BOURBON, ILE DE, an island in the Indian Ocean, the southernmost of the Mascarene Isles, lying about 100 miles south-west from Mauritius, and 360 miles east from Madagascar. It is one of the most important of the insular colonies of France. It has an area of about 950 sq. miles, being about 38 miles in length, and 28 in its greatest breadth. Pop. (1868) 209,737, including some hundreds of Chinese, 6000 negroes, 34,500 Indians, and a garrison, and other officials, to the number of about 2000. It may be described as one great mountain mass, of which the highest peaks are the Piton de Neiges—in the centre of the island, rising more than 10,000 feet above the sea—the Grand Bernard, and the Cimandef, in the north, with respective heights of 9500 and 7300 feet; and in the south-east, the Piton de Fournaise, 7200 feet high, one of the greatest volcanoes in the world, and one of the most active, its eruptions taking place at least twice every year, and its lava-streams sometimes reaching to the sea. This volcano occupies perhaps one-sixth of the island, often changes its crater, and is surrounded by a district of more than 10,000 acres, which is a dreary desert, and is called the *Pays Brûlé* (Burned Land). Except in this part, however, the soil is in general extremely fruitful. About a fourth part of the island is cultivated, chiefly along the coast, although much of the interior is of great natural fertility. The scenery is very beautiful. Streams, although not large, are very numerous, and rush in cascades to the sea. The climate, which was once mild and salubrious, is now very unhealthy to Europeans, who cannot reside four or five years on the island without an attack of typhoid fever or dysentery. The south-east monsoon and hurricanes often make fearful devastation. The plants of Arabia, of the Asiatic Archipelago, and of the south of Europe, succeed equally well here; coffee and cloves are produced, along with the fruits of Italy and Spain. The trade is estimated at about two millions sterling. By far the most important article of export is sugar; and the cultivation of the sugar-cane has of late years greatly increased. Next to sugar is coffee. Rice, maize, and tobacco are also cultivated. Cloves, salt-petre, wood for cabinet-making, and dye-woods, are the other principal exports. The value of the exports has of late greatly increased. The cereals grown in the island are not sufficient for its own wants. Cattle are imported from Madagascar. The capital of the island, and seat of government, is St Denis, on the north-west coast, with 9000 inhabitants, a college, a botanic garden, &c. Lat. 20° 52' S., long. 55° 30' E. The mean temperature here is 77° F. There is an almost total want of harbours, the whole coast of the island possessing only two tolerable anchoring-places—one at St Denis, and another at St Paul, 18 miles further south. The coast is consequently very dangerous. In one year, 1843—1844, no less than 11 large vessels were wrecked. B. and Mauritius were discovered by the Portuguese navigator, Mascarenhas, and named after him, the Mascarene Isles. After the French had begun their attempt to found a colony in Madagascar, they took possession of B. in 1649, giving it that name, which was changed to Réunion at the Revolution, and to Isle Bonaparte in 1809. The name has been varied according to the political changes in France. The French having also taken possession of Mauritius in 1720, which

they then named Isle of France, the Mascarene Isles were placed under one governor. In 1810 they were taken by the British, but B. was restored to France in 1814.

BOURBON, a French family of the highest note in history, and which came to possess several European thrones, derives its name from the castle and seignory of Bourbon, in the former province of Bourgogne, in the centre of France. The first lord or sire of this family, of whom history makes mention, was Adhémar, at the beginning of the 10th century. The fourth in succession from him, Archambaud I., added the name of the family castle to his own. Under his successors, who also bore the name of Archambaud, the family possessions were soon very much increased. At length the seignory of Bourbon having devolved upon an heiress, who, in 1272, married Robert, the sixth son of Louis IX. of France, thus passed to a branch of the royal family of the Capets, under whom it was converted into a duchy. The principal branch of this family was, in 1523, deprived of all its dignities and possessions, because the duke, Charles de B. (q. v.), the famous Constable, allied himself with Charles V. against Francis I. of France.

Of the collateral branches, that of Vendôme acquired great importance, first attaining by marriage, in the person of Antoine de B., Duke of Vendôme, to the throne of Navarre; afterwards by inheritance to the throne of France, in the person of Henry IV., on the extinction of the male line of the House of Valois; and by the fortune of war to the thrones of Spain and Naples. Among the numerous other collateral branches may be mentioned those of Montpensier, De la Marche, Condé, Conti, Soissons, and Orleans. Only a few members of the collateral lines, however, have borne the name of B.; for example, the Cardinal Charles de B., Duke of Vendôme, who, under the name of Charles X., was set up by the Catholic League as a rival king to Henry IV. The ducal dignity was revived by Louis XIV. in the House of Condé, so that the eldest son of that House should bear the title of Duke of Bourbon.

The dynasty of the Bourbons in France begins with Henry IV. (q. v.), who, after the assassination of Henry III., became, in virtue of the Salique law (q. v.), the next heir to the French throne. Through his father, Antoine de B., King of Navarre and Duke of Vendôme, he was descended from Robert, son of Louis IX., and husband of Beatrix, heiress of Bourbon. On his assassination in 1610, he left, by his second wife, Mary de' Medici, five legitimate children: 1. Louis XIII. (q. v.), his successor on the throne; 2. J. B. Gaston, Duke of Orleans (q. v.), who died in 1660, and left no male heirs; 3. Elizabeth, married to Philip IV. of Spain; 4. Christina, married to Victor Amadeus, afterwards Duke of Savoy; 5. Henrietta, married to Charles I. of England.—Louis XIII., on his death in 1643, left two sons by his queen, Anne of Austria: 1. Louis XIV. (q. v.), his successor; and 2. Philip, who received from his elder brother the title of Duke of Orleans, and was the founder of the family which has become the younger B. dynasty.—The Dauphin Louis, styled Monsieur, the son of Louis XIV. by his marriage with Maria Theresa of Austria, died on 14th April 1711, and left three sons by his marriage with Maria Anna of Bavaria: 1. Louis, Duke of Burgundy (q. v.); 2. Philip, Duke of Anjou, who afterwards became king of Spain, as Philip V.; 3. Charles, Duke of Berry, who died in 1714.—Louis, Duke of Burgundy, died in 1712. By his wife, Maria Adelaide of Savoy, he had three sons, of whom two died in early youth, the only one who survived being Louis XV.,

## BOURBON.

who succeeded his great-grandfather, Louis XIV. in 1715.—Louis XV. having married Maria Leszczynska, daughter of the dethroned king Stanislaus of Poland, had by her a son, the Dauphin Louis, who married Maria Josepha of Saxony, and died in 1765, leaving three sons: 1. Louis XVI. (q. v.), who succeeded his grandfather, Louis XV., in 1774; 2 Louis Stanislaus Xavier, Count of Provence, afterwards Louis XVIII.; 3. Charles Philippe, Count of Artois, afterwards Charles X.—Louis XVI. had three children by his queen, Marie Antoinette of Austria: 1. the Dauphin Louis, who died in 1789; 2. Louis, called Louis XVII. (q. v.), who died in 1795; 3. Marie Therese Charlotte, styled Madame Royale, afterwards Duchesse d'Angoulême (q. v.).—Louis XVIII. had no children; but Charles X. had two sons: 1. Louis Antoine de B., Duke of Angoulême (q. v.), who was dauphin prior to the Revolution of 1830, and died without issue in 1844; 2. Charles Ferdinand, Duke of Berri (q. v.), who was murdered in 1820. The Duke of Berri left two children: 1. Marie Louise Therese, styled Mademoiselle d'Artois, married to the Duke of Parma; 2. Henry Charles Ferdinand Marie Dieudonné, Duke of Bordeaux, now styled Count de Chambord, the representative of the elder branch of the Bourbons, till June 1871, exiled from France, and whom the French Legitimists sometimes designate Henry V.

It has already been stated that the founder of the Orleans or younger branch of the B. royal family of France, was Philip, Duke of Orleans (q. v.), the younger brother of Louis XIV. He died in 1701, leaving, by his second marriage with Elizabeth Charlotte of the Palatinate, a son of his own name as his heir, who was Regent of France during the minority of Louis XV. His son, Louis Philippe, Duke of Orleans (born 1703), married a princess of Baden, and died in 1752, leaving an only son of his own name (b. 1725, d. 1785), whose son and heir was that Louis Joseph Philippe, Duke of Orleans (q. v.), so notable in the French Revolution, who in 1792 renounced his rank, taking the name of Citizen Egalité, and died by the guillotine in 1793. He left four children: 1. Louis Philippe (q. v.), who, before the Revolution, was styled Duke of Chartres—that being the ordinary title of the eldest son of the Orleans family—became afterwards Duke of Orleans, was King of the French from 1830 to 1848, and died in England on the 26th of August 1850; 2 the Duke de Montpensier, who died in England in 1807; 3. the Count de Beaujolais, who died at Malta in 1808; 4. Adelaide, styled Mademoiselle d'Orleans, b. 1777, d. 1847.—Louis Philippe left a numerous family by his queen, Amelia of Naples; but his eldest son, Ferdinand, Duke of Orleans, lost his life by an accident on the 13th of July 1842, leaving by his wife, the Princess Helen of Mecklenburg-Schwerin, two sons, the eldest of whom, Louis Philippe Albert, now styled Count of Paris, is the representative of the younger or Orleans B. family.—Concerning the other members of Louis Philippe's family, see the article LOUIS PHILIPPE.
